Complete geometric criteria are presented for controllability and reachability of switched linear systems

Abstract

This paper investigates the controllability and reachability of switched linear control systems. It is proven that both the controllable and reachable sets are subspaces of the total space. Complete geometric characterization for both sets is presented. The switching control design problem is also addressed. © 2002 Elsevier Science Ltd. All rights reserved.

Keywords: Switched systems; Controllability; Reachability; Observability; Determinability; Switching control

1. Introduction

During the last decade, hybrid and switched systems have attracted considerable attention (Chase, Serrano, & Ramadge, 1993; Branicky, 1998; Wicks, Peleties, & DeCarlo, 1998; Ye, Michel, & Hou, 1998; Liberzon & Morse, 1999). Basically, a switched system consists of continuous-time/discrete-time dynamical subsystems and a rule (supervisor) that determines the switching among them.

Switched systems deserve investigation for theoretical reasons as well as for practical reasons. Switching among different system structures is an essential feature of many engineering control applications including power systems and power electronics (Williams & Hoft, 1991; Sira-Ramirez, 1991), and switched systems have numerous applications in control of mechanical systems, air traffic control, aircrafts and satellites and many other fields (Li, Wen, & Soh, 2001). Control techniques by switching among different controllers have been applied extensively in recent years. Indeed, a switched controller can provide a performance improvement over a fixed controller (Morse, 1996; Narendra & Balakrishnan, 1997; Savkin, Skafidas, & Evans, 1999). The switched controller architecture was proven to

be a rigorous design framework for general nonlinear systems (Kolmanovsky & McClamroch, 1996; Caines & Wei, 1998; Leonessa, Haddad, & Chellaboina, 2001). A switched controller can also achieve certain control object which cannot be accomplished by conventional methods, such as pure feedback stabilization of nonholonomic systems (Brockett, 1983; Kolmanovsky & McClamroch, 1995).

A fundamental pre-requisite for the design of feedback control systems is full knowledge about the structural properties of the switched systems under consideration. These properties are closely related to the concepts of controllability, observability and stability which are of fundamental importance in the literature of control. There have been a lot of studies for switched systems, primarily on stability analysis and design (Branicky, 1998; Dayawansa & Martin, 1999; Liberzon & Morse, 1999). As for controllability and reachability, studies for low-order switched linear systems have been presented in Loparo, Aslanis, and Ilajek (1987) and Xu and Antsaklis (1999). Some sufficient conditions and necessary conditions for controllability were presented in Ezzine and Haddad (1989) and Szigeti (1992) for switched linear control systems under the assumption that the switching sequence is fixed a priori. The complexity of stability and controllability of hybrid systems was addressed in Blondel and Tsitsiklis (1999).

For controllability analysis of switched linear control systems, a much more difficult situation arises since both the control input and the switching rule are design variables to be determined, and thus the interaction between them must be fully understood. For a switched linear discrete-time

control system, the controllable set is not a subspace but a countable union of subspaces in general case (Stanford & Conner, 1980; Conner & Stanford, 1987; Ge, Sun, & Lee, 2001). For a switched linear continuous-time control system, the controllable set is an uncountable union of subspaces (Sun & Zheng, 2001).

In this paper, we investigate the controllability and reachability issues for switched linear control systems in detail. We prove that, both the controllable set and the reachable set are subspaces of the total space, and the two sets always coincide with each other. Verifiable geometric characterization is presented for the controllable subspace. Dualistic criteria for observability and determinability are also presented.

The paper is organized as follows. In Section 2, we present the definitions of controllable and reachable notions. Preliminary results are given in Section 3. A complete characterization for the controllability and reachability sets is presented in Section 4. In Section 5, we briefly address the observability and determinability issues. An illustrative example is presented in Section 6. Finally, some concluding remarks are made in Section 7.

2. Definitions

Consider a switched linear control system given by

$$\dot{x}(t) = A_\sigma x(t) + B_\sigma u_\sigma(t), \tag{1}$$

where $x \in \mathfrak{R}^n$ are the states, $u_k : \mathfrak{R}^+ \in \mathfrak{R}^{r_k}$, $k = 1, \dots, m$ are piecewise continuous input functions, $\sigma : [t_0, \infty) \rightarrow M = \{1, 2, \dots, m\}$ is the switching path to be designed, and matrix pairs (A_k, B_k) for $k \in M$ are referred to as the subsystems of (1).

Given a switching path $\sigma : [t_0, t_f] \rightarrow M$, suppose its discontinuous (jump) time instants are $t_1 < t_2 < \dots < t_s$, we refer to the sequence t_0, t_1, \dots, t_s as switching time sequence, and the sequence $\sigma(t_0), \sigma(t_1), \dots, \sigma(t_s)$ as switching index sequence. It is clear that these two sequences can uniquely determine the switching path, and vice versa.

For clarity, let $x(t; t_0, x_0, u, \sigma)$ denote the state trajectory at time t of switched system (1) starting from $x(t_0) = x_0$ with $u(t) = [u_1(t), \dots, u_m(t)]^T$.

A state x is said to be controllable at time t_0 , if it can be transferred to the origin in a finite time starting from t_0 by appropriate choices of input u and switching path σ .

Definition 1. State $x \in \mathfrak{R}^n$ is controllable at time t_0 , if there exist a time instant $t_f > t_0$, a switching path $\sigma : [t_0, t_f] \rightarrow M$, and inputs $u_k : [t_0, t_f] \rightarrow \mathfrak{R}^{r_k}$, $k \in M$, such that $x(t_f; t_0, x, u, \sigma) = 0$.

Definition 2. The controllable set of system (1) at t_0 is the set of states which are controllable at t_0 .

Definition 3. System (1) is said to be (completely) controllable at time t_0 , if its controllable set at t_0 is \mathfrak{R}^n .

The reachability counterparts can be defined in the same fashion as follows.

Definition 4. State $x \in \mathfrak{R}^n$ is reachable at t_0 , if there exist a time instant $t_f > t_0$, a switching path $\sigma : [t_0, t_f] \rightarrow M$, and inputs $u_k : [t_0, t_f] \rightarrow \mathfrak{R}^{r_k}$, $k \in M$, such that $x(t_f; t_0, 0, u, \sigma) = x$.

Definition 5. The reachable set of system (1) at t_0 is the set of states which are reachable at t_0 .

Definition 6. System (1) is said to be (completely) reachable at t_0 , if its reachable set at t_0 is \mathfrak{R}^n .

Note that if $t' - t = t'_0 - t_0$, $u'(t) = u(t - t_0 + t'_0)$ and $\sigma'(t) = \sigma(t - t_0 + t'_0)$ for all $t \in [t'_0, t']$, then

$$x(t; t_0, x_0, u, \sigma) = x(t'; t'_0, x_0, u', \sigma').$$

That is, the state trajectory possesses the translation invariant property. Accordingly, if x is controllable (reachable) at a time t_0 , then x is controllable (reachable) at any arbitrary given instant of time. In the sequel, the reference of t_0 shall be dropped for conciseness.

It is obvious that if one subsystem, say (A_1, B_1) , is controllable, then system (1) is both controllable and reachable. In this paper, we shall investigate the nontrivial situation where each subsystem (A_k, B_k) , $k \in M$ is not controllable.

3. Elementary results

3.1. Elementary analysis

Given an initial state $x(t_0) = x_0$, inputs u_k , $k \in M$, and a switching path $\sigma : [t_0, t_f] \rightarrow M$, the solution of state equation (1) is given by

$$\begin{aligned} x(t) &= e^{A_{i_k}(t-t_k)} \dots e^{A_{i_0}(t_1-t_0)} x_0 \\ &+ e^{A_{i_k}(t-t_k)} \dots e^{A_{i_1}(t_2-t_1)} \\ &\times \int_{t_0}^{t_1} e^{A_{i_0}(t_1-\tau)} B_{i_0} u_{i_0}(\tau) d\tau + \dots \\ &+ \int_{t_k}^t e^{A_{i_k}(t-\tau)} B_{i_k} u_{i_k}(\tau) d\tau, \\ &t_k < t \leq t_{k+1}, \quad 1 \leq k \leq s, \end{aligned} \tag{2}$$

where t_0, t_1, \dots, t_s is the switching time sequence of σ , $t_{s+1} = t_f$, and $i_0 = \sigma(t_0), \dots, i_s = \sigma(t_s)$ is the switching index sequence of σ .

The reachable set of system (1) is given by

$$\begin{aligned} \mathbf{R} &= \{x : x = x(t; t_0, 0, u, \sigma), \\ &t \geq t_0, u \in U^r, \sigma : [t_0, t] \rightarrow M\} \end{aligned}$$

$$= \left\{ x: x = e^{A_{i_k}(t-t_k)} \dots e^{A_{i_1}(t_2-t_1)} \right. \\ \times \int_{t_0}^{t_1} e^{A_{i_0}(t_1-\tau)} B_{i_0} u_{i_0}(\tau) d\tau + \dots \\ \left. + \int_{t_k}^t e^{A_{i_k}(t-\tau)} B_{i_k} u_{i_k}(\tau) d\tau, \right. \\ \left. k = 0, 1, \dots, i_j \in M, u \in U^r \right\},$$

where $r = \sum_{j=1}^m r_j$ and U^r is the set of r th-dimensional piecewise continuous vector functions.

Note that for any matrices $A \in \mathfrak{R}^{n \times n}$, $B \in \mathfrak{R}^{n \times p}$ and $t > t_0$, we have

$$\left\{ x: x = \int_{t_0}^t e^{A(t-\tau)} B u(\tau) d\tau, u \in U^p \right\} = \sum_{j=0}^{n-1} A^j \text{Im } B, \quad (3)$$

where $\text{Im } B$ is the subspace spanned by columns of matrix B .

Denote $\mathbf{B}_k = \text{Im } B_k$, and $\mathbf{D}_k = \sum_{j=0}^{n-1} A_k^j \mathbf{B}_k$ for $k \in M$. It follows from (3) that the reachable set

$$\mathbf{R} = \bigcup_{k=1}^{\infty} \bigcup_{i_0, \dots, i_k \in M} \bigcup_{h_1, \dots, h_k > 0} (e^{A_{i_k} h_k} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_k}). \quad (4)$$

Similarly, the controllable set of system (1) is given by

$$\mathbf{C} = \bigcup_{k=1}^{\infty} \bigcup_{i_0, \dots, i_k \in M} \bigcup_{h_0, \dots, h_k > 0} (e^{-A_{i_0} h_0} \mathbf{D}_{i_0} + \dots + e^{-A_{i_k} h_k} \mathbf{D}_{i_k}). \quad (5)$$

Given a matrix A and a subspace $\mathbf{B} \in \mathfrak{R}^n$, let $\Gamma_A \mathbf{B}$ denote the minimal A -invariant subspace that contains \mathbf{B} , i.e.,

$$\Gamma_A \mathbf{B} = \mathbf{B} + A\mathbf{B} + \dots + A^{n-1} \mathbf{B}.$$

This operation can be defined recursively as

$$\Gamma_{A_1} \Gamma_{A_2} \mathbf{B} = \Gamma_{A_1} (\Gamma_{A_2} \mathbf{B}).$$

Let us define the nested subspaces for system (1) as

$$\mathbf{V}_1 = \mathbf{D}_1 + \dots + \mathbf{D}_m, \\ \mathbf{V}_{j+1} = \Gamma_{A_1} \mathbf{V}_j + \dots + \Gamma_{A_m} \mathbf{V}_j, \quad j = 1, 2, \dots \quad (6)$$

and

$$\mathbf{V} = \sum_{k=1}^{\infty} \mathbf{V}_k.$$

Note that if $\dim \mathbf{V}_j = \dim \mathbf{V}_{j+1}$, then $\mathbf{V}_l = \mathbf{V}_j$ for $l > j$. This fact implies that $\mathbf{V} = \mathbf{V}_n$. It is readily seen that this subspace is the minimal subspace which is invariant under A_k , $k \in M$ and contains $\sum_{k \in M} \mathbf{B}_k$. Subspace \mathbf{V} plays an important role in the following derivations.

Note that $e^{At} \text{Im } B \subset \Gamma_A \text{Im } B$ for all $A \in \mathfrak{R}^{n \times n}$, $B \in \mathfrak{R}^{n \times p}$ and $t \in \mathfrak{R}$. This gives

$$\mathbf{R} \subset \bigcup_{k=1}^{\infty} \bigcup_{i_0, \dots, i_k \in M} (\Gamma_{A_{i_k}} \dots \Gamma_{A_{i_1}} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_k}) \subset \mathbf{V} \quad (7)$$

and

$$\mathbf{C} \subset \bigcup_{k=1}^{\infty} \bigcup_{i_0, \dots, i_k \in M} (\mathbf{D}_{i_0} + \dots + \Gamma_{A_{i_0}} \dots \Gamma_{A_{i_{k-1}}} \mathbf{D}_{i_k}) \subset \mathbf{V}. \quad (8)$$

As has been shown in Sun and Zheng (2001), we have the following proposition:

Proposition 1. *If switched linear system (1) is controllable or reachable, then*

$$\mathbf{V} = \mathfrak{R}^n. \quad (9)$$

3.2. A heuristic example

According to (4) and (5), the controllable set and the reachable set of system (1) are uncountable unions of subspaces of \mathfrak{R}^n . A question arises naturally: Are \mathbf{R} and \mathbf{C} subspaces of \mathfrak{R}^n ? A heuristic way for addressing this question is by analyzing typical examples.

Example 1. Consider system (1) with $n = 4$, $m = 2$, and

$$A_1 = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \quad B_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \\ A_2 = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \quad B_2 = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}. \quad (10)$$

Simple calculation gives

$$\mathbf{V} = \text{span} \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \end{bmatrix} \right\}.$$

It follows from Proposition 1 that system (10) is neither controllable nor reachable.

Now we compute the reachable set for system (10). For clarity, let \mathbf{R}_j denote the set of states which can be transferred from the origin within j times of switching. Accordingly,

$$\mathbf{R}_0 = \mathbf{D}_1 \cup \mathbf{D}_2 = \text{span} \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} \right\}, \\ \mathbf{R}_1 = \left(\bigcup_{t \geq 0} e^{A_2 t} \mathbf{R}_0 + \Gamma_{A_2} \mathbf{B}_2 \right) \cup \left(\bigcup_{t \geq 0} e^{A_1 t} \mathbf{R}_0 + \Gamma_{A_1} \mathbf{B}_1 \right) \\ = \left\{ \begin{bmatrix} a \\ at \\ 0 \\ 0 \end{bmatrix} : a \in \mathfrak{R}, t \geq 0 \right\}.$$

Note that set \mathbf{R}_1 is neither a subspace nor a countable unions of subspaces.

Further calculation yields

$$\mathbf{R}_2 = \left(\bigcup_{t \geq 0} e^{A_2 t} \mathbf{R}_1 + \Gamma_{A_2} \mathbf{B}_2 \right) \cup \left(\bigcup_{t \geq 0} e^{A_1 t} \mathbf{R}_1 + \Gamma_{A_1} \mathbf{B}_1 \right)$$

$$= \left\{ \begin{bmatrix} a \\ b \\ bt \\ 0 \end{bmatrix} : a, b \in \mathfrak{R}, t \geq 0 \right\},$$

$$\mathbf{R}_3 = \left(\bigcup_{t \geq 0} e^{A_2 t} \mathbf{R}_2 + \Gamma_{A_2} \mathbf{B}_2 \right) \cup \left(\bigcup_{t \geq 0} e^{A_1 t} \mathbf{R}_2 + \Gamma_{A_1} \mathbf{B}_1 \right)$$

$$= \left\{ \begin{bmatrix} a \\ at_3 + b \\ bt_2 \\ 0 \end{bmatrix} : a, b \in \mathfrak{R}, t_2, t_3 \geq 0 \right\}.$$

Sets \mathbf{R}_2 and \mathbf{R}_3 are strict subsets of \mathbf{V} , and \mathbf{R}_3 strictly includes \mathbf{R}_2 as a subset.

Repeating this process, we have

$$\mathbf{R}_4 = \left(\bigcup_{t \geq 0} e^{A_2 t} \mathbf{R}_3 + \Gamma_{A_2} \mathbf{B}_2 \right) \cup \left(\bigcup_{t \geq 0} e^{A_1 t} \mathbf{R}_3 + \Gamma_{A_1} \mathbf{B}_1 \right)$$

$$= \left\{ \begin{bmatrix} a \\ b + ct_3 \\ bt_2 \\ 0 \end{bmatrix} : a, b, c \in \mathfrak{R}, t_2, t_3 \geq 0 \right\}$$

$$= \text{span} \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \end{bmatrix} \right\}$$

$$= \mathbf{V}.$$

From (7), it follows that the reachable set of system (10) is exactly \mathbf{V} , which is a subspace of \mathfrak{R}^4 .

By analogy, the controllable counterparts are given by

$$\mathbf{C}_0 = \text{span} \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} \right\},$$

$$\mathbf{C}_1 = \left\{ \begin{bmatrix} a \\ -at \\ 0 \\ 0 \end{bmatrix} : a \in \mathfrak{R}, t \geq 0 \right\},$$

$$\mathbf{C}_2 = \left\{ \begin{bmatrix} a \\ b \\ -bt \\ 0 \end{bmatrix} : a, b \in \mathfrak{R}, t \geq 0 \right\},$$

$$\mathbf{C}_3 = \left\{ \begin{bmatrix} a \\ -at_2 + b \\ -bt_1 \\ 0 \end{bmatrix} : a, b \in \mathfrak{R}, t_1, t_2 \geq 0 \right\}$$

and

$$\mathbf{C}_4 = \left\{ \begin{bmatrix} a \\ -at_3 + b - ct_2 \\ -bt_1 \\ 0 \end{bmatrix} : a, b, c \in \mathfrak{R}, t_1, t_2, t_3 \geq 0 \right\}$$

$$= \mathbf{V}.$$

From (8), it follows that the controllable set of system (10) is exactly \mathbf{V} , which is a subspace of \mathfrak{R}^4 .

To summarize, for system (10), we have

- (i) Both the controllable set and the reachable set are subspaces;
- (ii) $\mathbf{R} = \mathbf{C} = \mathbf{V}$;
- (iii) Not all \mathbf{R}_j and \mathbf{C}_j are subspaces, and $\mathbf{R}_j \neq \mathbf{C}_j$ for $j = 1, 2, 3$;
- (iv) The dimension of \mathbf{C} is three, while it needs four times of switching to transfer an arbitrarily given state in \mathbf{C} to the origin.

Properties (i) and (ii) are parallel to the nonswitching case while properties (iii) and (iv) indicate complex phenomena arising when switching between different subsystems occurs.

3.3. Rank divergent properties of e^{At}

As expressed in (2), the state transition matrix for switched system (1) is multiple multiplication of matrix function of the form e^{At} . Accordingly, properties of exponential matrix functions play an important role in structural analysis for switched linear systems. In this subsection, several good properties for e^{At} (called rank divergent properties for convenience) shall be presented. These properties are crucial to the derivations of the main results.

Lemma 1. For any given matrix $A \in \mathfrak{R}^{n \times n}$ and subspace $\mathbf{B} \subset \mathfrak{R}^n$, the following equation holds for almost all $t_1, t_2, \dots, t_n \in \mathfrak{R}$

$$e^{At_1} \mathbf{B} + e^{At_2} \mathbf{B} + \dots + e^{At_n} \mathbf{B} = \Gamma_A \mathbf{B}. \tag{11}$$

Proof. Let \mathbf{S} be the smallest subspace of \mathfrak{R}^n that contains the subspaces $e^{At} \mathbf{B}$ for all $t \in \mathfrak{R}$. That is, \mathbf{S} is spanned by the set of vectors

$$\{e^{At} \mathbf{B}z : t \in \mathfrak{R}, z \in \mathfrak{R}^n\}.$$

By (Drager, Foote, Martin, & Wolfer, 1989, Proposition 2.1), \mathbf{S} is exactly the controllable subspace of matrix

pair (A, B) :

$$\mathbf{S} = \text{span}\{e^{At}Bz : t \in \mathfrak{R}, z \in \mathfrak{R}^n\} = \Gamma_A \mathbf{B}.$$

Suppose $e^{At_j}Bz_j, j = 1, \dots, n$ spans subspace \mathbf{S} , i.e.,

$$\mathbf{S} = \text{span}\{e^{At_1^0}Bz_1, \dots, e^{At_n^0}Bz_n\}.$$

This implies that

$$e^{At_1^0}\mathbf{B} + \dots + e^{At_n^0}\mathbf{B} = \Gamma_A \mathbf{B}$$

or equivalently,

$$\text{rank}[e^{At_1^0}B, \dots, e^{At_n^0}B] = \dim(\Gamma_A \mathbf{B}).$$

Denote integer $r = \dim(\Gamma_A \mathbf{B})$, and matrix function

$$L(t_1, \dots, t_n) = [e^{At_1}B, \dots, e^{At_n}B].$$

Choose a nonsingular sub-matrix M_0 with maximal rank in $L(t_1^0, \dots, t_n^0)$. Therefore, M_0 is nonsingular and $\text{rank } M_0 = \text{rank } L(t_1^0, \dots, t_n^0)$. Denote the corresponding sub-matrix of $L(t_1, \dots, t_n)$ as $M(t_1, \dots, t_n)$, and its determinant as $d(t_1, \dots, t_n)$.

Since each entry in matrix $M(t_1, \dots, t_n)$ is an analytic function of variables t_1, \dots, t_n , $d(t_1, \dots, t_n)$ is also an analytic function of its variables. As

$$d(t_1^0, \dots, t_n^0) \neq 0,$$

function $d(t_1, \dots, t_n)$ is not identically zero. By Weierstrass Preparation Theorem (Kaplan, 1966, Theorem 62), its zeros forms a zero-measure set of \mathfrak{R}^n . Therefore, for almost all t_1, \dots, t_n , matrix $M(t_1, \dots, t_n)$ is nonsingular. This implies that

$$\text{rank } L(t_1, \dots, t_n) \geq \text{rank } M(t_1, \dots, t_n) = r$$

for almost all t_1, \dots, t_n . Together with the fact that $\mathbf{S} \subseteq \Gamma_A \mathbf{B}$, we can conclude that

$$e^{At_1}\mathbf{B} + \dots + e^{At_n}\mathbf{B} = \Gamma_A \mathbf{B}$$

for almost all t_1, \dots, t_n . \square

Lemma 2. For any given matrices $A_k \in \mathfrak{R}^{n \times n}$ and $B_k \in \mathfrak{R}^{n \times p_k}, k = 1, 2$, inequality

$$\text{rank}[A_1 e^{A_2 t} B_1, B_2] \geq \text{rank}[A_1 B_1, B_2] \tag{12}$$

holds for almost all $t \in \mathfrak{R}$.

Proof. Denote matrix function $\Omega(t) = [A_1 e^{A_2 t} B_1, B_2]$. Choose a nonsingular sub-matrix G with maximal rank in $\Omega(0) = [A_1 B_1, B_2]$. Denote the corresponding sub-matrix of $\Omega(t)$ as $\Delta(t)$, and its determinant as $\delta(t)$. It is standard that all elements of $\Delta(t)$ are linear combinations of the form $t^k e^{\lambda t}$, hence $\delta: \mathfrak{R} \rightarrow \mathfrak{R}$ is an analytic function on \mathfrak{R} . Because $\delta(0) = \det G \neq 0$, the zeros of $\delta(t)$ are isolated points (Kaplan, 1966; Theorem 43). Consequently, $\delta(t) \neq 0$ for

almost all $t \in \mathfrak{R}$. Accordingly, for almost all t , $\Delta(t)$ is nonsingular. Therefore,

$$\begin{aligned} \text{rank } \Omega(t) &\geq \text{rank } \Delta(t) = \text{rank } G \\ &= \text{rank}[A_1 B_1, B_2] \end{aligned}$$

for almost all t . \square

Note that inequality (12) cannot be substituted by equality as shown by the following example:

$$\text{rank}[e^{At}b, b] > \text{rank}[b, b],$$

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}, \quad b = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, \quad t \neq 0.$$

4. Main results

4.1. Geometric criteria

In this subsection, we shall identify the controllable set and the reachable set for switched linear systems.

Theorem 1. For switched linear system (1), the reachable set is

$$\mathbf{R} = \mathbf{V}. \tag{13}$$

Proof. We are to design a switching path σ such that each state in \mathbf{V} can be reached from the origin via this switching path.

Assume that the switching index sequence of σ is periodic, i.e.,

$$i_0 = 1, \quad i_1 = 2, \dots, i_{m-1} = m,$$

$$i_m = 1, \quad i_{m+1} = 2, \dots, i_{2m-1} = m,$$

$$\vdots \tag{14}$$

The switching time sequence t_0, \dots, t_l and the number l are to be designed later.

Let $t_f > t_l$. From (4), the reachable set at t_f is

$$\mathbf{R}(t_f) = e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + e^{A_{i_l} h_l} \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l}, \tag{15}$$

where $h_j = t_{j+1} - t_j, j = 0, 1, \dots, l-1$ and $h_l = t_f - t_l$. Since

$$\begin{aligned} &e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + e^{A_{i_l} h_l} \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l} \\ &= e^{A_{i_l} h_l} (e^{A_{i_{l-1}} h_{l-1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \\ &\quad + e^{A_{i_{l-1}} h_{l-1}} \mathbf{D}_{i_{l-2}} + \mathbf{D}_{i_{l-1}}) + \mathbf{D}_{i_l}, \end{aligned}$$

it follows from Lemma 2 that

$$\begin{aligned} & \dim(e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + e^{A_{i_l} h_l} \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l}) \\ & \geq \dim(e^{A_{i_{l-1}} h_{l-1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \\ & \quad + e^{A_{i_{l-1}} h_{l-1}} \mathbf{D}_{i_{l-2}} + \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l}) \end{aligned} \tag{16}$$

for almost all h_l .

By repeatedly applying Lemma 2, for almost all h_l, \dots, h_{l-m+1} , we have

$$\begin{aligned} & \dim(e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + e^{A_{i_l} h_l} \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l}) \\ & \geq \dim(e^{A_{i_{l-1}} h_{l-1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l}) \\ & \quad \vdots \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{D}_{i_{\tau_1-1}} \\ & \quad + \mathbf{D}_{i_{\tau_1}} + \dots + \mathbf{D}_{i_l}) \\ & = \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1), \end{aligned}$$

where $\tau_1 = l - m$.

It follows from Lemma 2 that

$$\begin{aligned} & \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & = \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} e^{A_{i_{\tau_1-1}} h_{\tau_1-1}} (e^{A_{i_{\tau_1-2}} h_{\tau_1-2}} \dots e^{A_{i_1} h_1} \\ & \quad \mathbf{D}_{i_0} + \dots + e^{A_{i_{\tau_1-2}} h_{\tau_1-2}} \mathbf{D}_{i_{\tau_1-3}} + \mathbf{D}_{i_{\tau_1-2}}) \\ & \quad + e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{D}_{i_{\tau_1-1}} + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} (e^{A_{i_{\tau_1-2}} h_{\tau_1-2}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} \\ & \quad + \dots + e^{A_{i_{\tau_1-2}} h_{\tau_1-2}} \mathbf{D}_{i_{\tau_1-3}} + \mathbf{D}_{i_{\tau_1-2}}) \\ & \quad + e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{D}_{i_{\tau_1-1}} + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & = \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} (e^{A_{i_{\tau_1-2}} h_{\tau_1-2}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} \\ & \quad + \dots + e^{A_{i_{\tau_1-2}} h_{\tau_1-2}} \mathbf{D}_{i_{\tau_1-3}} + \mathbf{D}_{i_{\tau_1-2}} \\ & \quad + \mathbf{D}_{i_{\tau_1-1}}) + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \end{aligned}$$

for almost all h_{τ_1-1} .

By the same reasonings, we have

$$\begin{aligned} & \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} (e^{A_{i_{\tau_1-2}} h_{\tau_1-2}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \\ & \quad + e^{A_{i_{\tau_1-2}} h_{\tau_1-2}} \mathbf{D}_{i_{\tau_1-3}} + \mathbf{D}_{i_{\tau_1-2}} + \mathbf{D}_{i_{\tau_1-1}}) \\ & \quad + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} (e^{A_{i_{\tau_1-3}} h_{\tau_1-3}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \\ & \quad + e^{A_{i_{\tau_1-3}} h_{\tau_1-3}} \mathbf{D}_{i_{\tau_1-4}} + \mathbf{D}_{i_{\tau_1-3}} + \dots + \mathbf{D}_{i_{\tau_1-1}}) \\ & \quad + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \quad \vdots \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} (e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \end{aligned}$$

$$\begin{aligned} & \quad + e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} \mathbf{D}_{i_{\tau_1-m-1}} + \mathbf{D}_{i_{\tau_1-m}} + \dots \\ & \quad + \mathbf{D}_{i_{\tau_1-1}}) + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & = \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} (e^{A_{i_{\tau_1-m-1}} h_{\tau_1-m-1}} \dots \\ & \quad e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1-m-1}}) \\ & \quad + e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \end{aligned}$$

for almost all $h_j, j = \tau_1 - 1, \dots, \tau_1 - m + 1$.

Continuing the above process gives

$$\begin{aligned} & \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} (e^{A_{i_{\tau_1-m-1}} h_{\tau_1-m-1}} \dots \\ & \quad e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1-m-1}}) \\ & \quad + e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} e^{A_{i_{\tau_1-2m}} h_{\tau_1-2m}} \\ & \quad (e^{A_{i_{\tau_1-2m-1}} h_{\tau_1-2m-1}} \dots e^{A_{i_{\tau_1-2m}} h_{\tau_1-2m}} e^{A_{i_1} h_1} \mathbf{D}_{i_0} \\ & \quad + \dots + \mathbf{D}_{i_{\tau_1-2m-1}}) + e^{A_{i_{\tau_1}} h_{\tau_1}} e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} \mathbf{V}_1 \\ & \quad + e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \quad \vdots \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} \dots e^{A_{i_{\tau_1-nm}} h_{\tau_1-nm}} \\ & \quad (e^{A_{i_{\tau_1-nm-1}} h_{\tau_1-nm-1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \\ & \quad + \mathbf{D}_{i_{\tau_1-nm-1}}) + e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_{\tau_1-nm+m}} h_{\tau_1-nm+m}} \\ & \quad \mathbf{V}_1 + \dots + e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & = \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} \dots e^{A_{i_{\tau_1-nm}} h_{\tau_1-nm}} \\ & \quad (e^{A_{i_{\tau_1-nm-1}} h_{\tau_1-nm-1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \\ & \quad + \mathbf{D}_{i_{\tau_1-nm-1}}) + e^{A_{i_{\tau_1}} (h_{\tau_1} + \dots + h_{\tau_1-nm+m})} \mathbf{V}_1 \\ & \quad + \dots + e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \end{aligned} \tag{17}$$

for almost all $h_j, j = \tau_1 - mn + 1, \dots, \tau_1 - mn + m - 1, \tau_1 - mn + m + 1, \dots, \tau_1 - mn + 2m - 1, \dots, \tau_1 - m + 1, \dots, \tau_1 - 1$. The relationships $i_j = i_{j+m}, j = 1, 2, \dots$ have been used in the last equation.

From Lemma 1, we have

$$\begin{aligned} \Gamma_{A_{i_{\tau_1}}} \mathbf{V}_1 & = e^{A_{i_{\tau_1}} h_{\tau_1}} \mathbf{V}_1 + \dots \\ & \quad + e^{A_{i_{\tau_1}} (h_{\tau_1} + h_{\tau_1-m} + \dots + h_{\tau_1-nm+m})} \mathbf{V}_1 \end{aligned} \tag{18}$$

for almost all $h_j, j = \tau_1, \tau_1 - m, \dots, \tau_1 - mn$. Accordingly, we can rewrite (17) as

$$\begin{aligned} & \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_{\tau_1-nm}} h_{\tau_1-nm}} \\ & \quad (e^{A_{i_{\tau_1-nm-1}} h_{\tau_1-nm-1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} \\ & \quad + \dots + \mathbf{D}_{i_{\tau_1-nm-1}}) + \Gamma_{A_{i_{\tau_1}}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}}). \end{aligned} \tag{19}$$

Applying Lemma 2 once again, for almost all $h_j, j = \tau_1, \tau_1 - m, \dots, \tau_1 - mn$, we have

$$\begin{aligned} & \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \geq \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} \\ & \quad (e^{A_{i_{\tau_1-mn-1}} h_{\tau_1-mn-1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \\ & \quad + \mathbf{D}_{i_{\tau_1-mn-1}}) + \Gamma_{A_{i_{\tau_1}}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}}) \\ & \geq \dim(e^{A_{i_{\tau_1-m}} h_{\tau_1-m}} \dots e^{A_{i_{\tau_1-mn}} h_{\tau_1-mn}} \\ & \quad (e^{A_{i_{\tau_1-mn-1}} h_{\tau_1-mn-1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} \\ & \quad + \dots + \mathbf{D}_{i_{\tau_1-mn-1}}) + \Gamma_{A_{i_{\tau_1}}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}}) \\ & \quad \vdots \\ & \geq \dim(e^{A_{i_{\tau_1-mn}} h_{\tau_1-mn}} (e^{A_{i_{\tau_1-mn-1}} h_{\tau_1-mn-1}} \dots \\ & \quad e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1-mn-1}}) \\ & \quad + \Gamma_{A_{i_{\tau_1}}} \mathbf{V}_1 + \mathbf{D}_{i_{\tau_1}}) \\ & = \dim(e^{A_{i_{\tau_1-mn}} h_{\tau_1-mn}} e^{A_{i_{\tau_1-mn-1}} h_{\tau_1-mn-1}} \dots \\ & \quad e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + e^{A_{i_{\tau_1-mn}} h_{\tau_1-mn}} \mathbf{D}_{i_{\tau_1-mn-1}} \\ & \quad + \mathbf{D}_{i_{\tau_1-mn}} + \Gamma_{A_{i_{\tau_1}}} \mathbf{V}_1), \end{aligned} \tag{20}$$

where the relationship $\mathbf{D}_{i_{\tau_1}} = \mathbf{D}_{i_{\tau_1-mn}}$ has been used.

Because each of (18) and (20) holds for almost all $h_j, j = \tau_1, \tau_1 - m, \dots, \tau_1 - mn$, almost all choice of $h_j, j = \tau_1, \tau_1 - m, \dots, \tau_1 - mn$ satisfies (18) and (20) simultaneously.

Continuing this process, we can prove that, for almost all $h_j, j = \tau_1 - mn, \dots, \tau_1 - m^2n + 1$, we have

$$\begin{aligned} & \dim(e^{A_{i_{\tau_1}} h_{\tau_1}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_1}} + \mathbf{V}_1) \\ & \geq \dim(e^{A_{i_{\tau_1-mn}} h_{\tau_1-mn}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots \\ & \quad + e^{A_{i_{\tau_1-mn}} h_{\tau_1-mn}} \mathbf{D}_{i_{\tau_1-mn-1}} + \mathbf{D}_{i_{\tau_1-mn}} \\ & \quad + \Gamma_{A_{i_{\tau_1}}} \mathbf{V}_1) \\ & \quad \vdots \\ & \geq \dim(e^{A_{i_{\tau_2}} h_{\tau_2}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_2}} \\ & \quad + \Gamma_{A_{i_{\tau_1}}} \mathbf{V}_1 + \dots + \Gamma_{A_{i_{\tau_1-m+1}}} \mathbf{V}_1) \\ & = \dim(e^{A_{i_{\tau_2}} h_{\tau_2}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_2}} + \mathbf{V}_2), \end{aligned}$$

where $\tau_2 = \tau_1 - m^2n$.

Proceed the above reasonings, we finally have

$$\begin{aligned} & \dim(e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + e^{A_{i_l} h_l} \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l}) \\ & \geq \dim(e^{A_{i_{\tau_n}} h_{\tau_n}} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + \mathbf{D}_{i_{\tau_n}} + \mathbf{V}_n) \\ & \geq \dim \mathbf{V}, \end{aligned} \tag{21}$$

where $\tau_n = l - \sum_{k=0}^{n-1} m(mn)^k$.

Let $l \geq \sum_{k=0}^{n-1} m(mn)^k - 1$, then from (7) and (21) it follows that

$$\mathbf{R}_s(t_f) = \mathbf{V}, \tag{22}$$

which implies (13). \square

Theorem 2. For switched linear system (1), the controllable set is

$$\mathbf{C} = \mathbf{V}. \tag{23}$$

The proof is completely parallel to that of Theorem 1 and hence is omitted.

By Theorem 2, the controllable set is subspace \mathbf{V} . We thus refer to \mathbf{V} as the controllable subspace of system (1).

Corollary 1. Both the controllable set and the reachable set are subspaces of the total space, and the two subspaces are always identical.

Corollary 2. For switched linear system (1), the following statements are equivalent:

- (i) The system is completely controllable;
- (ii) The system is completely reachable; and
- (iii) $\mathbf{V} = \mathfrak{R}^n$.

Due to Corollary 2, we can give an equivalent definition of controllability as follows:

Definition 7. System (1) is said to be (completely) controllable, if for any states x_0 and x_f , there exist a time instant $t_f > 0$, a switching path $\sigma : [0, t_f] \rightarrow M$, and inputs $u_k : [0, t_f] \rightarrow \mathfrak{R}^{r_k}, k \in M$, such that $x(t_f; 0, x_0, u, \sigma) = x_f$.

Remark 1. The controllable and reachable sets are invariant under re-arrangement of A_k and B_k for $k \in M$. That is, suppose both j_1, \dots, j_m and l_1, \dots, l_m are permutations of $1, \dots, m$, then the controllable (reachable) set of system (1) coincide with that of the system given by

$$\dot{x}(t) = \bar{A}_\sigma x(t) + \bar{B}_\sigma u_\sigma(t), \tag{24}$$

where

$$\bar{A}_k = A_{j_k} \text{ and } \bar{B}_k = B_{l_k} \text{ for } k = 1, \dots, m.$$

Remark 2. As noted in Example 1, although \mathbf{R} and \mathbf{C} coincide, \mathbf{R}_j and \mathbf{C}_j may differ from each other for certain j 's. This difference is due to incomplete switching which is a unique phenomenon of switched systems.

Remark 3. For a nonswitched linear system (A, B) , Theorem 2 degenerates to the well-known geometric characterization for controllable subspace (Wonham, 1979)

$$\mathbf{C} = \mathbf{B} + \mathbf{A}\mathbf{B} + \dots + \mathbf{A}^{n-1}\mathbf{B}.$$

4.2. Switching control design

By Theorems 1 and 2, any states in subspace \mathbf{V} can be transferred to each other in finite time. In this subsection, we study the following switching control design problem for switched system (1).

Switching control design problem. Given any two states x_0 and x_f in the controllable subspace \mathbf{V} , find a switching path σ and control input u to steer the system from x_0 to x_f in finite time.

Combining the proof of Theorem 1 and the geometric approach of linear systems (Wonham, 1979), we can formulate a procedure to address this problem.

From the proof of Theorem 1, we can find a natural number l , positive real numbers h_1, \dots, h_l , and an index sequence i_0, \dots, i_l , such that Eq. (21) holds. This, together with (7), implies that

$$\mathbf{V} = e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \mathbf{D}_{i_0} + \dots + e^{A_{i_l} h_l} \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l}. \quad (25)$$

Fix a positive real number h_0 . Define the switching time sequence as

$$t_0 = 0, \quad t_k = t_{k-1} + h_{k-1}, \quad k = 1, \dots, l + 1. \quad (26)$$

From the proof of Theorem 1.1 in Wonham (1979), for any $k \in M$ and $t > 0$, we have

$$\mathbf{D}_k = \text{Im } W_t^k, \quad (27)$$

where

$$W_t^k = \int_0^t e^{A_k(t-\tau)} B_k B_k^T e^{A_k^T(t-\tau)} d\tau.$$

Combining (25) with (27) leads to

$$\mathbf{V} = e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \text{Im } W_{h_0}^{i_0} + \dots + e^{A_{i_l} h_l} \text{Im } W_{h_{l-1}}^{i_{l-1}} + \text{Im } W_{h_l}^{i_l}. \quad (28)$$

If we can formulate a control input u satisfying the equation

$$\begin{aligned} x_f = x(t_{l+1}) &= e^{A_{i_l} h_l} \dots e^{A_{i_0} h_0} x_0 + e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \\ &\times \int_{t_0}^{t_1} e^{A_{i_1}(t_1-\tau)} B_{i_1} u_1(\tau) d\tau + \dots \\ &+ \int_{t_l}^{t_{l+1}} e^{A_{i_l}(t_{l+1}-\tau)} B_{i_l} u_l(\tau) d\tau, \end{aligned} \quad (29)$$

then the switching control problem will be solved. To this end, consider the piecewise continuous control strategy

$$\begin{aligned} u_k(t) &= B_{i_k}^T e^{A_{i_k}^T(t_{k+1}-t)} a_{k+1}, \\ t_k \leq t < t_{k+1}, \quad k &= 0, 1, \dots, l, \end{aligned} \quad (30)$$

where $a_k \in \mathfrak{R}^n$, $k = 1, \dots, l + 1$, are constant vector variables to be determined.

Combining (29) with (30) gives

$$\begin{aligned} x_f - e^{A_{i_l} h_l} \dots e^{A_{i_0} h_0} x_0 &= e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} \int_{t_0}^{t_1} e^{A_{i_1}(t_1-\tau)} B_{i_1} B_{i_1}^T e^{A_{i_1}^T(t_{k+1}-t)} d\tau a_{i_1} + \dots \\ &+ \int_{t_l}^{t_{l+1}} e^{A_{i_l}(t_{l+1}-\tau)} B_{i_l} B_{i_l}^T e^{A_{i_l}^T(t_{k+1}-t)} d\tau a_{l+1}. \end{aligned}$$

This is equivalent to

$$x_f - e^{A_{i_l} h_l} \dots e^{A_{i_0} h_0} x_0 = [e^{A_{i_l} h_l} \dots e^{A_{i_1} h_1} W_{h_0}^1, \dots, e^{A_{i_l} h_l} W_{h_{l-1}}^{i_{l-1}}, W_{h_l}^{i_l}] a, \quad (31)$$

where $a = [a_1^T, \dots, a_{l+1}^T]^T$.

Note that

$$x_f - e^{A_{i_l} h_l} \dots e^{A_{i_0} h_0} x_0 \in \mathbf{V},$$

it follows from (28) that linear equation (31) with unknown a has at least one solution. Solutions of linear equations (31) can be computed by symbolic or numerical softwares.

Suppose $a_0 = [a_{0,1}^T, \dots, a_{0,l+1}^T]^T$ is a solution of equation (31). Define the control inputs as

$$\begin{aligned} u_k(t) &= B_{i_k}^T e^{A_{i_k}^T(t_{k+1}-t)} a_{0,k+1}, \\ t_k \leq t < t_{k+1}, \quad k &= 0, 1, \dots, l \end{aligned} \quad (32)$$

and the switching path as

$$\sigma(t) = i_k \quad \text{for } t \in [t_k, t_{k+1}), \quad k = 0, 1, \dots, l. \quad (33)$$

By the above reasonings, we have

$$x_f = x(t_{l+1}; t_0, x_0, u, \sigma).$$

That is, the piecewise continuous control input (32) and the switching path (33) constitute a solution for the switching control problem of switched system (1).

4.3. Computational issues

As stated in Theorems 1 and 2, the controllable (reachable) set is subspace \mathbf{V} , which is defined recursively through (A_k, B_k) , $k \in M$. The quantity relationship between them is

$$\mathbf{V} = \sum_{\substack{j_1, \dots, j_n=0, 1, \dots, n-1 \\ i_1, \dots, i_n=1, \dots, m}} A_{i_n}^{j_n} \dots A_{i_1}^{j_1} \mathbf{B}_{i_1}. \quad (34)$$

That is, \mathbf{V} is the summation of $(mn)^n$ items. It requires large computational effort to calculate this subspace if m and n are relatively large.

In this subsection, we provide a procedure to calculate \mathbf{V} more efficiently.

Denote the nested subspaces as

$$\begin{aligned} \mathbf{W}_0 &= \mathbf{B}_1 + \dots + \mathbf{B}_m, \\ \mathbf{W}_j &= \mathbf{W}_{j-1} + \sum_{k=1}^m A_k \mathbf{W}_{j-1}, \quad j = 1, 2, \dots \end{aligned} \quad (35)$$

Let $\mathbf{W} = \sum_{j=0}^{\infty} \mathbf{W}_j$. We then have

$$\mathbf{W}_0 \subset \mathbf{W}_1 \subset \mathbf{W}_2 \subset \dots \subset \mathbf{W}$$

and

$$\mathbf{V} = \mathbf{W}.$$

Note that if $\mathbf{W}_j = \mathbf{W}_{j+1}$ for some j , then $\mathbf{W}_k = \mathbf{W}_j$ for $k \geq j$, and further $\mathbf{W}_j = \mathbf{W} = \mathbf{V}$. This fact together with $\dim \mathbf{W} \leq n$ imply that $\mathbf{W}_{n-n_0} = \mathbf{W} = \mathbf{V}$, where $n_0 = \dim \mathbf{W}_0$.

Denote

$$\rho = \min\{k: \mathbf{W}_k = \mathbf{V}\} \leq n - n_0$$

and

$$n_k = \dim \mathbf{W}_k, \quad k = 1, \dots, \rho.$$

A basis of \mathbf{V} can be constructed according to the following procedure:

Firstly, choose a group of base vectors $\gamma_1, \dots, \gamma_{s_1}$ in \mathbf{B}_1 , expand them to $\gamma_1, \dots, \gamma_{s_1}, \gamma_{s_1+1}, \dots, \gamma_{s_2}$ which form a basis of $\mathbf{B}_1 + \mathbf{B}_2$. Continuing this process, we can find a basis $\gamma_1, \dots, \gamma_{n_0}$ of \mathbf{W}_0 .

Secondly, because

$$\begin{aligned} \mathbf{W}_1 &= \mathbf{W}_0 + \text{span}\{A_k \gamma_j, k = 1, \dots, m, j = 1, \dots, n_0\} \\ &= \text{span}\{\gamma_1, \dots, \gamma_{n_0}, A_k \gamma_j, k = 1, \dots, m, j = 1, \dots, n_0\}, \end{aligned}$$

we can find a basis $\gamma_1, \dots, \gamma_{n_1}$ of \mathbf{W}_1 by searching the set

$$\{\gamma_1, \dots, \gamma_{n_0}, A_k \gamma_j, k = 1, \dots, m, j = 1, \dots, n_0\}$$

from left to right.

Continuing the process, we can find a basis $\gamma_1, \dots, \gamma_{n_0}, \dots, \gamma_{n_{l-1}+1}, \dots, \gamma_{n_l}$ for \mathbf{W}_l . Because

$$\begin{aligned} \mathbf{W}_{l+1} &= \mathbf{W}_l + \text{span}\{A_j \gamma_k, j = 1, \dots, m, \\ &\quad k = n_{l-1} + 1, \dots, n_l\} \\ &= \text{span}\{\gamma_1, \dots, \gamma_{n_k}, A_j \gamma_k, j = 1, \dots, m, \\ &\quad k = n_{l-1} + 1, \dots, n_l\}, \end{aligned}$$

by searching the set

$$\{\gamma_1, \dots, \gamma_{n_l}, A_j \gamma_k, j = 1, \dots, m, k = n_{l-1} + 1, \dots, n_l\}$$

from left to right for linearly independent column vectors, we can find a basis

$$\gamma_1, \dots, \gamma_{n_0}, \dots, \gamma_{n_{l-1}+1}, \dots, \gamma_{n_l}, \gamma_{n_{l+1}}, \dots, \gamma_{n_{l+1}}$$

for \mathbf{W}_{l+1} .

Finally, we have

$$\mathbf{V} = \text{span}\{\gamma_1, \dots, \gamma_{n_0}, \dots, \gamma_{n_{\rho-1}+1}, \dots, \gamma_{n_{\rho}}\}.$$

It involves not more than $r + mn$ column vectors in the procedure, which is only a small fraction of the original quantity, $(mn)^n$.

Remark 4. From the above analysis, a basis for \mathbf{V} is of the form

$$\{b_1, A_{i_{1,1}} b_1, A_{i_{k_1,1}} \dots A_{i_{1,1}} b_1, \dots, b_{n_0}, A_{i_{1,n_0}} b_{n_0}, A_{i_{k_0,n_0}} \dots A_{i_{1,n_0}} b_{n_0}\}, \quad (36)$$

where $b_j \in \mathbf{W}_0$, $k_j \geq 0$, $j = 1, \dots, n_0$, $1 \leq i_{l,j} \leq m$, $l = 1, \dots, k_j$, $j = 1, \dots, n_0$. Because the number of vectors in (36) is not more than n , there are at most n different subsystems whose parameters appear in (36). That is to say, for controllability and reachability issues, we may assume $m \leq n$ without loss of generality.

5. Observability and determinability

In the above analysis, reference is made to reachability and controllability only. It should be noticed that the observability and determinability counterparts can be addresses dually. In this section, we outline the relevant concepts and the corresponding criteria.

Consider a switched linear control system with outputs given by

$$\begin{aligned} \dot{x}(t) &= A_{\sigma} x(t) + B_{\sigma} u(t), \\ y(t) &= C_{\sigma} x(t), \end{aligned} \quad (37)$$

where $x(t) \in \mathfrak{X}^n$, $u(t) \in \mathfrak{X}^p$ and $y(t) \in \mathfrak{X}^q$ are the states, inputs and outputs, respectively, $\sigma: \mathfrak{X} \rightarrow M = \{1, 2, \dots, m\}$ is the switching path to be designed, and A_k, B_k, C_k , $k \in M$ are constant matrices of compatible dimensions.

Definition 8. The switched linear system (37) is (completely) observable, if there exist a time $t_1 > 0$ and a switching path $\sigma: [0, t_1] \rightarrow M$, such that state $x(0)$ can be determined from knowledge of the output $y(t)$, $t \in [0, t_1]$ and the input $u(t)$, $t \in [0, t_1]$.

Definition 9. The switched linear system (37) is (completely) determinable, if there exist an time $t_1 < 0$ and a switching path $\sigma: [t_1, 0] \rightarrow M$, such that state $x(0)$ can be determined from knowledge of the output $y(t)$, $t \in [t_1, 0]$ and the input $u(t)$, $t \in [t_1, 0]$.

In view of Theorems 1 and 2 for reachability and controllability, the following criteria are readily obtained for observability and determinability by using the principle of duality.

Theorem 3. For switched linear system (37), the following statements are equivalent:

- (i) The system is completely observable;
- (ii) The system is completely determinable; and
- (iii) $\mathbf{O} = \mathfrak{X}^n$,

where subspace $\mathbf{O} = \sum_{j=1}^{\infty} \mathbf{O}_j$ is defined by

$$\begin{aligned} \mathbf{O}_1 &= \text{Im } C_1^T + \cdots + \text{Im } C_m^T \\ \mathbf{O}_{j+1} &= \Gamma_{A_1^T} \mathbf{O}_j + \cdots + \Gamma_{A_m^T} \mathbf{O}_j, \quad j = 1, 2, \dots \end{aligned} \quad (38)$$

6. An illustrative example

Example 2. Consider the switched systems given by

$$\begin{aligned} A_1 &= 0, \quad B_1 = e_1, \quad A_j = e_j e_{j-1}^T, \quad B_j = 0, \\ j &= 2, \dots, m, \quad m \leq n, \end{aligned} \quad (39)$$

where e_j , $1 \leq j \leq n$ is the unit column vector with the j th entry equal to one.

To compute the controllable subspace \mathbf{V} , we follow the procedure presented in Section 4.3.

It can be readily seen that

$$\mathbf{W}_0 = \text{span}\{e_1\}.$$

By searching the independent vectors in

$$\mathbf{W}_1 = \text{span}\{e_1, A_j e_1, j = 1, \dots, m\},$$

we obtain that

$$\mathbf{W}_1 = \text{span}\{e_1, A_2 e_1\} = \text{span}\{e_1, e_2\}.$$

Continue this process, we have

$$\begin{aligned} \mathbf{W}_k &= \text{span}\{e_1, \dots, e_k, A_j e_k, j = 1, \dots, m\} \\ &= \text{span}\{e_1, \dots, e_{k+1}\} \end{aligned}$$

for $k = 2, \dots, m-1$, and

$$\begin{aligned} \mathbf{W}_m &= \text{span}\{e_1, \dots, e_m, A_j e_m, j = 1, \dots, m\} \\ &= \text{span}\{e_1, \dots, e_m\} \\ &= \mathbf{W}_{m-1}. \end{aligned}$$

Thus $\mathbf{V} = \mathbf{W} = \mathbf{W}_{m-1}$. According to Theorems 1 and 2, the controllable (reachable) set is

$$\mathbf{R} = \mathbf{C} = \text{span}\{e_1, \dots, e_m\},$$

which is an m -dimensional subspace. If $m = n$, then the switched system is controllable and reachable.

Now let us address the switching control problem for system (39). Following the procedure outlined in Section 4.2, we consider the periodic switching index sequence and piecewise continuous inputs.

Let us choose the switching time sequence to be

$$t_0 = 0, \quad t_1 = 1, \quad t_2 = 2, \dots \quad (40)$$

Accordingly, $h_k = h = 1$ for $k = 0, 1, \dots$. Simple calculation gives

$$e^{A_1 h} = I_n,$$

$$e^{A_j h} = I_n + A_j, \quad j = 2, \dots, m,$$

where I_n is the n th order identity matrix.

Let $l = ml_0$ with l_0 to be determined. Under the periodic switching index sequence (14), we can compute that

$$\begin{aligned} &\dim(e^{A_{i_l} h} \cdots e^{A_{i_1} h} \mathbf{D}_{i_0} + \cdots + e^{A_{i_l} h} \mathbf{D}_{i_{l-1}} + \mathbf{D}_{i_l}) \\ &= \dim(e^{A_{i_l} h} \cdots e^{A_2 h} \mathbf{D}_1 + e^{A_{i_l} h} e^{A_{i_{l-m+1} h} \cdots} \\ &\quad e^{A_{i_{l-m} h} h} \mathbf{D}_1 + \cdots + \mathbf{D}_1) \\ &= \dim(Q^{l_0} \mathbf{B}_1 + Q^{l_0-1} \mathbf{B}_1 + \cdots + \mathbf{B}_1), \end{aligned}$$

where

$$Q = e^{A_m h} e^{A_{m-1} h} \cdots e^{A_2 h} = I_n + A_2 + \cdots + A_m.$$

It can be verified that vectors $B_1, QB_1, \dots, Q^{m-1} B_1$ are linearly independent, and

$$\mathbf{V} = \text{span}\{B_1, QB_1, \dots, Q^{m-1} B_1\}.$$

Accordingly, we choose that $l_0 = m-1$.

Simple calculation gives

$$W_h^1 = e_1 e_1^T, \quad W_t^k = 0, \quad k = 2, \dots, m.$$

For any given states x_0 and x_f in \mathbf{V} , consider the equation

$$[Q^{m-1} W_h^1, \dots, Q W_h^1, W_h^1] a = x_f - Q^{m-1} x_0. \quad (41)$$

Let P denote the sub-matrix of $[Q^{m-1} B_1, \dots, Q B_1, B_1]$ consisting the first m rows. It is clear that P is nonsingular. Denote

$$a_0 = [P^{-1}, 0](x_f - Q^{m-1} x_0).$$

The solutions of Eq. (41) are given by

$$a = [a_0(1), *, \dots, *, a_0(2), *, \dots, *, \dots, a_0(m), *, \dots, *]^T,$$

where $a_0(j)$ denotes the j th entry of vector a_0 , and the symbol ‘*’ stands for any real numbers.

The corresponding piecewise continuous input is

$$u_1(t) = a_0(j+1), \quad t_{mj} \leq t < t_{mj+1}, \quad j = 0, \dots, m-1. \quad (42)$$

The switching index sequence (14) and control strategy (42) will steer the system from original x_0 at $t = 0$ to the target x_f at $t = m(m-1) + 1$.

The above switching control scheme involves $m(m-1)$ times of switching to transfer between two arbitrarily given states in the controllable subspace. This number can be reduced, if we use aperiodic switching index sequence instead of the periodic one. For example, let us consider the switching index sequence

$$\begin{aligned} i_0 &= 1, \quad i_1 = 2, \quad i_2 = 1, \quad i_3 = 3, \quad i_4 = 2, \\ i_5 &= 1, \dots, \quad i_{k-m+1} = m, \dots, \quad i_{k-1} = 2, \quad i_k = 1, \end{aligned}$$

where $k = (m-1)(m+2)/2$. Under the switching time sequence (40), we have

$$\begin{aligned} &\dim(e^{A_{i_k} h} \cdots e^{A_{i_1} h} \mathbf{D}_{i_0} + \cdots + e^{A_{i_k} h} \mathbf{D}_{i_{k-1}} + \mathbf{D}_{i_k}) \\ &= \dim(e^{A_{i_k} h} \cdots e^{A_{i_1} h} \mathbf{D}_1 + e^{A_{i_k} h} \cdots e^{A_{i_{k-m} h} h} \mathbf{D}_1 \\ &\quad + \cdots + \mathbf{D}_1) \\ &= \dim(Q_{m-1} \mathbf{B}_1 + \cdots + Q_1 \mathbf{B}_1 + \mathbf{B}_1), \end{aligned}$$

where matrices $Q_j, j = 1, \dots, m$, are defined recursively as

$$Q_1 = e^{A_2} \dots e^{A_m},$$

$$Q_j = e^{A_2} \dots e^{A_{m+1-j}} Q_{j-1}, \quad j = 2, \dots, m-1.$$

It can be verified that vectors $B_1, Q_1 B_1, \dots, Q_{m-1} B_1$ are linearly independent, and

$$\mathbf{V} = \text{span}\{B_1, Q_1 B_1, \dots, Q_{m-1} B_1\}.$$

Accordingly, a piecewise control input can be obtained by solving the following equation:

$$[Q_{m-1} W_h^1, \dots, Q_1 W_h^1, W_h^1] a = x_f - Q_{m-1} x_0$$

for any given initial state x_0 and target state x_f .

7. Conclusion

In this paper, detailed controllability and reachability analysis has been carried out for switched linear control systems. It has been proven that, both the controllable and reachable sets are subspaces of the total space, and the two sets always coincide with each other. The controllable subspace is exactly the minimal A_k -invariant subspace for $k \in M$ which contains $\sum_{k \in M} \mathbf{B}_k$. Criteria for observability and determinability have also been obtained by duality. These results generalize Wonham's geometric characterizations to switched systems.

A closely related interesting problem is controlling the switched linear systems with minimum number of switching. It seems that more rigorous rank estimation for exponential matrix should be developed to address this problem.

Zhendong Sun received the B.S. degree in Applied Mathematics from Ocean University of Qingdao (China) in 1990, the M.S. in Systems Science from Xiamen University (China) in 1993, and the Ph.D. degree in Electrical Engineering from Beijing University of Aeronautics and Astronautics (China) in 1996.

During 1996–1998, he was a postdoctoral research associate in Department of Automation, Tsinghua University, China.

In 1998, he joined the faculty of Science, Beijing University of Aeronautics and Astronautics, as an associate professor. From 2000 to 2001, he had been with the National University of Singapore as a research fellow.

Dr. Sun's current research interests are in the fields of nonlinear control systems, switched and hybrid systems, and sampled data systems. He was the winner of the Guan Zhao-Zhi Award at the Chinese Control Conference (HongKong, China) in 2000.

S.S. Ge received the B.Sc. degree from Beijing University of Aeronautics and Astronautics (BUAA), Beijing, China, in 1986, and the Ph.D. degree and the Diploma of Imperial College (DIC) from Imperial College of Science, Technology and Medicine, University of London, in 1993. From May 1992 to June 1993, he did his postdoctoral research at Leicester University, England. He has been with the Department of Electrical & Computer

Engineering, the National University of Singapore since 1993, and is currently as an Associate Professor. He was a visiting staff in Laboratoire de'Automatique de Grenoble, France in 1996, the University of Melbourne, Australia in 1998, 1999, University of Petroleum and Shanghai Jiaotong University, China in 2001.

Dr. Ge has authored and co-authored over 100 international journal and conference papers, two monographs and co-invented two patents. He served as an Associate Editor on the Conference Editorial Board of the IEEE Control Systems Society in 1998 and 1999, has been serving as an Associate Editor, IEEE Transactions on Control Systems Technology since June 1999, and a Member of the Technical Committee on Intelligent Control of the IEEE Control System Society since 2000. He was the winner of the 1999 National Technology Award, Singapore. He serves as a technical consultant local industry. He is currently a Senior Member of IEEE. His current research interests are Control of nonlinear systems, Neural Networks and Fuzzy Logic, Robot Control, Real-Time Implementation, Path Planning and Sensor Fusion.

T.H. Lee received the B.A. degree with First Class Honours in the Engineering Tripos from Cambridge University, England, in 1980; and the Ph.D. degree from Yale University in 1987. He is a tenured Professor in the Department of Electrical and Computer Engineering at the National University of Singapore. He is also currently Head of the Drives, Power and Control Systems Group in this Department, and the Vice-Dean (Research) in the Faculty of Engineering.

Dr. Lee's research interests are in the areas of adaptive systems, knowledge-based control and intelligent mechatronics. He has published extensively in these areas, and currently holds Associate Editor appointments in *Automatica*; the *IEEE Transactions in Systems, Man and Cybernetics*; *Control Engineering Practice* (an IFAC journal); the *International Journal of Systems Science* (Taylor and Francis, London); and *Mechatronics journal* (Oxford, Pergamon Press). Dr. Lee was a recipient of the Cambridge University Charles Baker Prize in Engineering.
