

3D PRINTING

The Labs host a variety of 3D printers including Makerbot, Ultimaker and BCN3D machines. No matter if your project is big or small, simple or complex, we have the resources to ramp up your production and set you up for success.

The most common material we use is white PLA plastic but there are a variety of materials that can be used including infused hybrid ones with higher structural capacities such as carbon fiber and PRTG. There are also materials that mimic metal and wood. There are soft materials that bend and ones that are conductive. For a full list of common 3D printing materials, please see our links page.

We can help you refine or develop models for printing and can also guide you to websites where you can download models that are often ready to print. The sky is the limit so reach out to learn more and get started.
