

Saving Image Files For The Portfolio

The Learning Portfolio template is designed to display image files at specific widths. You only need to ensure that every image file is **960px wide** to display correctly and not appear as low quality. At the same time, uploading files that are larger than 960px wide may slow down the speed of rendering your site online. WordPress only accepts **jpegs**, **pngs** and **gifs**. An image editor such as **Photoshop** can help to prepare your files for web when you save "**Save For Web**". Don't forget to review the tutorial "**Using Images With WordPress**" after you have prepared your images.

The template is designed to display images **960px wide**.

Step 1

Image Size

Image Size: 1.98M (was 22.2M) 

Dimensions:  960 px × 720 px

Fit To: Custom 

 Width:  Pixels 

Height:  Pixels 

Resolution:  Pixels/Inch 

Resample:  Bicubic Sharper (reduction) 

In Photoshop choose **“Image Size”** and make sure **“Pixels”** are selected for units. If your image is larger than **960px**, you can reduce it here. BUT, if the original image is smaller than 960px wide enlarging will display a blurry image and not presentable.

Step 2

Step 3

Don't forget to review the tutorial **"Using Images With WordPress"** after you have prepared your images.
