ECE-2025 Spring-2004

Lecture 16

Continuous-Time Signals and Systems

15-Mar-04

Info: Web-CT, Lab, HW

- Quiz #2: resolve grades by **26-March**
  - Graders were posted
- Quiz #3 will be 9-April (Friday)

- HW #8 due next week
- Lab #8 starts this week
  - Bandpass Filtering

Quiz #2 Results

Distribution for Quiz #2

Statistics:

Graded out of: 100.0 Highest grade: 99.0 Mean grade: 77.9

Number of records: 175 Lowest grade: 46.0 Median grade: 79.0

Score Range	Frequency
[45, 50)	3
[50, 55)	3
[55, 60)	6
[60, 65)	7
[65, 70)	16
[70, 75)	24
[75, 80)	32
[80, 85)	34
[85, 90)	27
[90, 95)	12
[95, 100)	11
[100]

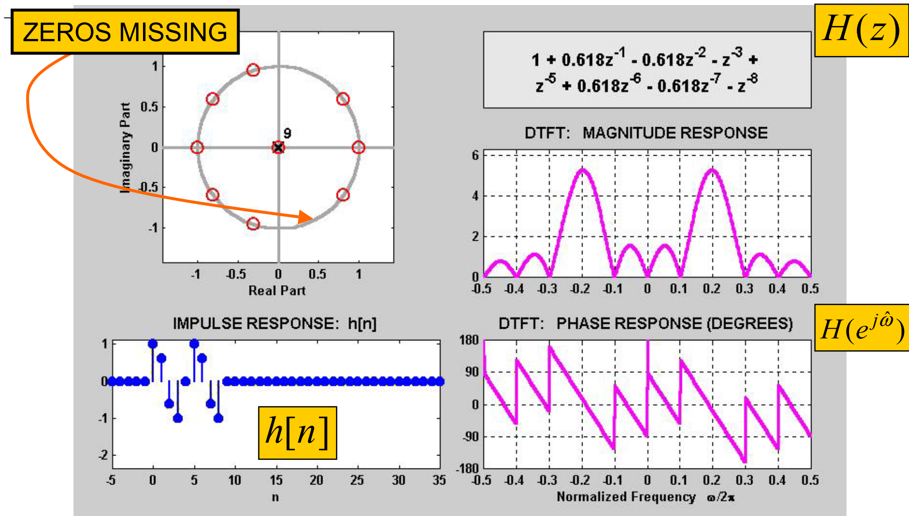
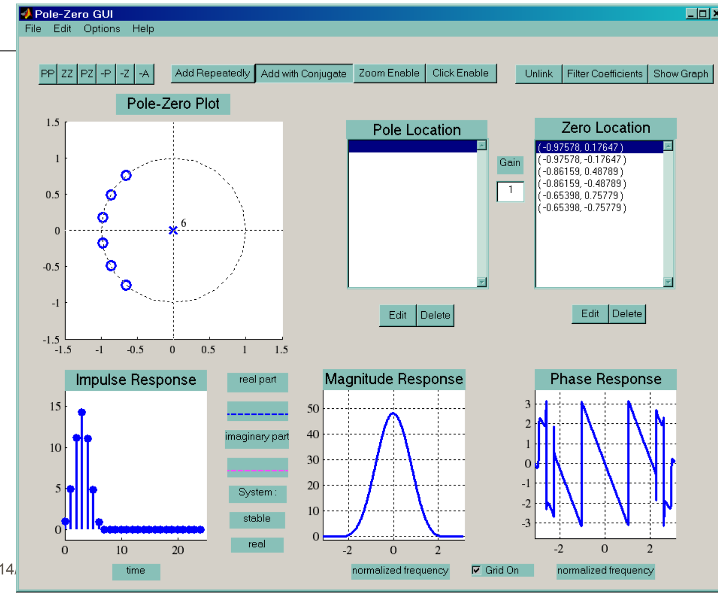
3 DOMAINS MOVIE: FIR



PeZ Demo: Zero Placing



Lecture

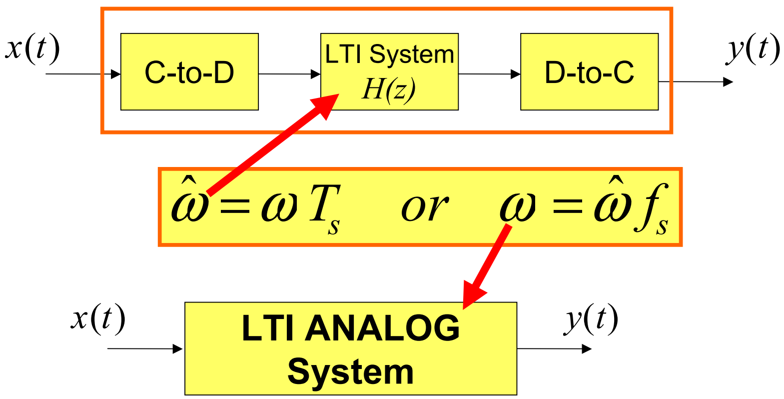
READING ASSIGNMENTS

- This Lecture:
  - Chapter 9, Sects 9-1 to 9-5
- Other Reading:
  - Recitation: Ch. 9, all
  - Next Lecture: Chapter 9, Sects 9-6 to 9-8

LECTURE OBJECTIVES

- Bye bye to D-T Systems for a while
- The UNIT IMPULSE signal
  - Definition
  - Properties
- Continuous-time signals and systems
  - Example systems
  - Review: Linearity and Time-Invariance
  - Convolution integral: impulse response

D-T Filtering of C-T Signals



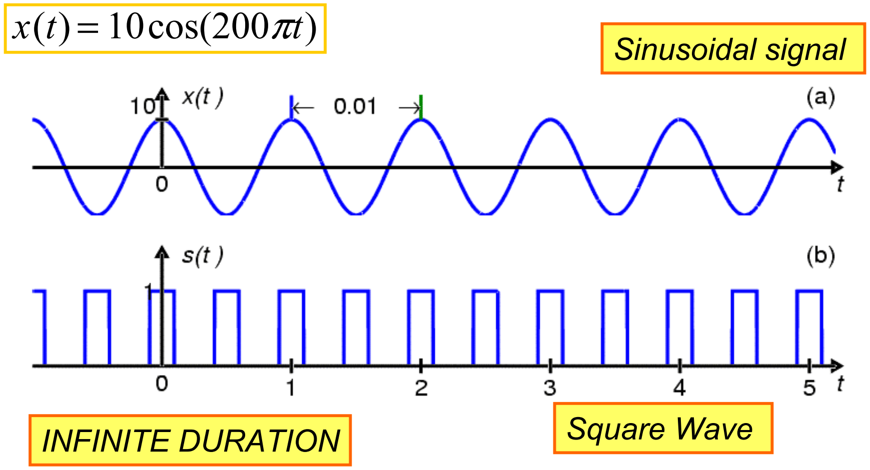
ANALOG SIGNALS x(t)

- INFINITE LENGTH
  - SINUSOIDS: (t = time in secs)
  - PERIODIC SIGNALS
  - ONE-SIDED, e.g., for t>0
    - UNIT STEP: u(t)
- FINITE LENGTH
  - SQUARE PULSE
- IMPULSE SIGNAL: δ(t)

- DISCRETE-TIME: x[n] is list of numbers

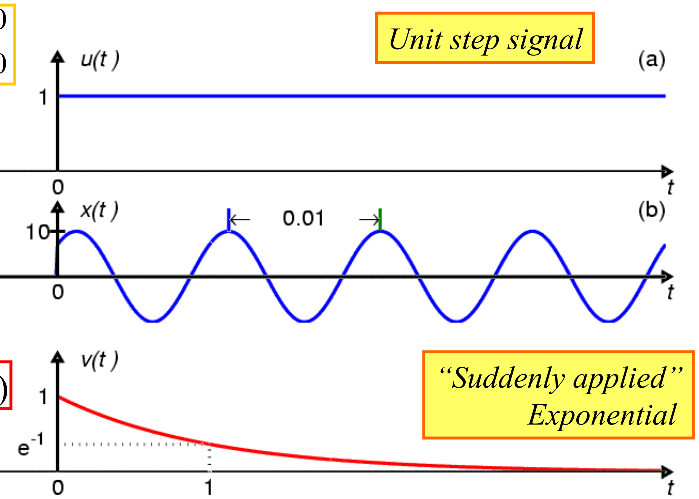
CT Signals: PERIODIC

$x(t) = 10\cos(200\pi t)$



CT Signals: ONE-SIDED

$u(t) = \begin{cases} 1 & t > 0 \\ 0 & t < 0 \end{cases}$

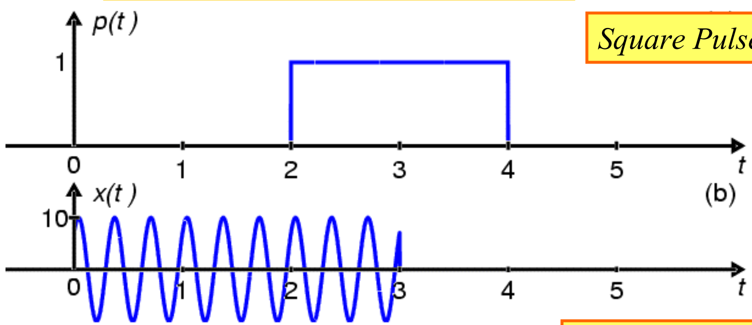


$v(t) = e^{-t}u(t)$

CT Signals: FINITE LENGTH

$$p(t) = u(t-2) - u(t-4)$$

Square Pulse signal



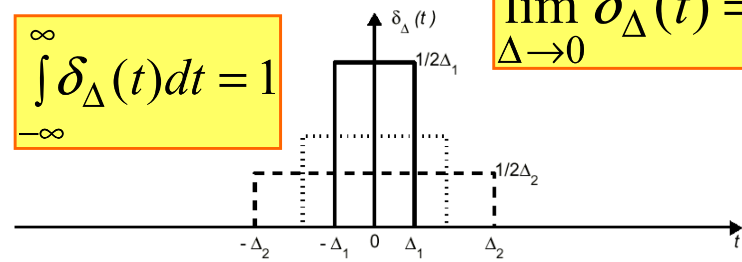
Sinusoid multiplied by a square pulse

What is an Impulse?

- A signal that is concentrated at one point.

$$\int_{-\infty}^{\infty} \delta_\Delta(t)\,dt = 1$$

$$\lim_{\Delta \to 0} \delta_\Delta(t) = \delta(t)$$



Defining the Impulse

- Assume the properties apply to the limit:

$$\lim_{\Delta \to 0} \delta_\Delta(t) = \delta(t)$$

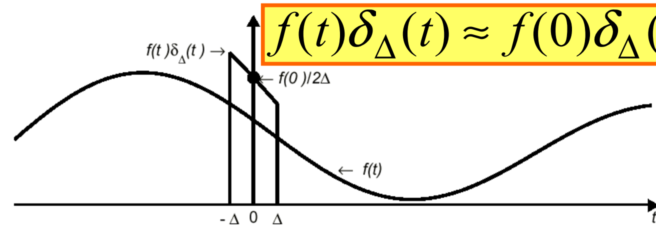
- One "**INTUITIVE**" definition is:

$$\delta(t) = 0, \quad t \neq 0$$ *Concentrated at t=0*

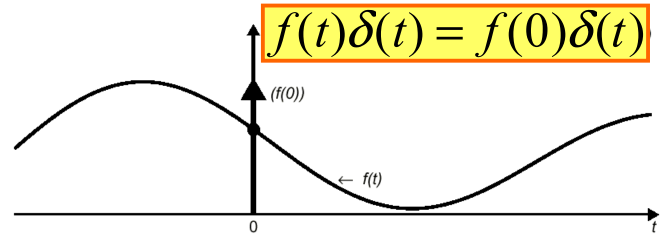
$$\int_{-\infty}^{\infty} \delta(\tau)\,d\tau = 1$$ *Unit area*

Sampling Property

$$f(t)\delta_\Delta(t) \approx f(0)\delta_\Delta(t)$$

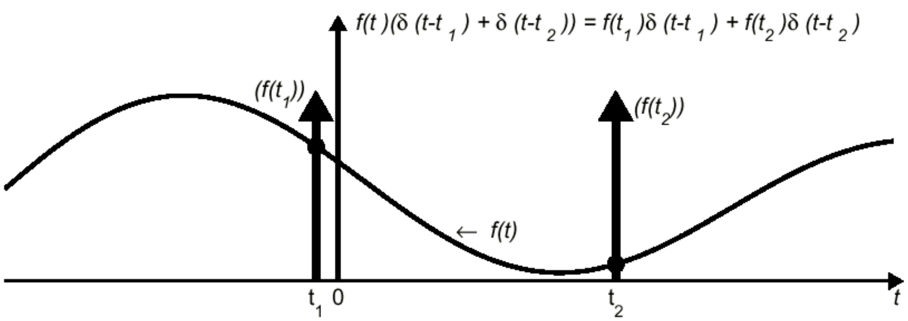


$$f(t)\delta(t) = f(0)\delta(t)$$



General Sampling Property

$$f(t)\delta(t-t_0) = f(t_0)\delta(t-t_0)$$



Properties of the Impulse

$\delta(t-t_0) = 0, \quad t \neq t_0$ Concentrated at one time

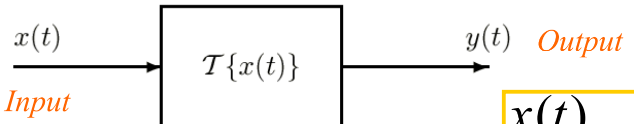
$\int_{-\infty}^{\infty} \delta(t-t_0)dt = 1$ Unit area

$f(t)\delta(t-t_0) = f(t_0)\delta(t-t_0)$ Sampling Property

$\int_{-\infty}^{\infty} f(t)\delta(t-t_0)dt = f(t_0)$ Extract one value of f(t)

$\frac{du(t)}{dt} = \delta(t)$ Derivative of unit step

Continuous-Time Systems



$$x(t) \mapsto y(t)$$

- Examples:
  - Delay $y(t) = x(t-t_d)$
  - Modulator $y(t) = [A + x(t)]\cos\omega_c t$
  - Integrator $y(t) = \int_{-\infty}^{t} x(\tau)d\tau$

CT BUILDING BLOCKS

- INTEGRATOR (CIRCUITS)
- DIFFERENTIATOR
- DELAY by t_o
- MODULATOR (e.g., AM Radio)
- MULTIPLIER & ADDER

Ideal Delay:

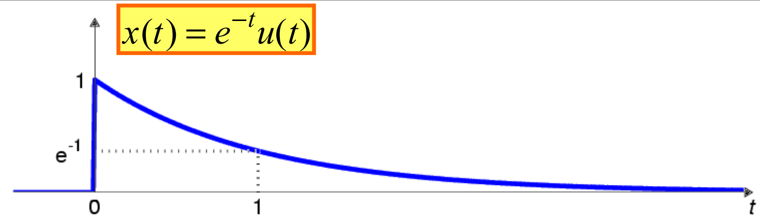
- Mathematical Definition:

$$y(t) = x(t - t_d)$$

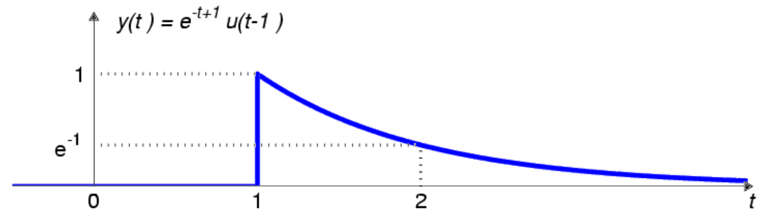
- To find the IMPULSE RESPONSE, *h(t),* let *x(t)* be an impulse, so

$$h(t) = \delta(t - t_d)$$

Output of Ideal Delay of 1 sec



$$y(t) = x(t-1) = e^{-(t-1)}u(t-1)$$



Integrator:

- Mathematical Definition:

$$y(t) = \int_{-\infty}^{t} x(\tau)d\tau$$

Running Integral

- To find the IMPULSE RESPONSE, *h(t),* let *x(t)* be an impulse, so

$$h(t) = \int_{-\infty}^{t} \delta(\tau)d\tau = u(t)$$

Integrator:

$$y(t) = \int_{-\infty}^{t} x(\tau)d\tau$$

- Integrate the impulse

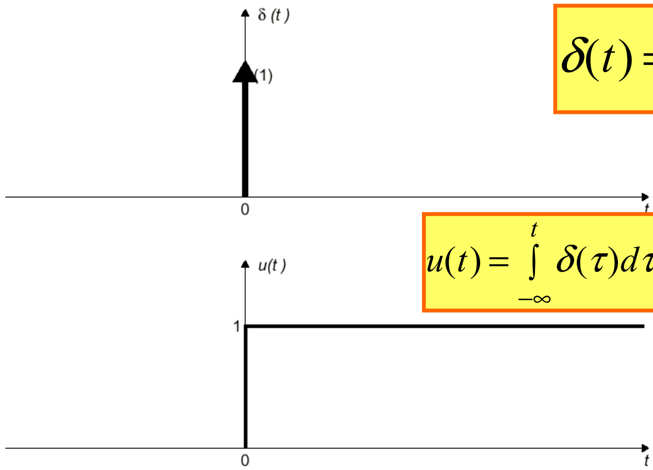
$$\int_{-\infty}^{t} \delta(\tau)d\tau = u(t)$$

- IF t<0, we get zero
- IF t>0, we get one
  - Thus we have h(t) = u(t) for the integrator

Graphical Representation

$$\delta(t) = \frac{du(t)}{dt}$$

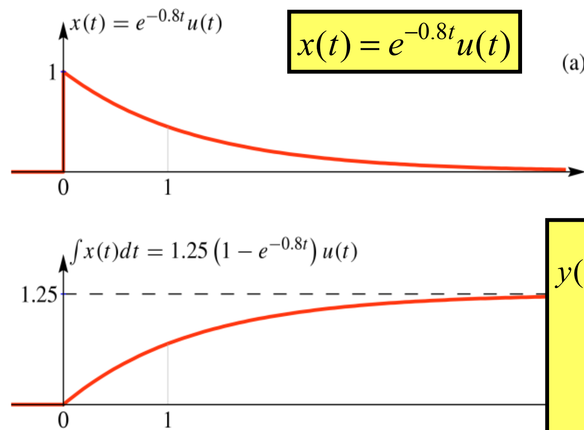
$$u(t) = \int_{-\infty}^{t} \delta(\tau)d\tau = \begin{cases} 1 & t > 0 \\ 0 & t < 0 \end{cases}$$



Output of Integrator

$$y(t) = \int_{-\infty}^{t} x(\tau)d\tau = x(t) * u(t)$$

$$x(t) = e^{-0.8t}u(t)$$



$$y(t) = \int_{-\infty}^{t} e^{-0.8\tau}u(\tau)d\tau$$

$$= \begin{cases} 0 & t < 0 \\ \int_{-\infty}^{t} e^{-0.8\tau}u(\tau)d\tau & t \geq 0 \end{cases}$$

$$= 1.25(1 - e^{-0.8t})u(t)$$

Differentiator:

- Mathematical Definition:

$$y(t) = \frac{dx(t)}{dt}$$

- To find *h(t)*, let *x(t)* be an impulse, so

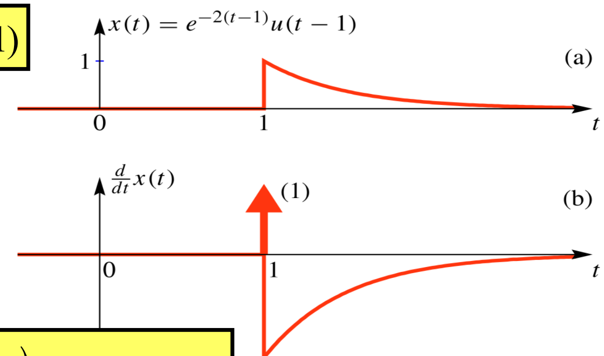
$$h(t) = \frac{d\delta(t)}{dt} = \delta^{(1)}(t)$$

Doublet

Differentiator Output:

$$y(t) = \frac{dx(t)}{dt}$$

$$x(t) = e^{-2(t-1)}u(t-1)$$



$$y(t) = \frac{d}{dt}\left(e^{-2(t-1)}u(t-1)\right)$$

$$= -2e^{-2(t-1)}u(t-1) + e^{-2(t-1)}\delta(t-1)$$

$$= -2e^{-2(t-1)}u(t-1) + 1\delta(t-1)$$

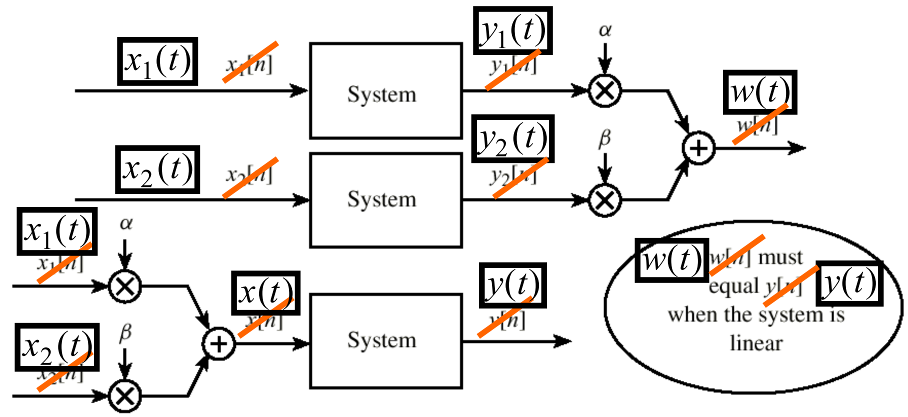
Linear and Time-Invariant (LTI) Systems

- If a continuous-time system is both linear and time-invariant, then the output *y(t)* is related to the input *x(t)* by a ***convolution integral***

$$y(t) = \int_{-\infty}^{\infty} x(\tau)h(t-\tau)d\tau = x(t) * h(t)$$

where *h(t)* is the ***impulse response*** of the system.

Testing for Linearity



Testing Time-Invariance
