Existential Psychology: Meaning & Purpose Preconference

8:00 AM – 5:00 PM | Location: Virtual

The science of existential psychology focuses on issues of "being" and "becoming," including: time, aging, and death; freedom and responsibility; isolation, uncertainty, and shared reality; culture, self, and identity; and meaning and purpose in life. The theme of our 8th consecutive Existential Psychology Preconference is "Meaning and Purpose." A Keynote Address will discuss the search for meaning, and a Special Address will consider Black Existentialism and the struggle for purpose among those coping with hostile and systematic racism as obstacles to authentic life goals. The event will also include a set of 12 Featured Research Talks exploring meaning and purpose in dynamic relation with social cognition, affect, and behavior; a poster session; two data blitz sessions; and an award ceremony. The preconference is organized by the International Society for the Science of Existential Psychology. Join at [ISSEP.org](https://www.issep.org) to become eligible for conference awards, research grants, and more!

Searching for meaning in life: Reviewing the research and highlighting where more search is needed

8:35 AM – 9:20 AM

To search for meaning feels fundamentally human, perhaps even universally so. In fact, something like a search for meaning, a will to meaning, helped galvanize interest in meaning and purpose through the writings of Viktor Frankl. This talk presents what we know about this construct, how it has been measured, whether it is a wellbeing variable or an indicator of distress, moderators of the search for meaning and ways in which searching may serve as a moderator itself, and some of the open questions that persist after nearly 20 years of research. The search for meaning is...something. But we have more to learn ahead than we have learned so far.

Approaching Anticipated Endings: Certainty About What Comes Next Promotes Closure

9:20 AM – 10:00 AM

When a phase of life is ending soon, what facilitates psychological closure (i.e., a subjective sense of completion)? Across five studies (total $N \approx 1300$), we show that future certainty, certainty about what comes after an anticipated ending, fosters closure about the ending. Using text analysis (Study 1), we found that participants who described the next life phase with more certainty reported greater closure over the end life phase. In three experiments (Studies 2–4), participants assigned to future certainty (vs. future possibility) conditions consistently reported higher closure. A 2x2 experiment (Study 4) revealed an interaction effect between future certainty and task completion, indicating that future certainty is particularly helpful for reaching closure when there are uncompleted tasks left in the ending life phase. Finally, a field experiment with individuals anticipating a real-life transition (Study 5) showed that episodic future thinking increased closure (vs. control), with the effect mediated by future certainty. Our research reframes closure as a future-oriented emotional state, with implications for emotion regulation during life transitions.

Being Present: Witnessing Landmark Historical Events Boosts Meaning in Life

9:20 AM – 10:00 AM

Although not everyone shapes history, everyone is present as it unfolds. In this research, we locate individuals in the ongoing process of history, examining how linking personal narratives to broader historical narratives fosters meaning in life. Specifically, we hypothesize that the sense of witnessing history enhances the presence of meaning and the search for meaning. We examined our hypotheses through five methodologically diverse studies. In Study 1, we utilized big data analytics, processing 2,317,527 Weibo posts. We found that people who felt they were witnessing history (vs. those who did not) used more meaning-related words during the event explosion phase. In Studies 2-5, we dissected the presence of and search for MIL, using experimental design to examine causality and a field study for ecological validity. We found that witnessing events of historical significance enhances the presence of and search for MIL, whether manipulated by recalling historically significant events (Study 2), framing an event as historically significant (Studies 3-4), or visiting a historical site (Study 5).

Beyond Utility: How People Engage with Existential Questions

9:20 AM – 10:00 AM

How do people engage with “big questions” in life, such as those on life’s meaning? Our studies (N = 1300, U.S. adults) examined questions and answers people expect for existential issues. Study 1 (N = 600) coded peoples’ top questions on meaning—a typical existential topic, finding that it elicited more philosophical (61%) than scientific or practical questions, more so than material or well-being topics did. Study 2 (N = 300) found that to answer existential questions, people expected approaches to feature perspective stimulation and novelty of ideas more than practical utility (Kruskal-Wallis H(2) = 51.33, p < .001). Philosophical approaches were seen as featuring these factors (M novel = 73.70, M stim = 68.10) more than the scientific or practical (all p < .001). Study 3 (N = 400) found most people (68%) believed that, when scientific methods (e.g., in psychology) are tailored to feature these factors, they too can help in answering existential questions. Results suggest individuals prioritize conceptual enrichment over practical tips for existential issues, informing future study of existential cognition in satisfying existential needs.

Epistemic Orientations and the Search for Meaning: Nihilism, Conspiracies, and the Affective Roots of Authoritarianism

9:20 AM – 10:00 AM

Across increasingly fragmented information environments, the search for meaning and purpose is often rooted in epistemic searching, manifesting as distinct orientations toward knowledge and understanding that emerge from uncertainty and isolation. In two studies, we examine how such orientations—existential nihilism (ENS) and conspiracy mentality (CMS)—bridge the relationship between affective states and authoritarian worldviews on both the political left and right. Across two American samples (n = 386; n = 502), path model results indicate that ENS and CMS each predict greater left- and right-wing authoritarianism. While information consumption appears to amplify these effects, to what degree depends on the particular sources influencing endogenous variables. This research suggests that the pursuit of meaning and coherence may foster authoritarian beliefs when grounded in maladaptive epistemic frameworks that occur under certain conditions. This highlights the emotional, experiential, and belief-based roots that underlie authoritarian attitudes, underscoring the centrality of meaning and purpose needs in increasingly fractious political and informational environments.

Day-level eudaimonic and hedonic motivations and their links with meaning: Additive, interactive, time-lagged, and response-surface effects

9:20 AM – 10:00 AM

We studied meaning as a day-level experience in a 21-day diary study (n=445). Predictors were day-level eudaimonic motivation and hedonic motivation (seeking pleasure, comfort). Additive effects: When the motivations controlled for each other, both eudaimonic motivation and hedonic motivation (pleasure-seeking only, not comfort-seeking) made additive contributions to same-day meaning, so meaning was maximized when both motivations were present. Interactive effects: However, the motivations interacted negatively, such that meaning derived from eudaimonic motivation was undermined in the presence of hedonic motivation (and vice versa). Time-lagged effects: Eudaimonic motivation predicted meaning for the next three days, while hedonic motivation had no predictive effect. Response-surface effects: When examining which combination of eudaimonic and hedonic motivation was optimal, meaning peaked when eudaimonic motivation was 7 (on 1-7 scale) but hedonic motivation was only 5 (on 1-7 scale).

Mortality Salience Predicts In-Group Favoritism After Viewing Pope Francis’s Body

9:20 AM – 10:00 AM

The public viewing of Pope Francis’s body lying in state in 2025 offered a rare opportunity to test core predictions of Terror Management Theory in a real-world, culturally charged setting. In a field study conducted at St. Peter’s Basilica (N = 146), we examined how direct confrontation with death shaped prosocial behavior and identity investment. Participants who reported heightened mortality salience after viewing the Pope’s body donated significantly more to a Catholic charity than to a neutral humanitarian organization, demonstrating selective in-group favoritism. These findings extend TMT beyond laboratory settings by showing that culturally meaningful encounters with death amplify identity-affirming generosity. They also highlight the role of religious worldviews in providing existential meaning and buffering mortality concerns. Our results highlight the importance of cultural context in shaping psychological responses to death and offer new insights into how meaning-making processes operate in naturalistic settings.

Doomsday: Value, Purpose, and the Collective Afterlife

9:20 AM – 10:00 AM

How do present values and sense of purpose relate to attitudes about the continued existence of humanity? Building on a novel philosophical thought experiment, we conducted three studies (N = 2,350) in four countries Colombia, India, Morocco, and the United States, to examine this question. Some participants were asked to think about living in a Doomsday scenario where humanity is wiped out 30 days after one's death. Using a mixed between- and within-subjects design, we found that people value epistemic, grit, and other-oriented virtues less after thinking about Doomsday. Moreover, people reported lower meaning, goal orientation and self-transcendence in Doomsday. These results were replicated when Doomsday consisted either in widespread infertility or of being immediately forgotten by everyone post-mortem. These results suggest that some dimensions of present value and sense of purpose are sensitive to the belief that humanity will continue to exist after one's death. Further, these results are robust across cultural differences.

Finding Meaning in Music: The Motivational Role of Autobiographical Memory Tuning

9:20 AM – 10:00 AM

People often turn to music to make sense of their life experiences. By relating their own life experiences to those of a singer's, people can feel better understood. This process of relating one's own life to a singer's life can be subjective: rather than relying on objective life similarities, people may use motivated perception to find similarities that are not readily apparent. We define this motivated process as autobiographical memory tuning (tuning): spontaneously relating one's own life to a singer's life when exposed to that singer's music. Our research finds that tuning is (1) driven by the need to belong, and (2) serves an epistemic function, increasing one's sense of meaning in life. The higher one's need to belong, the more they are motivated to engage in tuning. Tuning leads to the creation of shared reality with the singer, which then increases one's sense of meaning in life. In addition to bolstering a sense of meaning, we find that, through shared reality, tuning increases one's general sense of belonging and their behavioral intentions to support the singer. We identify tuning as a motivational process by which music plays a meaning-making function in our lives.

Home in Time? A First Look at How We Experience Temporal Rootedness

9:20 AM – 10:00 AM

Research shows that a sense of belonging predicts meaning in life (Lambert et al., 2013). While psychologists have studied how individuals develop a sense of belonging with others, little attention has been given to the sense of belonging in time, or temporal rootedness (Baldwin & Keefer, 2020). Temporal rootedness has previously been defined as what makes people feel like they are living in the "right time" or that they "belong in the present." Despite its positive link to well-being, its definition and content have remained unexplored. This study replicates Baldwin and Keefer (2020) to examine temporal rootedness and compare the themes that persist across time (i.e., 2020 and 2025). A representative sample of participants (N = 386) was recruited on Prolific to describe their source of temporal rootedness and complete a questionnaire assessing time metaphors, human flourishing, existential isolation, social and economic conservatism, familiarity with technology, and perceived discrimination. Results shed light on what it means to feel anchored in time and the implications for research on meaning-making.

Beyond Morality: How People Weigh Life's Pursuits for Themselves and Others

9:20 AM – 10:00 AM

What values are truly worth pursuing in life? From relationships to leisure, morality to civic duty, people can and do pursue many sources of value in life. Yet prior work in philosophy and psychology has suggested morality is the most important domain of value—it is most central to the self, and most tied to how people make judgments about others. The puzzle is whether people actually prioritize moral pursuits above other pursuits, both for themselves and for others. Across 4 studies (N = 751), we drew on philosophical accounts of value to test which pursuits people think are most worthwhile to pursue. Results revealed that people want to allocate more time to pursuing relationships (e.g., connecting with animals) both for the self and for others, but found no differences between morality and aesthetic pursuits. People also reported that moral pursuits should be more prioritized for others more than for themselves (p<.01). In contrast, people prioritize aesthetic pursuits more for themselves than for others (p<.009). These results suggest morality does not reign supreme. People are value pluralists—finding life value in a diversity of pursuits.

The Collective Neurotic Patterns Scale: Development and Theoretical Validation through Meaning Crisis

9:20 AM – 10:00 AM

According to Frankl, modern society faces a sense of meaninglessness that leads to shared attitudes such as provisional (living without long-term goals or direction), collectivistic (relying on majority opinions and avoiding personal responsibility), fanatic (idealizing a single value or belief as absolute), and fatalistic (feeling limited by external or internal conditions), known as collective neurotic patterns. Study 1 developed the Collective Neurotic Patterns Scale using data from 99 participants in Turkey, identifying these four factors with good model fit (CFI = .92, RMSEA = .06). Study 2 tested the relationships among meaningfulness, meaning crisis, and these attitudes in 306 participants in Turkey. Meaningfulness was negatively related to meaning crisis, provisional, and collectivistic attitudes, while meaning crisis positively predicted all four. These results provide empirical support for the theoretical framework, particularly confirming the role of meaning crisis.

Familiarity Seeking: Growing and Learning from Repeat Experiences

9:20 AM – 10:00 AM

Prevailing accounts of personal meaning and growth emphasize novelty, yet meaning need not come only from new experiences. This paper argues that repeatedly engaging with the familiar is a robust route to meaning. People routinely rewatch shows, relisten to songs, return to the same places, and reread cherished books. Repetition provides dependable value by linking past and present, deepening emotional connections, and revealing novelty embedded in the experience and in the self. Through reconsumption, people make better sense of what an experience means to them and harvest prior emotional, cognitive, and social investments. Repeated exposure allows relationships with experiences to develop and mature, creating conditions under which meaning, via coherence, significance, and purpose, can reliably grow. We synthesize theory on mere exposure, nostalgia, emotional attachment, and narrative identity; outline boundary conditions (overexposure, low complexity, nonvolitional repetition); and discuss how future research may further explore how familiarity fosters existential meaning and how to intentionally cultivate meaningful repetition in daily life.

Deriving Meaning and Engagement from Task Variety: How to Boost Situational Meaningfulness and Performance

9:20 AM – 10:00 AM

While people often express aversion to so-called bullshit jobs (Graeber, 2019), the conditions that foster a sense of meaning at a more granular, task level, remain to be fully understood. We tested how task-related meaning sources (skill variety, task identity) relate to task meaningfulness, performance and engagement. In Study 1 (N = 101), participants assembled either the same or different tangram patterns (skill variety), which were either preserved or deconstructed (task identity). We found that higher skill variety led to greater task performance, with no significant effect of task identity. In Study 2 (N = 235), we again manipulated skill variety and task identity. High skill variety increased perceived task meaningfulness, engagement, and performance. Participants assembled more patterns when the task was varied and deconstructed than when it was repetitive but preserved. This suggests that skill variety plays a more fundamental role than task identity in fostering task meaningfulness and performance, indicating that varying the nature of employees' activities can enhance engagement and meaning even when they cannot see the complete outcome of their work.

Crisis of meaning in post-modern societies

9:20 AM – 10:00 AM

When subjective well-being is equated with happiness, macro-psychological studies consistently link it to economic wealth. However, subjective well-being encompasses more than happiness; it includes multiple interdependent components, such as meaning, harmony, spirituality, and happiness itself. This study examines the relationship between economic wealth and societal well-being, redefining the latter as a country-level aggregate of a sense of meaning. Using data from 70 countries, we replicate and highlight the previously overlooked finding that meaning in life is higher in less affluent nations. This finding has important implications for the social sciences, as it seems counterintuitive – the social sciences commonly associate a country's economic prosperity with increased subjective well-being among its citizens. Importantly, inspired by recent research on subjective ideals of well-being, we find that ideal levels of meaning in life are not negatively related to economic prosperity. Thus, wealthier nations do not report lower levels of meaning because they have lower meaning-related aspirations.

Existential isolation predicts poor well-being and participation in justice-involved substance use treatment

9:20 AM – 10:00 AM

Individuals who are currently involved in the justice system represent a unique, at-risk, and underserved population. These individuals experience high rates of mental health issues, including trauma, PTSD, and substance-use disorders, along with systemic barriers and injustice. However, less is known about their existential concerns and well-being. Existential isolation (EI), or the feeling that one is alone in their subjective experience, is associated with higher psychological distress, lower meaning in life, and may influence mental health treatment processes. We investigated the relationship between EI, well-being, and treatment engagement in individuals enrolled in a justice-involved substance use treatment program by administering self-report surveys to 126 individuals enrolled in a program at a correctional facility. Results revealed that EI was negatively correlated with meaning purpose, positive affect, and all aspects of treatment engagement. Counselor rapport was a significant mediator between EI and treatment participation. We suggest further investigation and intervention to improve existential well-being among justice-involved individuals.

Age-Related Differences in End-of-Life Care Preferences: Intrinsic Religiosity, Faith in Science, Science-Religion Compatibility Beliefs

9:20 AM – 10:00 AM

This study examined how age is related to preferences for care near the end-of-life (PCEOL) and whether intrinsic religiosity, faith in science, and perceived science–religion compatibility mediate these relationships. We collected survey data from 1,572 adults (ages 18–99) across Canada and the United States, and conducted a series of multiple mediation models (PROCESS Model 4) for each of five PCEOL subscales: preference for natural death, healthcare provider decision-making, spirituality-informed decision-making, family involvement, and affective communication. Age was significantly, directly related to all five dimensions. Perceived science–religion compatibility partially mediated the positive relations between age and both preference for natural death and affective communication, while intrinsic religiosity partially mediated the negative relation between age and healthcare provider decision-making. Faith in science was not a significant mediator. Together, these findings highlight the nuanced role of existential belief systems in shaping end-of-life care preferences across adulthood.

Meaning Making in Action: Essentialism in Career Decision Narratives

9:20 AM – 10:00 AM

Knowing and expressing one’s avowed true self has been shown to promote meaning and choice satisfaction (Schlegel et al. 2011; Kim et al., 2022). This study, supported by an ISSEP Research Grant, aimed to measure if we could detect evidence of people using the idea of a true self to make meaning in narratives about their life choices. Specifically, we examined whether people naturally express self-essentialist language in essays describing how they picked their career. We focused on self-essentialism themes because the very idea of a “true self” is likely an essence place holder used by lay people to refer to an individual’s perceived self-essence (Christy et al., 2019). We hypothesized that the degree of self-essentialist themes in these essays would predict greater self-reported meaning and choice satisfaction. Results indicated that about half of the essays expressed some degree of self-essentialism. Furthermore, the degree of self-essentialist language in participant’s essays was positively correlated with career satisfaction and meaning. These results suggest that self-essentialism may play a role in helping people find meaning and satisfaction in their career choice.

Existential Isolation and the Facets of Meaning

9:20 AM – 10:00 AM

This research examines how two forms of interpersonal isolation, existential isolation and loneliness, relate to the three facets of meaning (coherence, significance, and purpose). Across two studies, we explored whether these forms of isolation are differentially associated with the facets of meaning. In Study 1 (N = 309) hierarchical regressions controlling for the other facets of meaning and isolation show that loneliness was negatively associated with coherence & significance, while existential isolation was negatively associated with coherence. Study 2 (N= 791) replicated and extended these findings by controlling for Big 5 personality and found that loneliness negatively predicted coherence and purpose, while existential isolation was negatively associated with significance. These findings suggest that loneliness and existential isolation may uniquely impact the facets of meaning in life.

Forecasting Interpersonal Closeness in Human-AI Interaction

9:20 AM – 10:00 AM

AI companionships have emerged as meaningful sources of support in the digital age. But can people accurately forecast these benefits for themselves? And how do these self-predictions measure against predictions about other people's feelings towards the same AI companions? We examined these two questions across two studies (N = 895). In Study 1, participants predicted how close they would feel to a hypothetical AI or human companion after either an intimate or small-talk interaction. We then compared these predictions to the actual closeness generated in-lab following identical interactions. Regardless of interaction type, we found that participants were surprisingly accurate in predicting their closeness to the AI but consistently underestimated their closeness to a human companion. In Study 2, we compared self-predictions to predictions about others' closeness toward the same AI or human across both interaction types. Participants consistently expected others to feel closer to their companion, AI or human, than they themselves did. We discuss the theoretical implications of these findings as well as what they mean for the preservation of human relationships.

Existential Factors of Psychological Resilience: Evidence from a Ukrainian Sample

9:20 AM – 10:00 AM

The study explores existential factors of psychological resilience among Ukrainians living under war-related uncertainty. It is grounded in Alfred L  ngle's Existential Analytic model of the Four Fundamental Motivations and Viktor Frankl's concept of the noetic dimension of personality. Correlations were examined between resilience (Connor–Davidson Resilience Scale) and existential parameters measured by the Existence Scale, Test of Existential Motivations, Professional Hardiness Questionnaire, and Posttraumatic Growth Inventory. Results revealed significant positive links between resilience and core existential dimensions—freedom, responsibility, self-transcendence, fundamental trust, and existential fulfillment. Participants showed predominantly medium to high resilience, reflecting the adaptive potential of Ukrainian society under prolonged crisis. Findings emphasize the essential role of existential orientation in sustaining psychological stability and personal integrity amid uncertainty and collective trauma.

Recovering from inauthenticity: Counterfactual thinking enhances meaning in life after inauthenticity

9:20 AM – 10:00 AM

Counterfactual (i.e., "If Only...") thinking allows individuals to compare what has happened to what might have been, and seems to enhance meaning derived from events. We were interested in examining counterfactual thinking after (in)authentic experiences, given the importance of authenticity for well-being. In our study (N=319), participants recalled events they were either authentic or inauthentic (order randomized) and were randomly assigned to describe either counterfactual or factual details of each event. Participants then reported event-induced meaning in life [MIL] and affect. Results revealed a moderated mediation such that inauthentic events produced lower positive and higher negative affect compared to authentic events, and lower positive (higher negative) affect predicted lower MIL. Importantly, this model was buffered for those who thought counterfactually, mitigating the difference in affect which subsequently weakened the association with MIL. This aligns with previous research that supports counterfactual thinking as an effective emotion-regulatory tool: mitigating the emotional impact of (in)authentic experiences and, consequently, weakening their influence on MIL.

Unrecognized ADHD: Women's Reflections on School Years and Self-Understanding

9:20 AM – 10:00 AM

Attention-deficit/hyperactivity disorder (ADHD) is often perceived as a "hyperactive boy" disorder, contributing to the under-recognition of girls during childhood. Little research has explored how this delayed recognition affects women's early experiences or their later understanding of themselves. This qualitative study examines the retrospective accounts of women diagnosed with ADHD in adulthood, focusing on how overlooked symptoms during school years shaped academic, social, and emotional development. Using semi-structured interviews and thematic analysis, participants reflected on missed signs, challenges in learning and relationships, and how receiving a diagnosis later prompted a reevaluation of their past experiences and sense of self. Findings highlight how women reconstruct their life narratives, reinterpret earlier challenges, and derive personal understanding from delayed recognition. By centering women's voices, this study provides insight into identity formation, the impact of diagnostic bias, and the ways individuals make sense of their lives when recognition comes later.

Exploring the distinct roles of existential loneliness, existential isolation, and general loneliness in depressive symptoms among older adults

9:20 AM – 10:00 AM

This study examines how existential loneliness (EL), existential isolation (EI), and general loneliness interrelate and contribute to depressive symptoms in older adults, aiming to clarify the conceptual distinction between these forms of loneliness/isolation and to better understand their unique contributions to depressive symptoms. The participants were 220 older adults aged 65 and over. Correlation analyses revealed that EL had a strong positive correlation with general loneliness, while EI had moderate positive relationships with both EL and general loneliness in older adults. Multiple regression analysis indicated that both EL and general loneliness significantly predicted depressive symptoms, with EL demonstrating the strongest predictive capacity. EI did not significantly predict depressive symptoms. Findings seem to suggest that EL, general loneliness, and EI are related but distinct constructs and that especially EL and general loneliness may be independent antecedents for depressive symptoms. Interventions specially targeting EL may offer a promising approach to supporting older adults' mental health. Future study is needed to test the results of this study.

Mattering's malleability: exploring how mattering is conceptualized and operationalized, a scoping review

9:20 AM – 10:00 AM

Mattering is a core component of the tripartite model of meaning in life. In this domain, it refers to the sense that our lives hold transcendental value beyond everyday mundanity. In social psychology, however, it is often framed as the value attributed to us within interpersonal relationships. Given its strong link to mental health and well-being, mattering has drawn attention across disciplines, resulting in varied definitions and operationalizations. We conducted a scoping review to map how mattering is usually approached in psychology and care studies, consulting CINAHL, ProQuest Central, PubMed, Scopus, and Web of Science. Only peer-reviewed reports written in English that addressed the experience of feeling valued were included (n = 418). Most sources (46%) defined mattering as a relational construct; 22% emphasized contextual relevance (e.g., school, family, work); and 7% addressed its transcendental dimension, often within broader meaning-in-life frameworks. Our findings highlight the construct's malleability and show that feeling valued is often identified in the literature as a core psychological need deserving further exploration in its diverse articulations.

The Effect of Shared Experience on Nostalgia

9:20 AM – 10:00 AM

Past research on shared experiences suggests that when people attend to emotionally evocative stimuli together, their emotional responses tend to intensify. However, it remains unclear whether this effect extends to nostalgia, an emotion often experienced in solitude. To address this question, we randomly assigned participants to listen to nostalgia-evoking music either alone or with another person, and then reported their feelings of nostalgia. The results provide preliminary evidence that nostalgic feelings are stronger when people listen alone rather than with others. This finding highlights the idiosyncratic nature of nostalgia, suggesting that it may be less readily shared with strangers, compared to other emotional experiences.

The effects of voluntary and non-voluntary hardship on grit: A scoping review

9:20 AM – 10:00 AM

Grit has been defined as the perseverance and passion for long-term goals and it is essential to understand how it shapes responses to hardships and adversities. However, there remains a limited understanding of grit in relation to experiences of hardship. This scoping review aims to explore how grit interacts with both voluntary and involuntary hardships, and vice versa. This review developed a conceptual framework using theoretical material available and synthesised evidence from empirical studies across populations and varying types of hardships. The findings of the review indicate the multiple roles played by grit in coping with hardships, the effect of hardship on diminishing or building grit based on context, intensity, or nature, and the bidirectional relationship between grit and experiences of hardship. A significant amount of evidence suggests that grit acts as a coping mechanism during hardships, and these hardships shape the level of grit in individuals. The limited yet growing evidence in this field suggests that grit and hardships interact with each other, but the intensity and thresholds of their effects remain underexplored.

Playing with Death: Video Games for Death-Education and Meaning-Making

9:20 AM – 10:00 AM

Confronting mortality can deepen our sense of meaning in life, yet motivating people to engage with death-related themes remains a challenge. In two mixed-method experiments, we explored how video games addressing death, loss, and grief can foster existential reflection and meaning-making. In Study 1 (N=44), participants played The Painting or a neutral control game. The existential game evoked deep emotional responses and reflection, but also an increase in death avoidance, possibly reflecting initial defense against confronting mortality. Study 2 (N=43) compared a control group to two experimental groups playing Brothers: A Tale of Two Sons over one month, with one group additionally taking part in a guided discussion. Both game groups showed higher presence of meaning and reduced death avoidance, strongest when discussing the game with others. Our findings suggest that video games can serve as powerful tools for death education when they are emotionally engaging and paired with structured reflection.

Existential Flourishing: Exploring Relational Cognition as a Mechanism to Produce more meaningful therapeutic experiences

9:20 AM – 10:00 AM

The goal of this research is to examine how individuals experiencing SI handle traditional death anxiety, attempting to understand perceived meaning of life in clinical and nonclinical populations. We hypothesized that SIs would serve a protecting function against thoughts of death. Clinical interviews were conducted with three groups: 1) undergraduates with a history of or currently experiencing SI (n = 17), 2) undergraduates with no history and not currently experiencing SI (n = 17), and a clinical sample that had a history or currently experiencing SI with 1+ attempts and currently in therapy. The results revealed first, the SI group felt at greater distance with their attachments and in more direct conflict. Second, suicide was seen as a maladaptive version of problem solving around life rather than a desire for death as an ending. Third, SI and non-SI samples were found to desire to protect their close attachments, but differently. Therefore, we conceptualized this as a distortion of relational cognition driven by the processes of attachment, something that is problematic when healthy close relationships buffer death anxiety.

Mass I-sharing, symbolic immortality, and rippling prosociality inspired by the collective enthusiasm for a feminine icon

9:20 AM – 10:00 AM

Across two studies, we detail the psychological and prosocial ramifications of a unique cultural moment of collective enthusiasm for a feminine icon: Taylor Swift's Eras Tour. We recruited participants in the "Eras Tour Bubble" condition before and after the show and recruited participants in the "Out-of-Bubble" control condition four months after the tour concluded. We examined the role mass existential connection, symbolic immortality, and communal values played in fostering "Bubble" participants' increased warmth and generosity that rippled out to in and out group members alike (i.e., rippling prosociality). Study 1 found that the "Bubble" condition predicted increased mass existential connection, which in turn predicted increased rippling prosociality. Study 2 found that the "Bubble" condition also predicted increased symbolic immortality. Increased symbolic immortality predicted increased communion, which in turn, predicted increased rippling prosociality. Results provide insight into the psychological impacts of the Eras Tour and shed light on the implications of living the same experience with thousands of others, for how we treat ingroup and outgroup members alike.

Understanding Suicide as Identity Failure: Integrating Existential and Identity Control Theories

9:20 AM – 10:00 AM

This review examines suicide as both a deeply personal and socially embedded phenomenon. Psychology often locates suicide within individual distress, while sociology views it as a response to disrupted integration and meaning. To bridge these perspectives, this review integrates Yalom's existential psychotherapy and Burke's identity control theory to propose a model of suicide as identity failure. Yalom describes how the existential givens of death, freedom, isolation, and meaninglessness can destabilize coherence and purpose. Burke's theory extends this view by explaining how individuals sustain self-concept through social feedback that affirms valued identities. Identity failure is conceptualized as the point at which feedback persistently disconfirms one's identity standards, producing a breakdown in coherence that mirrors existential collapse. Integrating these frameworks offers a model of suicide as identity failure, linking the loss of meaning with the breakdown of belonging and self-regulation. This integration highlights implications for theory and practice, suggesting that authenticity, acknowledgment, and social connection can buffer against identity failure and despair.

Helping Clients Find Purpose- Life Constellation

9:20 AM – 10:00 AM

This session outlines a clinical framework designed to facilitate meaning and purpose in life through values clarification and goal alignment. The process integrates established psychological theories on motivation and well-being with structured therapeutic exercises. Clients are guided to identify core values, differentiate essential needs from peripheral wants, and critically evaluate activities that either enhance or deplete authenticity. These values then inform the formulation of specific, measurable, attainable, and time-bound goals across life domains, fostering alignment between self-concept and behavior. Empirical research underscores that value-congruent goals promote autonomy, mastery, and purpose, contributing to enhanced resilience, self-efficacy, and overall well-being. Visualization and reflective practices further reinforce this alignment by engaging cognitive and affective systems that support goal pursuit. This framework provides clinicians with a replicable methodology to promote intentional living, offering both theoretical grounding and practical application for advancing client growth and fulfillment.

Individual Differences in Mortality Salience: An Agent-Based Modeling Approach

9:20 AM – 10:00 AM

Decades of work investigating terror management theory (TMT) have produced strikingly mixed experimental and meta-analytic results supporting the existence of mortality salience (MS) effects—the finding that reminders of death produce compensatory behaviors. Little is known, however, about whether potential theoretical mechanisms might explain this heterogeneity. We explored some of these mechanisms by developing an agent-based cognitive model designed to operationalize three potential ways of responding to MS: bolstering one's beliefs, derogating the beliefs of others, and avoiding engagement with MS entirely. We ran 10,000 independent simulations investigating the consequences of these MS response styles. Results showed that these response styles could lead to distinct outcomes in defensiveness: individual differences in responding produced variability in the extent to which worldview and self-esteem defenses were activated. Such individual differences may help explain some contradictory empirical findings in the TMT literature, highlighting a need for greater precision in how the core components of TMT and other theories of psychological defense are specified.

Creating Meaning & Purpose While Abroad: Motivation and mental health in short- and long-term study abroad among Japanese students

9:20 AM – 10:00 AM

A groundbreaking qualitative research study by Hishida, Yanase, & Sakagami (2024) identified that mental health factors motivate international students to travel to Japanese national universities. Less understood are the factors that motivate outbound Japanese study abroad students and whether they are shaped by deficit or strengths-based psychological processes, while additionally investigating how mental health informs these processes. Our goal is to create more meaningful study abroad experiences while minimizing distress. Interviews (N = 10) were conducted in English and Japanese to examine study abroad factors and mental health processes in both short- and long-term study abroad programs. We predicted that some outbound (Japan to abroad), will exhibit patterns of distress and that these experiences offer students an opportunity to “escape” their current reality. Results show an intersection between mental health, meaning & purpose, and the motivations behind studying abroad. We provide insights to create more meaningful experiences for students studying abroad in Japan and globally.

Discovering Human Purpose and Meaning: The Narmada Parikrama Experience

9:20 AM – 10:00 AM

Revered as a Mother Goddess, Narmada (Ma Narmada) is a perennial river running across three states in India around which a parikrama or clockwise circumambulation, is performed on foot. This arduous walking pilgrimage (Narmada Parikrama-NP) covering approximately 3300 kms, is undertaken by individuals (“parikramāwasi”) from all walks of life for its spiritual merit and to seek answers for many existential questions. Anchored in Indigenous Psychology, this qualitative inquiry examined NP as a culturally endorsed, voluntary experiment in self-transformation. In-depth interviews were conducted with 15 parikramavasis (18 to 70 years) who have completed NP at least once to understand their motives and reflective experiences. Interviews were conducted in the local language and tape recorded with permission. Participants discussed following strict routines with minimum material comforts and developing self-restraint. Parikramawasis voluntarily left comforts of their home to explore unknown terrains along the river, often without using money during the journey. Participants brought forth Hindu, Indian worldviews about the complex interface of human pursuits, meaning and purpose of life.

Learning my disorder isn't real: critical pedagogy and existential meaning in abnormal psychology

9:20 AM – 10:00 AM

Abnormal Psychology is often taught with rigid, biogenic assumptions about etiology and ontology of psychiatric disorders. This leaves little room for students to consider existential implications of endorsing biogenic explanations of what a disorder is. The current study examines how undergraduate students understand meaning and purpose of disorder diagnosis as it pertains to themselves and others. Study sample consists of students enrolled in Abnormal Psychology at SVSU (n = 28) thus far, and we will be continuing in future semesters. Materials include the Mental Disorder Causal Beliefs Scale (MDCB; Mannarini & Boffo, 2013), Biogenetic Causal Beliefs Scale (BCBS; Kvaale & Haslam, 2016), and four essay questions to gauge extent of students' biogenic causal beliefs and understanding of disorder ontology. After relevant material is taught, we re-administer MDCB, BCBS, and essay questions to explore potential changes to students' views on causality, ontology, and purpose of disorders/diagnosis.

The fiduciary human in the Anthropocene

9:20 AM – 10:00 AM

With human activity increasingly becoming the prime driver of the earth system and with humans almost crossing critical planetary boundaries, we face the risk of rendering ourselves the first species on earth to be held responsible for our own and other species' extinction. This contribution addresses crucial aspects of contemporary societies that seem to regard people from a data-perspective as mere items of information, thus detaching the 'human' from the 'nature'. Building on literature devoted to the fiduciary concept, it examines whether and the extent to which the human could be conceptualised as fiduciary of future generations with the duty to exercise other-regarding authority in the best interests of these generations. It argues that future generations have a profound interest in living in a healthy environment; and that humans should be bound by the obligation to care for nature. Based on the fiduciary approach to the human, this contribution analyses the specific context of our fiduciary obligations and responsibilities toward the environment and future generations.

Navigating wide and deep: Development and validation of the Dual Existential Meaning Search scale

10:05 AM – 10:20 AM

People pursue meaning in different ways, yet prior work has not directly examined how individuals search for meaning. Drawing on existential psychology, we propose that meaning search takes two distinct forms: breadth, seeking diverse sources of meaning, and depth, seeking the essential core of one's meaning sources. Across four studies, we developed and validated the Dual Existential Meaning Search (DEMS) scale. Breadth search related to curiosity, openness, and extraversion, whereas depth related to religiosity and need for closure. Depth also predicted perceived meaningfulness in foundational, stability-oriented domains (e.g., religion), while breadth predicted meaningfulness in outward, relational-societal domains (e.g., rights).

Momentary experiences of meaning in life

10:20 AM – 10:35 AM

Meaning in life research traditionally focuses on trait assessments of the meaningfulness of whole lives. Yet, feelings of meaning in life fluctuate from moment to moment. I will present findings from three diverse projects, focusing on routines, collective action, and friendship, that all use Experience Sampling Methods to track momentary feelings of meaning in life across situations. I will argue that assessing momentary feelings of meaning enables a more complete understanding the sources, consequences, and dynamics of meaning in life.

From values to action: Cultivating meaning through daily prioritization

10:35 AM – 10:50 AM

Decades of research show that meaning in life is central to well-being, resilience, and identity, mostly through the constructs of presence and search and the coherence–purpose–significance model. Yet many who reflect on what matters or search for meaning do not turn this awareness into a lasting sense of meaning or improved functioning. This talk presents 'prioritizing meaning', the intentional investment of time, attention, and behavior in what matters most, as a mechanism explaining this gap. Prioritizing meaning predicts presence and well-being beyond search and mediates pathways to mental health. Experimental interventions increase prioritizing meaning and translate reflection into meaningful action.

Place Attachment as a Source of Meaning in Life: Enhancing Purpose, Coherence, and Significance

10:50 AM – 11:15 AM

Can our environments be sources of meaning? While place attachment has been linked to well-being, its role in shaping meaning in life remains unclear. Across three studies, I tested whether place attachment enhances experiences of meaning. Using experimental sampling methods (N = 271), people reported greater momentary meaning when in places they felt attached to. To examine causality, two experiments (total N = 945) manipulated place attachment. Participants reported higher meaning when reflecting on places of attachment (vs. neutral, low, or negative places), even after accounting for baseline meaning levels. Findings suggest that attachments to place provide a psychological anchor for overall meaning as well as coherence, significance, and purpose. By highlighting the existential role of everyday environments, this work demonstrates that meaning is not only constructed internally but also rooted in the physical and social contexts where we live our lives. Future research will investigate whether the satisfaction of basic psychological needs, as proposed by self-determination theory, mediates the relationship between place attachment and meaning in life.

Writing a Meaning for Life: A Randomized Controlled Trial of a Single-Session Narrative Identity Intervention for Young Adults

10:50 AM – 11:15 AM

Emerging adults face the challenging task of developing a coherent life story that fosters meaning—encompassing purpose and existential mattering. Narrative identity theory proposes that coherent life stories promote self-continuity and meaning, but these claims have rarely been tested experimentally. We tested the Brief Meaning Boost (BMB), a single-session online intervention guiding participants through writing about key memories, identifying themes, and receiving wisdom from their future self. In this pre-registered randomized controlled trial (N=532), young adults ages 18-24 were assigned to BMB or an active control. Results showed moderate immediate effects on meaning/purpose (d=0.52) and mattering (d=0.34) that persisted at one week (ds=0.25, 0.19) and three weeks (ds=0.27, 0.24). Sequential mediation analyses provided experimental evidence for core theoretical claims: the intervention enhanced narrative coherence, which fostered self-continuity, which sustained meaning and mattering over time. This brief, scalable intervention advances narrative identity theory and demonstrates practical pathways for helping emerging adults cultivate purpose and significance.

Moved by the lightest touch of meaning: Even minimal meaning matters for motivation from childhood

10:50 AM – 11:15 AM

How essential and fundamental is a sense of meaning—the feeling that our efforts matter beyond the trivial or momentary—for motivation? Across our studies (N = 604 children aged 4–9 and 577 adults), we find that no amount of meaning is too small to matter, even for small actions early in life. Both children and adults strongly preferred artistic activities with minimal meaning (i.e., where their work would be saved) over activities with no lasting existence. This preference held for both repetitive and one-time tasks and was specific to creating artwork rather than merely observing it. Anticipating even minimal meaning motivated participants to engage in productive tasks rather than effortless alternatives. In the absence of such meaning, focusing on enjoying the process partially—but not fully—compensated for motivation. These findings illuminate the scope and sensitivity of meaning as a powerful motivational force, highlighting its role as a fundamental psychological need and offering insights into how to sustain motivation in an increasingly fast-paced, transient world.

Religious and atheist terror management: Faith in religion and science, worldview certainty, intuition/thoughtfulness, and closed/open-mindedness.

10:50 AM – 11:15 AM

Six studies examined the role of mortality awareness on acceptance of worldview-consistent and inconsistent beliefs, as well as on open-minded vs. close-minded cognitive orientations. In Study 1, after reminders of mortality (mortality salience [MS] vs. control topic), Christians reported increased certainty about their religious faith. In contrast, atheists became more certain in their rejection of religious faith. In Study 2, MS led Christians to become more certain about the existence of the Christian deity and the non-existence of Hindu deities. Studies 3-6 then examined cognitive orientations. In Study 3, MS led Christians to increase their reliance on intuitions, whereas atheists preferred analytic thinking. Studies 4, 5, and 6 found that MS led Christians to become more dogmatic in general, and after expressing faith in worldview consistent beliefs (i.e., religion and science). Conversely, atheists after MS became more open-minded in general and after rejecting worldview inconsistent beliefs (i.e., religious faith) but became more dogmatic after affirming worldview-consistent beliefs (i.e., faith in science). Theoretical and practical implications will be discussed.

Meaning and affect: cross-cultural similarities and differences

10:50 AM – 11:15 AM

Previous research established that meaning in life is driven by commonplace experiences such as positive emotions. However, these conclusions are based mostly on research in Western populations, where people tend to value higher levels of happiness than in other cultures. We used data from 17,803 individuals across 69 countries to examine the generalizability of the affect-meaning link. The positive correlation between positive affect and meaning was significant in 62 countries, and the negative association between negative affect and meaning was significant in 57 countries. However, the results of multilevel modeling revealed that the effects in Western countries were on average stronger than in other regions. Finally, we found a cross-level interaction, such that the associations between positive and negative affect and meaning in life were stronger in countries idealizing higher levels of happiness, which could not be explained by differences in national wealth and religiosity. Cumulatively, these results suggest that the link between affect and meaning can be observed in most cultural contexts, but is uniquely strong in happiness-oriented Western cultures.

Identity theft: Who we are and who we might become

11:15 AM – 11:30 AM

Marc got put into the Witness Protection Program as a child. Nathan didn't undergo hormonal puberty until his 20s, thanks to a rare genetic condition. Olivia got edited into a reality TV villain. These wildly different experiences all illustrate a phenomenon I'm calling "identity theft." Each person lost authority over their life story. This talk will describe the phenomenon of "identity theft," which I am currently writing a book about, and ask us to consider how it might reshape our understanding of identity at both the individual and the cultural level.

Finding vs. crafting meaning in work

11:30 AM – 11:45 AM

For decades, research on the meaning of work has focused on two main ideas: that some kinds of work are inherently meaningful, and that meaning is perceived by individuals (or not) in the jobs they occupy. In both views, people are portrayed as pursuing jobs that society—or their own values—deems important or fulfilling. A more recent perspective challenges this assumption. Instead of treating meaning as something to be found, it positions workers as active creators of meaning: people who shape their own experience by changing aspects of their tasks or interactions on the job. In this talk, I explore how our assumptions about where meaning resides—and how it is made—shape the way we think about work. As the nature of work continues to shift in its structure and setting, understanding these pathways to meaning is increasingly important.

The tripartite model of meaning in life – and beyond it

11:45 AM – 12:00 PM

Psychological research has seen much convergence around the idea that meaningfulness has three facets: coherence, purpose, and significance. However, behind this apparent consensus are debates about how each facet should be defined, such as the potential distinction between significance (Martela & Steger, 2016) and mattering (George & Park, 2016), along with proposals about new facets, such as interpersonal mattering and prosocial impact. At the 10 year anniversary of the key papers proposing this tripartite model, I will examine what is the current understanding of the three facets and potential new facets – and how should meaning in life be presently understood.

Before the Law: Imagination, History, and Repetition as Black Existential Psychology

12:30 PM – 1:15 PM

The law is a prominent site of reflection in the existential philosophical tradition. Law remains, however, under-examined in Black existentialist literature. Drawing from my current research—a book on the work of African American legal theorist Derrick Bell—I emphasize the role of imagination, history, and repetition in African American philosophical reflection and their connections to the existential concepts of anxiety, freedom, and responsibility, and their relevance for Black existential psychology. Through an examination of African Americans and their anxieties before the law, most notably the prospect of the permanence of anti-Black racism, my remarks aim to provide fertile ground for reflection not only on the psychological well-being of African Americans but also other marginalized groups through existential philosophical reflection and its relation to psychology.

Age, death-related concern, and religious faith among atheists: Data from the World Values Survey.

2:00 PM – 2:40 PM

Prior work finds death-related concern motivates religious faith among believers but not atheists, yet it remains unclear whether age might impact that relationship. The present research tests this question in 2 pre-registered studies with data from various waves of the World Values Survey and European Values Survey datasets composed of nationally representative samples in over 100 nations. A set of competing hypotheses were tested among atheists: 1) death-related existential concern (DEC) is not associated with faith regardless of age (terror management theory, TMT); 2) DEC is associated with faith regardless of age (no atheists in foxholes, age-universal perspective); 3) the DEC-faith relationship weakens with age (age-mitigated perspective); and 4) the DEC-faith relationship strengthens with age (age-amplified perspective). Among atheists, in Studies 1 (N = 10,368; 64 nations; ages 16-95, M = 42.61, SD = 16.59) and 2 (N = 2,343; 34 nations; ages 17-93, M = 37.92, SD = 15.58), consistent with the TMT perspective—an association between death-awareness and religious faith did not emerge among atheists.

The Philosophical Self: Exploring the Narrative Dimensions of Life Philosophy Through Mixed Methods Analysis of Life Story Interviews

2:00 PM – 2:40 PM

The current studies explore how midlife Black and white Americans express their life philosophy while telling their life stories (N=158). In Study 1, we focus on a smaller section of the Life Story Interview (McAdams, 2008) that directly prompts participants to express their life philosophy, exploring the psychological dimensions of these "life philosophy statements" in relation to quantitative measures of mental health. In Study 2, we present initial findings from a deeper qualitative analysis of full life story interviews, extending our analytical frame beyond direct statements of life philosophy to explore how a life philosophy is expressed organically throughout the interview. Together, these studies contribute to a framework for identifying and analyzing expressions of life philosophy within life narrative accounts, while also inviting reflection on two methodological approaches to this analysis.

Attributional Style Predicts Resilience in Ukrainian Survivors

2:00 PM – 2:40 PM

How people explain adversity shapes how they recover from it. This study examines attributional style—the tendency to explain negative events as internal or external, stable or unstable, and global or specific—as a predictor of resilience among Ukrainian survivors of political oppression. Using the Content Analysis of Verbatim Explanations (CAVE) method, we analyzed naturally occurring attributions in survivor narratives to explore how explanatory tendencies relate to psychological adaptation after prolonged trauma. We tested whether attributional dimensions linked to perceived control and permanence correspond with stronger or weaker resilience outcomes. Results illuminate cognitive patterns that distinguish adaptive from maladaptive meaning-making in contexts of sustained systemic threat. By integrating narrative data with established models of explanatory style, this work advances understanding of how individuals cognitively reconstruct their experiences to endure and recover under chronic repression.

Mortality Salience, Fear of Being Single and the Desire to Seek Potential Romantic Partners: A Terror Management Perspective

2:00 PM – 2:40 PM

Terror management theorists have proposed that when humans are faced with the certainty of their own death, they are driven to seek social connections to buffer existential anxiety (Mikulincer et al., 2003). We theorize that this can manifest through heightened desires for intimacy – particularly among those high in the fear of being single – which can ironically encourage the pursuit of unfulfilling relationships. Single participants (n = 189) completed a classic mortality salience manipulation (i.e., wrote about their own death) and were then asked about their fear of being single, desire for a romantic partner, and satisfaction with relationship status. For people high in the fear of being single, reflecting on death significantly increased desire for a partner and decreased satisfaction with singlehood compared to those in control conditions. These findings shed light on the connections among death awareness, fear of being single and desire for romantic partners, suggesting that singlehood may seem less desirable when it raises the possibility of dying alone. Broadly, this could insinuate that fear of death is associated with a fear of dying alone.

"If you agree with me, it must be true": Social verification creates shared Reality and consolidates impressions

2:00 PM – 2:40 PM

Shared reality about one's judgments can be reinforced through social verification. Yet, it is unknown whether impressions of others consolidate more when receiving verification. Across three experiments (N = 945), participants evaluated pairs of similarly qualified applicants based on photos and brief descriptions, then made hiring choices with a fictitious partner. Decisions were either verified or not. Impression consolidation was assessed as choice-consistency in trait attributions, that is, the tendency to assign positive vs. negative traits to pictures of selected applicants. Verification increased perceived shared reality, epistemic trust, and relational motivation toward the partner. It also enhanced choice-consistency, regardless of mood and partner-related feelings (Experiments 1–2), but only for job-relevant traits (Experiment 3). These findings indicate that social verification not only strengthens the sense of shared reality but also consolidates impressions, offering novel insights into communication, social cognition, and decision-making

Daily Dynamics in Meaning in Life: A Multi-Level Location Scale Model Approach

2:00 PM – 2:40 PM

Meaning in life (MIL) fluctuates daily, but patterns in these fluctuations are not understood. Using novel methods, we tested whether MIL exhibited dynamic characteristics: level (one's mean across days), instability (the magnitude of change in MIL across days), inertia (how likely MIL is to return to baseline after disruptions), and reactivity (how much MIL changes with changes in parent-adolescent closeness). Second, we tested whether individual factors might predict these meaning dynamics. This study sampled 150 adults (95.3% female, MAge=43.35) who completed a baseline survey and 21-day daily diary burst. The Bayesian multi-level location scale model revealed MIL exhibits level, instability, inertia, and reactivity to closeness (see Table 1), evidenced by significant means and variances for the components. Adults' baseline depression (DEP), anxiety (ANX), and life satisfaction (LS) were added as predictors, yielding nuanced results. DEP and LS predict levels of MIL, while ANX and LS predict MIL instability (see Table 2). MIL dynamics offer a useful framework for describing daily MIL processes in adults, and for understanding how individual factors impact MIL dynamics.

Existential Isolation and its Limits on Empathetic Understanding

2:00 PM – 2:40 PM

Existential isolation (EI) is feeling alone in one's subjective experience of the world – as if other people can't relate. e.g., A patient describing their chronic pain to a doctor might feel that the doctor hears the words but doesn't truly grasp what it feels like to live with that pain every day. Because of this perceived disconnection, existentially isolated individuals may find it harder to take others' perspectives; that is, to predict or understand others' emotional reactions. Thus, people who score high on EI may express less empathetic concern for others. Two cross-sectional studies were conducted, and the results found that existential isolation was linked to reduce empathy and perspective taking. There are many applied implications for this, many of which will likely be relevant within the medical setting, with higher levels of existential isolation in physicians likely to predict lower empathy for their patients. Thus, recognizing and addressing EI could improve therapeutic alliance, treatment adherence, and overall patient well-being.

The Need for Transcendence Scale and its associations with meaning and well-being indicators

2:00 PM – 2:40 PM

The "need for transcendence" refers to a perceived need for experiences and meanings beyond the self and daily life. Literature identifies vertical forms of transcendence (related to a higher immaterial dimension) and horizontal forms (where it is experienced in connection with the world, nature, or humanity). No available instrument effectively captures these needs. The study (N = 1,064 Italian adults) validated the Need for Transcendence Scale, a 12-item tool measuring the need for vertical, horizontal, and self transcendence. Exploratory and confirmatory factor analyses were conducted, alongside correlations with well-being and meaning measures (e.g., PWB, MLQ). Analyses confirmed the scale's three-factor structure. Need for transcendence dimensions correlated positively with psychological well-being, search for and presence of meaning, especially for respondents who identified themselves as spiritual (vs. non-spiritual). The scale shows solid psychometric properties and offers a new tool for religious and secular contexts. It further confirms the link between transcendence needs and the experience of meaning, especially in presence of a spiritual dimension.

God's plan? Examining how the religious 'dones' perceive suffering

2:00 PM – 2:40 PM

When tragic events occur, people seek explanations for why human suffering exists in the world. One explanation is that pain and suffering just happen randomly with no purpose. In contrast, religious people may prefer another explanation such as "God has a plan," implying that God must have allowed pain and suffering for some (good) purpose. This and other purpose-based explanations such as "everything happens for a reason" exhibit teleology—the idea that events happen to fulfill some future purpose. People who believe in God are especially likely to think teleologically about life events. Recent research has demonstrated the 'religious residue' effect, which occurs when remnants of religious cognitions persist for formerly religious individuals (the 'Dones'). This study examines whether this teleological tendency remains for people who walk away from religion. A pre-registered online experiment (target N=1,380) examines how the Dones, currently religious people, and those who have never been religious may differ on views of suffering and in how they evaluate religious and secular leaders who make teleological claims about natural disasters. Preliminary results will be presented.

A meta-analysis of orientations to happiness and meaning

2:00 PM – 2:40 PM

Meaning, pleasure, and engagement pursuits are central themes in well-being research. However, their roles in connection with meaning in life are underexplored. The current study combines available findings on the links between these pursuits and meaning in life. A systematic literature search was performed in Scopus and Web of Science databases before July 10, 2025, including Pearson's correlation coefficients. Pooled effect sizes were estimated through a random-effects model. The present meta-analysis demonstrates that all types of pursuits are positively associated with meaning in life. Meaning pursuits are more strongly linked to meaning in life, followed by engagement and pleasure. This meta-analysis contributes to a better understanding of pathways towards a meaningful and significant life.

Dual Forms of Teleological Reasoning in Judgments of Authenticity

2:00 PM – 2:40 PM

Teleological reasoning holds that entities exist for specific purposes, suggesting a link between perceived purpose and perceived authenticity. The present study tested whether judgments of authenticity in others rely on two distinct forms of teleological reasoning: a perceived individual telos, relating to skills and passions, and a perceived universal telos, relating to the moral ideal of being a good human being. In a within-subjects experiment, 269 undergraduates read vignettes in which characters either maintained or abandoned a unique passion and acted either morally or immorally. After each vignette, participants made both "shallow" and "deep" authenticity judgments of the character. Results revealed main effects of both consistency and morality, as well as a three-way interaction: shallow authenticity judgments were shaped more by self-consistency information, whereas deep authenticity judgments were shaped more by morality information. These findings provide initial evidence for a layered model of teleological reasoning in which authenticity judgments draw on both individual and universal conceptions of human purpose.

Nostalgia increases psychological richness in life

2:00 PM – 2:40 PM

Nostalgia is a bittersweet emotion that increases meaning in life. But meaning in life is multi-faceted and scholars have not yet explored which facets of meaning nostalgia increases. Furthermore, scholars have not yet investigated whether nostalgia enhances another form of the good life—psychological richness in life. The present research sought to determine which facets of meaning in life nostalgia increases and whether nostalgia also enhances psychological richness in life. We tested these research questions by conducting two high-powered, pre-registered between-subjects experiments (Study 1 N = 640, Study 2 N = 1007). We showed that nostalgia reliably enhances perceptions that life is psychologically rich. We found mixed evidence regarding the effect of nostalgia on meaning in life (and its facets). The implications of our findings are discussed.

Saving Lives by Creating Purpose: Utilizing an existential approach to design more meaningful airline safety messages

2:00 PM – 2:40 PM

Airline safety messages have a negative effect on recall and attention from passengers (see masked for review, 2016) which was exemplified by passengers with failed attempts to exit the aircraft during the US Airways 1549 crash landing on the Hudson River. Much of this can be attributed to a fear of death (see masked for review, 2016). With air incidents continuing throughout the world, a lack of attention to safety messages is a life-altering decision for passengers. Using Terror Management Theory as guidance, we predict that using an existential approach to designing these messages will promote more meaning and purpose for passengers, therefore creating a greater buy-in for attention and recall of the safety messages, and ultimately saving lives. Phase 1 of this research presents a quantitative content analysis of existing airline safety messages since 1980. The data is used to present a model for future research creating airline messages with an existential lens to test for Phase 2.

How does Culture Shape the Ways People Answer Humanity's Existential Questions Amidst Climate Change?

2:00 PM – 2:40 PM

Responding to climate challenges requires answering essential questions such as “what prospect does the future hold?”, “how should I/we feel in this situation?” or “what is the good way of acting in face of disasters?” I argue that culture plays an important role in shaping how people respond to these questions. Specifically, I introduce cultural defaults—“common” sense, taken-for-granted ways of thinking, feeling, and acting. Cultural defaults are reflected and reinforced in institutional practices and policies, in everyday interactions, artifacts, as well as in many individual psyches. As embodied knowledge, cultural defaults carry historically derived cultural wisdom and have been adaptive across various situations in the past. I aim to introduce 12 cultural defaults that are common in U.S. and East Asian contexts including optimism vs. realism, single factor vs. multiple factors, high-arousal vs. low-arousal, influence vs. adjustment, personal choice vs. social choice, promotion vs. prevention. I emphasize the significance of meaning-making across contexts, and how knowledge about cultural defaults can help us find shared agency for collaborative action.

Reflecting on Life and the Self amid Collective Upheaval: Narrative Identity in Lebanon

2:00 PM – 2:40 PM

How do people make meaning of collective crises within their personal life stories? This study examines interviews with 77 adults in Lebanon, who narrated significant autobiographical events in the context of historical and sociopolitical upheavals. Participants often integrated collective disruptions (e.g., wars, economic collapse, political instability) into their own developmental trajectories, revealing varied degrees of personally meaningful integration. Drawing on the concept of narrative identity and historical consciousness, we conducted a phronetic-iterative qualitative analysis to identify how collective crises shape meaning-making at personal, relational, and collective levels of selfhood. Planned quantitative analyses test how different forms of sense-making relate to mental health outcomes. Findings highlight how collective disruption becomes deeply personal, revealing what it means to reflect on one's life and self when the surrounding world is unstable.

Predicting the choice to plug in to Nozick's experience machine

2:00 PM – 2:40 PM

In his famous thought experiment, Nozick (1974) asks a key existential question: Would you plug into a machine that promised your ideal life but in simulacrum, withdrawing from the world for guaranteed pleasure, or instead choose the genuine activity of living despite all its imperfections? Across four samples (combined N = 1561), most people responded as Nozick assumed, with only about 30% of participants answering that they would plug in. But, despite choosing not to plug in, most thought other people would, suggestive of felt disconnect from others. Unexpectedly, for all samples tested, Modern Racism (McConahay, 1986) predicted the choice to plug in. Because racism seems only contingently connected to the thought experiment as conceived, we hypothesize Modern Racism is a proxy indicator of some related, more satisfactory explanatory predictor(s). We tested multiple predictors organized by type of motivation to plug in - epistemic (understanding and coherence), social (connectedness and significance), and existential (power and purpose) - to determine which type of individual predictors explain the choice to plug in.

Existential nihilism and affect, life satisfaction, meaning in life, depression, spirituality, religiousness, personal beliefs, and death acceptance

2:00 PM – 2:40 PM

Nihilism has been a profound topic in multiple different circles of study since its inception, being headlined by Nietzsche. With Nihilism being regarded as a philosophical viewpoint where all life and the universe has no purpose or lack of any meaning. With this known, prior studies have sought to find similar connections between nihilism and existential depression. This study seeks to draw connections between Existential Nihilism and Depression, life satisfaction, and meaning in life. Furthermore, aiming to see how nihilistic feelings affected undergraduate students as to eventually develop ways to prevent or mitigate the overall effects. Students could provide more thorough and unique reflections due to the high stress of classwork, combined with social and job responsibilities, and other external events that may contribute to the feelings of nihilism.

Religious-Spiritual Struggles, Domains of Uncertainty, and Religious Attachment

2:00 PM – 2:40 PM

Religious people often experience religious and spiritual (R-S) struggles, ranging from doubting their religious teachings to questioning their moral values. The consequences of these R-S struggles for people's attachment to their religion, however, are less clear. Two studies examined how R-S struggles elicited different types of uncertainty about one's religion and house of worship (HoW), and how these uncertainties produced different levels of attachment to one's religion and HoW, respectively. U.S. Protestants and Catholics reported their R-S struggles before reporting their uncertainty about their religious and HoW identity. As outcome variables, participants reported their religious disidentification and their intentions to exit their HoW. Results of a path analysis showed that R-S struggles with interpersonal relations and doubts about God related to dis-identification and HoW leave intentions through different uncertainties. Religious uncertainty was positively related to religious dis-identification, while HoW uncertainty was positively related to HoW exit intentions. The implications of R-S struggles and group-level uncertainties for religious behavior will be discussed.

The Entrepreneurial Self: How Neoliberal Capitalism Reshapes Identity

2:00 PM – 2:40 PM

With the rise of Reaganism and Thatcherism, neoliberal capitalism dismantled safety nets and unleashed free markets. Theorists argue that neoliberalism shapes not only economies but the soul, producing an entrepreneurial self. Those with an entrepreneurial self manage the self like a business, continually optimizing, responsabilizing, and promoting the self. While sociologists and philosophers have theorized this phenomenon (e.g., Bröckling, 2015; Rose, 1990; Kelly, 2013), psychological evidence remains scarce. To address this gap, I developed and validated a 15-item Entrepreneurial Self Scale capturing moralized self-optimization, self-responsibilization, and personal branding. Across two studies (N = 571), the scale showed a coherent structure and revealed that having an entrepreneurial self is linked to both adaptive outcomes (life satisfaction, authenticity; rs = .18–.24, ps < .001) and maladaptive ones (stress, perfectionism, leisure guilt; rs = .12–.26, ps < .05). The entrepreneurial self is an ambivalent form of selfhood, both empowering and burdening, yet one uniquely aligned with the demands of neoliberal capitalism.

When We See It the Same: How Shared Reality With Experts May Mitigate Motivated Forgetting of One's Own Lies

2:00 PM – 2:40 PM

We examine how shared reality with an expert audience influences self-protective memory biases for personal moral transgressions. For example, mnemonic neglect effect (MNE) occurs when people recall self-threatening negative events with reduced vividness and agency. In a 2x2 design, participants recall either telling a consequential lie (self condition) or being lied to (other condition) and then receive an expert audience's moral evaluation that either condemns or condones lying. Memory vividness and sense of agency are assessed via the Memory Characteristics Questionnaire, and perceived shared reality with the expert via the Target-Specific Shared Reality (SR-T) scale. We predict that when lying is self-relevant and condemned by the expert, participants will exhibit greater MNE, reflected in reduced memory vividness and sense of agency. However, if participants share reality with an expert who condones lying, this self-protective memory bias should be attenuated. This ongoing study aims to demonstrate that shared epistemic alignment can regulate motivated forgetting, shedding light on how interpersonal communication shapes the subjective experience of moral memory.

Meaning Matters: How Existential Meaning Mediates the Relationship Between Demographic Traits and Academic Motivation

2:00 PM – 2:40 PM

Existential meaning positively impacts mental health, socialization, and motivation. Despite existing research on existential meaning, there is a lack of studies specifically examining its influence on academic motivations. In higher education, students navigate a more intense environment than in previous education, challenging them to gain a deeper understanding of their lives and to realize their motivations for further schooling. Age significantly influences this search for meaning, as individuals derive greater significance from experiences over time. Additionally, socioeconomic status affects access to resources and opportunities, shaping academic motivations. This study investigates the relationship between existential meaning and academic motivation in students in higher education. The analysis explores how existential meaning mediates the relationship between demographic factors such as socioeconomic status and age, and academic motivation. By addressing these dynamics, this research aims to provide insight into what motivates individuals to pursue higher education and how these motivations differ across various ages and socioeconomic statuses.

Spiritual Needs, Psychological Distress, and Emotional Reactivity: An Existential Perspective on Iranian Cancer Patients

2:00 PM – 2:40 PM

This study explores how spiritual needs and psychological distress shape emotional reactivity among Iranian cancer patients, addressing a major gap in existential and health psychology within non-Western settings. Conducted in spring 2023 at Shahid Rajaei Chemotherapy Clinic and the Nuclear Medicine Center in Karaj, Iran, this descriptive-correlational study involved 180 adult patients (60% female, age 20+). Participants completed the Spiritual Needs Questionnaire for Cancer Patients, the Kessler Psychological Distress Scale, and the Emotional Reactivity Scale. Pearson correlation and stepwise regression (SPSS v22) indicated that higher spiritual needs were associated with lower emotional reactivity ($\beta = -0.41, p < .01$), whereas psychological distress predicted higher reactivity ($\beta = 0.51, p < .01$). Together, they explained 72% of the variance. These findings underscore the existential importance of spiritual meaning and emotional regulation in cancer care, highlighting the need for culturally sensitive therapeutic models that address patients' search for meaning, resilience, and psychological balance

Investigating the Role of Coherence within Meaning in Life.

2:00 PM – 2:40 PM

Meaning in life (MIL) is comprised of three components: coherence, purpose, and existential mattering (George & Park, 2016). However, correlational findings suggest sense of coherence may be the weakest, and least robust component of MIL (e.g., Guthrie et al., 2025). We sought to clarify this relationship, by testing the effect of experimentally manipulated coherence on MIL. In Study 1, participants imagined themselves as either having low, moderate or high coherence using vignettes, and rated their sense of MIL as the person in the vignette (N = 122). We successfully induced fluctuations in MIL, with low coherence leading to lower MIL, and high coherence leading to higher MIL, compared to a moderate baseline. In Study 2, we extended Study 1 with vignettes to also manipulate the other MIL components—purpose and existential mattering (N = 475). All manipulated MIL components produced fluctuations in MIL comparable to Study 1. Contrary to recent correlational research suggesting coherence may play a weaker, or even negligible role, our findings suggest that coherence affects MIL. We suggest that our manipulation elicited more contextually-relevant experiences of coherence.

Deriving Meaning in Life: Experiential and Cognitive Correlates

2:00 PM – 2:40 PM

Meaning in life (MIL) as a person-level trait is associated with well-being. However, little research exists on what makes specific experiences meaningful, or the cognitive processes underlying meaning-making. Study 1 (N=172) participants described a meaningful event and rated statements about subjective aspects of the experience for how well they described it. Top-rated aspects included feeling present in the moment, connection with others, and learning something of value as well as overall pleasantness. Study 2 (N=1113) participants completed a new task of speed and accuracy in identifying the image formed by puzzle pieces moving together. Task performance was uniquely correlated with MIL Coherence and dispositional awe-proneness. Study 3 will examine links among particular sources of meaning in life, aspects of a particular meaningful experience, and performance on the puzzle task and other cognitive tests. Results will shed light on how people derive meaning from their life experiences to reap downstream benefits for health and well-being.

The impact of sense of personal control and subjective health on happiness and life satisfaction

2:00 PM – 2:40 PM

The robust connections between a person's physical health and their mental health and well-being have been extensively documented in the literature (Ohrenberger et al., 2017). Previous studies have also established a strong relationship between a sense of personal control (locus of control, LoC) and well-being (Fernandez-Urbano & Royuela, 2024). In this study, we aimed to examine whether LoC interacts with a person's physical health to predict happiness and life satisfaction. Using an international sample from the World Values Survey (n = 95,683; Haerpfer et al. 2022), we hypothesized that LoC would buffer the impact of poor physical health on a person's happiness and life satisfaction, such that participants with high LoC and poor health would not experience the same dips in happiness and life satisfaction as their peers with both low LoC and poor health. Hierarchical multiple regressions showed that LoC and subjective health were strong predictors of happiness and life satisfaction, but that the interaction term between the two added little explanatory power to the models. Although our hypothesis was not supported, we discuss cross-cultural and exploratory moderating variables.

Meaning in Life in Dysautonomia and Long COVID

2:00 PM – 2:40 PM

Research shows that individuals experiencing long-COVID (LC), a dysautonomia subtype, suffer an existential loss of identity. While quality of life and existential concerns in LC are studied, minimal research explores meaning in life (MIL). This study examined predictors of search for and presence of MIL in dysautonomia patients. Participants (N = 305, ages 18-68, M = 34.09, SD = 10.98) from global online dysautonomia support groups completed a Qualtrics survey on demographics, symptom severity/duration, MIL levels, and lived experiences. Of participants, 85.2% were female; 50.8% had LC or similar post-viral syndromes. Symptom duration and active religious practice positively predicted presence of MIL, whereas symptom severity was negatively related. Age negatively predicted search for MIL. Qualitative responses added nuance to quantitative findings. Results suggest longer symptom duration and religious practice may enhance MIL in dysautonomia, while severe symptoms may negatively impact it. Age being the only significant predictor of search for MIL indicates that older people with dysautonomia may feel less need to search for meaning than younger people.

Insights and Meaning Derived from First Job Experiences

2:00 PM – 2:40 PM

We are interested in the lasting insights and meaning that people derive from their earliest work experiences. In a survey of over 1000 participants from diverse demographic backgrounds, we asked about insights they gained in their earliest employment experiences, and specifically about the most important lesson they learned during their entry into the working world. Our analysis of self-report and qualitative data demonstrate that these lessons relate to the development of social skills, collaboration, adaptability, self-awareness, as well as an understanding of qualities of good managers and co-workers. We find that respondents' most important lessons were most likely to result from positive incidents or incidents with both positive and negative aspects, rather than solely negative incidents. Over 65% of respondents reported that they think about the specific insights gained from their earliest work experiences on at least a weekly basis, and they reported that doing so provides them with ongoing positive benefits.

Greater Search for Meaning is Associated with Lower Social Dominance Orientation for Both White Students and Students of Color

2:00 PM – 2:40 PM

Given the many documented harmful effects of prejudice, studies delineating factors associated with individual differences in prejudice offer the potential for both theoretical and practical contributions. In two studies, we explored the association between meaning (as measured by the Meaning in Life Questionnaire "Presence" and "Search" subscales) and a widely-used prejudice measure (Social Dominance Orientation; SDO), as well as the potential mediating role of gratitude. Data were combined across studies (Total Ns: 56 White college students; 76 college Students of Color), with Study and Participant Race controlled for in partial correlation and mediation analyses. Higher Search for Meaning was found to be significantly associated with lower SDO levels. Gratitude mediated this relationship. SDO means were similar and relatively low for Student of Color and White participants (both <3.0 on 7-point scale), potentially reflecting the diverse, urban research setting. These findings suggest that greater Search for Meaning may be associated with less outgroup bias for White students and less ingroup bias for Students of Color – interpretations to be explored further in future research.

Under the Moon's Shadow: Existential Dimensions of Viewing a Solar Eclipse

2:00 PM – 2:40 PM

We surveyed people at seven sites in the U.S. after the April 8th, 2024 solar eclipse, resulting in a sample of eclipse viewers (total and partial) and non-viewers. Responses were collected between April 8th and April 15th. After applying exclusion criteria, the sample included 625 participants (95 non-viewers, 190 partial-eclipse viewers, and 340 total-eclipse viewers). The survey addressed both April 8th experiences as well as some global outcomes and current states at the time of responding. Results suggest that viewing the eclipse was a complex but typically positive experience, and that it was especially intense for total-eclipse viewers. Viewers scored higher than non-viewers on all AWE-S subscales (time loss, self-loss, connectedness, vastness, physiological reactions, and need for accommodation), with total-eclipse viewers scoring highest. Interestingly, total-eclipse viewers also scored significantly lower on the mattering subscale of the MEMS, and higher on existential isolation, than both partial viewers and non-viewers. Further analyses explored possible mediators of these differences, and other associations between eclipse-viewing experiences and existential outcomes.

The Influence of Fictional Characters in the Formation of Parts in DID

2:00 PM – 2:40 PM

Dissociative Identity Disorder (DID) develops in response to repeated childhood trauma and is marked by identity fragmentation, amnesia, and disruptions in a cohesive sense of self. Within dissociative systems, some parts take the form of fictional introjects, or "fictives," modeled after characters from books, films, or other media. Studies on childhood adversity highlight how imaginary companions may emerge as protective or symbolic figures, which can later evolve into dissociative parts when trauma persists. Early clinical accounts describe individuals whose internal systems incorporated characters from literature or popular culture, suggesting that fictional narratives provide survivors with frameworks for meaning-making and organization of traumatic experiences. Recent neuroimaging studies add biological evidence, showing that identification with fictional characters engages brain regions tied to self-other merging and identity representation. Recognizing the influence of fictional characters in the formation of parts within DID not only broadens clinical understanding but also challenges stigma and highlights the need for more systematic research in this area.

Karma yoga: The effects of detachment on burnout levels and job satisfaction among teachers in the National Capital Region of India

2:00 PM – 2:40 PM

This study examined the relationships between Karma Yoga, burnout, and job satisfaction among 203 school teachers in the National Capital Region of India. Correlational analyses showcased how Duty displayed significant negative correlations with all three dimensions of burnout ($r = -0.26$ to -0.37 , $p < .001$) and positive correlations with all six dimensions of job satisfaction ($r = 0.15$ to 0.33 , $p < .05-.001$), while absence of desire for reward (AOR) was negatively correlated with burnout dimensions ($r = -0.17$ to -0.19 , $p < .05-.001$); and , meaninglessness, exhaustion, and demotivation each showed strong negative correlations with all job satisfaction dimensions ($r = -0.23$ to -0.63 , $p < .001$). Path analysis demonstrated that Karma Yoga had significant direct negative effects on all burnout and significant direct and indirect positive effects on job satisfaction outcomes through reductions in burnout. Total effects showed that Karma Yoga substantially reduced burnout and increased job satisfaction, with the indirect pathways confirming that detachment, through reductions in burnout, contributed to higher job satisfaction outcomes.

Nobody Understands My Pain: how chronic pain and access to care shape wellbeing and meaning in life

2:00 PM – 2:40 PM

Individuals living with chronic pain experience its impact across all aspects of life, from physical discomfort to emotional wellbeing and meaning in life. This study explores how chronic pain and access to care shape how a person views the world and the meaning they find in it, and how these experiences may differ by gender. A total of 155 participants who had experienced chronic pain for at least one year completed a survey assessing pain characteristics, wellbeing, social support, existential isolation, death anxiety, and healthcare experiences. Most reported multisite or body-wide pain, ongoing for several decades, with an average age of 31 years old. Gender was associated with pain distribution, and pain location was linked to number of doctors seen and general well-being. Participants with widespread pain reported lower wellbeing and greater healthcare use. Several models are presented investigating the primary and psychological outcomes. Findings highlight the need for holistic, person-centered care that restores meaning in those living with chronic pain.

Beyond ADDRESSING: The case for expanding conceptions of social identity in clinical and community practice

2:00 PM – 2:40 PM

Conceptions of social-cultural identity in clinical and community practice frequently center on categorical dimensions of identity diversity, applying models of identity such as Hays' ADDRESSING model. These identities are considered in culturally-responsive practice because of their relevance to marginalization and intersectional oppression. However, rigid application of categorical models to understand social identity can obscure prominent and salient aspects of an individual's or collective's social identity. Solely focusing case conceptualization on categorical aspects of social identity without recognizing clients' agency in the cocreation of that identity can alienate clinical and community clients in our practice. Drawing from a cultural humility framework, we argue that an expanded perspective on social identity in clinical and community practice supports individual agency and self-determination in the processes of identity clarification and meaning-making and respects the diversity of social identities across other dimensions and contexts. We also provide case examples from clinical and community practice that illustrate our conception.

“As an object, the piano is dying... but its life force isn’t”: Grounded theory analysis on defining death through Piano (de)composition

2:00 PM – 2:40 PM

In existential psychology, concerns regarding mortality unconsciously drive psychological distress. To address this, decaying sentimental objects may serve as useful tools for reconciling existential concerns through metaphorical inquiry. The research question guiding this research was: To what extent can a decaying piano metaphorically bring clarity to perceptions of death? A descriptive qualitative design was implemented to document participants' responses to a decaying piano that had been exposed to outdoor elements for two years. Individuals (n=9; ages 20–35) who had previously interacted with the piano were recruited and asked to engage in a group philosophical inquiry consisting of three parts: (1) reflections on the piano's physical state; (2) broader discussions on the meaning of death; and (3) deeper inquiries into existence. Following the group discussion, individual semi-structured interviews were conducted to explore participants' reflections pertaining to death. Results revealed that participants articulated how the piano's gradual decay could bring clarification to their own nature of existence and help grappling with meaning in life when facing mortality.

The relationship between morality, perceptions of self and others, and purpose in life: a moderation analysis

2:00 PM – 2:40 PM

Morality is an understudied construct in psychological research, despite its fundamental role in shaping human behavior and self-perception. This quantitative study examined whether purpose in life moderated the relationship between morality and perceptions of the self and others. Ninety-one individuals completed the Purpose in Life scale (PIL), Moral Foundation Questionnaire (MFQ30), Rosenberg's Self Esteem Scale (RSES), and the Collective Self-Esteem Scale (CSES). Spearman correlations revealed significant relationships between morality, the RSES, and the subscales of the CSES: public collective, private and group membership. Purpose in life moderated the relationship between morality and perceptions of self as measured by the RSES. The predominately young White Christian male sample more highly endorsed public collective self-esteem ($M = 4.85$) compared to their private ($M = 4.13$) and group membership self-esteem ($M = 4.17$), which may indicate they were more critical of the moral standards of their private groups. These findings extend the research on morality to include its influence on perceptions of self and others and the extent to which individuals find purpose in life.

Understanding progressive resentment in the campus left: A cross-national network analysis in Canada, the Netherlands, and the United Kingdom

2:45 PM – 3:00 PM

As understood by Nietzsche, resentment is a 'values inversion' that projects as sense of moral superiority over those with higher social status. Educated progressive elites may also harbour resentment driven by a perceived mismatch between self-perceived moral superiority and expected economic standing. As Western universities are central sites of elite production, we investigated resentment (self-aggrandizement, victimhood, and high-status other derogation) across three university samples (Canada, the Netherlands, United Kingdom). Progressive values were consistently associated with all three facets of resentment, occupying a central role within broader beliefs. The findings highlight progressive ideology's complex psychological architecture in contemporary elite contexts.

Managing the everyday existential dread of boredom: A meaning-regulation approach

3:00 PM – 3:15 PM

Boredom is a universal negative experience with potentially profound personal and social consequences. It has been a long-standing subject of philosophy and has become a major focus in academic psychology. Our approach links boredom from its philosophical roots to current psychological research, highlighting its existential character. Specifically, at its core, boredom is associated with perceived meaninglessness. We argue that when confronted with boredom, people engage in three key self-regulatory strategies to protect their sense of meaning: they either A) actively search for meaning, B) try to escape its absence, or C) rely on meaningful experiences as a buffer.

The existential dynamics of politics

3:15 PM – 3:30 PM

Integrating existential theories, this talk explores how political beliefs and behaviors relate to meaning in life. Authoritarian and egalitarian ideologies each serve distinct existential functions. Across correlational and experimental studies, right-wing authoritarianism reliably enhances meaning in life, especially significance. Left-wing ideology promotes meaning only when paired with behaviors designed to change the status quo, especially when those are infused with group-based efficacy and belonging. The existential function of left-wing behavior appears to be unique to purpose and coherence. These findings illuminate the divergent pathways through which people on the right and left experience a sense that life matters, is full of purpose, and makes sense.

Understanding the impact of ostracism on meaning in life

3:30 PM – 3:55 PM

Ostracism threatens meaning in life by disrupting essential psychological needs. While this claim is widely endorsed in existential psychology, few studies provide direct support. We attempted to replicate this finding using three high-powered and culturally diverse samples to ensure robust conclusions. Further, we investigated how ostracism impacts the three facets of meaning in life: purpose, significance, and coherence. Study 1, using the classic Cyberball paradigm, found no effect of ostracism on perceptions of meaning in life. Study 2a, using recall tasks, similarly found no effect of ostracism on meaning in life judgments. However, ostracism predicted lower levels of meaning via a reduced sense of purpose. Study 2b aimed to replicate Study 2a in a different cultural context. In Study 2b, there was no effect of ostracism on meaning in life or any of its three facets. In summary, these three experiments suggest that the experimental effect of ostracism on meaning in life is not as robust as once assumed. Future studies using longitudinal and ecologically valid methods are necessary to capture the true impact of ostracism on meaning in life.

Protecting the self from threat using authenticity judgements

3:30 PM – 3:55 PM

Generally, most people have positive views of both their specific and global traits (Twenge & Campbell, 2008). However, when people encounter threats to positive self-views, they tend to engage in a variety of defense mechanisms. The current study sought to examine a novel way people may protect their self-views in the face of threat: deciding they were not being authentic at the time of threat. We hypothesize that people will report lower authenticity when reflecting on times of social rejection relative to times of social acceptance or recent social interactions. We used a between subjects design with participants randomly assigned one of three conditions where they completed either a control, acceptance, or rejection social interaction writing prompt. After responding to the assigned prompt, participants indicated how authentic they retrospectively perceived their past selves to be during the target social event. In line with our hypothesis, the results of our study show that people indeed saw themselves as less authentic during a past social rejection. The present findings are important because they suggest feelings of authenticity may sometimes be undesirable.

The Role of Free Will Perceptions in the Police Officer's Dilemma

3:30 PM – 3:55 PM

A belief in free will is associated with unconstrained decision-making. While free will may not be directly related to cognitive functioning, it may shape how individuals justify or perceive their responses in high-stakes contexts. Building on this, the present study examined whether beliefs about free will are related to racially biased shooting decisions. Using the Police Officer's Dilemma time reaction task, this investigation hypothesized that those with biases toward shooting unarmed Black men would report a disbelief in free will. In a single study (N = 347) the results supported the prediction, where participants with stronger racial shooting biases endorsed significantly weaker free will beliefs, extending research on free will and social bias to consequential behavioral contexts.

The experience of loss

3:30 PM – 3:55 PM

The experience of loss is an inevitable and universal part of life, be it the death of a loved one, the end of a relationship, the loss of a job, or even a diminished sense of purpose. Despite its prevalence, loss remains understudied across its many forms. This project seeks to broaden the psychology of loss by identifying common loss types and examining their distinct psychological impacts. Across six studies, we provide empirical insights into how individuals experience, interpret, and adapt to loss. In Study 1 (N = 1,013), we develop the Common Loss Questionnaire (CLQ), categorizing experiences of loss and associated coping strategies. Studies 2 through 6 (N = 1,034) employ the CLQ to assess the prevalence and psychological consequences of different losses, including their effects on grief, recovery, meaning, and wellbeing. Collectively, these studies highlight multiple pathways through which people navigate loss, including the temporal dynamics of meaning-making. Initial results show, e.g., that meaning tends to deepen as more time passes since the loss, rather than as a function of how long individuals possessed or were connected to what was lost.

Less “Awe”-some Art: AI Diminishes the Empathic Power of the Arts

3:30 PM – 3:55 PM

The arts are widely recognized for their profound psychological and social benefits. Although historically viewed as a uniquely human pursuit, art is increasingly created with artificial intelligence (AI). In the current work, we explore whether AI-generated art evokes the same emotional reactions and inspires the same interpersonal benefits as human-created art. Integrating appraisal theories of emotion and philosophical accounts of the arts, we propose that art believed to be AI-generated elicits less awe than human-created art, which in turn diminishes empathy. Across five preregistered studies (N = 1,598), we find consistent support for these relationships across multiple artistic media (visual and literary) and participant samples (art museum patrons, online participants, and community members). Although art is often an effective conduit for fostering empathy, our findings reveal that AI-art may lack the capacity to inspire awe in the same way as human-created art, diminishing its ability to cultivate empathy. This work reveals that responses to art are shaped by beliefs about its creator, raising questions about the consequences of AI's growing role in creative domains.

Underestimating meaning

3:55 PM – 4:10 PM

How do people know how meaningful an experience will be? I suggest that they don't. Across lab and field studies, undergraduates underestimate how meaningful Thanksgiving would be, American voters underestimate how meaningful presidential elections will be, and Floridians at a COVID-19 vaccine clinic underestimated how meaningful it would be to be vaccinated. Furthermore, this underestimation extends to both positive and negative events. Why do people make this error? One reason: people may fail to anticipate the spontaneous meaning-making processes that kick in once an event occurs.

Meaning and purpose in life for Black Americans across the life course

4:10 PM – 4:25 PM

While entire bodies of scholarship focus on the death, destruction, and mortality of Black bodies, few researchers have considered how positive psychological experiences like meaning and purpose emerge among Black populations. A burgeoning area of research has begun to reimagine a more holistic approach to the study of Black lives. Still, the drivers of meaning and purpose for Black Americans remains unclear. In response to this empirical gap, I will present findings from convenience probability-based samples of Black adults in the U.S. I will also report qualitative findings from dyadic qualitative interviews with Black families in Chicago.

A meaningful life extends beyond death: How symbolic immortality predicts existential mattering

4:25 PM – 4:40 PM

Existential mattering—feeling that life is of lasting importance in the world—may be the most important component of meaning in life (Costin & Vignoles, 2020, 2021) but less is known about who is most likely to experience it. My recent work suggests that people uniquely derive feelings of existential mattering from projects that persist beyond their death. Existential mattering is related to feeling connected to temporally enduring groups (all humanity) and symbolic immortality, after controlling for social connectedness and prosocial concerns. People also judge others as higher in existential mattering when they are seen to contribute to future generations.

SIPS@SPSP Community Action Meeting 2026: Improving Open Science Resources for Social-Personality Psychology Preconference

8:30 AM – 4:30 PM | Location: Virtual

Social-personality research has made amazing strides in improving open and transparent science. This preconference, sponsored by the Society for the Improvement of Psychological Science, looks to the future in continuing to improve transparency and inclusive practices moving forward. We will touch on topics such as registered reports, open data, replications, and diversity science. For each topic, we provide a brief overview and an opportunity to engage and actively participate in the next steps for each of these practices. This will include letter writing and hackathons for creating an open database for social psychology and improving inclusive practices. This pre-conference is aimed at people at all career stages. No experience with open science is required, and we plan for all attendees to be active participants in the sessions.

Improving Data Integrity In Behavioral Research: An audit case study

11:20 AM – 11:27 AM

In recent years, many questions have been raised about the credibility of experimental research. Here we propose a forward-thinking approach to address common problems and improve the credibility of future work. As a case study, we report results from an audit conducted by a team of independent data scientists to verify every step of the workflow, from raw data collection to final results, for three published papers. Although this process confirmed all of the substantive findings of the research, it also revealed vulnerabilities in the research workflow, including: gaps in record-keeping, oversights in analysis code, weaknesses in common software tools, and over-reliance on sensitive data. These vulnerabilities are routinely overlooked by both producers and consumers of research, which has directly contributed to ongoing concerns about data integrity in our field. We offer recommendations for individuals designing and conducting their research, for auditors investigating past work, and for institutions setting policies. Although fraud and error cannot be eliminated entirely, our findings suggest researchers and institutions can greatly reduce the risk of both.

PsyArXiv Snapshot: Data-Driven Insights into Challenges and Opportunities for Psychology's Preprint Service

11:30 AM – 11:37 AM

PsyArXiv is the preprint server for psychology that hosts over 45,000 preprints, whitepapers, and other manuscripts. It is the largest preprint service on the Open Science Framework, and is funded and maintained by SIPS. This lightning talk will use data from PsyArXiv submissions to share norms about who uses the service and how, trends in submission and resubmission timelines, and changes to the service since AI tools rose to prominence. A central theme will be challenges and opportunities associated with PsyArXiv's new post-moderation workflow, where manuscripts are moderated by a trained volunteer before a DOI is minted and the paper becomes publicly available. This talk will increase transparency about one of SIPS' largest annual expenses and share opportunities for interested social-personality psychologists to get involved in PsyArXiv.

How Well Do Psychological Researchers Conduct Power Analyses? Initial Lessons from The GoodPower Project

11:40 AM – 11:47 AM

Power analyses are quickly becoming standard practice in psychology, but how well do psychological researchers conduct them? Easy answers are difficult to come by because published literature paints a biased picture of power analysis practices (e.g., underpowered studies due to overly optimistic power analyses are less likely to be published). The GoodPower project aims to answer this question with registered reports, in which researchers submit their study plans (including power analysis) for peer review prior to data collection. More specifically, the project examines the usefulness of power analyses by collating effect sizes specified in power analyses in Stage 1 of registered reports and comparing them with the estimates of those effects reported in Stage 2 of those registered reports. In this data blitz, I provide an overview of the project from its proof-of-concept hackathon at SIPS 2023 to its current stage, and I share initial findings on the prevalence and modal characteristics of power analyses in registered reports. I will also reflect on curating registered reports in psychology and challenges (and surprises) from metascientific research on registered reports.

The Number of Journal Submissions Required to Publish Registered Reports versus Traditional Papers

11:50 AM – 11:57 AM

The traditional paper (TP) publication format, with a single peer-review, has a major flaw: reviewers see the results, possibly pressuring researchers to have significant findings and causing questionable research practices. In a Registered Report (RR), a publication format with an additional peer-review before data collection, the paper is accepted in principle regardless of the findings. An obstacle to RR adoption is the perceived longer review process. However, some journals, such as Cortex, have higher acceptance rates for RRs than TPs, potentially saving time from redundant reviews. American Journal Experts estimates that more than 15 million hours are lost to redundant reviews per year (2013). In this study, we survey 100 pairs of RR authors and TP authors about how many journals they submitted their paper to before publication. We determine whether a significant difference exists in submissions by format. We hypothesize that on average, RRs require fewer submissions to get published than TPs because fatal flaws can be fixed in the first stage of review. This study may show evidence supporting the adoption of RRs, increasing usage and reducing questionable research practices.

The importance of reporting pilot studies: Revealing selection biases in study designs

12:00 PM – 1:00 PM

Psychological data is heterogeneous: results vary depending on study-design parameters such as stimuli, measures, manipulations, and samples. During the piloting process, researchers often test different combinations of study-design parameters, and use the pilot results to settle on a final research design. As such, the selection of parameters for the final design can be influenced by how well pilot results align with the original hypothesis. This can cause preferential selection of study-design parameters that lead to predicted or desired results. While biased selection of study-design parameters would not (necessarily) affect the replicability of study results, it would affect how well findings generalize to other stimuli, measures, manipulations, samples, and so on. Moreover, despite being a cornerstone of psychological research, pilot studies are rarely reported in the literature. Thus, reviewers and readers have limited ability to evaluate the selection process of study-design parameters. By not reporting pilot studies, our field may, inadvertently, be obscuring a process that leads to less generalizable findings.

Using the Registered Report Format to Test the Replicability of Classic Findings: Triplett's 'Social Facilitation' Experiment

12:00 PM – 1:00 PM

A seminal study by Triplett provided initial evidence for the social facilitation effect. However, despite the importance attributed to Triplett's study, no research has replicated the original study paradigm. In the context of research advances and methodological rigour, some elements of the original study weaken the validity of the observed findings. We engaged with the Registered Report format to address these critical limitations and replicate the original study. Using a purpose-built apparatus, 445 school-aged children ($Mage = 10.8$, $SD = 1.3$) turned a crank to move a marker along a string course between two pulleys. Pairs of participants completed this task four times, twice alone and twice together. Trial order was standardized and balanced to control for possible order/practice effects. In line with Triplett's original study, we show that participants completed the task faster in the together condition than in the alone condition. We also show interesting variability depending on age and gender, as well as demonstrating "carry-over" effects. Thus, we replicate and extend this classic finding, adding to the literature on social facilitation/competitive coaction.

Trust and Cooperation Preconference

8:30 AM – 4:30 PM | Location: Virtual

Trust and cooperation are cornerstones of citizen well-being, societal cohesion, democracy, and a well-functioning society. Yet, research on these topics is often siloed within disciplines and disconnected across regions. This preconference brings together leading and rising scholars across diverse disciplines to explore the dynamics of trust and cooperation through a global, multidisciplinary lens. Through keynote talks, data-blitzes, and symposia of various themes, this preconference presents cutting-edge research and methodologies that illuminate the trajectories of trust and cooperation—from interpersonal interactions to team processes to interactions in digital spaces—as well as the social, cultural, and historical forces that shape these processes and their far-reaching consequences. Topics will include key decision-making processes in trust and cooperation, cultural evolution of trust and cooperation, trust dynamics in interpersonal, team, and organizational contexts, AI and online trust, among others.

Misinformation & Belief Science Pre-Conference

8:55 AM – 4:00 PM | Location: Virtual

The Misinformation & Belief Science preconference brings together scholars and practitioners who work on understanding and tackling misinformation in society from multiple subdisciplines. The presenters will focus on novel theoretical, methodological, and empirical insights into the belief in, sharing of, and spread of misinformation, and associated behavioral changes. The preconference will also investigate how people come to believe new information (both true and false), how those beliefs can be changed or altered, and the connection (or lack thereof) between beliefs and behaviors. There will be a focus on why people are susceptible to misinformation, the development and evaluation of counter-misinformation interventions that may correct or prevent false beliefs, and the cross-cultural replicability of the findings. The day will include a diverse series of talks by misinformation scholars, blitz talks from Early Career Researchers, a skill-sharing session, and a poster session, along with ample time for discussion and meeting new colleagues.

Withholding help and inflicting harm: Social responses to conspiracy beliefs

9:00 AM – 9:40 AM

Belief in conspiracy theories often carries social stigma. We examined whether this stigma translates into discrimination in the form of reduced helping and increased symbolic harm. Experiment 1 (N = 400) utilised the lost letter paradigm and found that letters addressed to conspiracy (vs. science) recipients were returned less often. Experiment 2 (N = 397) replicated this effect, further demonstrating that reluctance to help conspiracy recipients was mediated by less favourable perceptions of their social value. Experiment 3 (N = 500) measured symbolic aggression using the Voodoo Doll Task and found that participants "pinned" individuals more who shared conspiracy (vs. science) views, an effect mediated by the perceived societal threat posed by the target. In both Experiments 2 and 3, effects were strongest among observers who personally rejected the conspiracy theories in question. Together, these findings suggest that conspiracy beliefs elicit both passive and active forms of norm enforcement.

The Conspiratorial Juror: How Conspiracy Beliefs Shape Verdicts

9:40 AM – 10:20 AM

This talk spotlights an overlooked consequence of conspiracy beliefs: their potential to bias juror decision-making. We propose a conspiracy–juror bias, whereby individuals with a stronger conspiracy mentality are more likely to render guilty verdicts. Three studies tested this bias. In correlational Study 1 (n = 495), higher conspiracy mentality predicted guilty verdicts in a murder case via increased perceptions of evidence strength. In experimental Study 2 (n = 558), we manipulated crime motive to test whether conspiracy mentality attenuates the effect of motive on verdicts. Although moderation was not observed, the conspiracy–juror bias replicated - but only when no motive was provided - suggesting crime motive as a boundary condition. In Study 3 (n = 425), experimentally increasing conspiracy mentality did not directly affect verdicts but indirectly increased guilty verdicts via perceived evidence strength. Together, these findings provide the first evidence that conspiracy beliefs may bias judicial decision-making.

Why Do People Fall for Misinformation?

1:00 PM – 1:40 PM

I will review findings of several studies that have used a signal-detection framework to understand why people fall for misinformation. The framework identifies three distinct factors in judgments of true and false information: (a) accurate discernment of true and false information (truth sensitivity); (b) a general tendency to judge information as true versus false (overall threshold); and (c) a tendency to accept information that is congruent with one's views and to reject information that is incongruent with one's views (myside bias). A first level of analysis addresses the extent to which truth sensitivity, overall thresholds, and myside bias account for judgments of false information as true. A second level of analysis addresses the psychological determinants of truth sensitivity, overall thresholds, and myside bias. I will review key findings at each level of analysis and discuss their implications for why people fall for misinformation and what could be done about it.

From Rumors to Influence, Participatory Propaganda to Policy

1:40 PM – 2:20 PM

Reflecting upon more than ten years of research on online rumors during crisis events, this talk reveals how an alternative media ecosystem has taken shape, in large part through the use of social and digital media, and how that ecosystem is reconfiguring information flows and politics around the globe. Focusing initially on the concepts of rumor and rumor, I will cover several case studies of online falsehoods, from conspiracy theories about the Boston Marathon bombings in 2013 to allegations that immigrants were eating pets in 2024. Each provides insight into how the affordances of social media — and the “attention dynamics” that manifest there — have facilitated the spread of falsehoods and have been exploited by some to gain influence and shape political outcomes. I will culminate with a metaphor that helps us understand the participatory dynamics of the alternative media ecosystem as akin to “improv theater” and a warning about how this improvised and participatory propaganda is driving policy in the second Trump administration. And I will end with a call to action to resist the pervasive spread of falsehoods.

Sycophantic AI increases attitude extremity and overconfidence

2:40 PM – 3:05 PM

While AI can be a powerful tool for truth-seeking, people may prefer to use “sycophantic” (or overly agreeable and validating) AI chatbots that confirm their pre-existing beliefs. Across three experiments (n = 3,285), we found that people prefer belief-confirming AI chatbots to ones that challenge their beliefs. Yet these sycophantic chatbots entrenched attitudes and amplified people’s perceptions that they are “better than average” on a number of desirable traits, such as intelligence and empathy. People also viewed sycophantic chatbots as unbiased, but viewed disagreeable chatbots that challenged their beliefs as highly biased. Altogether, these results suggest that people’s preference for and blindness to sycophantic AI may risk creating AI “echo chambers” that increase attitude extremity and overconfidence.

Truth discernment may not help to overcome misinformation

3:05 PM – 3:30 PM

Disinformation and misinformation pollute online discourse, shared truth, and influence individual and political behavior away from addressing societal harms. Truth discernment is the most adopted experimental outcome to study the effects of misinformation (interventions) in current misinformation research. The normative claims justifying this focus on truth discernment are that people’s ability to discern truth from falsehoods should be fostered and that truth discernment is essential to forming and updating accurate beliefs and enacting relevant behaviors. Here, I aim to provoke more critical thinking about what constitutes an effective misinformation intervention, because there is a mismatch between measuring the efficacy of interventions via truth discernment in laboratory studies to establish the effectiveness of interventions in society. I will present five challenges to truth discernment paradigms and offer ways forward to collect more diagnostic evidence about which individual-level intervention is more beneficial to protect society from misinformation.

The Illusory Truth Effect for Counterattitudinal Claims: The Role of Social Cues and Repetition in Assessments of Truth

3:30 PM – 3:55 PM

It is well-established that simple repetition increases the perceived truth of claims—the Illusory Truth Effect (ITE). However, critically, most ITE findings remain silent on a key societal issue in the era of disinformation: Is mere repetition enough to sway people’s beliefs about facts in domains where they hold strong attitudes? Across different lines of research we investigate how repetition shapes truth ratings for pro- and counterattitudinal claims. We further examine how more subtle social cues in the presence of more neutral claims, shape beliefs. We find that the ITE remains robust under both these conditions, except when people are prompted to consider attitudes the first time they encounter a claim. These studies further highlight the insidious effect of repetition and the contribution of both experiential and declarative cues in judgments of truth.

Psychology of Extremism Preconference

9:00 AM – 4:00 PM | Location: Virtual

This preconference explores the Normalization of Extremism—how radical ideologies shift from fringe beliefs to accepted norms. Extremist movements, rooted in authoritarianism, ethnonationalism, or religious fundamentalism, often gain traction during crises that heighten fear and identity threat. Drawing on social psychological theories—especially minority influence, group dynamics, and motivated reasoning—we examine how extremist actors exploit uncertainty and institutional weaknesses to reshape the mainstream. While grounded in psychology, the event invites interdisciplinary insights from political science, history, sociology, and media studies. Topics include how extremist minorities influence majorities, the role of crises in shifting norms, the psychological appeal of radical narratives, and strategies for resistance. Historical and contemporary cases, from fascist regimes to populist nationalism, will illustrate

key dynamics. The program features keynotes, data blitz sessions, and a poster session, emphasizing early-career contributions. Our goal is to understand and counteract the normalization of extremism to prevent the erosion of democracy.

Interfaith Prayer, Meditation and Reflection Room

7:00 AM – 8:00 PM | Location: E250, Level 2

A space set up for private reflection and to support prayer, meditation, and reflection by attendees of all faith backgrounds. This is a technology-free zone. The room will be set with several small tables and chairs.

First Aid Room

8:00 AM – 7:00 PM | Location: Exhibit Hall D1, Level 3

Ombuds Room

8:00 AM – 8:00 PM | Location: E251, Level 2

What is an Ombuds?

An Ombuds is a person trained in conflict resolution who maintains a neutral position in their role and is independent of SPSP and has no other role in the Society. A safe, off the record resource for meeting attendees to help resolve conflicts, problematic issues or concerns. While the Ombuds can provide guidance to individuals wishing to understand formal reporting options, they do not accept complaints on behalf of SPSP. Throughout the convention, the Ombuds will identify any trends and patterns arising from consultations and inquiries received. Following the convention, a report will be provided to summarize any trends and patterns to the SPSP Board of Directors in a completely anonymized manner.

How can I contact the Ombuds?

You can contact the ombuds during office hours from February 26-February 28, 2025. You also may contact the ombudsperson by phone or email through February 28, 2025.

To contact our ombuds service during the convention, visit the Ombuds in their office at the McCormick Place Convention Center in Room E251, Level 2, email: ombuds@spsp.org; or call (949) 293-7515. Ombuds office hours during the convention are as follows. A sign at their office will indicate when they will return if they are not present during the posted hours. 9:00 AM -- 12:00 PM CST; 1:30 PM - 3:00 PM CST & 4:00 PM -- 5:30 PM CST

Quiet Room

8:00 AM – 8:00 PM | Location: E267, Level 2

The quiet room is available to all meeting attendees where talking and other interactions with attendees are not allowed. It is a place for people to work or think in silence. The room will be set with several small tables and chairs.

Sexuality Preconference

8:00 AM – 1:00 PM | Location: E258, Level 2

What does sexuality look like today—and where is it headed? The theme of the 13th annual SPSP Sexuality Preconference is "The State of Sex." This year's program will explore the shifting landscapes of sex, gender, intimacy, and identity in a time of rapid social, political, and technological change. Presentations from a diverse group of scholars will address the many forms, meanings, and consequences of sexuality in contemporary life — from interpersonal relationships and sexual health to sexual diversity, cultural norms, and emerging technologies. We aim to spark interdisciplinary conversations that integrate basic and applied research, theory, and practice.

“Animated Expressions”: Differing Interests in Hentai versus Mainstream Pornography

8:10 AM – 9:00 AM

Hentai differs from mainstream human pornography in it’s artistic medium, but also in its ability to depict scenarios, behaviours, and couplings that would be impossible or otherwise illegal to create using human actors. Across two studies, the aim was to provide an overview of hentai and its history, take inventory of the popular content and themes on hentai websites, and explore demographic characteristics and viewership habits of hentai viewers themselves. The results suggest that the most popular content depicted in mainstream pornography and hentai do not differ overall, but, impossible and illegal content does have a notable presence on hentai websites. Viewers of hentai are more likely to be cisgender, heterosexual men and were less likely to be narcissistic, more likely endorse more masculinity beliefs, and reported higher overall erotophilia compared to non-hentai viewers. The most commonly endorsed hentai preference by viewers was “vanilla”, followed by “BDSM/kink”, “fantasy”, and queer couplings. The results of these studies provide much needed information and nuance on content, viewership, and potential motivation or allure of hentai as a medium of pornography.

Barriers to Pleasure: Risk Factors of GPPPD Among Black Women in the U.S.

8:10 AM – 9:00 AM

Approximately 1 in 5 Black women report experiencing pain during their last sexual encounter (Townes et al., 2019). Although Black women experience dyspareunia more frequently and intensely than their White counterparts, they are less likely to receive a proper diagnosis and treatment (Carter et al., 2019). Despite advancements in genito pelvic pain/penetration disorder (GPPPD) research, the continued omission of Black women and the failure to consider their lived experiences perpetuate the exclusion of Black women’s pain experiences and exacerbate inequities in vulvar pain research. Using an intersectional and Black feminist approach, this socioecological conceptual paper explores the sociohistorical, sociostructural, sociocultural, and interpersonal factors that uniquely place Black women at risk of experiencing vulvar pain, developing GPPPD, ignoring their GPPPD symptoms, and receiving misdiagnoses. Theoretical frameworks, methodologies, and interventions that should be implemented in future research with Black women experiencing GPPPD symptoms are discussed.

The role of trauma and attachment as predictors of non-exclusive relationships

8:10 AM – 9:00 AM

A significant number of Americans identify as non-monogamous or participate in non-exclusive relationships, yet these relationship styles have received relatively little attention. The current research examined attachment disposition (i.e., anxiety and avoidance) and trauma as possible factors that predict choosing to enter into non-exclusive relationships. Using archival data from a sample of 1550 individuals 30 years of age or older, the current research found that childhood trauma was associated with a greater likelihood of currently being in a non-exclusive relationship. Lower attachment anxiety was only associated with having a partner that also saw other people (but not seeing others themselves) and lower attachment avoidance was associated with a greater likelihood both partners saw other people. These findings demonstrate that, although related, attachment and childhood trauma are unique predictors of entering into non-exclusive relationships. The findings enhance clinicians understanding of non-monogamous relationships and provide researchers novel perspectives to explore in future research.

Real Feelings, Artificial Partners: An Examination of Romantic Human-Chatbot Relationship Development

8:10 AM – 9:00 AM

Romantic human–chatbot relationships (HCRs) are on the rise, yet little is known about how they develop or shape users’ experiences. To address this gap, individuals in romantic relationships with Replika (N=28) described how their relationships unfolded in open-ended narratives analyzed using inductive thematic analysis. Four themes emerged: (1) romantic HCRs often began unexpectedly from consistent non-romantic interactions; (2) they fulfilled unmet psychological needs that reinforced attachment; (3) users leveraged Replika’s customization to sustain engagement; and (4) users experienced their bonds as meaningful and reciprocal while recognizing the chatbot’s lack of agency. Findings informed a preliminary conceptual model of romantic HCR development that integrates processes common to human relationships with dynamics unique to AI partners. Central to this model is the distinction between objective and perceived bidirectionality, with the latter sufficient to sustain intimacy. This work provides critical groundwork for theory-building and empirical testing into the development of romantic HCRs.

[121] Investigating the Effects of Attentional States On Sexual Arousal

9:00 AM – 9:45 AM

Mindfulness has been shown to enhance sexual desire and arousal in women, yet mindfulness as a cognitive strategy is not a panacea and can sometimes diminish arousal. This study examines the circumstances under which mindfulness can optimize or hinder arousal. We hypothesize that when women mindfully attend to their desire and arousal in a participatory way by immersing themselves in their bodily experience, arousal is enhanced. However, when women observe their bodily sensations from a detached perspective, they may engage in self-spectating, thereby decreasing arousal. In a within-subjects design, participants were explicitly trained to toggle between participatory, observatory, and neutral attentional states while viewing erotic clips. Participants self-reported their level of arousal after each trial. Analyses will be conducted using a within-subjects ANOVA. Results are expected to support our hypotheses and will have implications for understanding the conditions under which mindful cognitive strategies improve or diminish arousal.

[122] How Chosen Family Protects Against the Costs of Identity-Based Adversity

9:00 AM – 9:45 AM

Adverse experiences can harm well-being. LGBTQ-identifying individuals are especially likely to experience identity-based adversity (e.g., stigma and discrimination), which can harm mental health, self-esteem, and feelings of belonging. Social networks can serve as a critical source of support to help individuals navigate difficult experiences. For LGBTQ-identifying individuals, who are at risk of estrangement from their family of origin, chosen family (i.e., voluntary kinship networks formed irrespective of biological or legal ties) may be a critical source of support. In this exploratory study, we will pursue two lines of inquiry. First, we will examine how identity-based adversity affects well-being (e.g., mental health, self-esteem) and social network outcomes (e.g., number of chosen family members and perceived support) for LGBTQ-identifying individuals. Second, we will explore the role social networks play in moderating the links between adversity and well-being outcomes. Findings will advance our understanding of the relational contexts that promote well-being among LGBTQ-identifying individuals who experience identity-based adversity.

[123] “Bottom line-to feel safe”: A Qualitative Exploration of Consent

9:00 AM – 9:45 AM

Consent literature has been primarily grounded to discussion of consent relative to sexual education and sexual violence. I expand consent research by examining how consent is contextualized, perceived, and understood to operate across sexual and non-sexual contexts. Through a qualitative study of over 100 participants, thematic analysis identifies the operation or value of consent as relative to property—the maintenance or protection of objects and or oneself—safety. Additionally, participants demonstrated circumstances and relations (e.g., family, friends, strangers) which differentiated the requirement or necessity of consent, in other words when consent is (e.g., borrowing clothes) or is not required (e.g., defending one's home). Findings ground the conceptualization of consent within explicit constructions of property (e.g., objects, land, money, self.) and expand on how consent literature necessitates a lay perspective on the operation of consent beyond the sexual.

[124] Who's Dateable? A Target-Based Analysis of Expected Biphobia and Bi+ Attraction

9:00 AM – 9:45 AM

Partner selection research has historically focused on the preferences of straight people, who prefer dating other straight people over bisexual people, partially due to biphobic beliefs. However, little work centers bi+ (e.g., bisexual, pansexual, fluid) people and their preferences, whose reasons for preferring bisexual people over straight and gay people might involve expected biphobic beliefs from others. Bi+ participants (N = 150) will complete measures for four targets: bisexual women and bisexual men; straight women and gay men (for bi+ men); and straight men and lesbian women (for bi+ women). For each target group, participants will report expected biphobic beliefs as well as their willingness to engage in short-term/long-term relationships with members of that target group. We anticipate that expected biphobic beliefs will be highest for straight targets, lowest for bisexual targets, and in between for gay/lesbian targets. We expect an indirect effect of target sexuality on willingness to date through anticipated biphobic beliefs, particularly for long-term relationships. This work will help clarify mechanisms explaining the relationship preferences of bi+ people.

[125] Body Dissatisfaction and Gay Community-Related Social

9:00 AM – 9:45 AM

Previous research has linked social media use to body dissatisfaction in heterosexual populations. However, there is a lack of literature explicitly examining the effects of social media use on body dissatisfaction in sexual minority men, despite this population experiencing appearance-related stressors at higher rates than their straight counterparts. In line with intra-minority stress theory and social comparison theory, this study aims to investigate the role of gay community-related social media use on body dissatisfaction in sexual minority men. Through the use of a correlational research design (N = 300), we test whether increased online interactions with mainstream gay community-related media is associated with higher muscularity and body fat dissatisfaction. We hypothesize that increased interactions with mainstream gay community-related media will be associated with higher levels of body dissatisfaction and that intra-minority stress will mediate this relationship. We anticipate that dating app usage will moderate the relationship between gay community-related social media usage and body dissatisfaction and will be positively associated with gay community stress.

[126] A Qualitative Exploration of Motivating Factors for Dominants and submissives that Participate In Or Hold BDSM and Kink Identities

9:00 AM – 9:45 AM

The motivations behind a person's involvement in bondage, domination, sadism, and masochism (BDSM) are widely misunderstood, which perpetuates stigma towards the BDSM community. We collected online interviews completed by BDSM community members to assess themes related to motivations among participants organized by self-identification as Dominant and submissive. Qualitative data were collected via a survey on FetLife. Questions were written to address the following research question: What are the motivating factors to be Dominant/submissive in BDSM spaces? Responses to nine open-ended questions about motivations and experiences from more than 30 Dominant and 50 submissive-identifying participants were analyzed using thematic analysis procedures outlined by Braun and Clarke (2022). We identify themes that are both overlapping and distinct between the Dom and sub identities. Understanding the motivations of community participants will help researchers to work towards the destigmatization of BDSM, which will support better mental health outcomes for community members, informed safe practice, and improved general understanding of BDSM identities in society.

[127] So...what are we?: Defining the situationship and identifying its attributes, causes, and emotional outcomes.

9:00 AM – 9:45 AM

Background Recent dating culture has seen a rise in "situationships," a grey area past just being friends but falling short of a committed relationship (CR). Yet, little is known about the relational attributes, behaviors, and wellbeing outcomes that distinguish them from more established relationship types. Methods We take a mixed methods approach in a series of three observational studies. In Studies 1 and 2, undergrads completed surveys comparing experiences and perceptions of situationships, CRs, and hookups. In Study 3 we plan to analyze open-ended accounts of situationship experiences. Results Though situationships show levels of commitment and intimacy between those of CRs and hookups, they are also as low in sexual satisfaction as hookups, and as high in conflict as CRs. And, they provide fewer gains to self-esteem and less support than CRs. Low commitment readiness was both the top reason for and a key predictor of future situationship involvement. Discussion Despite their bad reputation, situationships remain pervasive. The current work characterizes them and begins to disentangle what qualities and contextual factors make them emotionally costly versus fulfilling.

[128] "It is None of My Business if Grandpa Wants to Get Freaky": A Qualitative Analysis of Young Adults' Perceptions of Sexuality in Older Adulthood

9:00 AM – 9:45 AM

Older adult sexuality is highly stigmatized, particularly by young adults, yet few studies have examined these perceptions qualitatively. The only prior qualitative work (Allen & Roberto, 2009) focused exclusively on older women, finding that students recognized societal ageism/sexism but not their own biases. Thus, the current study extended this work by exploring young adults' attitudes toward older adult sexuality across genders. Three hundred twenty-two young adults (ages 18–25) answered the prompt, "How do you feel about older adult sexuality?", yielding three themes: positive, negative, and neutral/ambivalent. Within positive themes, most participants viewed older adult sexuality as natural and emphasized autonomy. Negative themes involved concerns about health, consent, desire, and appropriateness. Neutral themes involve having no opinion or feeling they do not have a say in the matter. Despite generally positive responses, lingering health misconceptions and intolerant attitudes remain concerning. Our findings mirror prior work and extend to all genders, emphasizing the need for education that challenges stereotypes and normalizes later-life sexuality.

[129] Adaptive authenticity: How bisexuals respond to LGBTQ+ vs. heterosexual prejudice

9:00 AM – 9:45 AM

Bisexuals are the largest subgroup within the LGBTQ+ community, yet they are routinely stigmatized by heterosexuals and fellow LGBTQ+ members. While harmful outcomes of prejudice are well-documented, less is known about how social identity and intergroup dynamics affect bisexual identity expression. This study (N = 263) explored the role of inter- and intragroup sources of prejudice, identity centrality, and relative ingroup prototypicality on bisexual identity expression. Results revealed a three-way interaction. When prejudice came from gay and lesbian individuals, identity centrality predicted greater authentic identity expression regardless of whether bisexuals felt that bisexuality is representative (prototypic) of the LGBTQ+ community. When prejudice came from heterosexual individuals, identity centrality predicted authentic identity expression only when bisexuals perceived themselves as representative of the LGBTQ+ group. These results suggest that when facing external prejudice, bisexual individuals may need both identity centrality and a sense of group legitimacy to respond with authentic identity expression; otherwise, dominant group stigma may suppress expression.

[130] “Something must be wrong with you”: Dimensions of Asexual & Non-Asexual Experiences

9:00 AM – 9:45 AM

Research on sexuality and sexual identity is often limited to studying and portraying allosexual perspectives—those who experience sexual attraction. In contrast to this heteronormative standard, asexuality research frequently questions the normalized assumptions regarding sexual identification. Our project presented asexual participants with a variety of experiences—using labels, coming out, navigating relationships, sexual activity—and had participants indicate their importance relative to different targets—themselves, other asexuals, & everyone regardless of sexual orientation. A phenomenological approach was used to identify recurring themes in participants’ experiences, including a range from indifference to repulsion towards sex, a desire for asexuality to be more widely understood, the under-appreciated nature of non-sexual closeness, and the shared experience of asexual people being portrayed or perceived as not fully human, unfeeling, or robotic. Implications and future directions focusing on the nuance of asexuals’ lived experience, their relationship with sexual identity, and the comparison with non-asexuals’ perceptions of asexuality and asexuals will be discussed.

[131] Reframing Camming: How Defining Interactions Between Cam Models and Viewers as Relationships Impacts Commitment, Sexual Ideals, and Sexual Quality

9:00 AM – 9:45 AM

An increasing number of individuals engage with camming platforms not only for sexual gratification but also to fulfill emotional, psychological, and relational needs. Although these exchanges are often viewed as purely transactional, many evolve into ongoing, emotionally meaningful relationships that blur the line between commercial and intimate connection. This study examined members (n = 544) and models (n = 199) to test whether perceiving one’s interactions as part of a romantic or relational bond predicted differences in sexual and relational well-being. Participants who identified as being “in a relationship” reported higher sexual satisfaction, desire, investment, and commitment, and viewed their partners as more attractive and of higher mate value. These findings highlight that technologically mediated relationships can promote authentic emotional closeness and challenge assumptions that digital sexual exchanges are devoid of relational depth or intimacy. As online platforms increasingly serve as spaces for emotional connection, understanding these dynamics can help destigmatize digital intimacy and inform future work on technology’s role in modern relationships.

[132] Body Esteem, Family Functioning, and Sexual Sensation Seeking as Predictors of Risky Sexual Behavior among Socially Vulnerable Women

9:00 AM – 9:45 AM

This study explored psychological predictors of risky sexual behavior among socially vulnerable women engaged in transactional sex, a population often overlooked in sexual health research. Using a descriptive–correlational design, 217 women attending welfare and counseling centers in Qazvin, Iran (2024–2025) completed the Zuckerman Sensation Seeking Scale, the Franzoi & Shields Body Esteem Scale, the Family Assessment Device, and the Sexual Sensation Seeking Scale. Pearson correlation and multiple regression analyses (SPSS v22) showed that sexual sensation seeking was the strongest positive predictor ($\beta = .485, p < .001$), while body esteem ($\beta = -.265, p < .001$) and family functioning ($\beta = -.219, p < .001$) negatively predicted risky sexual behavior. The model explained 45.1% of the variance ($R^2 = .451$). Findings highlight the need for interventions that enhance body esteem and family support to reduce sexual risk-taking among socially vulnerable women.

[133] What Type of Infidelity Upsets You Most? Gender and Sexual Orientation Differences in Upset Over Behaviors Ranging from Pornography Use to Online Sexual Flirtation

9:00 AM – 9:45 AM

Is having sex with a robot considered cheating? New technologies have expanded opportunities to experience sexual and emotional connections with others besides one's partner, blurring lines of what cheating is. Here we rely on a diverse Census-matched survey of 8629 adults examining how gender, sexual orientation, and other individual differences are related to upset over 14 types of sexual interaction with others. There were significant main effects of gender and sexual orientation across the measures. For example, women, regardless of sexual orientation, reported greater emotional upset with behaviors like sending flirtatious emails to a coworker ($d = 0.51$) and webcamming or online sexual chatting ($d = 0.51$), and bisexual women were less upset than heterosexual women across all measures, and heterosexual men than bisexual men ($d = 0.36$). These findings have implications for sociocognitive and evolutionary perspectives on emotional responses to infidelity and how these are shaped by continued technological innovations.

[134] What People Say About Pornography: A Comparative Study of Gendered Common Sense in Three Societies

9:00 AM – 9:45 AM

Pornography is a global phenomenon that provokes diverse social and moral responses. Across cultures, people debate its benefits and harms in ways that reflect local values, gender norms, and moral beliefs. Yet, most research has been shaped by Western perspectives, often overlooking cross-cultural and gendered differences in how individuals express these views. This study addresses that gap by examining how men and women in Japan, the United States, and Malaysia describe the benefits and harms of pornography. Language reflects shared social understandings that guide moral judgment and behavior. Data were collected from 978 participants (399 males, 579 females): 25.7% from Japan, 33% from the U.S., and 41.3% from Malaysia, most of whom were heterosexual university students. Using central core theory, key words were identified. Common benefits included sex education, pleasure, and stress relief, while harms focused on spreading false knowledge and unrealistic expectations. Japanese participants also mentioned crime prevention. The findings highlight cultural and gender differences with implications for sex education and media literacy.

[135] The Many Kinks Project: Mapping Consent, Identity, and Well-Being in BDSM

9:00 AM – 9:45 AM

A total of 40 researchers and BDSM community leaders examined consent, role identity, personality, and well-being across five hypotheses within a global sample (46 countries; $N = 1,361$) of BDSM-identified individuals. Evidence confirmed consent as a central tenet for BDSM, with qualitative support showing that consent, communication, and trust are the most common features identified when asked what is important for BDSM interactions. Findings demonstrated that men are more likely to identify with left of slash (Dominant, Master, Top) roles and that women are more likely to identify with right of slash (submissive, slave, bottom) roles. Inconsistent with expectations, gender-expansive individuals were equally likely to identify as switches or right of slash. Findings suggest that role fluidity may be particularly salient in younger individuals, with identity consolidation occurring across adulthood. Personality traits and well-being comparisons also found differences across BDSM roles. Although small role-linked variations were detected, the broader picture affirms BDSM as a diverse, consensually structured practice.

[136] Perceptions of Sex Researcher's Likeability and Hypersexuality

9:00 AM – 9:45 AM

Sex research is often politicized and devalued, yet little is known about how such institutional stigma affects perceptions of sex researchers themselves (Irvine, 2014). This study examined whether researchers studying sex vs. relationships differ in perceived likeability and hypersexuality, and whether these effects are moderated by researcher gender and participants' sex positivity. Recruited via crowdsourcing, 219 adults ($M = 39.11$, $SD = 11.53$) viewed one of four researcher profiles (male/female; sex/relationship) and rated the target's likeability and perceived hypersexuality. They also completed a measure of sex positivity. Sex researchers were rated as less likeable and more hypersexual ($p's < .01$). Sex positivity interacted with researcher type on perceptions of likeability (but not hypersexuality), with greater sex positivity being linked to reduced penalization of the sex researchers. Overall, sex positivity was related to slightly lower hypersexuality perceptions. In addition, female researchers were rated as more likeable. These findings indicate the interpersonal stigma that sex researchers face and underscore the important protective role of sex positivity.

[137] Love limited or limitless? Validating a measure of love abundance and scarcity in ethically non-monogamous relationships

9:00 AM – 9:45 AM

Romantic love is a multi-dimensional experience characterized by alterations to an individual's affect, behavior, cognition, and physiology (Fletcher et al., 2015). Predominant conceptions in Western monogamous relationships construct love as a scarce resource that is limited, and thus necessarily allocated exclusively to one other individual (i.e., monogamous relationships). However, the extent to which individuals construe romantic love as a scarce resource may vary, as evident by engagement in ethically non-monogamous relationships. Two empirical studies validated a novel measure of love scarcity and abundance using reports from individuals in both monogamous and ethically non-monogamous relationships. Moreover, reports of love scarcity-abundance were correlated with existing measures of relationship orientations (e.g., attachment, growth and destiny beliefs, sociosexuality). Implications for perceptions of love scarcity and abundance across all relationship types will be discussed.

[138] Study on the structure of sexual feelings

9:00 AM – 9:45 AM

How does sex feel? Emotion research taxonomies often overlook affective feelings (Ekman, 1992) or group them under a single construct like 'sexual desire' (Cowen & Keltner, 2017). Yet, sex research terminology implies a richer discrete sub-emotions phenomenology, including desire, stimulated, feeling wanted and other related states. Our study explored whether sexual experience is unitary or multidimensional, if the latter, whether it can be aligned with core-affect structure (e.g., valence and arousal) or discrete sub-emotions. Participants (N = 438; 220 F, 218 M) reported on their recent partnered sexual activities using 22 items derived from sex and emotions research. Exploratory factor analysis (Oblimin; KMO = .96; Bartlett's χ^2 (231) = 7,549, $p < .001$) identified three distinct factors across sexes: Sexual Arousal, Intimate Connection, and Negative Affect. Females' EFA explained 62% of the variance; males' explained 56%. Results suggest sexual experience is better represented as a core-affect-like structure with separate components rather than a single bipolar continuum.

[139] Beyond Normativities: Sexual, Relational, and Individual Well-Being Among Neurodivergent and Neurotypical Individuals in Polyamorous Relationships

9:00 AM – 9:45 AM

No work has examined how consensual non-monogamy (i.e., mutual agreements involving multiple romantic and/or sexual partnerships) intersects with neurodiversity, a framework recognizing natural variations in brain functioning such as autism and ADHD (Miranda-Ojeda et al., 2025). Estimates suggest over 30% of neurodivergent individuals (NI) identify as LGBTQ+ (George & Stokes, 2018b), and LGBTQ+ communities are more likely to practice CNM (Haupt et al., 2017). NI often report relational strain in monogamous relationships (Wymbs et al., 2021) but polyamory (i.e., form of CNM involving multiple committed partnerships) may offer adaptive benefits by fostering flexible and supportive networks (Iantaffi, 2009). In an ongoing study of polyamorous adults (N = 56), 75% identified as neurodivergent. NI reported higher depression and lower orgasm frequency with Partner 2 than their neurotypical counterparts. No differences emerged for individual anxiety or partner-specific relationship satisfaction, sexual satisfaction, and orgasm frequency across two relationships. This challenges prior work suggesting poor relational functioning among NI, highlighting an erasure of CNM-NI dynamics.

Group Sex in Canada. More Than a Risk Factor: Group Sex as a Source of Well-Being

10:00 AM – 10:55 AM

Group sex is often framed in research as an HIV/STI risk, overlooking broader potential impacts on well-being. As part of a community-based, bilingual, Canada-wide survey on group sex, 1104 participants indicated whether group sex improved, worsened, or had no impact on 11 domains of their well-being. We assessed differences by gender, sexuality, race, and financial strain via multinomial logistic regression. Participants most frequently reported improved self-esteem (70%), body image (69%), and communication skills (63%). Cisgender women were the most likely to report improved well-being across domains, followed by gender minorities, followed by cisgender men. Sexual majorities were more likely than minorities to report improved relationships and communication skills. Both Participants of color (vs white participants) and financially strained (vs comfortable) participants were more likely to report worsened physical well-being and self-esteem. These findings are important for understanding group sex beyond HIV/STI risks. Positive outcomes were not evenly distributed across social location, underscoring the need to continue increasing group sex inclusivity.

Milestones in Asexual Identity Development: Insights from Multi-Year Survey Data

10:00 AM – 10:55 AM

Asexual individuals often experience identity development trajectories that diverge from LGB individuals. The current study uses multi-year cross-sectional survey data from The Ace Community Survey to examine how first online community participation, asexual identity strength, and negative experiences, predict the timing of key sexuality milestones: first identification and first coming out. Integrated data analysis (IDA) is conducted to combine survey responses, allowing for a robust examination of developmental patterns. Preliminary findings reveal that later first involvement in asexual communities is associated with later initial identification and later first coming out as asexual. Moreover, stronger asexual identity predicts earlier initial identification and earlier coming out as asexual. Negative experiences were linked to earlier identification and earlier coming out as asexual. Our project expands on how asexual identity milestones occur throughout development and presents implications for current understandings of the trajectory for sexuality milestones relative to other LGBTQ groups.

Ambivalence and Sexual Consent: Cognitive Mechanisms of Real-Time Stay-or-Leave Decisions

10:00 AM – 10:55 AM

Consenting and wanting sex are not the same, and people sometimes stay in sexual interactions they do not desire. Most research is retrospective, which do not capture the complexity of real-time consent decisions in dynamic sexual interactions. We present a novel experimental paradigm, based on evidence accumulation models, to study real-time stay/leave decisions under dynamic ambivalence. Participants viewed fluctuating positive and negative emotional cues and decided moment by moment whether to stay in or leave an interaction. Across two studies (heterosexual women), we compared intimate interactions: first date (Study 1, N = 123) or sexual interaction (Study 2, N = 202), with matched professional interactions. Discrete-time survival analysis showed that ambivalence increased decision difficulty but had context-specific effects on leaving. Women were more tolerant of ambivalence in dating contexts, staying longer despite mixed signals, but less tolerant in sexual contexts, where ambivalence increased leaving. This paradigm offers an experimental approach to studying sexual consent as a dynamic decision, enabling causal tests of factors that shape real-time sexual decision-making.

A High-Fidelity Kinsey Scale: The Sexual And Romantic Orientation Scale (SAROS)

10:00 AM – 10:55 AM

Three studies (total n = 2327) evaluated a new self-report sexuality measure, the Sexual and Romantic Orientation Scale (SAROS). SAROS has 3 unique features compared to other scales, it: (a) asks about sexual and romantic attraction as separate questions; (b) includes both cis and trans targets; and (c) does not require sexual orientation labels. Thus, SAROS aligns with modern understandings of gender and sexuality, and reflects the original thoughts behind "The Kinsey Continuum," including the ability to model asexual/aromantic response patterns. Using person-centered approaches (viz., cluster analysis, latent profile analysis) on the SAROS items to derive 7 clusters/profiles that represent sexual and romantic attraction patterns toward different combinations of targets. The cluster profiles were: (1) attraction to cis women only; (2) attraction to cis men only; (3) high generalized attraction to all genders; (4) attraction to all women (cis and trans) and nonbinary individuals; (5) attraction to all men (cis and trans) and nonbinary individuals; (6) low attraction to all genders; and (7) mid-level generalized attraction to all genders—representing a new way to organize sexuality.

The cultural scripts of expressing romantic interest in the modern era

10:55 AM – 11:55 AM

How should romantic interest be expressed in contemporary times? In a 2025 survey experiment with a probability sample of Wisconsin residents, participants rated the appropriateness of behaviors for expressing romantic interest. Initiator gender (woman/man), recipient gender (woman/man), and setting (rec league/workplace) were varied. Expressing romantic interest is seen as more appropriate in a rec league than a workplace. Same-gender advances are viewed as less appropriate than cross-gender advances among older but not younger participants. In cross-gender interactions, a man asking a woman on a date is seen as more acceptable than the reverse, but most other behaviors (e.g., inviting the person to lunch, initiating conversation) are seen as equally appropriate for women and men to initiate. It is seen as more appropriate for women than men to express romantic interest through touch or requesting a social media handle. The results show that the cultural scripts for expressing romantic interest in the 2020s are characterized by traditional gender scripts alongside novel permutations of gendered scripts, as well as decreasing homophobia among younger generations.

"I felt like Dorothy landing in Oz..." Late-in-Life Lesbians/Fireflies Narratives of Stepping Into Their Authentic Selves

10:55 AM – 11:55 AM

A qualitative merged narrative inquiry case study of 21 fireflies coming out later-in-life offers quotes about the moments they understood their queerness and their overall sense of well-being as they began a new chapter. Thematic analysis reveals commonalities related to compulsory heterosexuality and sexual scripts, the role of community and resources in the choice to disclose to their partner, intersectional considerations of community and acceptance of a non-heterosexual identity, religiously-based heteronormative messaging and education about sexuality, and medical gaslighting pertaining to the medicalization of female sexuality. Implications inform the need for systemic changes to sex education and gender inequities in a capitalist society. Narratives highlight the insidiousness of compulsory heterosexuality and how society privileges heterosexual partnerships at the expense of safety for fireflies. Narratives also elucidate joy and relief upon realizing their bodies are not broken, that they do experience desire and arousal, and that with community, culturally competent therapy, and economic security their monochrome hetero Kansas can become their Queer technicolor Oz.

Leveraging Interpersonal Scripts in a Restrictive Sociopolitical Climate: A Couple-Based Intervention for Women’s Sexual Pleasure

10:55 AM – 11:55 AM

Sexual pleasure is key for sexual health, yet women partnered with men report lower pleasure entitlement, more pain, and fewer orgasms than men. Heteronormative sexual scripts underlie this inequity, leading researchers to endorse structural interventions (e.g., comprehensive sex education) that increase clitoral knowledge and challenge gender roles. Yet such reforms are slow to implement, require institutional buy-in, and overlook a more malleable level of scripting theory—interpersonal dynamics within couples. This talk presents a novel couple-based intervention targeting partnered sexual norms and behaviors (asymmetric orgasm pursuit, insufficient clitoral stimulation) that sustain inequity in mixed-gender sex. Partners complete guided reflections on their typical vs. ideal sexual routines and a dyadic discussion to co-create new ones emphasizing mutual pleasure. A formative feasibility trial (14 couples) evaluates implementation outcomes and participant-driven refinements. This work offers a scalable model for leveraging romantic relationships to advance sexual pleasure equity in a sociopolitical climate that resists such progress.

Exploring the Motivations of Orgasm Faking Among Australian Heterosexual Women

10:55 AM – 11:55 AM

Sexual wellbeing is more than the absence of dysfunction—it’s about pleasure, connection, and authenticity. Yet, one behaviour that quietly disrupts this is orgasm faking. Reported disproportionately by women, it reflects how gendered expectations, sexual scripts, and partner dynamics shape intimate experiences. This study explores why Australian women fake orgasms and how this behaviour affects sexual satisfaction. Using survey data from 137 women aged 18 and over, we combine quantitative insights with thematic analysis of open-ended responses. Emerging motivations include partner appeasement, performance pressure, and ending unwanted encounters—each revealing the emotional and relational negotiations that occur during sex. Our findings suggest that orgasm faking operates as a coping strategy within unequal cultural scripts, often at the cost of sexual agency and authenticity. By situating this behaviour within broader sociocultural norms, this research challenges the myth of the “perfect” sexual encounter and calls for education and therapeutic approaches that centre pleasure equity and honest communication.

Sexual Coercion: Not Hot! Experiencing Sexual Coercion Predicts Lower Sexual Desire Among Women Partnered with Men

10:55 AM – 11:55 AM

Diminished sexual desire is the most reported sexual health complaint among women partnered with men. Women's low desire is often treated as biological, but a new heteronormativity theory of desire proposes that it stems from how gender norms shape interpersonal relationship dynamics. One such dynamic is men's sexual coercion (using psychological or physical threats to obtain sex) of women. Research shows that coercion in relationships is common, but surprisingly, no previous studies have explicitly tested associations between experiencing coercion and women's lower desire. The present studies examined whether women's experiences of sexual coercion from their partners contribute to lower desire within relationships. In Study 1 (cross-sectional), higher coercion frequency was associated with lower desire, and the effect increased with relationship length. In Study 2 (longitudinal), greater sexual coercion frequency at Time 1 was associated with lower desire at Time 2 (four months later), controlling for T1 desire, age, and relationship length. Results support that men's sexually coercive behaviors play a role in women's decreased desire within relationships.

Unmet Sexual Ideals in Online Camming Relationships

10:55 AM – 11:55 AM

Past work suggests many cam-site users form emotionally meaningful relationships with models, yet little research has examined investment processes in these relationships. The current study investigated whether unmet sexual ideals predict lower sexual quality (sexual satisfaction, sexual desire, perceived partner desire, and extradyadic desire) among cam models and members, and whether perceived partner sexual responsiveness (PPSR) and sexual communication buffer these effects. Separate regression analyses were conducted for online camming members and models. For both groups, unmet sexual ideals were linked to lower sexual satisfaction, desire, and perceived partner desire. Among members, PPSR and sexual communication were positively associated with sexual quality, though only sexual communication buffered the negative association between unmet ideals and sexual desire. Among models, both PPSR and sexual communication buffered the negative association between unmet ideals and sexual satisfaction. Findings highlight role-based differences in how sexual ideals and responsiveness shape sexual quality in online erotic relationships.

Mismatch and Maintenance: Exploring the Relationship Between Mate Value Discrepancies, Sexual Desire, and Investment in Online Camming Relationships.

10:55 AM – 11:55 AM

Background: Mate value discrepancies (MVD)—when individuals perceive their partner's mate value as higher or lower than their own—can shape both sexual desire and investment into a relationship. Although relationships between members and models on camming platforms share many features with offline romantic relationships, little is known about how MVDs function in these contexts. Method: Models and members on LiveJasmine completed measures of self- and partner-rated mate value, sexual desire, and relationship investment. MVD was calculated by subtracting self-rated from partner-rated mate value. Indirect effect analyses tested whether sexual desire explained the association between MVD and investment. Results: Results indicated that, for both members and models, perceiving one's partner as higher in mate value predicted greater sexual desire and higher investment. Furthermore, sexual desire significantly explained this association, such that there was an indirect effect of MVD on investment through sexual desire. Conclusion: These findings suggest that dynamics of mate value and desire operate similarly in technologically mediated relationships as in offline romantic partnerships.

Knowledge to action: Investigating mixed-sex couples' ability to adapt their interpersonal sexual scripts to facilitate women's orgasm

10:55 AM – 11:55 AM

The orgasm gap is a pressing close relationships and gender equity issue that affects women's lives in and outside of the bedroom. While research has clearly established that clitoral stimulation is key to women's orgasm, male partners may be unaware of or fail to sufficiently implement these clitorally-focused sex acts into the couple's sexual script. For the current project, we recruited 161 mixed-sex couples (one cisgender man and one cisgender woman) and assessed men's knowledge of their female partner's most reliable route(s) to orgasm from a list of sex acts. We found that couples with more accurate knowledge of the female partner's most reliable route(s) to orgasm engaged in those specific sex acts more often, and for a longer duration. More frequent engagement in the female partner's most reliable routes to orgasm predicted women's greater orgasm frequency. These results can be used to inform potential interventions for addressing the orgasm gap in mixed-sex relationships, through (1) sexual communication, (2) the translation of knowledge to action, and (3) the modification of sexual scripts within each relationship.

Sexual health in monogamous and (consensually) nonmonogamous relationships: Evidence from convenience and population-based samples

10:55 AM – 11:55 AM

How people manage multiple sexual relationships may influence their sexual health. We examined sexual health in monogamous, consensually non-monogamous, and non-consensually non-monogamous (i.e., infidelity) relationships in a multinational online sample (Study 1; N=888), and Finnish population-based data (Study 2; N=10,504). In Study 1, women with multiple partners reported greater desire and satisfaction with non-primary than primary partners, and greater arousal with non-primary partners compared to monogamous women. Polyamorous individuals were more likely to have ever been tested for, but not diagnosed with, sexually transmitted infections. In Study 2, nonmonogamous men reported fewer early ejaculatory symptoms, non-monogamous women reported higher sexual desire, and both men and women in nonmonogamous relationships reported greater dyadic desire compared to monogamous participants. Across both studies, sexual functioning was overall similar between monogamous and non-monogamous participants, and self-reported infidelity was not associated with sexual health. We suggest that having multiple partners, whether consensual or not—does not necessarily compromise sexual health.

Explaining the Orgasm Gap(s) During Last Sexual Event: Variation Among LGBH Populations

10:55 AM – 11:55 AM

It has been well established that there are multiple orgasm gaps: men orgasm more routinely than women during sexual activity, and lesbian women orgasm more routinely than other women. Less understood is how these differences between groups are driven by orgasm-related cognitions, motivations, behaviors during sex, and definitions of what is considered sex. Two years ago at this sexuality preconference, after presenting results highlighting behaviors that best predicted orgasm during last sexual event among heterosexual women, I promised I would update attendees about the experiences of people of other sexual orientations. The current study presents the results from 637 gay, bisexual, and lesbian men and women matched to the 931 participants in the original heterosexual sample. The LGB participants reported the cognitions, emotions, and behaviors that occurred during their last sexual event. There were notable differences not only in orgasm frequency across the the groups, but also in the predictors of orgasm. Here I highlight key factors that potentially explain portions of the orgasm gap(s) and the implications for improving sexual experiences.

Breast Friends and Public Places: What Shapes Women's Comfort with Public Breastfeeding?

10:55 AM – 11:55 AM

The current studies investigated factors that may influence women's comfort level with, and likelihood of, breastfeeding in public. Across three vignette-based experiments, we manipulated location (home vs. a restaurant), relationship to a bystander (friend vs. stranger), gender of the bystander (female vs. male) and coverage (present vs. absent). In addition, the valence of the bystander's comment (positive or negative), and the focus of the comment (focus on the breastfeeding mother vs. others) were examined. Results indicated that the relationship to, and gender of, the bystander as well as the type of comment they made were the most consistent predictors of women's comfort with public breastfeeding and likelihood of public breastfeeding. Specifically, a female friend who made a positive comment or a mother-focused comment led to the highest levels of comfort and likelihood of publicly breastfeeding. In addition, we found that previous experience (both breastfeeding in general and public breastfeeding specifically) and partner support were strong predictors. Implications for increasing breastfeeding rates by fostering supportive proximal social environments are discussed.

Teaching of Personality and Social Psychology Preconference

8:00 AM – 1:00 PM | Location: E270, Level 2

Most SPSP members have or will have teaching-related responsibilities in social psychology or related specialties. The STP Teaching Preconference focuses on these responsibilities and ways to improve teaching based on best practices and findings from SoTL research. The Preconference provides programming supporting teaching at all levels (graduate students to senior faculty), emphasizes novel, empirically-supported techniques and content for teaching, provides opportunities for teachers to share effective practices, and addresses a wide variety of teaching issues and contexts. The goal of this preconference is for attendees to leave with specific,

teaching-related ideas that can be implemented upon attendees' return from the preconference. This preconference is appropriate for those at every professional level, from novice instructors who might be building courses for the first time to veteran faculty who continue to update courses. This preconference has been held 22 consecutive years at SPSP, and attendees reliably consider it valuable and enjoyable.

[81] CANCELLED: Students Like Games! The Art of Using Gamification to Improve Course Engagement

9:00 AM – 10:00 AM

Gamification, or the incorporation of games into classroom learning, has become an increasingly popular instructional strategy. Activities such as Jeopardy and Pictionary can be leveraged to enhance knowledge retention, foster collaborative discussions, and encourage active student participation. These interactive approaches not only make learning more enjoyable but also promote critical thinking and engagement, creating a dynamic classroom environment that supports deeper understanding of course material. Furthermore, using interactive activities increases interaction between the instructor and students, which in turn may positively influence end-of-course evaluations. In one of my courses, I incorporated gamification as exam review, and students reported that these activities were among the elements they valued most, particularly for supporting their understanding and retention of course material.

*POSTER

[82] Relational Pedagogy: What It Is and How to Apply It

9:00 AM – 10:00 AM

Instructors often hear the phrase "teaching is relational", but what does that actually mean, and how can we put it into practice? Relational pedagogy reconceptualizes instructors and students as co-learners. It shifts from a hierarchical model of learning, and relies more on mutual vulnerability, authenticity, and trust. In practice, relational pedagogy can be applied via classroom dialogue, syllabi, assignments, and interactions with students during office hours. As a fourth-year PhD candidate, I study close relationships and the effects that responsive support (or a lack of responsive support) can have on well-being. In a similar way, student success can vary based on their perceived level of responsive support from the course instructor. I draw from my experience in teaching two courses as instructor-of-record and eight courses as a teaching assistant to discuss how I have incorporated relationship-building into each stage of my teaching approach. I reflect on what has worked well (versus not well), in the context of my former students' reviews of my courses. I conclude by proposing relational pedagogy as a skill that educators can develop at any stage of their careers.

[83] Testing Identity Safety Cues for LGBTQ College Students: Instructor Identity and Diversity Statement Effects

9:00 AM – 10:00 AM

Identity Safety Cues (ISCs), or environmental signals that communicate acceptance and value to stigmatized groups, can reduce identity threats in the classroom for LGBTQ college students. Common ISCs include minority representation and diversity philosophies, yet little research has examined their independent effects for LGBTQ students. This study tested whether minority representation (an instructor's LGBTQ identity vs. a non-LGBTQ identity) and the framing of a diversity statement (more vs. less authentic) influence students' anticipated belonging, course interest, and perceptions of instructor inclusiveness. Identity centrality, or the importance of one's LGBTQ identity to their self-concept, was examined as a moderator. A national sample of LGBTQ college students (N = 300) was randomly assigned to view one of four course welcome videos varying by instructor identity and diversity statement framing. We expect that students higher in identity centrality will report greater belonging, interest, and perceptions of inclusiveness when the instructor shares their LGBTQ identity and uses a more authentic diversity statement. Implications for ISC use in the classroom will be discussed.

[84] Learning Statistics with Purpose: Purpose Reflection's Role in Authentic Belonging and Enjoyment in STEM

9:00 AM – 10:00 AM

Recent research emphasizes fostering purpose-driven engagement in STEM (Diekman et al., 2024; Thoman et al., 2025). Using the “full-cycle social psychology” framework (Cialdini, 1980), in which field studies check the external validity of experimental work, this research investigated whether a purpose reflection intervention, the act of reflecting on one’s reasons for pursuing STEM, and its implementation format, related to students’ psychological experience in a psychology statistics class. Controlling for race, age, gender, and generation status, students who were instructed to reflect on purpose (n = 38) perceived more opportunities to achieve self-focused (agentic) and others-focused (communal) goals than students who were not (n = 97). These perceived opportunities related to higher authentic belonging and enjoyment in their major. Students also reported most positive outcomes following the interactive format of purpose reflection, in which reflection was embedded into course activities and materials. Together, these findings highlight that purpose reflection, particularly when embedded within course activities, can enhance students’ experiences in challenging STEM contexts.

[85] From Anxiety to Engagement: Understanding Students’ Experiences with Group-Based Learning

9:00 AM – 10:00 AM

While prior literature highlights the efficacy of group-based active learning strategies, students are often resistant to coursework involving small- or large-group activities. In this study (n = 198), we examined undergraduate students’ attitudes toward group-based learning. Participants reflected on their emotions, perceived obstacles and concerns, and positive experiences with group work. A thematic analysis revealed that anxiety, discomfort, frustration, and distrust were the most common emotional responses. Key obstacles included concerns around fairness and unequal effort, fear of social judgment, and coordination challenges within groups. Students’ most positive experiences centered on connection, equitable collaboration, and cognitive growth through diverse perspectives, with many emphasizing that these outcomes depended on instructor practices and classroom climate. Overall, these results underscore the importance of psychological safety, belongingness, and shared responsibility in cultivating effective and engaging group-based learning environments.

[86] An Alternative Approach to Teaching Introductory Psychology

9:00 AM – 10:00 AM

This poster offers an alternative for teaching introductory psychology at colleges. Introductory psychology typically is taught as a survey course where the major subfields (e.g., biological, cognitive, social) are covered in only two to three weeks, primarily via textbook readings and lectures. Whereas this is an effective approach for many, it can lead to difficulties. For example, students may find it redundant if they have taken AP Psychology or they may fail to see connections between subfields. For professors, it can be difficult to model critical reading of sources when students have little background in methods. Our alternative is to offer multiple introductory seminars from which students can select one. Each goes into depth in a particular area while emphasizing methodology throughout. All students work with real data and typically present findings both orally and in short APA-Style papers. In this poster, we discuss three example seminars taught in this way: Animal Training as an Introduction to Methods in Psychology; Memories: True, False, and Distorted; and Understanding Human Emotion We discuss the pros and cons of each individually, and of the approach collectively.

[87] What Can (and Can’t) Courses Change About Stigma and Prejudice?

9:00 AM – 10:00 AM

Can courses effectively challenge bias? Two studies examined what changes—and what resists change—when students learn about mental illness stigma and sexism. Study 1 examined mental illness misconceptions before and after three courses: Stigma of Mental Illness in Film (n=23), Abnormal Psychology with stigma discussion and contact (n=28), and control courses (n=48). Participants completed five misconception items, analyzed via 2 (Time) x 3 (Course) mixed ANOVAs. Control courses showed no change (ps>.31), but both intervention courses reduced misconceptions about autism and schizophrenia (ps<.04), demonstrating some beliefs are more malleable than others. Study 2 examined the impact of Psychology of Gender (N=41). Pre-post measures showed the course reduced Hostile and Benevolent Sexism and denial of sexism (ps<.01), while increasing gender activism and feminist identification (ps<.01). The course also reduced body surveillance (p<.01) but body shame remained unchanged. Courses can effectively reduce stigma and prejudice but may not change deeply internalized beliefs, particularly about the self. Practical tips for educational interventions on bias will be discussed.

Teaching themes of linguistic justice, cultural communication, and social identity using a storytelling game about language and loss

10:15 AM – 10:30 AM

Mass marketed table-top role-playing games can be effectively adapted for use in the classroom to engage students actively, build class community, and create memorable learning experiences. I will describe a classroom activity I have developed with Dialect, a collaborative storytelling game about an isolated community whose language changes over time. Dialect's rules offer a strong foundation classroom use: they guide players to establish a setting and characters, invent new vocabulary, and engage in brief role-played conversations. I will discuss how I have implemented this game in the classroom to explore themes of linguistic justice, cultural communication and social identity. Beyond this specific game, I will share a template for adapting rules and conventions of any table-top game to a classroom activity that empowers students to guide themselves through the experience with minimal instructor oversight. This template incorporates safety tools adapted from tabletop community best practices alongside postgame reflection prompts. These elements work together to enhance student learning by creating a structured framework for processing and applying insights gained during gameplay.

The Impact of Diversity Statements in the Course Syllabus on Students' Perceptions of the Instructor and Course

10:30 AM – 10:45 AM

This study assessed how the inclusion of a diversity statement affects student perceptions of the instructor and course. Undergraduates (N = 555) evaluated one of six randomly assigned course syllabi, differing by the presence/position of the diversity statement and instructor gender. We found that the presence of a diversity statement led to more positive evaluations of the course climate and instructor character and impartiality, yet also higher for instructor political liberal ideology. These results were present even after controlling for key demographic factors. These findings draw attention to the opportunity that diversity statements offer in fostering effective teaching and learning.

What Professors Say to Students: Undergraduate Students' Reports of How Professors Have Made Them Feel Better and Worse About Themselves as Students

10:45 AM – 11:00 AM

A positive classroom climate is important for supporting students' learning and success in higher education. Instructors need to develop rapport, trust, and connection with their students. When students perceive their instructors to be more effective and supportive in their communication with them, the students demonstrate greater achievement outcomes. We examined the statements that undergraduate students (N = 362; 64% first-year students, 65% women, 88% heterosexual; 82% White) reported that professors made to them that made them feel better and worse about themselves as students. Overall, more students reported a statement made by a professor that made them feel better (91%) than worse (73%), and students reported that statements that made them feel better were made more often than statements that made them feel worse. We did find differences in these reported experiences due to students' gender, race, and age. We will discuss these differences as well as the themes that emerged in the statements that made students feel better and worse about themselves. We will conclude with recommendations for how professors may provide may better experiences for and support to their students.

Inclusive Discussion Facilitation Methods

11:00 AM – 11:15 AM

Class discussion is a key active learning strategy that relies on student participation. How it is elicited—through volunteering or calling on students—can shape its quality, quantity, and equity (Bean & Peterson, 1998), yet research remains limited. Some (e.g., males) are more likely to volunteer (Aguillon et al., 2020), and frequent volunteers often become perceived "experts" (Grunspan et al., 2016). To foster inclusion, many advocate cold-calling (Carstens et al., 2016; Hogan & Sathy, 2023), while others fear it heightens anxiety. However, anxious students often grow more comfortable over time (Dallimore et al., 2005), and cold-calling can diversify participation (Souza et al., 2010; Dallimore et al., 2012). "Warm calling" with notice can ease anxiety and promote equity. In an Introductory Social Psychology course, GSIs randomly led discussions using voluntary, warm-, or cold-calling. A 2-way ANOVA found no grade differences by race, but students in cold-calling sections earned higher final grades (M = 3.97) than those in warm-calling (M = 3.86) or volunteer (M = 3.90) sections, $F(2,290) = 47.33$, $p = .02$, $\eta^2 = .98$. Findings suggest cold-calling can enhance equity and learning.

Psychology of Music Playlist Assignment

11:15 AM – 11:30 AM

This presentation introduces a creative and research-informed assignment designed to enhance student engagement and critical thinking in courses addressing the psychology of racism. In this assignment, students create a curated playlist of songs that reflect key psychological concepts and themes explored throughout the semester (e.g., implicit bias, collective action, internalized racism, racial identity development, and structural racism). For each selected song, students write a brief analytic reflection linking the song's lyrics and cultural context to relevant empirical literature. The assignment encourages students to bridge academic theory with lived cultural expressions, reinforcing the real-world relevance of psychological science. Assessment emphasizes students' ability to synthesize peer-reviewed research, apply psychological concepts to new contexts, and articulate their insights clearly. Preliminary feedback indicates that students find the assignment both personally meaningful and academically challenging, fostering deeper understanding of complex topics and promoting inclusive, culturally responsive learning.

Relationship Science Through the Music of Taylor Swift: Reflections on Increasing Student Engagement by Incorporating Pop Culture and Collaborative Tools in a Newly Developed Course

11:30 AM – 11:45 AM

Pop culture can serve as an engaging educational tool. Here, we will describe the process and reflections of incorporating the prolific music of pop culture icon, Taylor Swift, into a close relationships course. Students (N = 13) read relationship science journal articles and tied content to the music and lyrics of Taylor Swift in an online summer course. Students actively discussed readings using Perusall annotation software and shared thoughts on readings' relationship to the music of Taylor Swift using Padlet video discussion boards. At the end, students provided open responses to questions about course effectiveness, use of collaborative learning tools (Perusall, Padlet), the course's contribution to personal/intellectual growth, and communication/critical thinking development. Four themes emerged: student recognition of depth and complexity of relationship science; efficacy and impact of Taylor Swift's music integration on the course; personal growth, critical thinking, and real-world application; effectiveness of collaborative tools. Our work will benefit those who are interested in developing courses fusing pop culture with applications of innovative pedagogy.

Psychology of Media and Technology Preconference

8:00 AM – 1:00 PM | Location: E350, Level 3

New media technologies continue to fundamentally alter how people connect, communicate, and understand themselves and others. This preconference will explore recent developments in new media, including (but not limited to) advances in multimodal AI systems, adoption of decentralized social media platforms, and the rise of immersive AR environments (e.g., smart glasses). How do people form meaningful relationships with AI? What drives digital well-being on emerging social media platforms? How does always-on augmented reality shape sociability? Invited talks from researchers in psychology and allied fields will spotlight novel work in these areas. Data blitzes and poster sessions will showcase the diverse work of early-career researchers.

Coach not crutch: AI assistance can enhance rather than hinder skill development

9:15 AM – 9:45 AM

It is widely believed that relying on AI tools inadvertently cheats us of the opportunity to develop our own capabilities. In this investigation, we examine the possibility that using AI—even while reducing effort invested in a task—may nevertheless enhance learning. Contrary to lay forecasts, participants who practiced writing cover letters with access to AI improved writing skill more than participants who practiced without AI, participants who received personalized feedback from professional editors, or participants given access to a Google Search for cover letter examples and tips. Forecasters were not wrong about effort: participants worked longer and harder when practicing without access to AI. However, AI-related decrements in effort appear to have been offset by an increase in the utility of the practice task itself: writers merely shown an AI-generated cover letter (without any opportunity to practice) improved in skill as much as writers who practiced writing with the original AI tool.

Taken together, these findings constitute an existence proof that, by providing personalized, high-quality examples, using AI tools can improve, rather than undermine, learning.

Theory-Driven Implementation of Personality in Social Robots: Toward Psychological Foundations for Human-Technology Interaction

9:15 AM – 9:45 AM

Social robots are an emerging media technology deployed in real-world settings, yet their design lacks theoretical grounding in psychological research. This study introduces the cognitive constructionism approach, which integrates psychological theory into robot design to bridge psychology and engineering. Grounded in personality psychology (Big Five, person-centered approach), we manipulated prosody (speech rate, pitch height, and pitch range) and gaze behavior (direction and aversion rate) in a social robot (CommU) across three studies (N = 1,028). Participants viewed short videos and evaluated the robot's personality. Results revealed that voice and gaze parameters interact non-additively to produce three theory-consistent personality types: resilient, average, and delicate. This approach demonstrates that personality perception mechanisms generalize from human-human to human-robot interaction, grounding robot behavior in validated psychological principles. As social robots are expected to mediate connection in healthcare and education, this work enables development of technologies supporting meaningful relationships, reducing social isolation, and enhancing digital well-being.

Reducing High Arousal Negative Content in Social Media Feeds Improves User Well-Being

9:15 AM – 9:45 AM

Despite widespread concern that high-arousal negative (HAN; e.g., angry, scary) social media content harms well-being, causal tests are rare because they typically require access to platform algorithms. We addressed this by (1) building an algorithm-independent browser extension that detects and filters HAN posts in real time and (2) evaluating its effects in three preregistered 4-week field experiments conducted before, during, and after the 2024 U.S. presidential election (10,056 daily observations; N=406). Participants were randomized to a week with or without HAN filtering and provided daily reports. Filtering reliably increased daily life satisfaction across studies; during the election, it also reduced anxiety and depressive symptoms. Benefits occurred without reducing time on platform, political engagement, or news knowledge. The results offer causal evidence for a scalable, user-controlled intervention that can improve well-being, especially under heightened stress.

Social Media Use Intentionality Improves User Experience and Well-being Outcome

9:15 AM – 9:45 AM

A key challenge in social media use (SMU) and well-being studies is that SMU behaviors are highly context- and content-dependent. This study thus aims to examine the underlying psychological drivers of SMU outcomes. Drawing on theories of goal-directed behavior and user agency, we test how motivation strength and awareness of motivation (intentionality) relate to well-being. We conducted a 7-day Ecological Momentary Assessment (EMA; six surveys/day) with 266 US adults (71.3% response rate), linked to screentime screenshots and user-donated TikTok data (80.5% EMA matched). Within individuals, higher intentionality and motivation strength predicted more positive experiences and greater well-being, especially when SMU was used for coping, entertainment, passive time, or habit. Between individuals, awareness of motivation fully explained the link between SMU agency and well-being. TikTok data showed little behavioral variation by intentionality, except that more intentional users skipped videos faster. Findings highlight intentionality as a key process shaping momentary SMU experiences, while also underscore the need to better capture behavioral signals of intentional SMU.

[81] Beyond Job: AI as Perceived Threat to Self-Identity

10:30 AM – 11:30 AM

AI is often portrayed as a threat to employment. However, this assumption might overlook a deeper mechanism: the threat that AI poses to self-identity. We propose job loss threat as a trigger, while the ultimate source of fear might be the potential loss of uniqueness. When individuals perceive AI as a threat to their role, they are not only afraid of unemployment but also of the erosion of a part of their identity.

Based on research on ego-defensiveness and self-identity, this study outlines the model where AI salience → Job loss threat → Identity threat - Defensive attitudes towards AI. For those who have work-identity centrality, this causation could be much stronger.

We outline a study design in which participants would be randomly assigned to read vignettes describing AI implementations with (a) job loss with income loss, and (b) job loss without income loss. This design would allow us to test whether AI fear persists even when income is guaranteed. If yes, it might suggest that the driver is an identity threat.

This model frames AI anxiety as an existential rather than purely economic concern and points to new directions for theory and communication.

[82] Artificial Intelligence Is Stereotypically Linked More with Socially Dominant Groups in Natural Language

10:30 AM – 11:30 AM

Despite the growing role of artificial intelligence (AI) in society, its social representation remains underexplored. We show that AI is asymmetrically stereotyped, being more closely associated with socially dominant groups. Specifically, we examined AI's positioning on the warmth–competence dimensions of the stereotype content model, its links with advantaged (men, young, wealthy, White) versus disadvantaged (women, older, poor, non-White) groups, and its perceived impact on high- versus low-prestige occupations. Across four studies using language-based analyses with static embeddings, BERT, GPT-4, and human-participant validation, we found: (i) AI was strongly associated with competence but showed variability in warmth; (ii) AI was more strongly linked to advantaged groups; (iii) advantaged groups were semantically closer to AI on warmth–competence dimensions; and (iv) high-prestige occupations were associated more with AI's benefits, while low-prestige ones were tied to its threats. These findings indicate that perceptions of AI are systematically biased toward dominant groups, potentially reinforcing social inequalities and raising concerns about an emerging “AI divide.”

[83] Who Did the Work? Egocentric Bias in Human-AI Collaboration

10:30 AM – 11:30 AM

When people collaborate with others, their perceptions are distorted by egocentric bias, where they tend to overestimate their own contributions. However, AI presents a new frontier: we don't know what the egocentric bias will look like when people interact with AI. What dynamics will shape egocentric biases during human-AI interactions? Do people attempt to mentalize AI's processes? If they do, what does that look like? Across three initial studies, we examine how the egocentric bias unfolds in human-AI collaboration. In two experiments (N = 299 and N = 60), Ps summarized an article either independently or with AI assistance. Those who used AI attributed substantially less of the final product to themselves than Ps who worked alone, suggesting that people initially recognize AI's substantial role. However, in a third study (N = 319), this accuracy eroded over time: participants who collaborated with AI on a creativity task later recalled a greater share of the ideas as their own two weeks after the interaction. These findings reveal that people's perceptions of authorship in AI-assisted work are dynamic—initially accurate but increasingly biased toward self-enhancement over time.

[84] When Algorithms Hide: How Concealment and Personalization Depth Shape Privacy Concern and Purchase Intention

10:30 AM – 11:30 AM

In July 2025, Reuters reported that Walmart would launch AI "super agents" like Sparky for reorders and event planning (Cavale, 2025). Netflix, Spotify, and Starbucks likewise show that personalization is now the default interface (Tang et al., 2023; Spotify, 2023). Yet such systems often conceal how data and inferences are used, creating opacity and lowering trust (Ananny & Crawford, 2018).

Drawing on privacy-calculus and transparency-as-signal theories, we examine algorithmic concealment—when firms hide inference logic—and its interaction with personalization depth. In a live shopping experiment, hyper-personalization increased engagement. A second study (PROCESS Model 7) showed that personalization affected purchase intention via privacy concern, moderated by perceived concealment. When concealment was low, hyper-personalization raised concern; when high, the concern gap vanished.

Overall, concealment can offset privacy tension in hyper-personalization but harm trust in traditional settings.

[85] Feeling Good Leads to Stable Play: Reciprocal Feedback between Gaming and Well-Being

10:30 AM – 11:30 AM

Video games are a ubiquitous form of leisure with complex connections to well-being. Using a large longitudinal dataset (N = 7,618; 74,422 player-days), we applied a dynamic -SEM approach to estimate continuous-time effect sizes and draw implications for same-day, next-day, and between-person associations between playtime and well-being, enjoyment, autonomy, competence, focus, and immersion. On days when players gamed more, they reported slightly higher levels of affective functioning compared to their typical well-being ($r = .05$, $p < .001$). However, this same-day association did not persist over time. In contrast, higher well-being predicted slightly more play the following day ($\beta = 0.02$, $p < .01$), consistent with a "feel-good-return" pattern. Location-scale models showed that individuals experienced modest increases and greater stability in well-being on days they played more, suggesting gaming may temporarily elevate and stabilize affect. Event-specific effects (e.g., progression, equipment unlocking) and behavioral tendencies (e.g., idle time, regularity) illustrate how design features can shape short-term psychological experiences.

[86] Joking at our expense: Humorous critiques of economic inequality depict the working-class as powerless and dumb

10:30 AM – 11:30 AM

Online humor has become a key channel through which people express grievances about the economic system and economic inequality. The present mixed-methods study examines the forms of humor used in critiques of the economic status quo and the subsequent representations of the American working class. We sampled 193 anti-capitalist memes and jokes created and shared by real online users through social media sites and meme databases. A participant sample (N = 500) rated the extent to which the posts belittled an out-group (disparagement humor) and used self-deprecating jokes to make light of difficult situations (gallows humor). Whereas derogation and self-deprecation were present at similar rates across the sampled stimuli, most jokes provided negative depictions of the working class. Disparagement jokes tended to belittle in-group members such as coworkers and politically dissimilar members of the working class, depicting them as dumb. Critiques using gallows humor depicted the self or similar others as powerless. Informed by Social Identity Theory, we suggest these results may represent current challenges to the development of a working-class identity in the United States.

[87] Pride or Prejudice? Consumer Responses to Corporate Activism

10:30 AM – 11:30 AM

Over the past decade, the frequency of companies taking public stances on social issues, such as BLM, climate change, and LGBTQIA+ rights, has steadily increased. But today's shifting political and cultural climate has complicated this wave of corporate advocacy. How will companies' decision to commit to, or step away from, social advocacy impact perceptions of the causes they supported, their motives, and the company itself? And how do cultural perceptions of companies' political leaning shape these judgments? My study investigates this question using responses to real-world corporate social media posts supporting, or not acknowledging, Pride Month in June 2025. I will examine how their decision shapes support for LGBTQIA+ rights, whether people think their advocacy is self-serving or altruistic, and people's affinity towards the companies. Additionally, I will compare perceptions of these companies in 2023 to now, to examine how companies' decision to continue or stop advocating for Pride Month impacts how people perceive them. This work will help illuminate how the current political and cultural climate has changed the interpretations and impacts of corporate advocacy.

[88] I Sometimes Feel Closer to AI Than to People I Know in Real Life: Examining Generative AI Attitudes and Loneliness

10:30 AM – 11:30 AM

Generative AI (genAI)'s rising popularity necessitates research addressing its potential psychosocial impacts. This Prolific survey of U.S. 18–25-year-olds (N = 1004; 56.3% women, 39.4% men, 4.3% another gender) examined links between loneliness and genAI attitudes and motivations. We developed, using EFA and internal consistency metrics, a scale of genAI emotional support motivation (ESM, desire to use genAI for companionship and connection; $\alpha = .95$) and two measures of genAI attitudes: AI-Human Substitution (AIHS, preference for AI over human interaction; $\alpha = 0.91$) and AI Idealization (AIi; idealizing AI characteristics; $\alpha = 0.87$). A linear regression controlling for gender, genAI use frequency, race, and SES shows that AIHS ($p < .001$) and AIi ($p = .03$), but not ESM ($p = .12$) were related to more loneliness. We also tested interactions between ESM, AIHS, and AIi. There was a significant interaction between AIi (but not AIHS) and ESM ($b = -.07$, $p = .002$). For those with high (but not low) AIi, ESM was related to significantly lower loneliness ($b = -.10$, $p = .02$). Findings suggest genAI attitudes and motivations might jointly predict different psychosocial outcomes.

[89] Body vs. Face Satisfaction and Appearance-related Social Media Consciousness

10:30 AM – 11:30 AM

While the relationship between social media and adolescent depression remains inconsistent, appearance-related social media consciousness (ASMC) has been shown to precede mental health challenges among adolescents. Identifying ASMC correlates can help target interventions. We examined cross-sectional associations between body and face satisfaction and ASMC among 1,594 adolescents (ages 11–15, M = 13.15; 47.5% girls; 36.7% Latine). Youth reported satisfaction with face (facial features, eyes, nose, hair thickness, hair color, hair texture, skin complexion/texture, skin tone/color) and body (stomach, muscle tone, weight, height). Controlling for gender and time on social media, lower body satisfaction ($b = -.33$, $p < .001$) and lower face satisfaction ($b = -.18$, $p < .001$) were associated with higher ASMC. Higher time on social media amplified the negative association between ASMC and both body satisfaction ($b = -.02$, $p = .029$) and face satisfaction ($b = -.04$, $p = .005$). Findings highlight the need to address specific appearance concerns in adolescents, especially among heavy social media users, to mitigate the impacts of ASMC.

[90] The Paradox of AI Humor: ChatGPT Makes Us Laugh – Until We Know It's AI

10:30 AM – 11:30 AM

Is ChatGPT funny – and do people think so? Across four preregistered experiments (N = 1,185), we compared ChatGPT-3.5's humor to that of laypeople (Study 1) and professional comedy writers (Study 2), and examined how perceived authorship shapes humor judgments (Studies 3–4). Participants rated the funniness of jokes generated in response to comedic prompts (e.g., complete a setup, fill in an acronym, or write a playful "roast") (Study 1) or satirical news headlines (Study 2), without knowing their source. Across tasks, ChatGPT's jokes were rated funnier than those written by laypeople ($p < .001$, $d = 0.63$) and as funny as those by professional comedy writers at The Onion ($p = .14$, $d = 0.10$). In Studies 3 and 4, we manipulated the perceived source of the same jokes. When jokes were labeled as AI-generated (vs. human-generated), participants found them less funny ($p's < .001$, $d's = 0.24–0.81$). This effect was mediated by perceived authenticity: jokes seemed less "real" or genuine when thought to come from AI. These findings highlight a paradox of AI humor – machines can make us laugh, yet their jokes fall flat once we know who's telling them.

[91] Talk, Listen, Connect: How Humans and AI Evaluate Empathy in Responses to Emotionally Charged Narratives

10:30 AM – 11:30 AM

Social interactions promote well-being, yet barriers like geographic distance, time limitations, and mental health conditions can limit face-to-face interactions. Emotionally responsive AI systems, such as chatbots, offer new opportunities for social and emotional support, but raise critical questions about how empathy is perceived and experienced in human-AI interactions. This study examines how empathy is evaluated in AI-generated versus human responses. Using personal narratives, we explored how persona attributes (e.g., gender, empathic traits, shared experiences) and story qualities affect empathy ratings. We compared responses from standard and fine-tuned AI models with human judgments. Results show that while humans are highly sensitive to emotional vividness and shared experience, AI-responses are less influenced by these cues, often lack nuance in empathic expression. These findings highlight challenges in designing emotionally intelligent systems that respond meaningfully across diverse users and contexts, and informs the design of ethically aware tools to support social connection and well-being.

[92] Does Repeated Participation in Crowdsourcing Research Undermine Trust in Researchers? A Natural Language Processing Analysis

10:30 AM – 11:30 AM

Crowdsourcing platforms are widely used in social science research, yet researchers often regard workers merely as "data providers" rather than as individuals, imposing burdens through research design. Such negative experiences can foster workers' distrust toward researchers, which may be reflected in their language use—for example, through expressions of negative emotions or superficial responses in open-ended comments. We examined this possibility by asking 1,191 Japanese workers to describe their experiences with crowdsourcing tasks. Their responses were analyzed using J-LIWC (the Japanese version of the Linguistic Inquiry and Word Count). With greater participation experience, the use of negative emotion words did not increase, whereas the use of cognitive process words decreased. Distrust may reduce workers' willingness to reflect on and articulate their dissatisfaction or suggestions to researchers. Although shared mental models foster trust, repeated participation may weaken workers' motivation to seek mutual understanding with researchers. While researchers tend to distrust "professional respondents," they should also recognize that this distrust can be mutual.

[93] actor Structure of Social Media Use Motivations Among Diverse Adolescents

10:30 AM – 11:30 AM

Social media is a key setting for adolescent connection, information-seeking, and entertainment (Allen et al., 2014). For LGBTQ+ adolescents, online spaces may be particularly important for finding community and support not always accessible offline. As research increasingly emphasizes diverse motivations for social media use rather than overall "screen time" (Maheux et al., 2024), the present study used exploratory factor analysis to identify underlying factors of adolescents' social media motivations and examined their associations with psychological wellbeing. Participants (N = 1275; Mage = 18) completed measures of social media use frequency, motivations, and wellbeing. Four motivation factors emerged: connection, entertainment, emotion regulation, and health information-seeking. LGBTQ+ youth reported greater engagement in activism and health information-seeking compared to non-LGBTQ+ youth, who were more motivated by entertainment and emotion regulation. Findings underscore the multidimensional nature of social media use and the importance of understanding diverse motivations across adolescent groups.

[94] Violent Media Exposure and Aggressive Behavior in Adolescents

10:30 AM – 11:30 AM

This study investigates the link between violent media exposure and aggressive behavior in adolescents, addressing a growing concern in psychological research. With the rise of violent content in television, films, and video games, past studies suggest a correlation between exposure and increased aggression, particularly in children aged 8 to 12. This research aims to determine if violent media consumption directly correlates with heightened aggressive thoughts and actions. Approximately 200 children will be recruited from local schools, ensuring balanced gender representation and demographics. Participants will be assigned to experimental and control groups, exposed to violent and non-violent media, respectively. Aggression levels will be measured using the Buss-Perry Aggression Questionnaire after media exposure. Findings are anticipated to provide insights into the cognitive and social mechanisms that mediate the relationship between violent media and aggression. This study aspires to address existing gaps in the literature, enhancing the understanding of how violent media shapes adolescent behavior across various contexts and developmental stages.

[95] It's Not Me, It's Zoom: Misattribution of Delay in Turn-Taking on Speaker Judgments

10:30 AM – 11:30 AM

Human conversation relies on turn-taking mechanisms that allow speakers and listeners to coordinate rapid speaking. Remote video platforms like Zoom introduce subtle delays that may impair these mechanisms. This study examines how medium-induced timing disruptions affect listeners' judgments of their conversational partner's confidence with a metacognitive judgement known as Feeling of Another's Knowing (FOAK). Sixty-four participants engaged in structured dialogue tasks either in person or over Zoom, with FOAK ratings and conversational smoothness measured before and after a period of adaptation. FOAK ratings were significantly lower in the remote condition than in the in-person condition, and increased over time across both media. General conversational smoothness ratings also increased over time, but showed no effect of condition. These results suggest that disruptions in turn-taking caused by remote communication may be misattributed to the speaker's knowledge state. The findings highlight the sensitivity of conversational timing mechanisms to medium constraints and suggest that listener judgments may be implicitly biased by delay, even when conversation appears fluent.

[96] How Does Culture Moderate the Relationship Between Self and Autobiographical Memory Online?

10:30 AM – 11:30 AM

The present study investigated how self and autobiographical memory interact in the online space and whether culture plays a role. Asian and European American participants were randomly assigned to work online on a simulated social media platform or offline, where they provided self-descriptions and shared autobiographical memories with relevant photographs. Results showed that the total number and positivity of self-descriptions were higher in the offline condition than the online condition, particularly among European Americans. For Asian participants, higher positive self-evaluation predicted a greater tendency to mention positive emotions in the online context, whereas positive self-evaluation was not associated with this tendency in the offline context. For European American participants, positive self-evaluation was not associated with the tendency to mention positive emotions in either context. These findings suggest that both cultural background and online context shape autobiographical memory through the extent of expression of self.

[97] From Ally to Algorithm: How Disagreement Shapes AI Perception

10:30 AM – 11:30 AM

With AI's utilization of natural language processing, individuals have begun to leverage it for their personal issues. While it seems useful as an impartial companion, prior research has shown it answers in an amicable nature, leading to confirmation bias. In this study, we investigated how individuals react to AI when it disagrees with them on complex topics involving human emotions, like choosing to prioritize one's family or partner. Participants (N = 259) were randomly assigned to one of these human issues, decided how to act, and then defended their reasoning to GPT-5 mini. Participants were also randomly assigned to a model with instructions to either agree or disagree with their reasoning. Then they answered questions about their perception of AI and its capabilities. Results demonstrated that participants evaluated AI's ability to understand human emotions higher when it agreed with their reasoning, than when it disagreed. Additionally, we found a gender difference, as men perceived AI's response as more machine-like when it disagreed, while women judged humanness similarly across conditions.

[98] Emotional Responses to Human–AI Collaboration Across Professional Contexts

10:30 AM – 11:30 AM

Artificial intelligence (AI) represents not merely a technological tool but a social agent that reshapes human collaboration. This study examined how different cooperative roles between humans and AI, whether AI or the human served as the thinker (strategizing) or the doer (implementing) influence emotional evaluations of collaboration. Across four countries and four occupations (psychotherapy, art, engineering, and surgery), participants rated their trust, appreciation, and affective responses to the work process. Assigning AI to either the thinking or doing role reduced trust, appreciation, and positive affect relative to human-led conditions. Job type shaped these perceptions: when AI acted as the doer in emotionally charged professions such as therapy, trust, appreciation, and positive affect declined sharply. In contrast, assigning AI as the thinker did not further diminish evaluations. Anthropomorphism moderated these effects, participants who viewed AI as more human-like expressed greater trust, appreciation, and positivity.

[99] Digital Companionship and Romantic Loneliness: The Psychology of Virtual Love

10:30 AM – 11:30 AM

Love, traditionally shared between humans, is increasingly being directed toward virtual agents (VAs). Across five studies (N = 1,951), we explore why people pursue romantic connections with VAs (Studies 1 and 2), how romantic needs emerge in these interactions (Study 3), whether virtual romance offers real-world psychological benefits (Study 4) and alleviate romantic loneliness (Study 5). Our findings reveal that engaging with VAs can reduce loneliness and enhance well-being, regardless of relationship status. Surprisingly, individuals in romantic relationships report stronger emotional engagement and greater psychological benefits from VAs than singles. These partnered individuals also experience emotional support from VAs, which contributes to their sense of resilience. Gender differences are emerged that men feel more guilt about spending time with VAs but not about spending money on them. Although users feel ambivalent about microtransactions involving romantic VAs, they continue to use these interactions to fulfill personal needs. The findings highlight the benefit of virtual romance and the importance of understanding how technologies are reshaping human relationships.

[100] Directors Imbue their Films with Clues to their Gender

10:30 AM – 11:30 AM

Common refrains suggest people signal who they are through their things (e.g., “you can tell a lot about someone from their shoes”), but how might media products reveal creators’ identities? Building from research describing person perception from behavioral residue, here we investigated how directors’ gender manifest subtly and incidentally in films. Funneled investigation across 14 experiments (N = 1593) revealed that participants could detect directors’ gender from minimal exposure to their films because male directors’ films featured more men and more gender-typical actors. People therefore detect creators’ gender from their creative products, and gendered-film stereotypes explain the specific mechanisms of these inferences. The same cues to gender also manifested in non-directors’ casting decisions, evidencing a broader pattern by which one’s social categories subtly manifest in and enable social inference from media products. Taken together, this work helps to explain one means through which people generate and shed behavioral residue, breaking new ground in understanding how people inextricably relate to, and imprint themselves upon, the mediated worlds around them.

[101] The (In)effectiveness of Bias Indicators

10:30 AM – 11:30 AM

In recent years, multiple organizations have built political bias indicator solutions with the explicit aim of informing news consumers about the political leaning of individual news articles or sources, with the idea that providing this information will reduce partisan bias. The present research examined the effectiveness of political bias indicators from NoBias, which report the partisan leanings of individual news articles. In Fall 2020, Participants (N=399) selected articles to read from eight buffets of news headlines featuring various current events, each containing headlines from either left-leaning, right-leaning, or center-leaning articles (according to the NoBias algorithms); half of the buffets included bias indicators. Results indicated that bias indicators actually increased partisan selective exposure, particularly for conservatives (though liberals displayed more selective exposure overall). This research suggests that tools like bias indicators may not be practically useful at reducing partisan selective exposure, and instead may be harmful.

[102] Context Collapse in Self-consciousness on Social Media is Gendered

10:30 AM – 11:30 AM

Women tend to be more self-conscious than men. Drawing on computer-mediated communication theorizing on objectification theory and context collapse, we show, however, that gender differences in self-consciousness manifest differently between offline and social media contexts. Participants (Studies 1 and 2; N = 2770; 58% women) completed measures of self-consciousness specified to indicate a) offline and b) social media contexts in c) private (i.e., concerning internal states) and d) public (i.e., concerning external appearance) senses. Findings showed that public self-consciousness was pronounced on social media in women relative to men (Study 1). Greater femininity predicted greater public self-consciousness on social media as well (Study 2). We corroborated these findings with women’s qualitative experiences (Study 3; N = 37, 76% women). Our findings imply unique gender dynamics on social media, namely a context collapse centering public self-consciousness in women on social media.

[103] Shaping empathic expressions: how human-AI collaboration influences first person perceptions of empathic messages

10:30 AM – 11:30 AM

Generative AI models perform well at generating messages that convey empathy when judged by third party raters, but can they help people elicit empathy? This project examines first person perceptions of empathy by studying how participants creating empathic messages with or without AI perceive their messages and experience. We conducted an online RCT (N = 605) that randomly assigned participants to write an empathic message for people experiencing mental health challenges with human-AI collaboration or without (control). We also examined two styles of human-AI collaboration in which participants either created the first draft of a message and the generative AI edited it (co-pilot condition) or they edited the first draft created by AI (monitor condition). Results showed that people perceived their messages as more empathic in the human-AI collaboration conditions than on their own. Collaborating with AI did not reduce their perception of how authentic the message was overall, even though they reported less effort to create the message with AI. Our findings suggest that working with AI can help people express empathy to others in meaningful ways while reducing the cognitive cost.

[104] Moralization Predicts Topic Prevalence on Social Media but not Traditional Media

10:30 AM – 11:30 AM

Moral content captures human attention, guiding which information warrants concern. This phenomenon may be particularly strong on social media, where the impact of human bias on content feeds is especially pronounced. The current research presents a large-scale exploration of whether morality guides which topics become more prevalent in social media and traditional media over time. We combined text corpora from social media (Twitter/X; 9.8M posts from 12,838 randomly sampled users across 48 million users) and traditional media (the Corpus of Contemporary American English; 115K texts from newspapers, television, and magazines) to examine if issues that were highly moralized in earlier years were more likely to become prevalent in public discourse in later years. Highly moralized topics on Twitter/X became highly prevalent in online discourse on Twitter/X (as topics low in moralization became less prevalent) over time, but traditional media did not show this pattern. These results suggest that the content of social media (versus traditional media) may be more strongly shaped by biases favoring moral content.

[105] Predictably Divisive News

10:30 AM – 11:30 AM

Political polarization shapes how Americans interpret the same information, yet little is known about how political partisanship informs the way individuals evaluate identical news content when source cues are removed. Across two preregistered studies, Democrats and Republicans rated Wall Street Journal (N = 275) and New York Times (N = 276) headlines on credibility and engagement. Each participant rated 50 real-world headlines, presented without outlet identifiers. For the Wall Street Journal, Democrats and Republicans did not differ in credibility but Republicans found headlines more engaging. For the New York Times, Democrats rated headlines higher on both credibility and engagement. Across both outlets, credibility exceeded engagement within parties. These findings suggest that polarization extends beyond source selection to the interpretation of shared news content: even when stripped of source cues, headline language evokes distinct affective and epistemic responses across party lines, highlighting how linguistic framing can reinforce partisan divides.

[106] Love Triangles are Endgame: How Wishful Identification, Perceived Similarity, and Parasocial Relationships Inform the Pop-Media Relationship Puzzle

10:30 AM – 11:30 AM

The “love triangle”—typically found in romantic media for young adults—is a device that explores the idea of choice and identity in the context of romantic relationships. Young adults (YAs) learn by social cognitive theory; they may also learn and form beliefs from watching romantic media. This study investigates roots of fan investment in love triangles, and whether factors such as wishful identification and perceived similarity with female love interests (LIs) serve as predictors. Using preliminary survey data from N=235 straight and bisexual undergraduate women, we found that wishful identification with female LIs significantly mediates ($p<0.01$) the relationship between perceived similarity and certain dimensions of parasocial relationships (e.g., paracouple relationship investment). Furthermore, across three YA romance fandoms, viewers reached consensus for ratings of neuroticism [23-.58] and conscientiousness [.27-.31]; opposing male LIs from each fandom were different from one another on both traits ($ps<0.001$), suggesting character archetypes that might inform viewers’ preferences for one LI over another. Data collection and analyses are ongoing.

[107] Identity styles, processes, and motivations for social media use

10:30 AM – 11:30 AM

Young people today often turn to social media (SM) as they engage in the critical task of identity formation. Yet, little empirical work has examined how identity styles (i.e., characteristic ways of engaging in identity development), and identity processes (e.g., exploration and commitment) relate to motivations for social media use. In this cross-sectional study of emerging adults in the California Bay Area (N = 708), we examined how identity styles and processes relate to three identity-relevant motivations: Self-Expression (e.g., to show my personality), Self-Exploration (e.g., to explore who I want to become), and Information Sharing (e.g., to share useful information). Regression analyses revealed that greater identity exploration, as well as more informational and normative identity styles, was a significant predictor of all three motivations. In contrast, greater identity commitment was a significant predictor of self-expression motivation. Taken together, the findings shed light on the identity processes that explain why young people use social media, and underscore the significance of the digital context as a meaningful space for identity development.

[108] When (and when NOT) to use AI to simulate humans

10:30 AM – 11:30 AM

The growing use of large language models (LLMs) as AI surrogates—synthetic participants in psychological and behavioral research—has sparked both excitement and concern. Proponents highlight their potential to rapidly test hypotheses, model social processes, and complement traditional data collection. However, recent work shows that these tools risk amplifying biases, narrowing diversity, and creating illusions of generalizability when treated as substitutes for human samples. Drawing on recent empirical and theoretical contributions from cognitive science, psychology, and computational social science, this presentation reviews the promises, pitfalls, and safeguards associated with using AI to simulate human behavior. We argue that while AI-based simulations can expand experimental reach, they should be grounded in human data, validated against real participants, and used only for questions that cannot feasibly or ethically be tested with humans. In short, humans remain the gold standard; AI can complement—but not replace—them.

[109] From posts to playlists: Social media use and belonging in music fans across an album release

10:30 AM – 11:30 AM

As celebrity fandom becomes increasingly intertwined with social media usage, it is important to apply empirical understandings of social media use to celebrity fandom. Previous research recognizes the role of belonging in fan identity (Tague et al., 2020) and connects social media use with the need to belong (Büttner et al., 2022). The present study will explore individuals' sense of general and fandom-specific belonging in relation to social media use. Participants (N ≈ 300) will report social media use (categorized as active or passive, with additional items on fan-oriented behaviors) and belonging in the two weeks before and after an album release by a celebrity for whom they identified as a fan and/or regular listener. Analysis of reciprocal relationships and differences between social media use and belonging before and after the album release, as well as comparisons between platforms, will provide insight into how fans connect through social media. Results will increase understanding of behaviors and motivations associated with fandom – this is particularly important as fandom and social media play an increasingly large role in individuals' lives.

[110] How Status Shapes AI Use in Creative Work

10:30 AM – 11:30 AM

Artificial intelligence (AI) is increasingly integrated into creative work, offering new opportunities for innovation. Yet, whether using AI in creativity is applauded remains debated (Small, 2023). Because creativity is closely tied to creative professionals' rewards, pay, and promotions (Proudfoot et al., 2015), concerns about how others judge AI use are likely amplified. Our research examines how professional status shapes creative professionals' attitudes and behaviors toward AI in organizations. We propose that low- and high-status individuals differ in evaluation concern, the extent to which they fear being judged (Carleton et al., 2006), for relying on AI, which in turn influences their AI use and disclosure. In our pilot study with creative professionals and students, low-status individuals showed higher evaluation concern and were less likely to disclose AI use, though actual use did not differ significantly. These findings highlight important organizational implications, as nondisclosure may hinder collaboration and transparency in creative teams, offering new insights into how social hierarchies shape human–AI integration in creative work.

[111] Digital Detox: Effective or Inconsequential?

10:30 AM – 11:30 AM

The media, influencers, and dinner table discussion will all tell you about the purported harms of smartphones on our mental health and well-being. One obvious and increasingly popular solution would be to engage in digital detox practices, where we intentionally restrict our use of technology for a certain period of time. But do these practices actually work? We randomized 331 undergraduates to either engage in digital detox each morning for one week or to a control condition without an intervention. Participants in the digital detox condition complied with instructions only 65% of the time. But contrary to our pre-registered hypotheses, even on days when participants did comply with instructions in the digital detox condition, we found no significant difference in mood or social media usage compared to participants in the control condition. However, exploratory analysis did reveal a significant positive association between digital detox and energy levels. These results highlight both the difficulty in getting people to actually engage in digital detox practices, as well as the limited efficacy of these interventions on improving well-being outcomes.

[112] The interaction effect of task type and types of human-AI interaction on preferences for humanlike AI

10:30 AM – 11:30 AM

As AI grows more humanlike, attitudes toward it remain mixed. Drawing on task-technology fit (TTF) and the SEEK model, we conducted two experiments to examine how task type (creative vs. algorithmic) and interaction type (collaborative vs. competitive) shape preferences for humanlike AI. Results confirmed a significant interaction: individuals preferred humanlike AI more when collaborating (vs. competing) on creative tasks, but no difference emerged for algorithmic tasks. Study 2 further revealed that this effect was stronger among individuals high in neuroticism. These findings advance understanding of technology adoption and human-AI interaction by showing that preferences for humanlike AI depend on both task characteristics and user traits, and they highlight the need for organizations to consider task context and individual differences when integrating AI into the workplace.

[113] Reducing Transgender Prejudice via Video Game Player Characters

10:30 AM – 11:30 AM

The purpose of this study is to test whether playing a video game with a transgender player character can reduce transgender prejudice. The parasocial contact hypothesis states that interactions with outgroup media characters can reduce prejudice toward that group. Research on parasocial contact has indicated its effectiveness with several outgroups, including transgender people. Past research on parasocial contact has typically utilized video-based media, such as TV. Video games, as an interactive medium, have unique qualities (such as high immersion) that may change the impact of intergroup contact. Participants will be 80 undergraduate students enrolled in an introductory psychology course at a private university. Participants are randomly assigned to one of two conditions. Those in the experimental condition play the video game Tell Me Why, where the player controls a transgender man. Participants in the control condition play the video game The Awesome Adventures of Captain Spirit, where they control a cisgender boy. Participants play the game for 90 minutes and then complete a survey measuring prejudice toward transgender men.

[114] Moderation in moderation? Intuitions about content moderation are misaligned with effective practices for reducing the spread of conspiracy beliefs

10:30 AM – 11:30 AM

Which social media posts are the most important to remove to prevent the spread of conspiracy beliefs? Participants viewed sets of social media posts containing evidence for conspiracy theories in one of three moderation conditions: with no posts removed, with a post containing plausible evidence removed, or with a post containing implausible evidence removed. We found that individuals believed conspiracy theories less when posts containing plausible evidence had been removed but not when posts containing implausible evidence had been removed. However, in follow-up experiments using the same materials, participants making moderation decisions believed that it was more important to remove posts containing implausible evidence than posts containing plausible evidence. Our results suggest that moderation efforts may be spending outsized attention addressing content that is not substantively contributing to the spread of conspiracy beliefs. Our work also underscores the importance of considering the spread of misinformation not just at the level of individual pieces of content but also with attention to how broader false beliefs emerge from exposure to this content.

[115] Parents talk Online Safety: Understanding US parents' expectations and concerns about children's online safety

10:30 AM – 11:30 AM

Much news has been generated about social media's impact on children's mental health and wellbeing — but what do parents think about this issue? Are they concerned, and do they want change? In this study, we examine parents' beliefs about children's online safety, self-described precautionary behaviors (e.g., use of parental controls), and attitudes towards regulation. Using a nationally representative survey of parents of children ages 17 or under (N = 2,082), and five focus groups (N = 50), we find that parents across backgrounds and beliefs agree on both the scale of the challenge, the need for action, and the solutions—presenting a key point of consensus in a time of profound political division.

Lunch

12:00 PM – 1:00 PM

Lunch will be served in the Exhibit Hall. Seating is available in the Exhibit Hall, Cafe on Level 3, and the Lobby on Level 2. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

oGrilled Chicken Pesto Sandwich: Grilled Chicken Breast, Fresh Mozzarella, Oven Dried Tomato, Arugula, Basil Pesto, Ciabatta Roll

oRoast Turkey Caprese Pasta Salad: Rotini Pasta, Cherry Tomatoes, Fresh Mozzarella, Basil Pesto, Mixed Greens, Balsamic Glaze

oRoasted Vegetable Wrap (V): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto, Wrap (limited gluten free wraps available)

oMediterranean Chickpea Salad (VG | GF | DF): Crispy Chickpeas, Cucumbers, Tomatoes, Red Onion, Kalamata Olives, Feta Cheese (on the side), Mixed Greens, Lemon Vinaigrette

*PRECON (IN-PERSON)

Historical Psychology Preconference

8:00 AM – 1:00 PM | Location: E351, Level 3

History is a psychological fossil record that opens up an exciting source of data from "dead minds." Studying this fossil record could shed light on how and why our biases, emotions, attitudes, and beliefs have changed over time, and how our psychologies could change in the future. Our historical narratives (our shared understandings of past events) also undergird our collective identities and drive conflict and cooperation between groups. The Historical Psychology preconference brings together researchers from different corners of personality and social psychology to discuss these processes. It will feature talks, data blitzes, and a poster session focused on the historical roots of modern psychological and behavioral phenomena, such as stereotypes, values, and intergroup relations. Talks will be methodologically diverse, allowing attendees to learn about new advances in text analysis, agent-based modeling, ethnographic analysis, historical large-language models, and other tools that illustrate how minds and histories dynamically shape each other.

Historical Migration and the Evolution of Emotion Culture

8:10 AM – 8:30 AM

Cultures change, but new cultural systems also emerge over history. The socio-ecological factors that exert pressure on human values and practices to evolve in dynamic ways are numerous. In this talk, I examine the emergence of culture due to conditions created by long-history migration. The populations of today's countries and other geographic regions have descended from an uneven influx of people from different cultural and linguistic traditions. I suggest that the challenges of social living in contexts of historic intergroup mingling, which include social unpredictability, linguistic variability, and a collision of conflicting social norms, constitute contexts that encourage the emergence of new cultural adaptations. Specifically, I show that cultures of emotion that emerge in ancestrally diverse societies involve 1) emotional expressiveness and 2) expressive accuracy, 3) the frequent use of smiles potentially to communicate preferences and establish trust, and 4) regular exercise of the balance between sympathetic and parasympathetic nervous systems to support a high level of non-verbal communication and informational exchange. I also motivate the hypothesis that languages evolve in predictable ways in ancestrally diverse societies. Specifically, features of language that facilitate language acquisition by adult learners, such as compressibility, should become more common in ancestrally diverse contexts.

History as a prior: How past experience shapes and limits future exploration

8:30 AM – 8:50 AM

Human history is shaped by the actions of many people; learning from others often seems like a way to correct individual mistakes and make past experience more reliable. However, in this talk, I argue that socially learned experience can both accelerate learning and trap people in suboptimal decisions. Using collective hiring as an example, I show that when there is one optimal group to hire for a position, learning from prior experience is useful; shared history quickly points everyone to the right choice. But when there are multiple optimal groups, relying on the past becomes a problem. People follow what others have done, settle on a narrow set of options, and stop exploring alternatives. Evidence comes from multi-agent reinforcement learning simulations and large-scale multiplayer human behavioral experiments. I discuss how this perspective offers a new view of statistical discrimination in labor markets: historical events function as a collective prior that can both guide and mislead future decisions.

Cohorts and Cultural Change

8:50 AM – 9:10 AM

How does a society's distribution of beliefs, opinions, and values change over time? In this talk, I will argue that most change on most things (e.g., politics, gender, race) occurs via cohort replacement. After outlining the theoretical possibilities for change mechanisms and reviewing existing evidence from cross-sectional and longitudinal studies, I will present some new empirical work. I conclude by offering a theoretical interpretation of cohorts as an essential part of human cultural evolution.

A Typology of Value Systems and their Historical Origins

9:10 AM – 9:25 AM

The Schwartz Theory of Basic Values identifies ten universal values that guide behavior across cultures, but people differ in how they resolve conflicts among values to form coherent value systems. In Study 1, across 14 large datasets, 747,358 participants, 95 countries, and two decades, we used Latent Profile Analysis to reveal three value systems that recur across countries and time—Stability Seekers (emphasizing security, tradition, conformity), Status Seekers (emphasizing power, achievement), and Experience Seekers (emphasizing self-direction, stimulation). In Study 2, we zoom in on regional variation in the prevalence of these value systems across Europe (European Social Survey; 332 regions; 365,483 participants), examining the effects of historical shocks on modern value systems. Using Instrumental Variable analyses, we test whether variables such as Black Death mortality, Protestant diffusion, Napoleonic reforms, industrialization, and Cold War divisions can provide causal explanations for why different value systems are more or less prevalent across European regions, illuminating the historical forces that have shaped the cultural evolution of these value systems.

Culture Bridges in Historical Knowledge Networks

9:10 AM – 9:25 AM

Human innovation relies on transmitting information through social networks spanning space and time. Yet we know little about what information traveled along these cultural bridges, how transmission dynamics have changed historically, and whether bridges facilitated innovation. We address these questions by constructing a large-scale, multiplex social network of about 12,000 global knowledge producers (1000–1900 CE). Our method draws from a cross-validated database of producers and their Wikipedia linkages, identifying 1 million ties. We then employed a large language model to categorize them into specific social relationships based on the texts. We find that cultural bridges vary across knowledge domains. Music-related occupations have the most bridges, while STEM sciences have more than the social sciences and arts. Additionally, cultural diversity in local environments and networks relates to the emergence of important creativity in history. These findings illuminate how cross-cultural exchange unfolded across history. Our network-based approach offers a scalable method for studying cultural transmission and creativity across historical periods and knowledge domains.

Mapping the Moral Mind Across History and Space

9:35 AM – 9:55 AM

Human moral thought has evolved across millennia, yet we lack a descriptive framework that captures how moral concepts are structured across both historical eras and contemporary cultures. We use a computational approach that models moral knowledge as a multidimensional conceptual space in which behaviors are organized by their semantic and evaluative relationships. In prior work, we applied this method to compare the moral conceptual structures of contemporary Chinese and American participants, revealing both shared low-dimensional organization and culturally specific emphases. In this project, we extend the same analytic strategy to ancient Chinese texts, using natural language processing to reconstruct historical moral spaces and compare them with modern data. By integrating cross-cultural behavioral ratings from contemporary populations with semantic analyses of ancient moral discourse, this project examines how universal and culturally shaped dimensions of morality persist—or transform—across time and space.

Historical and Contemporary Predictors of Religious Similarity Across 35 Nations

9:55 AM – 10:15 AM

Why do Christians in the Philippines share more similar beliefs about supernatural punishment with Muslims in Egypt or Hindus in India than with other Christians in Belgium or Germany? This highly specific example poses a broader question: how do culturally distinct societies come to resemble one another despite different historical lineages? This project examines how socioecological contexts and historical opportunities for cultural transmission are jointly associated with similarities between cultural systems in different nations. We use distance metrics to assess the similarity between multidimensional profiles of religious belief and practice across religions in 38 countries. Data span over 7k religious individuals and 7 world religions. Regardless of religious tradition, religious profiles are more similar in nations that have historically had more opportunities for cultural transmission, as well as in nations with similar current-day levels of security threats and political instability. These findings underscore the importance of considering both historical and contemporary contexts when studying patterns of cultural convergence and divergence.

Religion shapes cultures of construing and regulating emotion

9:55 AM – 10:15 AM

One of the earliest observations in scholarship on religion, stemming from writers such as Durkheim and James, was the powerful connection between religion and emotion. Since then, work across diverse fields has established how religion impacts emotional experience and the role of transcendent emotion in religious worship. Yet, religion is not just an institution dealing in mystical emotional experience. It is also culture which shapes everyday emotional experiences, including how people conceptualize what emotion is and what to do with it. In this research, we sought to map religious cultures of emotion by turning to the "source code" of religions: canonical scripture. Across 198,000 sentences (roughly 2.5 million words) from canonical scriptural texts of 7 major world religions, we used natural language processing to identify the patterns of emotion beliefs, values, and regulation tools encoded in ancient religious texts, and map how these vary across religions. By doing so, we provide a systematic, comprehensive, and integrative picture of how scriptures, the historical fabric of religions, conceptualize emotion for the individuals and cultures embedded within them.

Using SocioMap to facilitate linking data on ethnicities, religions, languages and districts for historical and cross-cultural analyses

10:15 AM – 10:35 AM

Historical and cross-cultural studies of human psychology often examine variation across complex groupings, such as cultural groups, linguistic groups, religious groups, and administrative districts (e.g. countries, parishes). Today, more than a thousand public use datasets provide valuable social, psychological, demographic, and cultural data on these groups, presenting new opportunities for examining the roots of cultural diversity and change. However, bringing data on these complex groupings together across disparate datasets poses serious challenges. To address these challenges, SocioMap provides a web-based application (<https://catmapper.org/sociomap>) for researchers to find where data is available on over 22,000 ethnic groups, 3,000 religions, 25,000 languages, and 200,000 administrative districts worldwide and to bring that data together across more than 2500 datasets transparently and reliably. In this paper, we illustrate how to use SocioMap to bring together datasets for novel cross-cultural and historical analyses by these complex groupings.

Worldwide Divergence, then Convergence, in the Representation of Female Olympians from 1920-2016

10:35 AM – 11:00 AM

Do cultural values converge or diverge in a globalizing world? To test competing predictions of global convergence (Fukuyama, 1992) versus divergence (Huntington, 1993) regarding egalitarian values, I examine female representation in the Olympics over nearly a century. The dataset includes 178,941 athletes (1920–2016) across 209 National Olympic Committees, grouped into 10 cultural regions. In every time segment, regions differed significantly in the proportion of female competitors (all ps < .001). The share of female Olympians rose in every time period. However, cross-regional variation followed a U-shaped trajectory—minimal early and late in the period, peaking around 1980–84. This pattern indicates initial divergence in gender representation, followed by convergence towards egalitarian representation. Findings were robust to alternative regional categorizations, exclusion of dominant countries, and inclusion of only Summer Games, and emerged mainly in individual (vs. team) sports. The results highlight both divergence and convergence processes in global cultural change, revealing how gender equality in sport diffused unevenly but ultimately converged across world regions.

The main global cultural differences today evolved from environment-related historical agricultural patterns

10:35 AM – 11:00 AM

Decades of research have demonstrated that many cultural differences between modern nations are associated with a single dimension of culture, namely “individualism-collectivism” (IDV-COLL). Despite a partial worldwide shift toward IDV, these country differences are relatively stable. Previous research explains them as a function of differences in wealth, climate, pathogen prevalence, Western Church policies, and more. We propose a new theory arguing that historically prevalent types of agriculture explain IDV-COLL differences. We predict the variation in three contemporary national-level IDV-COLL indices and one for the 50 US states. For all national IDV-COLL measures, historically prevalent dairy farming is associated with IDV, whereas nomadic herding and shifting cultivation are associated with COLL. Across 48 US states, historically prevalent dairy farming predicts IDV, while plantations predict COLL. Agriculture always produces the strongest direct effects. The effects of the other predictors are inconsistent, with the seeming exception of wealth. Yet, some environmental predictors have a distal effect on IDV-COLL, mostly through the mediation of agricultural types.

How the Nomological Network of Personality Changes Over Historical Time

10:35 AM – 11:00 AM

Prior work maps how personality structure varies across space, but less is known about how it changes across historical time. We will assemble a dataset of top-charting U.S. albums for each year 1950 to 2025 and use an existing dataset of TIME magazine articles 1923 to 2006. We will score these data for the 6 HEXACO personality traits and 24 facets using Contextualized Construct Representations, an embedding-based approach to deriving psychological constructs from natural language. We then build yearly networks with TMFG, a network algorithm designed to find stable pairwise links, and EGA, a network-based factor analysis technique. We animate the network graph to observe longitudinal change, and track mean edge strength, node centrality, and betweenness across years. This pipeline allows us to determine changes in the nomological network of personality dimensions over historical time. Initial results suggest a stable core of Anxiety-Dependence-Forgiveness, and Sociability-Aesthetic Appreciation-Forgiveness. Community detection suggest 4 dimensions: an affiliative cluster (X+A), a sensitive cluster (E), a discipline cluster (C+H), and a unconventionality cluster (O+C).

[1] Socioecological Predictors of Regional Personality Variations in China

11:00 AM – 11:30 AM

Growing evidence suggests that systematic regional personality differences exist and that they are shaped by sociocultural, demographic, and ecological factors. While prior research has focused on singular influences such as migration, climate, and land features, few studies have simultaneously tested a comprehensive set of predictors to determine which factors best explain regional personality variation. To bridge the gap, here we examine a diverse array of socioecological variables retrieved from archival sources to explain the geographic clustering of Big Five personality traits across 26 provinces in China (N = 37,104; China Family Panel Studies). Specifically, we link provincial personality traits with indicators such as historical conflicts, ecological threats, climate, land features, and food culture. Analyses employing elastic net regularization and spatial regression are underway to identify the most relevant predictors of regional personality differences. This study contributes to historical psychology by clarifying how long-standing socioecological conditions shape regional personality patterns in an Eastern context.

[2] The seven virtues of Samurai: How a classic can revive through large language models.

11:00 AM – 11:30 AM

Cultural traditions often resonate far beyond their origins, prompting questions on how their underlying values are transmitted across cultural and temporal boundaries. Examining globally influential non-WEIRD “psychological fossil records” can reveal how non-WEIRD moral values are effectively communicated to WEIRD audiences. Recent advances in natural language processing enable rigorous theory-driven analyses of such classical texts. This study applies Contextualized Construct Representation (CCR) to Bushido: The Soul of Japan, a classic that introduced Japanese moral values to the West. CCR quantitatively captures moral constructs embedded in language. Compared with documents on Christianity and Japanese culture, Bushido showed consistently higher CCR scores across moral domains, indicating a stronger semantic alignment with these constructs. Multidimensional scaling identified Meiyo (honor) as the conceptual core among Bushido’s seven virtues, distinct from pride-based Western notions of honor. These findings reveal how moral frameworks articulated in classical non-WEIRD texts resonate across time and culture, offering a new perspective beyond the WEIRD-centric paradigm.

[3] How Violent Political Shocks Affect Outgroup Attitudes of Non-Involved Parties

11:00 AM – 11:30 AM

Social psychologists have studied violent political shocks such as wars and terrorist attacks in the context of intergroup relations and how conflicting parties view each other. But the effects of such events over time remain understudied, especially in third parties. The attack on Israel on October 7th, 2023, is such a shock with a global aftermath. Across two studies, we use regression discontinuity design and difference-in-differences analyses to estimate the effect of conflict onset on prejudice and hate crimes against Muslims and Jews in the United States. We find that non-Jewish, non-Muslim Americans express lower warmth toward both Islam and Judaism after conflict onset, and increasingly associate both Islam and Judaism with terrorism. We also found a significant increase in hate crimes targeting Jewish people, and a smaller rise in hate crimes against Muslims. The present research provides causal evidence, using econometric methods, that violent political shocks can have far-reaching consequences outside the immediate context of conflict.

[4] Moralistic Supernatural Explanations Were Widespread Across 114 Historical Societies

11:00 AM – 11:30 AM

Moralistic supernatural explanations—beliefs in supernatural reward for moral behavior or punishment for immoral behavior—are thought to coevolve with social scale. Yet most evidence focuses on “moralizing high gods,” likely underestimating moralization in small-scale societies and overlooking variation in moral content. We analyze 706 supernatural explanations from 114 historical societies to assess (a) the prevalence of moralistic explanations, (b) their link to social scale, (c) their reward versus punishment orientation, and (d) their association with different supernatural agents. Moralistic explanations are widespread: 89% of societies have at least one, and on average, 44% of a society’s supernatural explanations are moralized. While prevalent across social scales, they are more common in large-scale societies, driven mainly by supernatural reward. They are also more often attributed to superior gods—deities overseeing communities or regions—than to high gods. These findings challenge the emphasis on punitive “moralizing high gods,” showing that moralizing beliefs are pervasive and that increasing social scale corresponds with a stronger supernatural reward emphasis.

[5] Antecedents of cultural diversity in India

11:00 AM – 11:30 AM

India is at once the world’s most populous nation, home to vast cultural diversity – and strikingly understudied. To bridge the gap, we construct an index of cultural Tightness, which characterizes regional variation in the strength and enforcement of social norms. The index utilizes archival data featuring 19 etic (e.g., drinking laws) and emic (e.g., anti-casteism laws) indicators across 28 Indian states and 3 union territories ($\alpha = 0.93$). Through spatial regression models, specification curve analyses, and conditional random forests, we then examine Tightness in association with previously studied antecedents (e.g., historical rice farming and regional conflicts), as well as previously unstudied indicators of historical trade. Our results paint a nuanced picture – some aligning with, and others diverging from prior Tightness literature. For instance, tighter Indian regions experienced greater regional conflict, but were weakly associated with historical trade and rice-farming.

[6] Perceived Cooperation Need, Ecological Threats, and Norm Enforcement

11:00 AM – 11:30 AM

Past work has established the link between experiences of historical ecological threat and heightened norm enforcement, indexed by cultural tightness or right-wing authoritarianism. Researchers theorized that this arises as norm enforcement facilitates cooperation, which is necessary for addressing these threats. We directly test this hypothesis, by examining 1) whether perceivers think some threats require more cooperation to address than others and 2) whether threats that people perceive to require more (vs. less) cooperation to address lead to more norm enforcement. Across 2 studies, we find that participants consistently rank food scarcity, disease threats, and droughts as requiring more cooperation to address than outgroup threats, storms, and overpopulation. We then correlated the prevalence of each threat with norm enforcement at the country-level, using data retrieved from public databases. Consistent with the hypothesis that norm enforcement facilitates cooperation to address threats, preliminary findings across two studies show that, in general, threats that are perceived to need more cooperation exhibit higher correlations between threat-level and norm enforcement.

[7] Shifting Relational Norms Across Time: An Analysis of 19th and 20th Century Corpora in the United States and China

11:00 AM – 11:30 AM

Relational norms – culturally prescribed expectations that guide behavior within relationships – structure everyday interactions and judgments (Earp et al., 2021). We analyze shifts in relational norms (care, hierarchy, transaction and mating; Bugental, 2002) across key relationships (e.g., parent-child, romantic partners) using U.S. Congressional speeches (1873-2010) and China's People's Daily (1950-2021). We embed sentences with a GPT 3's text-embedding model to produce yearly semantic representations. For each norm-relationship pairing, we construct anchor embeddings (prototype sentences reflecting the norm in context) and compute semantic similarity between yearly sentence embeddings and corresponding anchors. We link these semantic similarity time series to exogenous variables including GDP per capita, relational mobility, power distance, and major historical events (e.g., WWII, the Cultural Revolution). This research reveals how relational norms and societal conditions coevolve, showing when and under what circumstances public discourse about relationships shifts.

[8] Historical Shifts in Response to COVID-19: A Big-Data and Large-Language Model Analysis of Social Media Posts in China

11:00 AM – 11:30 AM

Using Greenfield's Theory of Social Change, Cultural Evolution, and Human Development as a framework, this study situates the early COVID-19 outbreak in China as a historical moment of rapid cultural adaptation. We focus on three levels—mortality salience at the psychological level, collectivism at the cultural level, and subsistence activities at the behavioral level. Our big-data sample consists of over 200,000 posts (before and during the outbreak). Quantitatively, we found a significant increase in mentions of mortality salience, collectivism, and subsistence activities, consistent with prior results established in the U.S., Mexico, Indonesia, and Japan, suggesting a universal historical developmental path to existential threat. For qualitative analysis, the Large Language Models (LLMs) developed in AI provided our tool for thematic analysis. We used GPT4 to identify the most frequent recurring themes across three levels. This analysis complemented the quantitative analysis by providing in-depth insight into the COVID experience. A methodological innovation was to compare expert human coding to AI coding, establishing both the reliability and validity of AI coding.

[9] Quantifying Gender Differences in Online Engagement

11:00 AM – 11:30 AM

Online platforms like TED Talks offer presenters a global stage; however, their success depends on audience engagement. Using natural language processing, we analyzed gender disparities in engagement (measured by likes) across 4,500 TED Talks (2006 to 2021). We found that gender differences in engagement are context-dependent, shifting with the topic, language, and time. Overall, engagement with female speakers has declined, while engagement with male speakers has remained stable over time. However, these trends are context-dependent. For example, men now receive more engagement in mental health topics, reversing historical trends, while women's lower engagement in AI topics remains stable. Additionally, such disparities are partially driven by gender stereotypes. Women are penalized for using agentic (achievement-oriented) language and receive no benefit for using communal (connection-oriented) language. This asymmetry also depends on time and domain: men receive positive reinforcement for using agentic language in natural sciences, whereas women are penalized for the same style. Our study demonstrates how gender and societal stereotypes affect engagement in the real-world.

[10] Evolution of moral attitude towards care for suffering: An Analysis of 19th and 20th century corpora in the United States and China

11:00 AM – 11:30 AM

Suffering is often framed as a violation of human rights and a failure of well-being. Yet, in some moral traditions such as Confucianism, enduring hardship is regarded as a path to virtue and moral cultivation. This study investigates how moral attitudes toward suffering have evolved historically across two contrasting cultural and political contexts: the People's Republic of China and the United States. We analyzed two large-scale political text corpora—the People's Daily (1946–2021) and U.S. Congressional Records (1873–2010)—using natural language processing methods to extract psychological constructs. Yearly moral attitudes toward suffering were quantified as the cosine similarity between prototypical moral statements derived from validated questionnaires and sentences from annual corpus. Cross-cultural and temporal comparisons reveal distinct trajectories in the moralization of suffering, highlighting how sociohistorical conditions shape moral values over time. These findings contribute to historical psychology by elucidating the cultural and temporal dynamics underlying moral conceptions of suffering.

[11] Perceived vs. lived history in times of crisis: Divergences between public beliefs and societal trends during COVID-19

11:00 AM – 11:30 AM

Public perceptions of societal change are integral to collective narratives of progress (or decline) and expectations of the future. However, perceptions of past change diverge from objective evidence, especially during heightened uncertainty (e.g., COVID-19). To examine such perception-reality gaps, we invited 644 Americans to estimate change across thirteen domains for which objective markers of change existed, ranging from well-being, to minority prejudice, to violent crime. Participants' estimates over six-month and one-year timeframes since the first COVID-19 lockdown (April 2020) were then compared to national-level change during these periods. In only five out of thirteen domains did most participants correctly estimate the change direction: depression, life satisfaction, prejudice, charitable giving, and religiosity. Accurate estimation was associated with greater task deliberation, metacognitive engagement, and confidence in one's estimates. These findings reveal that under pandemic uncertainty, perceptions of historical change were misaligned with objective change, with implications for cultural evolution of crisis narratives and assessment of historical psychology.

[12] Shades of Inequality: Examining the Impact of Skin Tone Disparities in Role Allocation

11:00 AM – 11:30 AM

Prior research shows that individuals with darker skin tones experience lower well-being, but the organizational mechanisms behind this remain unclear. I propose that one pathway is disparities in role assignments—darker-skinned individuals are more likely to be placed in hazardous work. Building on historical-sociological work on colorism, I argue that a societal imprint persists in role allocation, biasing managers toward assigning darker-skinned individuals to riskier roles. In Study 1, I analyze sorting into concussion-prone positions among nearly 15,000 college football players, using AI and human ratings to measure skin tone. Studies 2a and 2b use national archival data to show that darker-skinned individuals are disproportionately sorted into hazardous jobs, a pattern evident within racial groups and strongest in the American South, where the imprint of slavery remains most pronounced. Critically, these riskier roles do not come with higher pay, suggesting structural inequality rather than rational compensation. Together, these findings show how historical hierarchies shape who does hazardous work, with lasting implications for inequality, health, and well-being.

[13] Tighter Kinship Networks Linked to Fewer Serial Killers

11:00 AM – 11:30 AM

Beyond individual psychopathology, could broader cultural conditions influence the prevalence of serial killings? We propose that kin-based social structures foster cultural environments in which fewer serial killers emerge. To test this hypothesis, we conducted three complementary studies. In Study 1, using data from 81 countries, we find that higher kinship intensity is associated with lower rates of serial killings across societies. In Study 2, we replicate this relationship in the United States. We show that states with stronger kinship networks report fewer serial killings. In Study 3, a time-series analysis of U.S. cultural data from 1900 to 2008 (using Google Ngrams) reveals that temporal patterns may be bidirectional. Together, these findings suggest a dynamic interaction between kinship intensity and serial killings, highlighting how collective social structures may both shape and respond to extreme forms of violence.

[14] Exploration strategy varies by Relational mobility

11:00 AM – 11:30 AM

One important dimension of historical change involves relational mobility: people in many societies can form and leave relationships more easily today than they could in the past. Whereas past accounts have argued that relational mobility increases social exploration (Thomson et al., 2018), we argue that it changes exploration level. People with high relational mobility search for the best people. People with low relational mobility search for the best traits in the people they know. We tested this in an experiment where subjects (N = 344) played the role of managers delegating tasks to workers. Workers had trait profiles, revealed through clicks, that signaled aptitude on different tasks. In the high-mobility condition, subjects could fire and replace workers. In the low-mobility condition, they could not. We found that those in the high-mobility condition earned more money than those in the low-mobility condition, finding the best workers. However, those in the low-mobility condition engaged in more in-depth trait exploration, measured by profile clicks. People with limited relational mobility redirect learning to traits rather than evaluating people as globally “good” or “bad.”

[15] Explaining Cultural Persistence through the Value–Instrumentality Dimension: Computational and Experimental Evidence

11:00 AM – 11:30 AM

In a changing and globalizing world, which forms of culture will converge and which will remain diverse? Using computational and experimental studies (N = 1,351), we find that a classic Weberian distinction between “value-based” culture and “instrumental” culture addresses this fundamental question. We first use computational methods to validate a value-instrumental axis. Using BERT topic modeling on 894 open-ended responses about cultural traits, we find that traits vary widely on a value-instrumental axis. Technologies cluster toward the instrumental end, while beliefs and customs align with the value end. Through historical (1800–1990) and cross-linguistic (English–French) comparison, we next test whether value-based cultures are less likely to culturally converge than instrumental cultures. We then replicate our findings in four experiments involving cultural mergers (e.g., joining states, merging organizations). In these mergers, people are more willing to adopt the same forms of out-group culture (e.g., a company logo, a national cuisine) that are instrumental-framed but not value-framed. Even as the world converges on technology, values may remain diverse across groups.

[16] Racialized Histories: How Narratives of Mestizaje Shape Mexican-American Political Perceptions

11:00 AM – 11:30 AM

This study investigates how Mestizaje Racial Ideologies (MRIs) shape Mexican Americans’ perceptions of a political candidate accused of discrimination. A consequence of Spanish Colonization, MRIs suggest that most Latinxs share a mixed-race ancestry and are therefore incapable of within-group discrimination. Previous research has shown that MRIs can mask instances of discrimination within majority Afro-Latinx communities like the Dominican Republic (Diaz, 2024). Traditional Mexican history has obscured the contributions of Africans and excluded them from the national narrative of Mestizaje, contrary to the historical reality. To explore this tension, the politician’s social media page includes three conditions: Traditional-Mestizaje, emphasizing European and Indigenous ancestry and excluding African identity; Afro-Mestizaje, which includes African ancestry; and a neutral control. We expect participants will be less likely to vote for the politician in the Afro-Mestizaje framing compared to the other conditions, but more likely to negate the allegation of discrimination. Subsequent analysis will investigate a variety of moderating factors, including knowledge of Mexican History.

[17] Historical Changes in Conceptions of the Good Life: A Cross-Cultural Analysis of English and Chinese Poetry

11:00 AM – 11:30 AM

We explored historical changes in conceptions of the ideal life through analysis of English and Chinese poetry. Study 1 analyzed 247,600 English poems (1000–2000 CE) using large language models to infer ideals of a “good life” expressed in each poem (e.g., comfort, purpose, variety). We then assessed how inferred ideals were semantically related to three types of the good life—happiness, meaning, and psychological richness. Results showed historical divergence among the three conceptions: meaning-centered ideals (e.g., fulfillment, purpose) declined steadily and sharply after the 1700s, happiness-centered ideals (e.g., joy, comfort) first rose and then fell around the 1700s, while psychological richness-centered ideals continued to increase—reflecting a broader shift toward more exploratory and adventurous conceptions of a good life. In contrast, Study 2 analyzed 127,591 pre-modern Chinese poems (618-1644 CE) and found no significant historical changes in life ideals. A forthcoming analysis will examine how changes in knowledge and technology predict whether such shifts in life ideals occur.

[18] Attributing History: Explanatory Style Predicts Psychological Resilience in Ukrainian Survivors

11:00 AM – 11:30 AM

How did survivors of Soviet political terror explain their suffering—and how did these explanations shape their capacity to endure? This study analyzes archival narratives from Ukrainian survivors of GULAG imprisonment to examine historical patterns of attribution and adaptation. Using the Content Analysis of Verbatim Explanations (CAVE) method, we coded naturally occurring causal language to identify how explanatory style—internal vs. external, stable vs. unstable, global vs. specific, controllable vs. uncontrollable—related to long-term psychological resilience. By tracing these cognitive tendencies in personal accounts of repression, the project illuminates how historical context, ideology, and control shaped individual meaning-making under totalitarian rule. The findings demonstrate that even amid systemic dehumanization, survivors' causal reasoning reveals enduring efforts to preserve agency, coherence, and hope. This work bridges historical psychology and personality science, showing how explanatory frameworks become part of a culture's psychological legacy.

From Predicting the Past to Surveying the Dead: New Methods for Historical Psychology

11:40 AM – 12:00 PM

Why did the past unfold as it did? How did people think in the past? In this talk I discuss novel methodological approaches that may help us to answer these questions including retrodiction tournaments and a proposal to create Historical Large Language models to simulate subjects

from historical or ancient populations. These approaches may yield important insights for psychologists and historians alike, enabling new discoveries and greater rigor in this emerging interdisciplinary endeavour.

Lunch

12:00 PM – 1:00 PM

Lunch will be served in the Exhibit Hall. Seating is available in the Exhibit Hall, Cafe on Level 3, and the Lobby on Level 2. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

Grilled Chicken Pesto Sandwich: Grilled Chicken Breast, Fresh Mozzarella, Oven Dried Tomato, Arugula, Basil Pesto, Ciabatta Roll

Roast Turkey Caprese Pasta Salad: Rotini Pasta, Cherry Tomatoes, Fresh Mozzarella, Basil Pesto, Mixed Greens, Balsamic Glaze

Roasted Vegetable Wrap (V): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto, Wrap (limited gluten free wraps available)

Mediterranean Chickpea Salad (VG | GF | DF): Crispy Chickpeas, Cucumbers, Tomatoes, Red Onion, Kalamata Olives, Feta Cheese (on the side), Mixed Greens, Lemon Vinaigrette

Self and Identity Preconference

8:00 AM – 1:00 PM | Location: E352, Level 3

The Self & Identity Preconference, sponsored by the International Society for Self and Identity (ISSI), spotlights emerging scholars, in poster presentations and data-blitz (flash) talks, and invited addresses, including by ISSI lifetime and early career awardees. This year, the program highlights a special focus on developing ally and advocate identities.

Origins of the Social Mind Preconference

8:00 AM – 1:00 PM | Location: E353B, Level 3

Since 2021, the Origins of the Social Mind Preconference has provided a home for Developmental, Comparative, and Cross-Cultural Psychologists at SPSP. These disciplines share a focus on the foundational mechanisms driving the origins of social thought and behavior—across development, across species, and across cultures. Start your SPSP alongside researchers who explore similar questions using diverse methodologies: You might learn about results from infants or adolescents, dogs or apes, cities or villages, all of which will fuel our shared fire for theoretical questions about the social mind at its origins! We look forward to seeing you there!

Who Looks Nice: Visualizing Children’s Mental Representations of Prosociality

9:15 AM – 9:21 AM

As early as infancy, children demonstrate an understanding of others’ social intentions (Hamlin et al., 2007; Warneken et al., 2007). Building on this foundational sensitivity to prosociality, we applied a novel data-driven Generative Reverse Correlation method with children as young as three, to visualize their mental representations and reveal the visual cues they associate with prosociality. In Study 1, children 3-7 (N = 125/160) categorized 40 synthetic faces as nice or mean to generate individual-level models. Ratings revealed that children—across all age groups—associate "niceness" with femininity, happiness, and trustworthiness, highlighting the early emergence of visual stereotypes that shape impressions of prosociality. In Study 2, children 5-9 (N = 165) categorized faces as nice or brilliant. Findings replicated associations from Study 1, demonstrating that prosocial visual biases are robust across different comparison traits. These findings demonstrate that visual stereotypes of prosociality are robust and emerge early in development. Further, our results introduce a valid and novel methodology for developmental psychologists to study children’s mental representations.

Does Loneliness Make Children Prosocial or Aggressive?

9:21 AM – 9:27 AM

Loneliness is a fundamental signal in the social mind, yet its role in shaping children’s social behavior remains paradoxical. While some studies have linked loneliness to increased prosociality, others have linked it to aggression. We addressed this paradox in a two-year longitudinal dataset of 465 children (N=1542 observations; Mage=8.86) across four waves in five public schools. We found that within-person increases in loneliness predicted greater prosocial behavior, suggesting that transient (state) loneliness activates children’s foundational motives to restore belonging. In contrast, between-person differences in chronic (trait) loneliness were associated with reduced prosociality and heightened aggression, consistent with maladaptive developmental trajectories. By simultaneously modeling prosocial and aggressive outcomes, our study provides a rare opportunity for an integrated test of loneliness as a driver of social development. In doing so, we show how this emotional signal channels young people toward both cooperative and conflictual pathways during middle childhood.

Do Dogs (Canis Lupus Familiaris) Prioritize Prosociality or Dominance In Their Social Evaluations?

9:27 AM – 9:33 AM

Social evaluation, the ability to select social partners using observed behavior, has been documented in a variety of species including humans, bonobos, and domestic dogs. While social evaluation is thought to occur in two domains, prosociality and competence, social organisms may also evaluate agents on the basis of status or rank: Humans and bonobos prefer agents who win competitive interactions. Humans, but not bonobos, display sensitivity to the manner of winning by negatively evaluating agents who displayed aggressive behavior in the competition. Here, we explored whether dogs, a species who evolved in a human-centric environment, display a human-like preference for the winners of competitions and whether the method of winning impacted dogs’ preferences. We found that dogs preferred the winners of competitions, but did not negatively evaluate agents who won by stealing. Further, dogs did not show a preference for agents who acquired resources in the absence of competition. Taken together, these data suggest that while the preference for high-ranking agents is widespread across the mammalian lineage, humans appear to be unique in considering prosociality when evaluating status.

Relational mobility strengthens effects of empathic concern on helping in the absence of interdependence

9:33 AM – 9:39 AM

A relationship-building perspective predicts that people default to feeling empathic concern and helping non-interdependent others because doing so may allow them to build new cooperative relationships. If so, empathy should motivate helping non-interdependent others to a greater extent in places where social relationships are more flexible. For example, when relational mobility is high (i.e., having opportunities for meeting new people and the freedom to choose one's relationships). Past studies among US adults show empathic concern predicts helping motivation only when people perceive low, not high, interdependence in their relationship. In the present work, including one study among Mayangna participants (small-scale subsistence society), and a cross-cultural sample (Brazil, Egypt, Philippines), we further show relational mobility strengthens the effect of empathy on helping low-interdependence others across several fitness-relevant domains (Studies 1-2), and in a virtual dictator game (Study 2). Study 3 (in progress) tests these effects in an experimental design by inducing empathic concern and manipulating relational mobility.

[41] Children and Adolescent's Evaluations of Wealth-based Competence Assumptions in Academic Contexts

10:39 AM – 11:29 AM

Children and adolescents are aware of group-based social status hierarchies. Although children are less likely than adolescents to recognize the negative outcomes associated with wealth-related biases, less is known about age-related differences regarding whether it is unfair for peers to make assumptions about academic competence based on wealth. Drawing on the social reasoning developmental (SRD) model, we investigated how children (N = 100, ages 7-15, Asian 17%, Black 14%, Latine 7%, Multiracial 15%, White 40%, Other 7%) evaluate assumptions of math competence as well as inclusion decisions based on wealth in academic contexts. Additionally, we investigated how evaluations are shaped by the racial background of the peer dyads (cross-race or same-race). We hypothesized that cross-race assumptions would be viewed more negatively than same-race, given increased awareness of prejudice during middle childhood. We predicted that with age, participants would evaluate wealth-based assumptions as unfair and favor inclusion of the low-wealth peer. Findings from the study will reveal novel insights into how children think about assumptions based on race and wealth in the classroom.

[42] How do Humans Develop the Capacity to Understand Others? Testing Competing Developmental Theories of Mentalizing

10:39 AM – 11:29 AM

Abstract: How do humans develop the capacity to mentalize, or understand others' underlying mental states? In this study, adolescents (N = 38; Range = 12-24 years old; Mean age = 16.74) and adults (N = 31; Range = 28-40 years old; Mean age = 32.86) completed a series of social cognitive tasks inside and outside of the fMRI scanner. In the scanner, participants completed a modified version of the EmpaToM task, designed to elicit spontaneous mentalizing about others' mental states. Afterwards, participants completed a new task designed to induce simulation, where they listened to passages from fictional novels and were instructed to simulate the main characters' experience. Outside of the scanner, most participants endorsed using simulation (92.11% of adolescents and 90% of adults), general reasoning (92.11% of adolescents and 85% of adults), perspective-taking (63.16% of adolescents and 85% of adults), and theory theory (71.05% adolescents and 70% of adults) to understand others' underlying mental states. Regarding which strategy they used most, adolescents reported simulation (39.47%), followed by general reasoning (31.58%), theory theory (15.79%), and perspective-taking (13.16%).

[43] Children's and Adults' Moral Concern in Context of Social Relationships and Trade-Offs

10:39 AM – 11:29 AM

Recent research suggests that young children display broader moral concern than adults. One possible explanation is that increasing awareness of resource limits and trade-offs drives the developmental restriction of whom we help. Across two studies, we tested whether children and adults endorse helping distant others when trade-offs are explicit. In Study 1 (Nadults=170, Nchildren=121, ages 5–9), participants judged helping decisions that pitted a close other (family/friend) against a stranger. Adults rated helping close others more positively, whereas children's evaluations were less differentiated, showing broader concern. Study 2 (Nadults=120, Nchildren=40, in progress) replicated these effects across praiseworthiness and obligation judgments. Children attributed stronger obligations toward both close and distant others and viewed helping anyone in need as more praiseworthy than adults, while adults restricted praise to non-obligatory acts. These findings show that even when trade-offs are explicit, children show broader moral concern than adults. Our studies provide further evidence of early moral expansiveness and call for further investigation into its underlying mechanisms.

[44] Examining the Privileged Status of Social Category Information in Children's Social Curiosity

10:39 AM – 11:29 AM

Social psychologists have long theorized about and tested the impacts of adults' tendencies to mentally represent people as undifferentiated social category members vs. as distinct individuals (e.g., Er-rafy & Brauer, 2013; Fiske & Neuberg, 1990). However, we know relatively little about the origins of these tendencies. The goal of the present research was to understand whether children, in their formative years, privilege social category information when learning about new people. Our research question was: When children encounter a new person, how interested are they in knowing social category information (e.g., someone's gender) compared to individual attribute information (e.g., someone's food preferences)? Findings revealed that 4- to 8-year-old U.S. children (N=125) preferred to learn information about people's gender, language, and nationality over information about their individuating attributes. The present study provides a first step in exploring the privileged status of social category information in children's social curiosity. Future studies will test children's interest in seeking information about people's race, age, and novel social category memberships.

[45] The costs of companionship: Children expect people to burden friends with help requests

10:39 AM – 11:29 AM

Children often think helping others is a sign of friendship (Afshordi & Liberman 2021); giving benefits to those you call friends makes total sense. What about the opposite, asking for help which often involves requesting that they do something tedious? Although on the surface this may seem unfriendly, in three studies we predicted that children would link friendship to requests for help, even when the task was tedious. In Study 1 (N = 121), 6- to 9-year-olds thought that desiring that someone do a tedious task indicates a lack of friendship but requesting that they do that same tedious task is much more connected to friendship (4- to 5-year-olds didn't show this effect). Study 2 (N = 80) found 6- to 9-year-olds treated requests for help as a stronger cue to friendship than similarity. Finally, in Study 3 (N = 100), 6- to 9-year-olds predicted that a protagonist's best friend would be upset, rather than happy, at not being asked to help. This is because friends expect their good friends to ask them for help. Together, these studies show that children link friendship and costly help requests. We discuss implications for children's developing conception of friendship and loyalty.

[46] “He’s such a poser!”: When children think “white lies” are self-serving

10:39 AM – 11:29 AM

Children often approve of “white lies” because they make people feel good (Heyman et al., 2009). But an ostensibly “white lie” can also be self-serving: Praising a film you’ve never heard of can make you look cool with the right crowd. In two preregistered studies (N=280, Study 1, 4-9-year-olds | Study 2, 6-9-year-olds), we probed children's evaluations of someone who told a white lie, similar to the above example, to either a popular or unpopular kid. In Study 1, we explicitly provided children with the liar's ulterior motive (to ingratiate himself to the popular kid or to make the unpopular kid feel good). In Study 2, we asked children to infer the liar's motive (and this time, he dishonestly “liked” a peer's social media post about the movie). In both studies, we predicted and found that telling this white lie to the unpopular kid was considered good. But by 8-years-old, children condemned the same white lie when aimed at a popular kid, inferring reputational motives (e.g., “to become cool”). As children mature, they increasingly read in self-serving intentions, revealing a sophisticated appreciation of the reputational motives that may be at play in their social environments.

[47] Testing the generalizability of minimal group attitudes in minority and majority race children

10:39 AM – 11:29 AM

Using a collaborative multi-site study approach of 4- to 6-year-old children, we test the generalizability of the minimal group effect. We found that, as a whole, the minimal group effect was observed in the total sample (N = 716 across five regions in the United States; 47.1% girls; 40.5% White, 13.3% Black, 12.6% Asian, 24.6% Latine, 9.2% multiracial) and no significant differences were found between racial/ethnic groups; yet exploratory analyses revealed that the minimal group effect was most strongly displayed among older children compared with younger children and, when considered separately, was more clearly present in some racial/ethnic groups (White) but not so in others (Black). In addition, there was no relationship between children's minimal group attitudes and racial group preferences, suggesting that factors other than ingroup/outgroup thinking may influence young children's racial bias. Taken together, results highlight the continued need for large and racially diverse samples to inform and test the generalizability of existing influential psychological theories.

[48] Examining Cross-cultural Differences in Normative Language Uses During Caregiver-child Interactions

10:39 AM – 11:29 AM

The use of normative language may differ across cultures due to variations in the cultivation of filial obedience versus autonomy, the endorsement of the collectivistic versus individualistic orientation, and the interdependent versus independent self-perceptions. The current study focuses on China and the US to probe how differences in normative language uses between caregivers and children may be attributed to aforementioned cultural factors. This study hypothesizes that Chinese dyads use more expressions of politeness, more explicit judgements, and more directive languages than American dyads within the scope of normative language usage. Specifically, we analyzed naturalistic caregiver-child interactions from Chinese and American families involving children aged 4 to 6 years, drawing data from established CHILDES corpora in both cultures. The results indicates that the uses of normative language do not significantly differ between China and the US, suggesting that cultural variation does not play a particularly important role in parent-child naturalistic interactions that shape children's internalization of social norms.

[49] Examining How Explanations Structural vs. Internal Influences Children's Judgements of Inequality and Status Mobility

10:39 AM – 11:29 AM

This work examines whether structural explanations focusing on societal factors offer an alternative framework for explaining inequality. A total of 179 children aged 5-11 years (M=7.83, SD=1.91) from the Midwest were randomly assigned to one of three conditions: Structural, Internal, or Control. Children heard stories about two novel groups with different status levels, receiving corresponding explanations for these disparities. The structural condition emphasized systemic factors, the internal condition attributed differences to inherent traits, and the control condition provided neutral explanations. This poster will center around first on how structural explanations shaped children's beliefs about social mobility differently across domains. In the wealth domain, structural explanations led to marginally significant beliefs that high-status individuals could lose their wealth ($\beta=-0.16$, $p=.088$). For achievement, both structural and control conditions significantly increased beliefs in downward mobility for high-status groups. In addition to how children each explanation influenced children's certainty about social status mobility across both domains.

[50] Believing to belong: the developmental origins of belief maintenance

10:39 AM – 11:29 AM

Shared ideology can bring people together, but we may prioritize the resulting social affiliations over our motivation to believe what is best supported by evidence. Indeed, affiliation with an ideology-based group has led adults to endorse and maintain false beliefs (e.g., Bayes & Druckman, 2013; Enders et al., 2023). Humans have an early-emerging motive to cooperate (Tomasello & Vaish, 2013), which may similarly lead young children to favor affiliation over truth-seeking. In two studies, 4- to 5-year-old children (N = 144) form a belief and are inducted onto team of other believers. Children in the focal Belief-contingent condition learn that their membership is contingent on their maintenance of this shared belief. We contrast this with two cases where team members share the belief, but maintenance is not necessary for continued team membership. Children maintained their initial endorsement after observing disconfirming evidence only when membership was contingent on the shared belief. These findings suggest that the affiliative power of ideology has developmental roots; even in our earliest years, what we believe is closely linked to who we affiliate with.

[51] Prior Positive and Negative Intergroup Contact Informs Children's Prosocial Behavior toward Peers with Disabilities

10:39 AM – 11:29 AM

Despite the importance of fostering inclusive attitudes early, research on children's views of peers with disabilities remains limited. Over 8% of U.S. children have disabilities (U.S. Census Bureau, 2024), and children without disabilities frequently interact with peers with disabilities in schools and communities, making these interactions critical for social development. Intergroup contact theory suggests that positive, meaningful interactions can reduce prejudice and promote inclusion, yet studies often overlook differences in contact frequency, quality, and valence, which may shape distinct attitudes. This study examines how non-disabled children's direct contact with peers with physical, cognitive, or sensory disabilities relates to inclusive behavior and whether stereotypes mediate this association. Preliminary results from 30 children (ages 8–11, M = 9.37) indicate that contact quality and positive experiences, more than frequency, predict inclusive behavior, with warmth stereotypes potentially mediating this link. These findings highlight the theoretical and practical importance of fostering high-quality, positive intergroup interactions to support inclusion in childhood.

[52] Wording Matters: How Generics vs Statistical Language Shapes Children's Generalizations

10:39 AM – 11:29 AM

Children learn about social groups through the language adults use, often generics (e.g., "boys like blue"). Generics can promote overgeneralization because they attribute traits to entire categories and are treated as universally true despite limited evidence. We therefore asked if statistical language (e.g., "half of girls like pink") reduces overgeneralization. In study 1 (N=82; ages 4–9), children who heard statistical language made fewer group-to-individual generalizations than those who heard generics ($F(1,78)=11.12, p=0.001, \eta^2=0.13$). Study 2 (N=240; ages 4–7) tested additional quantifiers ("few", "many") and if generalizations are influenced by children's essentialist beliefs (believing social categories have fixed properties). Preliminary findings suggest that language effects depend on essentialism: when essentialism is low, generic/"most" phrasing produces more generalization than statistical ("half," "few") phrasing, but this reverses as essentialism increases, $F(3,22)=6.26, p=.003$. Together, these studies illuminate how children interpret prevalence language and how subtle wording shifts can curb social-group overgeneralization.

[53] Children and Young Adults Factor Merit into their Judgments of Gender-Based Science Resource Inequalities

10:39 AM – 11:29 AM

Despite individual's early emerging orientations towards fairness and equality, many adults accept and support existing social inequalities through meritocratic beliefs. However, the developmental origins of meritocratic beliefs have yet to be fully investigated. Participants in this study were younger children (n = 49; 24 girls; Mage = 5.83 years), older children (n = 47; 24 girls; Mage = 10.74 years), and young adults (n = 48; 24 girls; Mage = 19.92 years) from racially/ethnically diverse backgrounds in the U.S. They were presented with inequalities of science education resources between groups of children who differed in their level of merit in science (high, low) and gender (girls, boys). Participants' judgments of the inequalities were assessed. Results revealed that participants across age groups judged inequalities more negatively when they disadvantaged high-merit groups compared to low-merit groups, both when girls ($p = .002$) and boys ($p < .001$) were disadvantaged by inequalities. These findings provide novel evidence of the developmental origins of meritocratic beliefs as a social-cognitive framework that individuals use to judge the fairness of inequalities.

[54] Learning Who Helps About What: Variability in Children's Information-Seeking

10:39 AM – 11:29 AM

Children often learn by asking questions, using responses received as cues about others' expertise and reliability, which shape children's choices about who to trust. In our study, 118 children ages 3–8 heard everyday riddles followed by either a causal explanation (answering the question) or a non-explanation (on topic but not answering), and were asked about their interest in future learning. Regardless of explanation type, children were equally interested in learning about a new topic from the same informant ($\beta = -0.229, p = .763$). However, children showed a stronger preference to learn from someone new about the original riddle if they had received a non-explanation from the informant compared to a causal explanation ($\beta = -0.22, p = .027$). These findings suggest that children flexibly update their trust based on the context: they do not lose general trust in an informant based on one poor explanation, but may re-evaluate that person's helpfulness about a specific topic. To further explore these trust patterns, we are linking children's epistemic curiosity and executive functioning with task performance to examine individual differences in children's trust decisions.

[55] Do Children Reproduce Gendered Household Labor Patterns?

10:39 AM – 11:29 AM

Gender inequality in household labor is a persistent pattern across cultures. Women are more likely to take on household chores, which can negatively affect their career opportunities, social status, marital relationships, and mental health. Yet, little is known about how such gendered patterns may be transmitted across generations. This study examines whether children replicate their own family's household work patterns when assigning chores in a new family. We recruited children aged 4 to 9 years in the U.S. (target $n = 120$). Children were asked about the division of household work in their own families and completed a chore allocation task for a hypothetical family, with the task order randomized. Preliminary analyses with half of the sample suggest that children show tendency to replicate their family's chore patterns. Notably, girls are more likely than boys to reproduce their family's division of labor. These findings provide early evidence that gendered household labor patterns may emerge in childhood, highlighting the role of family socialization in shaping gender role expectations.

[56] Infants sensitivity to sartorial signals of "ethnic" identity

10:39 AM – 11:29 AM

Research in "folk sociology" shows that humans predict behavior based on group membership. Much work has examined infants' expectations about bodily differences, especially race, often seen as innate attention to physical traits. Some suggest infants' positive (us)–negative (other) associations reflect an inherent own-race bias. Yet humans only recently encountered diverse racial phenotypes, whereas they have used costume to mark group identity for millennia, inferring the likelihood of an evolved sensitivity to sartorial cues of group membership. By adapting Fulkerson and Waxman's (2007) categorization task, we tested whether preverbal infants use dress and ornamentation to classify people. If so, infants' attention to racial cues may reflect a broader, evolved capacity for group-based reasoning grounded in attire rather than biology. Preverbal infants saw women in one of two indigenous costumes paired with speech and used sartorial signals to categorize individuals, suggesting that such signals are as influential in person perception as bodily features and support a developmental basis for social categorization grounded in human-made rather than biological variation.

[57] First-Person Norm Inference Precedes Social Generalization in Early Childhood

10:39 AM – 11:29 AM

Our social world rarely provides an exhaustive list of rules to follow. Instead, we must infer what norms apply, to whom, and when. Children especially have the most to learn and the least information to make social decisions, and understanding how they navigate ambiguous cases offers a window into the mechanisms underlying the social mind. We investigate how young children make normative inferences under uncertainty and how those inferences apply to themselves and others. In two studies (4- to 6-year-olds; projected $N = 160$), children were told that two objects were permitted while a third was left unspecified. To act in line with adult normative inferences, they would need to treat the ambiguous object as implicitly off-limits. Preliminary results reveal a developmental trend: while older children aligned actions and judgments, 4-year-olds avoided the ambiguous object only in their own behavior yet judged it permissible for a third party. This asymmetry suggests that children may first experience norms as applying primarily to themselves, only later extending them to others—a key early step in constructing the social mind.

[58] Dreams defy constraints: How aspirations shape children's perceptions of future possibilities for themselves and others

10:39 AM – 11:29 AM

Young children dream about their future — but do they believe those dreams can shape reality? Across three studies ($N = 310$, ages 4–9), we examine how children integrate motivational and structural information when judging the possibility of future outcomes for themselves and others. In Study 1, imagining that they "really, really want" various jobs caused children to view those jobs as more possible for themselves ($B = 0.52$, $p < .001$). In Study 2, children judged a structurally disadvantaged character's goal as more attainable when the character aspired to it ($B = 0.91$, $p = .026$). In Study 3 (ongoing), children weighed aspirations against both structural and temporal constraints, granting higher possibilities to disadvantaged yet aspirational characters than to merely advantaged characters ($B = -1.89$, $p < .001$). These results suggest that children treat aspiration as a causal force that can overcome constraint, highlighting an early-emerging link between motivation and epistemic reasoning in the developing social mind.

[59] Do children use source information when evaluating gossip?

10:39 AM – 11:29 AM

Gossip is a unique type of testimony that provides valuable social information, but it can be biased. To protect against misinformation, children must evaluate gossipers' credibility based on their information sources. Five-, 7-, and 9-year-olds ($N = 120$) heard two sets of gossipers describe two classmates with the same trait (e.g., hardworking). One set stated they saw and the other that they heard evidence of this claim. Children rated the credibility of each set of gossipers (seeing-gossipers, hearing-gossipers) before comparing them. Results showed an age-related increase in children's preference for seeing- over hearing-gossipers. Nine-year-olds rated seeing-gossipers as more ($B = 1.43$, $SE = 0.5$, $p = .004$) and hearing-gossipers as less credible than 5-year-olds ($B = -2.12$, $SE = 0.46$, $p < .001$). Further, 9- ($B = 2.45$, $SE = 0.49$, $p < .001$) and 7-year-olds ($B = 0.84$, $SE = 0.36$, $p = .02$) showed a stronger preference for seeing-gossipers than 5-year-olds. Broadly, this study highlights a developing ability to link information sources with credibility to evaluate trustworthiness of gossip. We discuss implications for children's learning from second-hand information with age.

[60] Emergence of costly protest: when do children begin paying a cost to punish unfair behaviors?

10:39 AM – 11:29 AM

While children expect fairness early in development, their willingness to incur a personal cost to enforce fairness emerges more slowly. Using the Inequity Game, we examined when preschoolers ($N = 119$; ages 2–4 years) begin to reject disadvantageous offers with a personal cost. Two- and 4-year-olds strongly rejected disadvantageous offers where they stood to gain nothing (i.e., 0) while a partner received something (e.g., 3). However, only 4-year-olds rejected disadvantageous offers when rejection was costly (e.g., 1 vs. 3). These results suggest a developmental progression in children's responses to unfairness, where 2-year-olds protest unfair offers at no personal cost, but only around 4-years are willing to forgo resources to enforce fairness. These findings also suggest that fairness-related behavior develops from self-protective responses to costly moral stands throughout early childhood.

[61] Stereotypes of brilliance: Unpacking their links with gender presentation and gender identity

10:39 AM – 11:29 AM

The gender brilliance stereotype associating high intelligence with men has been documented across development and cultures. The current work seeks to understand how gender identity (identifying as a man or woman) and gender presentation (presenting as more masculine or feminine) contribute to beliefs about brilliance in early childhood. Children ($N = 144$; 5-10-yos) received 12 trials. In each trial, children saw a pair of photos featuring two people of the same gender (two men or two women), yet one individual appeared more masculine than the other. In half of the trials, children guessed which person was really smart; in the other half, they selected which person was really nice (control trait). When evaluating women, children were more likely to select a masculine woman as "really smart" than as "really nice", whereas the effect of trait was insignificant when evaluating men. In fact, children preferentially chose masculine men over feminine men for both brilliance and niceness. These results highlight the flexible nature of children's brilliance stereotypes, providing initial evidence for an early-emerging connection between perceived masculinity and intellectual talents.

[62] Gender Differences and Mindset in Perceptions of Success and Future Competence in Esports

10:39 AM – 11:29 AM

Esports have become a part of children's and adolescents' social interactions, understanding gendered perceptions about esports is essential. This study investigated how perceptions of success and future competence in esports are shaped by gender and mindset (fixed vs. growth), and how mindset predicts these perceptions for boys and girls. Participants were 572 children and adolescents (11-18 years, $Mage = 14.44$; 347 girls). Perceptions of success and future competence in esports for both genders, growth and fixed mindset beliefs on esports were assessed. Gender-based comparisons from repeated measures ANOVAs showed that girls were more likely than boys to report female players as successful and competent; boys were more likely to report male players as successful and competent. Within-subject comparisons indicated that girls viewed male players as more successful than females; boys viewed male players as both more successful and competent than females. Girls reported a higher growth mindset than boys; boys reported a higher fixed mindset than girls. Regressions showed that participants with stronger growth mindset reported higher perceived female and male success and competence.

[63] The Physiology of Moral Teaching: Parent–Child RSA Synchrony Across Cultures

10:39 AM – 11:29 AM

Physiological synchrony between parents and children may provide a window into how moral understanding develops across cultural contexts. Respiratory sinus arrhythmia (RSA), an index of parasympathetic regulation, reflects moment-to-moment physiological alignment that supports emotional attunement and social learning. The present study examined parent–child RSA synchrony during a moral teaching task among 6–9-year-old children and their parents in the United States and Japan. We tested whether dyads exhibited dynamic RSA coupling while discussing moral transgressions and whether the strength or pattern of synchrony differed across cultures. Analyses included both concurrent and time-lagged synchrony to assess real-time and directional physiological coordination. We predicted stronger parent–child synchrony in both cultures, with culturally distinct patterns reflecting differing socialization goals—autonomy and reasoning in the U.S. versus empathy and relational harmony in Japan. Findings highlight physiological coregulation as a potential mechanism through which moral socialization occurs across cultural contexts.

[64] The effects of social disadvantage on children’s emotions and motivation

10:39 AM – 11:29 AM

Social inequality impacts children’s academic and life outcomes. However, how this occurs is not well understood. This study drew on Relative Deprivation Theory to test for a causal effect of subjective disadvantage on children’s justice-related affect (JRA) and motivation to persist. Children (ages 4-7, current N=54, target N=100) played a board game that either gave them fewer or the same opportunities (randomly assigned) as a partner. They then rated their emotions and the game’s fairness and completed a timed persistence task. Disadvantaged children reported more negative JRA (more sadness/anger, less happiness/fairness) than those in the equal condition ($p < .001$), and older children (6-7 years) in the disadvantaged condition persisted for less time ($M=123$ vs 77 seconds; $p=.046$), whereas younger children’s persistence did not differ by condition. These findings suggest that experiencing disadvantage negatively impacts children’s emotions and fairness judgments and, for older children, reduces persistence. These results suggest a causal role for unequal opportunities that can directly impact affective and motivational processes essential for children’s academic achievement.

[65] The development of procedural choice in contexts of resource scarcity

10:39 AM – 11:29 AM

When resources are scarce, people must choose among procedures to allocate them. In medical crises, adults prefer procedures that favor need, utilitarianism, or social role over egalitarian ones (e.g., lotteries). In this study, we examine the development of procedural choice in two pre-registered experiments. 5- to 8-year-olds ($N=64$, $Mage=6.95$) and adults ($N=64$, $Mage=37.45$) chose between various selective procedures (Need, Favoritism, Maximizing Benefit, Order of Arrival, Merit, and Social Usefulness; within-subjects) and an egalitarian one, and predicted what an authority would choose between options. By age 6, children chose need, maximizing benefit, merit and social usefulness over the egalitarian option, and rejected favoritism ($ps<.049$), mirroring adult patterns. Children rejected order of arrival by age 8 ($p=.015$). Both groups predicted an authority would choose favoritism and order of arrival more often than they would themselves. Combined, these results reveal sophistication in procedural choice by 6 years, and an awareness that authorities may choose procedures that are deemed as less appropriate.

[66] Of One Mind? Testing Mind-Perception Items for Identity-Based Measurement Invariance

10:39 AM – 11:29 AM

Mind perception (MP) refers to ascribing mental and emotional capacities to characters (Gray et al., 2007). Much of MP research does not consider identity; intergroup psychology implies identity may influence MP without explicitly testing this (Hester & Gray, 2020). We study whether participants view items measuring MP similarly regardless of characters’ and their own identities by testing MP items for measurement invariance (MI), expecting items to be noninvariant. In Study 1, 366 Black and White participants ascribed MP to characters varied by race, gender and social class. As predicted, items were noninvariant in 14/16 MI tests, meaning participants viewed identical items differently by their own race and characters’ identities. In Study 2, 319 Black participants ascribed MP to characters varied by race and gender; items were noninvariant in 3/4 MI tests. That items were noninvariant in 17/20 MI tests suggests identity shapes how participants view MP items. Patterns in the noninvariance align with work on intersectional stereotyping and White male societal defaults. We offer strategies to improve MP items’ psychometric properties to make them representative of a diverse society

[68] Talking, Teaching, and Learning: Children's Perspectives on Resolving Intergroup Conflict

10:39 AM – 11:29 AM

How do children think intergroup conflict can be resolved? Participants were U.S. children ages 7-12 (N=120, Mage= 9.5(1.7), 48% female) who saw intergroup conflict vignettes and independently evaluated and ranked nine conflict resolution strategies: contact, compromise, apology, perspective taking, superordinate goals, authorities' intervention, increasing resources, parents educating children, and children educating parents. Children evaluated parents educating their children highest ($p=.032$). A second group comprising contact, apology, resources, and children educating their parents significantly differed from parents educating their children and the third group ($p=.023$). The third group comprised superordinate goals, perspective taking, and compromise. Authorities' intervention was rated lowest ($p<.001$). Child rankings largely mirrored their evaluations. With age, children evaluated and ranked superordinate goals lower, while also ranking perspective taking lower and parents educating their children higher (all $ps<.05$). Findings highlight children's nuanced conceptions of conflict resolution, providing novel insight into the development of intergroup conflict resolution.

[69] Do dogs (Canis Lupus Familiaris) remember prosocial humans? An exploration of dogs' social memory

10:39 AM – 11:29 AM

Prior research has documented dogs' preference for prosocial humans in a variety of contexts. This likely emerged during the domestication process when seeking out prosocial humans conferred evolutionary benefits. However, it is unknown whether dogs remember their preferred social partners over time. We tested dogs' ability to form and retain preferences for a prosocial human who shared food over an antisocial human who refused to share food. After an initial reputation formation phase wherein dogs successfully formed a preference for the prosocial human, we introduced a short time delay (90 seconds) before retesting their preferences. Dogs preferentially interacted with the prosocial actor demonstrating their ability to retain information about the humans in working memory. In a separate sample, we replicated the initial reputation formation phase, but this time introduced a longer (7 day) delay before the retest. Dogs appear to retain their preference over this longer time delay. However, this effect is reduced compared to the shorter time delay. These data suggest that dogs form stable perceptions of human social partners and use this information to guide future interactions.

Cultural Values and Children's Prosociality: The Case of Latine Caregivers and their Children

11:29 AM – 11:35 AM

Research is needed to better characterize the cultural values that nurture children's prosocial behavior. Building on recent theoretical work (e.g., Cortes Barragan & Meltzoff, 2025), we focused on *simpatía*, a Latine cultural value that prioritizes warm, positive engagement with others. We examined the relation between caregivers' *simpatía* and Latine children's prosocial behavior toward a stranger. A preregistered, experimental field study was conducted in Los Angeles County, within an area of the County in which Latines are a super-majority of the population. Caregivers ($n = 100$) reported the degree that they personally endorsed *simpatía* using the validated *Simpatía Scale*. Independently, their children ($n = 100$) participated in an experiment using a standardized assessment of prosocial behavior. Children's behavior was videorecorded for scoring by independent coders. Results showed that there was a significant positive association between caregivers' *simpatía* and children's prosocial behavior on the experimental test, even when controlling for preregistered covariates. These findings expand cultural and developmental theories about the roots of prosocial behavior.

Loyalty or Need? US and Chinese Children's Judgments of Competing Moral Obligations

11:35 AM – 11:41 AM

How do children evaluate others' decisions when moral obligations conflict with loyalty to close relationships? Chinese and U.S. children (N = 284, ages 5–9) and adults (N = 150) evaluated characters who chose between helping their own child or friend with minor problems versus helping strangers with serious ones. Across cultures, when evaluating the action, children judged helping a stranger in greater need as more morally virtuous ($B = -1.20, p < .001$), with this preference strengthening with age ($B = -0.27, p = .005$). Yet when evaluating relationships maintenance, adults favored loyalty (rating helpers who had prioritized close others as a better parent or friend, $B = .24, p = .039$), while children rated both choices similarly ($B = .01, ns$). Additionally, US children's moral evaluations were more sensitive to need-based helping than Chinese children's ($B = .31, p = .034$), possibly reflecting cultural emphasis on impartial justice versus relational harmony. Together, these findings suggest that even young children recognize the tension between impartial moral obligations and loyalty to one's inner circle, though the relative emphasis on these values varies across cultures.

The Social Roots of Innovation: How Children Learn from Teaching

11:41 AM – 11:47 AM

Human learning is deeply social. From infancy, humans are sensitive to others' actions and interpret information communicated with ostensive cues as intentional acts of teaching. Yet, teaching can be a double-edged sword: while it guides children's learning of hard-to-acquire and generalizable knowledge, it can also constrain exploration if learners infer that a teacher's demonstration exhausts all relevant solutions. The present study examined whether this constraint is an inevitable aspect of pedagogy or if it depends on the type of instruction children receive. Five- to seven-year-olds (N = 114) were randomly assigned to one of three conditions: Principle ("Liquids can make objects float"), Example ("Water can make rubber ducks float"), or Control ("Bottles can be toys"). In a modified floating-peanut task, children in the Principle condition generated significantly more total, on-target, and liquid-based solutions than those in the Example or Control conditions. These findings reveal that children learn from instruction flexibly: when teaching highlights causal principles rather than specific examples, it promotes exploration, problem solving, and generative reasoning.

Children's Representational Landscapes Shape their Beliefs and Attitudes Towards Native Peoples

11:47 AM – 11:53 AM

As a consequence of the ongoing process of settler colonialism in the United States, Native Peoples are often overlooked and depicted as "people of the past," perpetuating bias and discrimination. This talk examines how such omission shapes intergroup cognition in children as young as four. Across three studies, we show that omission of modern representation sustains beliefs that Native Peoples are "of the pas,t" contributing to negative attitudes, while positive, modern portrayals enhance them. Specifically, in Study 1 (N=113), we demonstrate historical (vs. modern) portrayals led to more negative attitudes towards Native Peoples. Extending this finding, in Study 2 (N=210), we directly measure children's beliefs that Native Peoples are not around today, and find that these beliefs relate to more negative attitudes. Finally, in Study 3 (N=104), through a longitudinal design, we find exposure to modern Native representation highlighting Native identity improves children's beliefs of Native Peoples as contemporary and attitudes. Overall, omission has significant intergroup consequences, even for young children, addressing these requires thoughtful representation.

Emotion Preconference

8:00 AM – 1:00 PM | Location: E353C, Level 3

The SPSP Emotion Preconference is an interdisciplinary event that brings together social and personality scientists interested in affective science, a subject spanning any psychological process in which emotion plays a role, from decision-making and outgroup bias to close relationships and mental health. Held every year since 2006, this preconference is an opportunity to learn about cutting-edge work across a wide range of domains and engage in fruitful scholarly exchange. The program prioritizes diverse perspectives and will include a series of invited and submitted talks as well as a poster session. The session will end with a themed panel on "Emotion Contagion in Groups," during which three experts will give talks, then participate in a moderated discussion and answer audience questions.

Happiness and Well-Being Preconference

8:00 AM – 5:00 PM | Location: E253AB, Level 2

Join us at the 13th Annual Happiness and Well-Being Preconference to explore ground-breaking work in the science of well-being. This dynamic event will feature leading experts presenting their latest research and discussing future directions for the field. Featured presentations will highlight innovative theoretical contributions, cutting-edge research methodologies, and real-world practical applications. Students and postdocs will showcase their work in engaging data blitzes and poster sessions. Ample time will be allocated for audience questions and discussions. Mentoring lunches will also provide time to informally connect. Don't miss this exciting opportunity to be part of a vibrant community advancing happiness and well-being research at SPSP 2026.

Computational Social Psychology Preconference

8:00 AM – 5:00 PM | Location: E253CD, Level 2

The Computational Psychology Preconference spotlights emerging methods, theory and debates for using computational methods and big data in psychological research. Talks span data-driven discoveries and methodological tools to theory-driven modelling to applied insights for politics and data privacy.

*PRECON (IN-PERSON)

Breakfast

8:00 AM – 9:00 AM

Critical Perspectives in Psychology Preconference

8:00 AM – 5:00 PM | Location: E255, Level 2

The Critical Perspectives in Psychology preconference is dedicated to showcasing psychological research taking critical perspectives to push psychology forward in service to society. In its second installment, this preconference will amplify innovative and critical interdisciplinary methodologies, establish networking opportunities, and validate the importance of such work amidst current challenges in conducting critical scholarship. Given the current political climate and underrepresentation of minoritized scholars, we aim to create a platform for a diverse group of speakers and attendees where their work can be celebrated. This year's theme will feature talks on the "Systemic and Interpersonal Approaches to Social Issues" with an emphasis on critical methodologies that are bringing new informative tools into our field. Notably, this preconference will not only feature keynote speakers but also presentations, data blitzes, and posters from early-career scholars and graduate students.

Does It Really Translate? How Conversational Silencing Impedes What Social Psychology Can Offer the World

9:10 AM – 9:30 AM

Despite its commitment to improving social life, social psychological research often fails to produce knowledge that meaningfully translates into real-world contexts. In this presentation, I argue that translational failure is not primarily a problem of dissemination, but also a structurally produced consequence of the field's dominant epistemic and methodological norms. Controlled, decontextualized designs frequently abstract behavior from intersectional identities, sociopolitical conditions, and structural constraints, limiting the application of findings. Using the framework of conversational silencing, this work theorizes how these norms are maintained by privileging certain questions, methods, and forms of knowledge while rendering implementation, context, and relational knowledge nonobjective and methodologically suspect. This process not only constrains what is studied, but shapes core assumptions about human behavior that ultimately undermine the translational potential of our science. Through personal case examples from identity safety cue research, this talk demonstrates how methodological choices shape translation, revealing tensions between methodological ideals, applied realities, and how practical conditions are often obscured in reporting. The goal of this work is to reframe translation as a methodological and ethical obligation in social psychology, reconnecting the field with its foundational commitments to social change and applied relevance.

What We Learn When We Address Sampling Biases

9:30 AM – 10:00 AM

Social psychologists have spent several decades documenting the prevalence of sampling biases in the field. Scholars have written numerous papers about the "WEIRD people problem," as well as about the overreliance on homogeneous convenience samples within particular countries (e.g., the U.S.). To address these issues, for the past several years our research team has been purposefully recruiting samples of people who are traditionally excluded from or underrepresented in psychological science to participate in studies about a broad range of social issues. In this talk I will share lessons learned from those efforts, and their implications for the advancement of psychological theories as well as the

practical application of those theories.

Beyond Shared Identity: Collective Liberation as a Pathway to Solidarity Among Polarized Minority Groups

10:00 AM – 10:20 AM

Can collective liberation move polarized minority groups toward coalition? Across six mixed-methods studies (N = 2,900), we test three pathways to solidarity: stigma-based solidarity, critical consciousness, and an ecologically-grounded pathway we call collective liberation, the belief that oppressions and rights are intertwined (e.g., "none of us are free, until we are all free"). Studies 1a–1d demonstrate group conflict among our samples. Study 2 (qualitative field study) shows that all three pathways emerge spontaneously among protestors on the ground. In a preregistered survey (Study 3), collective liberation more strongly predicts positive intergroup attitudes and uniquely predicts collective action beyond competing frameworks. We then develop and validate a one-factor Collective Liberation Scale via EFA and CFA (Studies 4 and 5). A one-month longitudinal survey (Study 6) tests incremental predictive validity of collective liberation for attitudes and coalition behaviors (e.g., collective action) over time while controlling baselines. Together, results position collective liberation as a practical, non-identity pathway to durable coalitions among polarized minority groups.

Navigating Anticipated Discrimination: Black Job Seekers' Strategic Preference for Team-Based Work

10:00 AM – 10:20 AM

Psychological theories of work motivation often treat autonomy and individual performance as universally valued. Yet these ideals reflect racialized organizational histories that privilege independence while overlooking the bias and surveillance faced by minoritized workers. In this work, we challenge the assumption that job preferences reflect stable cultural orientations such as individualism or collectivism. Specifically, in an individualistic society where working alone yields the highest rewards, choosing collaboration presents a psychological tradeoff. While it limits opportunities for recognition and visibility, it also reduces exposure to bias. Across three studies using archival, survey, and experimental methods, we find that Black (but not White) job seekers prefer team-based (vs. independent) roles because they anticipate less discrimination in collaborative contexts. These perceptions mediate the relationship between job type and job attractiveness. Together, these findings suggest that systemic inequities may shape interpersonal orientations toward work and suggest that job preferences can serve as a buffer against racial discrimination.

The Algorithmic Accountability Gap: Less Blame, More Demand for Change

10:00 AM – 10:20 AM

Algorithms increasingly shape high-stakes decisions in domains such as healthcare, finance, and criminal justice. Although often justified by claims of greater "objectivity," evidence shows that algorithms can replicate the same systemic biases held by their human programmers. Yet little is known about how people evaluate discrimination attributed to algorithms versus humans; the present research tests this question empirically. Across three studies (N = 1,700), participants read about a healthcare diagnostic system—led by either algorithms or human decisionmakers—that produced disparate outcomes for female (vs. male) patients. We then measured participants' perceptions of accountability for biased outcomes and their support for institutional reforms to mitigate them. Across studies, algorithms were judged less accountable than human decisionmakers yet elicited greater support for institutional reform. Moreover, greater perceptions of institutional blame (Study 2) and lower perceptions of agency (Study 3) explained responses to algorithmic (vs. human) discrimination.

Sticks and Stones: Communicated Bias in Social Psychology

10:20 AM – 10:40 AM

Social psychology has a problem in how it thinks about, studies, and writes about Black people. Like other fields of psychology articles about the Black community are scant and rarely center Black voices (Roberts et al., 2020). We seek to add to the growing literature regarding inequality in psychological research by examining how problematic practices in methodology and publishing affects current Black scholars in social psychology and the perceptions of prospective students. We began by examining over 100 articles published in high-impact social psychology journals over the last 10 years to examine trends in reinforcing stereotypes, the use of Black people as a methodological tool, and other components that may communicate racial discrimination. Following this archival analysis, we interviewed Black scholars from various psychology-related fields to receive feedback about how to improve previously published research to decrease harm toward Black people. Next, we edited previously published research based on this feedback to examine if it improves undergraduate students' interest in social psychology and reduces social identity threat in social psychological settings.

Whose paradise? The impact of multicultural paradise narratives on perceptions of inequality

10:50 AM – 11:10 AM

Hawai'i is frequently depicted as a multicultural paradise where racial and ethnic groups coexist harmoniously within egalitarian systems. However, this narrative contrasts sharply with the significant inequalities faced by Native Hawaiian and Pasifika communities living within Hawai'i. Using a large diverse sample of participants from Hawai'i (and Hawai'i visitors; N = 2,000) I examine how multicultural paradise narratives distort perceptions of inequality. In Study 1, I examine the extent to which multicultural narratives are perpetuated and evaluated on social media platforms. Study 2 explores how such narratives are related to perceptions of inequality in Hawai'i. In Study 3, I experimentally test whether alternative narratives (i.e., critical historical narratives), compared to multicultural paradise narratives) provide more accurate perceptions of inequality in Hawai'i and increase motivation to address these issues. Given that such multicultural discourses are perpetuated globally, it is crucial to examine how these narratives shape such perceptions and motivations to address inequality in order to develop interventions that lead toward meaningful social change.

Considering context: Queer Puerto Ricans' gender & sexuality norm constructions

11:10 AM – 11:30 AM

Social norms are the predominant beliefs, attitudes, and codes of conduct that regulate individual behavior, and emerge from historically situated power structures that privilege certain ways of being while marginalizing others (Cialdini et al., 1991). Norms can be official or unclear, and are dependent on context. While Puerto Ricans share the liberties on gender and sexuality from US federal law, local laws set rigid expectations on gender & sexuality. Furthermore, colonial legacies (e.g., religion) also shape how people make sense of what is "normal" (Lugones, 2016). Looking from critical cultural psychology, we explore how LGBTQIA+ Puerto Ricans make sense of these normative expectations, while considering their own gender and sexuality. Conducting a thematic analysis of 25 semi-structured interviews, we found that participants often make sense of the origins through collective memories, some participants internalized conservative norms, others redefined or resisted them through anti-normative practices, and some problematized norm-adherence within the queer community. With this, we offer a consideration of context when studying the social construction of norms.

Systemic Narratives: The impact of stories on stigma and systemic awareness

11:10 AM – 11:30 AM

How does narrative media shape our awareness of systemic bias? Exposure to a compelling story can uniquely influence people's attitudes and beliefs. For instance, evidence suggests that positive or redemptive stories about members of stigmatized groups can reduce interpersonal prejudice toward those groups, and accordingly, a growing media presence is working to highlight such stories. However, the impact of these stories on readers' opposition to systemic bias is underexplored. Across four studies (N=2325), we examine how real, popular, redemptive stories of incarceration influence readers' interpersonal attitudes toward incarcerated people, and distinctly, awareness of bias in the carceral system and support for its restructuring. We find that these popular stories improve interpersonal attitudes toward incarcerated people, but do not reliably increase awareness of or opposition to the bias in the carceral system, in part due to their valence and structure. This research draws a necessary distinction between the interpersonal and systemic attitudes that are shaped by mainstream stories, and highlights implications for using narrative tools to communicate about systemic bias.

The Punitive Default

11:10 AM – 11:30 AM

Despite inconsistent success rates and negative outcomes, punishment remains a popular approach to solving social problems in America. One could argue the nation's largest institutions, not only the carceral system, but our educational and occupational institutions as well, are problematically and disparately punitive. Tough-on-crime responses and zero-tolerance policies have even resurged in the political sphere in recent months, as pushes for alternatives to punishment have receded. Do Americans have an unwarranted appetite for punitiveness? Across three studies, from three different contextual domains, we find participants born and raised in the U.S. err towards suggesting a punitive response to a wide range of misbehaviors which vary in their severity. Data also show little differentiation in punitive responses between American subgroups, suggesting the presence of a broader cultural phenomenon. One we term, the Punitive Default. What triggers it? What drives it? What might reduce its impact? A range of theoretically-supported interventions will be considered.

Evidence for a Culture of Colorblindness in Psychology

11:30 AM – 12:00 PM

Colorblindness (CB) is an intergroup ideology suggesting that race should not matter in day-to-day life and that, regardless of race, all people are the same. Although individuals who endorse CB often do so because they want to seem egalitarian, CB ignores real-world racial inequality and, as such, perpetuates (rather than disrupts) structural racism. In this talk, I will present evidence suggesting that CB is embedded within the culture of psychological science. CB may describe how psychologists do research to the extent that 1) race is perceived by psychologists as irrelevant to most psychological processes and 2) psychologists tend to ignore racial differences both between and within racial groups. Drawing on the "Culture Cycle" framework (Markus & Connor, 2014), this talk will discuss evidence for CB at multiple levels of culture: specifically, the ideas, institutional policies, interactions, and individual beliefs that characterize our field. Lastly, I will discuss the importance of recognizing CB in psychology, as CB may reduce the relevance of our research to, and the impact of our findings on, the real-world.

Are Unions Obsolete? Historical Narratives Shape Support for Workplace Collective Action

2:40 PM – 3:00 PM

Labor unionization—the collective organization of workers to protect rights—has long been a powerful form of collective action. Union density is linked to reduced inequality (Western & Rosenfeld, 2011), compressed wages (Ahliquist, 2017), and greater life satisfaction (Flavin & Shufeldt, 2016). However, since the 1970s, union density has declined steadily. Despite high pro-union sentiment, membership sits at 9.9%, the lowest on record. Union decline is often framed as an inevitable consequence of structural labor shifts. Yet, recent work suggests that misperceptions of what unions do may explain the gap between union sentiment and union action (Kamphorst & Willer, 2024). Using a cross-sectional, between-subjects design, we tested how historical narratives of U.S. labor unions (Studies 1–2) and personalized data on union benefits (Study 3) shaped support for collective action. Results show historical narratives boost pro-union sentiment and solidarity with strikers but not action intentions. However, pairing narratives with personalized data did raise action intentions. Findings suggest that reconnecting labor's history to workers' lived experience may strengthen union participation.

Defaulting to Whiteness: Dual-Minority Biracial Perception and Exclusion

2:40 PM – 3:00 PM

The majority of biracial research in psychology focuses on White perceivers and biracial people with half White ancestry (e.g., Black/White biracial people) rather than dual-minority biracial people (i.e., biracial people with two minority racial identities). This research practice perpetuates Whiteness as the default experience. To mitigate this, the present study examines how monoracial Asian and Black Americans categorize dual-minority biracial people. Participants (N = 360) were randomly assigned to respond to perceived discrimination and racial categorization measures about either dual-minority (Asian-Black) biracial or ingroup/White (Asian/White or Black/White, depending on the perceiver's race) biracial targets. Results showed that participants categorized the part-White targets as ingroup members more than the Asian-Black targets, and that participants estimated that part-White biracial targets experience significantly less discrimination than Asian-Black biracial targets. This is some of the first empirical data revealing the differences in the perceptions and categorizations of dual-minority biracial people compared to part-White biracial people.

Measuring Structural Ableism: Justification, Process, and Preliminary Findings

2:40 PM – 3:00 PM

The term ableism reflects a system of power that positions certain bodies and minds as “normal” and fully human, and others as abnormal and subhuman (Campbell, 2008). In the present work, I argue for the need to develop a measure of experiences with structural ableism (the norms, policies, and standards that enact ableism and devalue disability) and share preliminary findings from a project developing such a measure. This measure, developed in consultation with disabled community members and researchers, assesses frequency of encountering access barriers across 9 domains (e.g., education, housing) and policy barriers across 5 domains (e.g., subminimum wages). Most of the N = 481 participants had encountered at least one access barrier (n = 413) and at least one policy barrier (n = 366). The data also highlight the importance of considering multiple marginalization in disability experiences, as, in line with critical disability perspectives, experiences of structural ableism differ by race, gender, and sexual orientation. I discuss these results as well as findings from ongoing qualitative coding of open-ended questions and next steps in developing this measure.

Black Activists' Learning Processes on the History of Black Liberation Movements in the United States

3:30 PM – 3:50 PM

As Black history is rarely taught in schools, and when taught, reflects reductive narratives of racial progress (Loewen, 2008), it is imperative to examine how Black communities develop and adopt counternarratives. Social movements have been examined as predictors of systemic change; yet, there has been limited work examining them as sites of social learning. Ten semi-structured focus group discussions were conducted with Black organizers (N=47, 18-61 years) in New York City. We utilized reflexive thematic analysis to examine the questions: How do Black activists learn about Black history and historical Black liberation movements? What are their sources and processes of learning? Preliminary analysis suggests three themes: (1) agentic engagement with cultural representations of counternarratives (e.g., museums, archival media); (2) intergenerational transmission of counternarratives (e.g., within families, social movements); and (3) resistance to the endorsement of master narratives. Our findings inform theories on the development of critical consciousness among activists (Mosley et al., 2021) to further inform interventions that promote sociopolitical collective action.

[1] College Students' Self-Censorship During Israel's Ongoing Genocide Against Palestinians in Gaza: A Mixed Methods Investigation

4:00 PM – 5:00 PM

Extant research has shown that students may self-censor or refrain from sharing their political views and perspectives when perceived as a minority (holding differing views from the majority group). However, little is known about students' experiences with self-censorship during global crises, which may be linked to their well-being. We draw on social identity theory and the social justice education literature to examine students' experiences and factors contributing to their self-censorship during the 2023 Israel-Hamas War. Participants comprised 480 college students who completed a series of measures and open-ended questions about factors that support or hinder open discussion of the ongoing genocide. Quantitative findings suggest that self-censorship positively predicted psychological distress. Next, moderation analyses examined whether this relationship was moderated by college students' support for Palestine/Israel. Additionally, ten themes were identified that supported or hindered discussion of the war. We conclude by providing practical recommendations for how scholars, educators, and institutions can have difficult dialogues about ongoing global conflicts and issues.

[2] Examining the Relations Between Educational Censorship Laws Affecting High School Curricula and the Ethnic-Racial Identity Development of Youth of Color

4:00 PM – 5:00 PM

Research shows that when schools affirm students of color's racial and cultural identities through inclusive curricula, it promotes stronger ethnic-racial identity (ERI) and greater well-being. However, in recent years, over 30 U.S. states have introduced or passed educational censorship laws that restrict what public schools can teach about race, gender, and sexual orientation. This study examined whether censorship laws shape students' experiences of school racial climate and ERI development. Participants were 299 18–19-year-olds of color who recently completed high school in states with active censorship laws, proposed but failed censorship bills, or no such proposed legislation. They completed measures of school racial climate and ERI. Results showed no significant differences across policy contexts. However, students who were more aware of the spread of educational censorship laws reported experiencing greater stereotyping from teachers and in their school materials, lower positive ERI regard, and more engagement in critical action. Since these laws are recent, future research should track the development of awareness and its implications.

[3] Roots and Dreams: A Community Field Experiment Shows that Fostering Alignments Between Future Aspirations and Racial/Ethnic Identities Boosts GPA in a Diverse Cohort of Middle Schoolers

4:00 PM – 5:00 PM

This study examines whether fostering alignments between adolescents' racial/ethnic experiences and their aspirations boosts the benefits of traditional but color-evasive approaches. Through a community-engaged school partnership, middle schoolers were randomly assigned to take part in novel 'ethnically aligned' group activities or in traditional 'identity-based motivation' group activities (n=142, incl. 54% Latine, 10% Black, 11% biracial/multiracial). On average, middle schoolers in the novel group reported higher GPA through the school year than their peers in the traditional group. The extent to which students retained core lessons partly explained this effect: students' reflections at the end of group activities integrated more core lessons in the novel group than in the traditional group, and higher number of lessons retained was in turn associated with higher GPA scores. This field experiment shows that connecting goals with racial and ethnic experiences can boost school outcomes for Latine, Black, and other adolescents, especially when they are encouraged to reflect on strengths from their communities, and to find points where these experiences and their aspirations align.

[4] How normative diversity ideologies impact evaluative outcomes for students of color at universities

4:00 PM – 5:00 PM

Diversity statements in university messaging may be critical in students' anticipated sense of institutional belonging (Cochran & David, 1986). We explored diversity, equity, and inclusion (DEI) statements at top colleges in the U.S. In Study 1, we conducted a content analysis of statements, assessing the prevalence of four variables: the mention of race and/or demographic groups, multiculturalism, and social good. In Study 2, university students rated their perceptions of these statements. Study 3 tests the effect of race-conscious versus colorblind DEI statements on students of color's (SOC) sense of fit at universities. Content analyses revealed that most statements do not mention demographic groups, and further, most do not mention multiculturalism (80%), or race (84%). Additionally, statements mentioning race, multiculturalism, and demographic groups were more likely to be rated high in societal good. These findings suggest that colorblindness is the prevalent model used in diversity messaging at elite U.S. universities. We discuss the implications that race-conscious DEI statements hold for SOC's belonging and interest in colleges.

[5] Centering Social Fit, Self-Concept Fit, Goal Fit, and Resource Fit as Core Elements of Students' Experiences of Belonging at School

4:00 PM – 5:00 PM

Promoting belonging in school has become a focal concern. Such efforts require a comprehensive, accurate understanding of what belonging means. In this theoretical work, I argue that social psychological research on students' experiences of belonging has overwhelmingly focused on their sense of social connection to others at school (social fit), while overlooking other factors essential to these experiences. Adopting a critical perspective on belonging in social psychology, I show that when students—especially those from underresearched groups—define belonging, they also emphasize the extent to which they experience support for their valued identities (self-concept fit), goals (goal fit), and basic financial, nutritional, and safety needs (resource fit). Furthermore, I demonstrate that the reason that these four forms of fit matter is because they enable students' social connections, identities, goals, and needs to feel natural, inconspicuous, and "right" when they are at school, and it is those feelings of "fluency" that ultimately produce a holistic experience that they belong. Implications for measuring belonging and for belonging-supportive interventions/policies are discussed.

[6] Beyond In-Group Identity: How Integration of U.S. Cultural Identity—Rather Than Rejection of Puertorriqueñidad—Shapes Political Status Preferences.

4:00 PM – 5:00 PM

Research on acculturation suggests that bicultural individuals often support policies that challenge the system. Yet, decolonial theory suggests that biculturalism may at times reinforce colonial mentalities (CM)—not through ingroup derogation, but through identification with the dominant culture. With a sample of Puerto Ricans (N=607), we examined how Puerto Rican (PRID) and U.S. American (USID) identification predicted voting preferences in the 2020 status plebiscite. Logistic regressions revealed significant PRID×USID interactions for U.S. statehood ($b = .33$), indicating that bicultural individuals were more likely to vote for full annexation; and for independence ($b = -.31$), indicating that biculturals were less likely to vote for independence than those high only in PRID. Mediation analyses showed that CM explained these effects: PRID predicted lower CM, while USID predicted higher CM, which, in turn, increased the likelihood of voting for statehood and decreased support for independence. The model explained 54% of the variance, highlighting the link between biculturalism and CM, which, in turn, legitimizes continued U.S. hegemony via full annexation of the island-nation.

[7] The Missing Piece: Overlooking Interpersonal and Systemic Influences in Social and Health Psychology Research

4:00 PM – 5:00 PM

The majority of health psychology research conducted by social psychologists studies individuals' engagement in health behaviors. Much of this work draws on individual-oriented theories (e.g., the Theory of Planned Behavior). While these theories were designed to focus on the individual to predict behavior, this limited focus inadvertently excludes many other factors that impact behavior, namely interpersonal and systemic factors. We argue that this lack of focus on interpersonal and systemic factors leads to: (1) research that is less generalizable and only applies to people not facing systemic disadvantages, (2) research that may cause healthcare professionals to place undue blame on their patients if they don't successfully engage in health behaviors, and (3) the creation of health behavior policies that are not optimally effective. Using the Socio-Ecological Model, we provide a novel framework for health psychology researchers to account for interpersonal and systemic factors in their research, as well as provide practical recommendations for future research. Our arguments apply broadly to health psychology and social psychology research using individual-oriented theories.

[8] Intersectional disparities in pain care: The roles of target race and gender

4:00 PM – 5:00 PM

Pain experienced by 1) Black (vs.White) individuals and 2) women (vs.men) is under-perceived and undertreated in the US. Yet, less is known about how a target's race and gender identities simultaneously shape pain perception and treatment—a research gap that may perpetuate inequitable healthcare outcomes for Black women, who suffer intersectional invisibility. In a preregistered internal meta-analysis (20 experiments; N=3120), we tested if perceivers' pain perception & treatment recommendations varied by target race (Black vs.White) & gender (female vs.male) interactively. Black women's & men's pain is seen less readily than their White counterparts, with this gap magnified within Black men. Black women & men suffer similar anti-Black biases in treatment. Also, White women's pain is seen less readily than White men's, but no perceptual gender bias emerged for Black targets. Yet, a corresponding gender bias in treatment manifested similarly for Black & White women. Together, Black women's racial & gender nonprototypicality may blunt their susceptibility to bias in pain perception but not in treatment, showing the importance of intersectionality when studying healthcare disparities.

[9] Beyond Direct Harm: Contextualizing Off/Online Vicarious Discrimination Experiences on Health

4:00 PM – 5:00 PM

With the rise of social media consumption, exposure to racial unfairness has extended into digital spaces, compounding the ways in which individuals experience race-based stressors. While studies link direct racial discrimination (DRD; i.e., firsthand experiences of racial unfairness) to health, recent findings suggest that vicarious racial discrimination (VRD)—the secondhand experience of racial discrimination—may be encountered more frequently than DRD and thus, also detrimental for health. However, lack of differentiation between DRD and VRD exposures hinders standardization and cross-study comparisons. In two studies, we aimed to identify the frequency and health impact of VRD, compared to DRD. Study 1 (N=147) was a cross-sectional survey that examined frequency patterns of off/online VRD/DRD exposure across various domains and their associations with health. Study 2 (N=144) used an 8-day ecological momentary assessment (EMA) to examine how off/online VRD/DRD exposure impacts same and next-day metrics of health. Findings clarify VRD/DRD similarities and differences, expanding our understanding of how racial discrimination affects health, even among those vicariously exposed.

[10] Examining the impact of Black and Latina mothers' experiences with discrimination on children's health: An intergenerational approach to vicarious racism

4:00 PM – 5:00 PM

A systematic review by Heard-Garris et al. (2018) examined vicarious racism among caregivers and its impact on children, revealing that parental depression mediates the link between caregiver discrimination and children's internalizing behaviors, such as anxiety. However, aspects like parental stress and anxiety have been less studied. This project investigates the association between maternal experiences of racial discrimination and children's health outcomes, focusing on maternal sleep and stress as mediators. Utilizing the Baby's First Years project, an ongoing randomized controlled trial, 1,000 low-income mothers from cities like New York and Omaha were assigned to high or low-cash gift groups. The final analysis included 424 Black mothers and 440 Hispanic mothers, excluding others. Preliminary results show significant mean differences, with Black women reporting higher stress and discrimination encounters than Hispanic women. Also, encounters with racial discrimination were positively associated with maternal stress. The presentation will discuss the mediation results and highlight the use of secondary data to address racial and social issues.

[11] "sh*t...he heard it.": Ethnic-racial socialization in the context of sociopolitical hostility

4:00 PM – 5:00 PM

Ethnic-racial socialization is an important process that occurs across a variety of contexts and by various social forces. Emerging scholarship suggests that the messages and frequency with which adults communicate about race to the children in their care varies not only by ethnic-racial group membership, familiarity with racial concepts and knowledge, or experience with racial discrimination but also by the broader sociopolitical context. Using community-based participatory research, this paper is designed to provide an in-depth perspective of the way issues of systemic racism and police brutality emerge across home and school during moments of heightened sociopolitical tension. Critical reflexive analyses of focus groups and interviews (n=13) reveal how the sociopolitical context raised the urgency of race conversations but the level of preparation, the practices employed when it emerged, and the ideologies used to justify them indicate that some children are navigating contexts of discontinuity where race is salient at home and not at school, or salient at school and not at home. This talk concludes with discussion of the implications for children's developing ideas about race.

[12] Perceptions of Intersectionality: Beyond Two Identities

4:00 PM – 5:00 PM

Can people perceive more than two social identities simultaneously? Numerous studies have investigated the influence of two social identities (ex: race & gender) on social perception. However limited work has investigated past this barrier. Across three studies (two preregistered, one ongoing), participants assessed the likelihood of targets to experience significant negative life events. We manipulate race (black/white), gender (women/men), and sexuality (gay/straight). We find a positive correlation between the amount of stigmatized identities and perceptions of experiencing negative life events, however this relationship follows a quadratic pattern with diminishing returns. The effect holds when accounting for perceptions of how problematic/common various forms of discrimination are. In Study 3, we aim to extend these results to the domain of discrimination using an adapted version of the Everyday Discrimination Scale (Williams et al., 1997). We predict the same pattern of results, suggesting that individuals with more (vs. less) intersecting stigmatized identities may be perceived to face relatively less discrimination and thus might be overlooked in conversations about stigma.

[13] Are White Women the Prototype? A Black Perspective on Intersectional Invisibility

4:00 PM – 5:00 PM

Recent theoretical work on intersectional invisibility highlights that individuals with multiple subordinate identities may be overlooked because they do not match group prototypes. Black women are a key example: they are often undifferentiated from Black men and are underrepresented in studies of femininity and gender stereotypes. Empirical studies show that White women are strongly associated with the category "woman," while Black women are viewed as non-prototypical, masculine, and more similar to Black men. However, most of this research has examined White people's perceptions of Black women. This project investigates whether Black individuals' perceptions of the prototypical woman align more with Black women or White women. Participants will be randomly assigned to consider women in general, Black women, or White women, and will complete the Bem Sex Roles Inventory as well as open-ended qualitative questions. We expect Black participants' prototypes of "woman" to more closely reflect White women. This mismatch between the general "woman" and the Black woman may create conflicting ingroup expectations for Black women that may lead to social stress.

[14] Asymmetries in felt understanding: An intersectional analysis of cross-race and cross-gender interactions

4:00 PM – 5:00 PM

Although all people have a basic need to feel understood, we propose that the fulfilment of this need is not equitably distributed. Specifically, we hypothesize an asymmetry in felt understanding: Individuals with marginalized identities (H1a: women, H1b: people of colour, H1c: women of colour) feel less understood by advantaged partners (H1a: men, H1b: White people, H1c: White men) than vice versa. To test our hypotheses, we collected 52,560 ecological momentary assessments over a month from participants who reported the race and gender of their interaction partners and how understood they felt by them. We found support for asymmetrical felt understanding: People of color felt less understood by White people than White people felt by people of color, and women of color felt less understood by White men than vice versa (H1b-c). We did not find asymmetrical understanding when examining gender alone (H1a); instead, both men and women felt more understood by women than by men. Our results suggest that how understood an individual feels depends on the race and gender of the individual and their interaction partner, highlighting the importance of taking an intersectional perspective.

[15] Incidence of and Motivations for First-Name Whitening among Ethnic Minorities

4:00 PM – 5:00 PM

Among ethnic minorities in the U.S., some choose to adopt "whitened" versions of their first names, which has been shown in past research to have career benefits. Yet no research has examined how many people make this choice, and why and when they do so. In a large sample of Americans of color (N = 875), we find that 32% use a whitened name. Immigrants (vs. native born) and Black Americans (vs. Latinx and Asian Americans) were most likely to report name whitening. On average, respondents use their whitened names in 59% of daily interactions, especially in social (e.g., dates) and public (e.g., restaurants) settings, followed by friend/family interactions, institutions (e.g., hospitals), and work. Most name whitening decisions were self-initiated vs. suggested by others, and were especially motivated by the desire to aid others' pronunciation, followed by a sense of name whitening as culturally normative, and an expectation of greater career success with a whitened name. Interestingly, name whitening was not driven by ethnic identity strength. These data document the incidence of name whitening and generate insights toward research on identity management among ethnic minorities.

[16] A functional framework of Asian American racial ingroups

4:00 PM – 5:00 PM

When there are multiple ways to describe one's identity, each option implies a different ingroup, implying different targets are ingroup members. When describing their racial ingroup, Asian Americans include only targets of their same nationality group (e.g., Chinese) in some situations, but in others, all people of colour can be seen as ingroup members. We propose a framework of how Asian Americans negotiate their racial ingroups, suggesting that the way individuals identify themselves varies based on situational features. Drawing on coalitional cognition and dynamic models, this framework suggests that Asian American ingroups are flexible because they are functional. This framework explains previous findings that Asian Americans identify with narrower ingroups as well as research on Asian American solidarity with other Asian American and non-Asian American groups in some contexts. We extend the framework to a broader conceptualization of functional ingroups applied to other contexts. We present qualitative and quantitative data supporting our model.

[17] Rethinking Racial Perception: Ethnicity, Afrocentricity, and Solidarity Among Black Women

4:00 PM – 5:00 PM

Dominant psychological models of racial perception often homogenize racial groups, erasing ethnic diversity and reinforcing narrow constructions of Blackness. This study challenges these limitations by examining how Black women from varied ethnic backgrounds are perceived in terms of Afrocentricity, racial solidarity expectations, and racial positioning. By interrogating frameworks such as the Racial Position Model, this research exposes how traditional theories overlook ethnic heterogeneity within Black populations. Findings reveal that African American women were perceived as more Afrocentric and more likely to show ingroup solidarity compared to African, Caribbean, and Afro-Latina women. By integrating ethnicity into racial perception research, this study offers a critical perspective, highlighting how methodological and theoretical blind spots contribute to marginalization, invisibility, and misunderstanding of Black experiences within psychological science.

[18] From Perceived Racism to Activism: An Existential and Affective Science Approach

4:00 PM – 5:00 PM

Social justice movements are essential for societal advancement. In the case of racial progress, anti-racism movements are motivated by the negative experience of perceived racism. This project explores the path from experiencing racism to activism intentions, focusing on existential and affective motivations. As racism is both a threat to existence and negative emotional experience, this project hypothesized that existential threat and negative affects—specifically anger and anxiety—predict activism intentions post-racism experiences. Using two studies (N = 595), this project explored the path from perceived racism to activism. Study 1 did not find indirect effects, however, perceived racism directly predicted activism, existential threat, and negative affect. Next, this investigation explored the proposed paths using an experimental manipulation of perceived racism. The indirect paths in the Study 2 hypothesized model were not supported. However, alternative models pointed to paths toward activism. With these two studies, this work contributes to a deeper understanding of how existential and emotional responses to racism contributes to activism.

[19] Beyond Black and White: A Reconceptualization of Racial Ambiguity

4:00 PM – 5:00 PM

Racial ambiguity research often uses Multiracial faces to test how person perception is disrupted, yet it overlooks monoracial groups (e.g., South Asian, Latine) who can also appear racially ambiguous. We propose a reconceptualization of racial ambiguity that extends beyond Multiraciality to include monoracial groups, linking disruptions in perception to miscategorizations (e.g., an Asian person categorized as Latine) and stereotype misattributions (e.g., South Asian faces associated with Latine stereotypes). Across two studies (N = 582), we ask perceivers to categorize and stereotype South Asian and Latine faces. When South Asian faces were miscategorized as Latine, they did not receive Latine stereotypes, yet when Latine faces were miscategorized as South Asian, they did receive South Asian stereotypes. This work is some of the first to include understudied monoracial groups within the racially ambiguous processing literature. Importantly, we find evidence that racial ambiguity is more than just a disruption in the person perception process—it can meaningfully shift stereotypes and offers a new direction for studying stereotyping, prejudice, and intergroup relations.

[20] The Color of Foreignness: Distinct Consequences for Black Individuals in the U.S.

4:00 PM – 5:00 PM

Members of groups perceived as foreign (e.g., Asians/Asian Americans) face foreignness-based discrimination. However, research on foreignness rarely includes Black people, leaving out a growing population of the U.S.: Black immigrants. Across four studies, we find that the traditional relationship between perceived cultural foreignness and negative stereotyping is different for Black groups in the U.S. In Study 1, Asian immigrants were stereotyped less positively than Asian Americans, but the reverse was true for Black groups: Black immigrants were stereotyped more positively than Black Americans. For Black groups, these stereotype differences lie primarily along status and warmth dimensions (S2). In examining these stereotype differences in action, we found that students expected higher work quality from a Black immigrant (vs. Black American) partner, mediated by status stereotypes (S3). These findings highlight the overlooked diversity within the Black population while challenging assumptions linking foreignness to negative stereotyping.

[21] Narratives of Harmony, Systems of Oppression: The Consequences of Endorsing Hawai'i's Multicultural Paradise Narrative

4:00 PM – 5:00 PM

Hawai'i is globally recognized as a model of multiculturalism, where racial and ethnic groups live in harmony resulting in equitable social systems. This narrative, however, obscures the persistent systemic inequalities faced by Native Hawaiian and Pasifika communities. For instance, while Native Hawaiians and Pasifika groups make up 10% of the population, they make up 44% of incarcerated populations. This study examines how endorsement of this multicultural paradise narrative shapes the perceptions of Hawai'i visitors (n = 880). That is, we examine how endorsement of the multicultural paradise narrative is associated with system-justifying beliefs (e.g., defending U.S. occupation of Hawai'i), diminished perceptions of inequality (e.g., perceiving smaller wealth gap), and opposition to redistributive policies (e.g., limiting short-term rentals). Taken together, our analysis highlights the masking effect of multicultural paradise narratives of inequality in Hawai'i which ultimately reinforces systems of colonialism. Implications for interventions that counter these narratives are discussed.

[22] The (Mis)perception of Racial Economic Progress: Identity and Temporal Considerations

4:00 PM – 5:00 PM

These studies explore White and Black Americans perceptions of racial economic progress and how ethnic-racial and national identity considerations come to bear on these perceived trajectories. S1 split White Ps into either a 'past-to-present' (PTP) condition, which estimated B-W inequality (income, wealth) across 7 time points (1963-2023), or a 'present-only' (PO) condition. The PTP cond. overestimated present equality to a larger extent than the PO cond. Within the PTP cond., ethnic-racial identification and patriotism interacted with these perceptions, such that the relationships became increasingly more pronounced as time moved toward the present. S2 split White and Black Ps into three conditions: A 'distant past' (DP) condition with 11 points (1924-2024); a 'close past' (CP) condition with 6 points (1974-2024); and a 'present-only' (PO) condition. The DP cond. overestimated present equality to a larger extent than the CP cond., who, in turn, overestimated more than the PO cond. Again, the more Ps could create a linear narrative of progress, the more they (mis)perceived the present. Among White Ps, we replicate the interactions across time with ethnic-racial ID and patriotism.

[23] A Differential Item Functioning Analysis of the International Welfare Attitudes Scale

4:00 PM – 5:00 PM

Objective: Based on item response theory methods, I will conduct a differential item functioning analysis of the widely used International Welfare Attitudes Scale (IWAS) to evaluate whether the instrument demonstrates invariance when assessing welfare attitudes among different gender, racial, and ethnic groups. Method: Data was available from 1,265 Americans in the General Social Survey. Final analyses will be performed using the multi-group graded response model on six question items within a unidimensionality framework to investigate the presence and impact of differential item functioning across gender, racial, and ethnic groups. Results: Based on results of the multi-group graded response models, I will clarify which items exhibit differential item functioning among different types of social groups. I expect that the magnitude of the differential item functioning will be minimal and will not produce differential measurement error at the scale score level. Conclusion: These findings will provide evidence of measurement equivalence of the IWAS, examine the potential algorithmic inequalities, and confirm its usefulness in measuring welfare attitudes across social groups.

[24] Generational Historical Reflexivity: Inheriting the past and acting on the future

4:00 PM – 5:00 PM

Generational Historical Reflexivity (GHR) is the recognition of oneself as part of an intergenerational lineage embedded within history - inheriting material conditions of the past and feeling responsibility for what will be handed to the future. Across three samples (N = 1,300), a GHR scale demonstrates strong psychometric reliability and predicts a more expansive political imagination, problem-solving orientation toward inequality, openness to diverse forms of political action, and higher critical consciousness. Building on these findings, the next phase applies GHR in critical community interventions to foster resilience, empowerment and efficacy among marginalized populations. On-going projects help participants situate their generational lineages within history to: (1) motivate milestone completion in a transitional housing program among chronically homeless men; (2) motivate participation in an English language program for West African asylum seekers; (3) understand the efficacy of a political education program for Black men. Together, these interventions test how cultivating GHR can convert personal development into collective, historically grounded action.

[25] Investigating Racial Differences in Tonic Electrodermal Activity among Black and White Participants

4:00 PM – 5:00 PM

Electrodermal activity (EDA) reflects skin conductance changes linked to stress or arousal, consisting of tonic and phasic components. Although widely used in research and consumer wearables, racial disparities in EDA remain underexplored. Black participants are often labeled as "non-responders" due to lower scores, leading to exclusion and reduced generalizability. We examined racial differences in tonic EDA using a relatively large sample (N=139) of Black (n=72) and White (n=67) adults aged 18–59, recruited for a study on police attitudes. EDA was recorded at 1000Hz from the non-dominant hand with Ag/AgCl electrodes during a 6-min baseline (traffic noise). Black participants showed significantly lower tonic EDA (M=4.13µS, SD=2.49) than White participants (M=7.95µS, SD=3.19), p<.001. This pattern held across gender: Black women (M=3.92µS) vs. White women (M=8.76µS), p<.001; Black men (M=4.63µS) vs. White men (M=7.16µS), p<.001. Findings highlight robust racial disparities in baseline tonic EDA, independent of stimulus, underscoring the need for inclusive measures and reconsideration of "non-responder" definitions to avoid racial bias.

[26] Towards Measurement Diversity: Racialized Conceptualizations of Masculinity and Measurement “Invariance”

4:00 PM – 5:00 PM

This study critically examines what is lost in the pursuit of “measurement invariance,” particularly in the context of racialized masculinity. Participants (N = 917: 303 Asian, 294 Black, 320 white participants) assessed the masculinity of Asian, Black, and white men targets using a 20-item scale. We conducted a measurement invariance analysis and six exploratory factor analyses for each participant and target race/ethnicity group. Results showed that each group mapped masculinity differently using the same 20 items, producing distinct factor structures that varied in the number of factors and the items that fell under each factor. Consequently, in the process of developing a “generalizable” factor structure that works for the entire sample, some items dropped out because they only worked for specific groups and not all, despite being potentially important to understanding masculinity within those groups. We discuss how conventional approaches to measurement invariance can obscure the situatedness of how masculinity is conceptualized, including across different race/ethnicity groups; and that “measurement diversity” is a potentially more just and empirical approach.

[27] From Framing to Feedback: Computational Analyses of How Audiences Respond to Racism Disclosures

4:00 PM – 5:00 PM

Social media is a site where racism is publicly negotiated—where disclosures of discrimination and the comments that follow become opportunities for “vicarious race talk.” Across two experiments (N = 1235), participants viewed posts describing racial discrimination framed interpersonally or structurally, sometimes followed by validating or denying comments. Quantitative results show that structural framing and validation increased support for the poster and perceived value of the disclosure, while belief systems—especially structural and racial-progress beliefs—shaped observer reactions. The next stage of this work combines computational text analysis (e.g., topic modeling and large language models) to identify common themes and emotional patterns in participants’ open-ended responses. These analyses will examine how people legitimize, contest, or reinterpret racism claims, revealing how audiences make sense of both personal and systemic accounts of discrimination. By integrating computational and qualitative approaches, this project uses a critical lens to examine how digital discourse reproduces—or resists—dominant narratives about racism.

[28] Who Counts as ‘People’? AI Shows Generalizability Bias While Summarizing Research Findings

4:00 PM – 5:00 PM

Psychological research often relies on Western, educated, industrialized, rich, and democratic (WEIRD) participants, yet findings from these limited samples are often assumed to generalize to all people. Reflecting this bias, papers describing studies with non-WEIRD samples typically specify nationality (e.g., Turkish participants), whereas those with WEIRD samples simply use general terms such as “participants” and “people.”. In the current study, we tested whether Large Language Models show the same generalizability bias. We prompted GPT to generate titles for studies described in psychology abstracts from PsychArchive; for each abstract, we created versions that specified that participants were from one of the 195 countries in the world. Results showed a strong negative correlation: GPT mentioned nationality significantly more often for countries with a lower Human Development Index, indicating that the model mirrors existing biases in how research populations are linguistically framed. This finding highlights generalizability bias across the internet, illustrates how such reasoning biases may be inherited from human data, and underscores the risk of AI-assisted writing.

[29] The Humanized-System Narrative: Inspiring Action at Both Individual and Systemic Levels

4:00 PM – 5:00 PM

One of today’s most urgent challenges is translating concern about societal problems like climate change, public health crises, and humanitarian disasters into action rather than paralysis. To address this, social scientists have traditionally downscaled these problems to the story of an identified victim. While such narratives inspire personal action, they neglect, and sometimes even suppress, support for systemic change. In contrast, growing research uses systemic narratives, which highlight the broader scale and systemic causes of societal problems. While these narratives raise awareness of the necessity for systemic solutions, they can overwhelm audiences to the point of inaction. So how can we motivate personal and systemic change? Across two domains (climate change and public health), we compare individual and systemic narratives against a novel synthesis of these two approaches: the humanized-system narrative. We find that only the humanized-system narrative motivates both personal prosocial behavior and support for policy change, providing a promising strategy for communicating about today’s most pressing societal problems.

[30] A Critique of Diversity Approaches In Psychology: Lessons from Cultural Psychology

4:00 PM – 5:00 PM

A prominent response by mainstream Psychology to the recent generalizability crises has been to advocate for greater representation of historically marginalized subjectivities—what I term as the Representation Discourse. I identify three interrelated recent trends in recent Psychology where Diversity Discourse finds its origins: awareness that Psychology primarily consists of samples from Western, Educated, Industrialized, Rich, and Democratic societies, a significant portion of Psychology does not confirm prior results, and Psychology overrepresents white subjectivities, reflecting a structural embeddedness of Psychology with racism. While they call for greater diversification of subjectivities to deter the dominance of white epistemologies, they largely fail to interrogate essentialist assumptions about culture implicit in dominant approaches and neglect the sociohistorical constitution of psychological phenomena and knowledge production. We discuss how cultural psychological approaches and decolonial perspectives offer a way for Psychology to address its problems of whiteness, without reifying cultural groups and the racism in which it is embedded.

[31] Daily Challenges and A Lack of Visibility for Students with Disabilities: The Need for Critical Disabilities Studies

4:00 PM – 5:00 PM

College students with disabilities experience many challenges as disability resources are cut and broader systemic cuts also impact disabled people. Our mixed-methods survey compared perceptions of campus accessibility and visibility in disabled and non-disabled samples. We found large disparities in the visibility of disabled people across our samples, including in leadership, classes/class content, student organizations, and close friendships/romantic relationships. Non-disabled students had few interactions with or even knowledge of disabled people around campus and thus had less interest in learning more or pushing for systemic changes. Meanwhile, students with disabilities reported numerous challenges on campus with social interactions, classes, mental health resources, and more. Our work also highlights the need for more intersectional research on disability populations. In our sample, students with disabilities also held other marginalized identities, including race, gender, sexuality, and SES. Despite this, open responses often discussed and reinforced hierarchies within disabilities communities, which also shows how important critical disabilities studies are in this work.

[32] Rooted in Culture: Research with Hispanic/Latine Communities

4:00 PM – 5:00 PM

Hispanic/Latine communities are among the fastest growing ethnic groups in the United States, yet they remain underrepresented in research. For research to be inclusive, representative, and meaningful to Hispanic/Latine communities, it must be culturally responsive. Drawing on our experiences in an ongoing study with Hispanic/Latine families who speak Spanish and/or English, I will discuss three key considerations in designing and implementing culturally responsive research. These considerations include barriers to participation (i.e., recruitment methods, building trust with participants, and study accessibility), challenges with linguistic heterogeneity (i.e., differences in regional dialects, translation accuracy, and participant comprehension), and community representation (i.e., incorporating lived experiences and engaging community partners). In discussing these considerations, I will outline strategies and research practices we have implemented to address them. Taking these considerations into account is necessary for research practices in social psychology to be culturally responsive and inclusive of Hispanic/Latine communities.

[33] “Nice,” quiet neighborhoods: Banda music and the racialization of space

4:00 PM – 5:00 PM

Informed by the intersecting histories of the construction of the Mexican race and the racialization of space within the United States, this research employs a mixed-methods approach to investigate whether Banda music, a genre of Mexican regional music, functions as an audio cue for the racialization of space as Mexican. Further, we investigate how the racialization of space as Mexican differentially shapes feelings of connection to space for Mexican and non-Latinx perceivers. Study 1 provides initial evidence that Banda music facilitates the racialization of space -- operationalized as applying negative racial stereotypes to spaces -- in non-Latinx perceivers. Additional analyses reveal that this pattern of results is underpinned by social conservatism and informed by the white spatial imaginary. Study 2 finds that, for Mexican and Mexican-American perceivers with higher-than-average identification with their ethnic-racial identity, Banda music increases feelings of connection to space. Overall, this work provides initial empirical evidence that the racialization of space is a multisensory process that elicits different effects depending on identity, experience, and ideology.

[34] Going Through the System: Racialized Perceptions of Criminal Defendants and Consequences for Racial Disparities in the Criminal Justice System

4:00 PM – 5:00 PM

According to Social Dominance Theory and past research, the criminal justice system reproduces the American racial hierarchy by disproportionately targeting and imposing harsh sanctions on racial minorities, especially African Americans. This study (N = 202) focuses on differences in negative perceptions of criminal defendants and severity of recommended punishment, as Black and White defendants progress through four stages of the criminal justice system: crime, arrest, prosecution, and sentencing. The results revealed that racism, punitiveness, SDO, conservatism, and support for rehabilitation predicted negative perceptions and punishment of Black, but not White, criminal defendants, in all stages, and that the magnitude of these associations increased as Black defendants advanced through the criminal justice system, reflecting increasing racial disparities. This work demonstrates the racialization of attitudes towards criminal defendants and has implications for understanding when and how racial disparities occur in the criminal justice system and implementing interventions to reduce such disparities.

[35] From Public Ideology to Lived Identity: A Multi-Method Analysis of Adults in Custody

4:00 PM – 5:00 PM

Political ideologies shape public attitudes toward Adults in Custody (AIC)—influencing criminal-justice policy and reform—and may also shape how AIC experience rehabilitation and identity. This multi-method project includes two studies: (1) a quantitative investigation of ideological drivers of public attitudes toward AIC and (2) a qualitative study of identity change among women in a prison workforce-development program using lifeline interviews. Study 1 tested how neoliberal attitudes shaped perceptions of AIC, especially the tendency to view them as immoral. Using a validated single-item measure of perceived immorality, we examined whether belief in free will mediated the link between neoliberalism and immorality perceptions and found that neoliberalism and right-wing authoritarianism differed in how they predicted immorality and dehumanization. Study 2 identified themes of isolation, systemic failures, and turning points, suggesting that AIC may internalize neoliberal beliefs about personal responsibility and worth. With more than 95 % of AIC eventually returning to society, understanding these societal ideologies and narratives is vital for both reform and research.

[36] Justice, Just for Me: Identity and Conditional Attributions for Inequality

4:00 PM – 5:00 PM

How do people decide when discrimination “counts”? This study tested whether stigmatized identity promotes structural recognition of inequality, or whether that awareness remains confined to one’s own marginalized domain. Three hundred white women were randomly assigned to evaluate workplace discrimination lawsuits involving either gender or racial bias, presented in corporate contexts designed to obscure prejudice through “false diversity cues.” Participants rated whether claimant outcomes reflected individual failings or systemic injustice. The centrality of participants’ gender identity moderated these effects. Women who viewed gender as a core to their self-concept consistently made structural attributions, seeing discrimination as institutional, claimants as credible, and the company overall as more unfair – but only in gender discrimination cases. When evaluating racial discrimination, women attributed outcomes more to individual factors. Findings suggest that marginalization can heighten sensitivity to structural injustice, but this awareness often remains bounded by identity relevance, shaping when people make structural versus individual attributions for inequality.

Sustainability Psychology Preconference

8:00 AM – 7:00 PM | Location: E265, Level 2

In this preconference, we showcase cutting-edge research from scholars working across specialties, using a variety of methodologies, and working at both the micro and macro level to move beliefs and behaviors toward sustainability. We offer formal learning experiences with invited talks, symposia, and data blitzes. We also invite informal conversation and networking through poster sessions, discussions, and a happy hour event.

(Hegemonic) Conceptions of Environmentalism: Nature Preservation, Eco-Modernism, and Racism-Evasion

8:05 AM – 9:15 AM

Environmental historians note that dominant threads of environmentalism—Wilderness Preservation (WP) and Eco-Modernism (EM; green development)—reflect global north sensibilities, erasing environmental injustice in global majority settings and responses to it—Environmental Justice (EJ). Across two studies, we investigated Black, Latinx, and white Americans' conceptions of environmentalism; whether they 1) include discussions of racism, and 2) vary by racial identification. In Study 1 (N=182), across racial categories, participants emphasized behaviors associated with the WP more than EM and EJ. 73% denied a connection between racism and climate change. In Study 2 (N=446), participants reported whether 30 environmentalist activities (10 each thread) represented environmentalism. Across racial groups, environmentalism was most strongly associated with WP, then EC and EJ activities. Racial identification was positively associated with conceiving EJ environmentalism among Black and Latinx but negative among white participants, signifying racism-relevance of environmentalism. We discuss importance of critical race and decolonial perspectives in the study of environmentalism.

Why Good Intentions Aren't Always Enough: Identity and Misalignment in Bridging Knowledge Systems in Science Collaborations

8:05 AM – 9:15 AM

Intercultural collaborations between Western scientists and Indigenous Knowledge Holders are vital for addressing climate change and environmental degradation. Yet these collaborations often remain constrained by power imbalances and the partial integration of knowledge systems. This research investigates how Western scientists' social identities, particularly their identification with Western science, shape their engagement in such collaborations. Grounded in Social Identity Theory and drawing on in-depth interviews with marine scientists and Alaska Native key informants in the Gulf of Alaska, the study reveals how multiple, intersecting identities influence perceptions of legitimacy, authority, and positionality. While scientists broadly supported intercultural collaboration, many retained control over its structure and epistemic framing, highlighting persistent dynamics of dominance even within well-intentioned partnerships. This work emphasizes the psychological dimensions of knowledge system integration and points to the need for institutional and educational reforms that foster epistemic humility and support identity transformation among Western scientists.

An Ecofeminist Game-Style Intervention to Increase Pro-Environmental Action for a Sustainable and Just Future

8:05 AM – 9:15 AM

This research tests an ecofeminist game-style intervention that highlights the complementarity between human, social justice, and environmental goals to foster support for pro-environmental collective actions. In two experiments, 410 undergraduates and 451 Canadian adults, respectively, made fictional city policy choices benefiting both people and the environment, receiving feedback on co-benefits. In Experiment 1, the game increased support for environmental policies used in the game and social justice policies not used in the game. In Experiment 2, support for environmental and social justice policies in and not in the game, willingness to act, and environmental donations all increased. Effects were mediated by perceived complementarity of human (Experiments 1 and 2) and social justice goals (Experiment 1) with environmental goals, and to a lesser extent, participatory efficacy and environmental cognitive alternatives (Experiment 2). Findings suggest emphasizing the compatibility of environmental and human goals can increase climate action.

Does environmental psychology afford an “effective context” for the study of structural racism?

8:05 AM – 9:15 AM

Recent manifestations of racial violence have renewed conversations about structural racism. An important question for psychologists concerns how they might contribute to scholarship that adequately illuminates and confronts structural racism. In this paper, we consider whether environmental psychology (EP)—a discipline unique in its attention to the everyday environment of psychological experience—can serve as a site for such scholarship. We critically review articles that mention racism in EP's two leading journals (Journal of Environmental Psychology and Environment & Behavior). We find that of the roughly 4,500 articles published in the two journals, the word 'racism' appears in 45 articles, 10 of which effectively apply EP's framework to illuminate and confront structural racism. We conclude by arguing for EP to shift toward a racism-conscious lens, until which an EP for the study of structural racism will remain unborn.

When Green Innovation Backfires: The Dual Role of Disgust and Perceived Innovativeness in Sustainable Food Acceptance

10:15 AM – 11:15 AM

Achieving sustainable change depends not only on technological innovation but also on public acceptance of it. Yet green innovations often elicit both fascination and aversion. Cultured foods—produced by growing cells from living organisms—illustrate this tension between sustainability potential and psychological resistance. Across two studies (N = 601, N = 602), we examine how core disgust (pathogen-based aversion) and moral disgust (moral violation aversion) shape acceptance of cultured foods, and how perceived innovativeness alters these effects. Perceiving cultured foods as innovative directly reduces disgust, but paradoxically amplifies its impact on acceptance—strengthening the barrier when disgust is present. These findings reveal that innovation cues can both alleviate and magnify emotional resistance, underscoring the complex psychology of green innovation adoption. They offer insights for science communication and policy aiming to promote sustainable technologies without triggering affective rejection.

Valuing the Future: Sustaining the Commons for Future Generations

10:15 AM – 11:15 AM

In two pre-registered studies (N = 2,350), we use an incentivized intergenerational common pool resource paradigm to investigate whether moral concern about future generations promotes sustainable management of shared resources. In study 1 (N = 355), we find that individuals higher in Impartial Intergenerational Beneficence (IIB), Obligation to Future Generations, and Legacy motives take fewer shared resources, demonstrating their willingness to forego personal earnings to improve the welfare of future resource users. In study 2 (N = 1,995), we find that an intervention aimed at increasing consideration of future generations leads participants to use less resources, thus sustaining the commons for more generations. In a mediation analysis, we find suggestive evidence that the behavioral effects may be explained by an increased sense of moral obligation to future generations following the intervention. Together, these findings offer evidence that psychological interventions can promote intergenerational concern and cooperation, with implications for intergenerational commons problems like climate change.

Proximity to effects of climate change, identity and proenvironmental behavior

10:15 AM – 11:15 AM

An environmentalist identity tends to lead to more proenvironmental attitudes and behavior (Vesely et al., 2021). However, environmentalist identity is less common among non-White (vs. White) participants even though they support sustainable policies at the same rate as White participants (Schuldt & Pearson, 2016). In two studies, we tested the proximity hypothesis to explain this divide. We propose that proximity to climate change effects reduces the influence of abstract identities on proenvironmental outcomes. In Study 1 (N=302) proximity (e.g., feeling that climate change is close) was a stronger predictor of six proenvironmental outcomes (rmean=.35) than environmentalist identity (rmean=.17). Study 2 (N=12 collected; 88 expected) is a 2(proximity)x2(environmentalist identity) design where randomly assigned participants read about extreme weather either attributed to climate change (high proximity) or normal cycles (low proximity) and are labeled an environmentalist or not after completing a behavior questionnaire. We expect that environmentalist identity will have a weaker effect on the six proenvironmental outcomes for participants in the high vs. low proximity condition.

What is Nature? Student Conceptions of Nature Predict Sustainability-Related Beliefs, Attitudes, and Behaviors

10:15 AM – 11:15 AM

Although student conceptions of nature have been investigated with respect to content (inclusion of humans, non-human animals, plants, abiotic elements, and their interactions), little work has linked conceptions to other environmental cognitions. We elicited brief written definitions of nature and other measures of environmental thinking from 711 undergraduate students. Plants, non-human animals, and abiotic elements were each mentioned in roughly 33% of responses. Humans were included in only 8% of responses, whereas 54% of responses implicitly or explicitly excluded humans from the definition of nature. Moreover, avoiding human exclusion and demonstrating systems thinking were positively associated with perceived impact of nature on humans, endorsement of human-nature reciprocity, perceived human connectedness to surrounding ecosystems, and willingness to classify organisms in human context (e.g. a bird on wire) as "nature." Results suggest that conceptualizations of nature and humans' place in it have important implications for pro-environmental beliefs, attitudes, and behaviors.

Ecospirituality Predicts Pro-Environmental Outcomes Across 15 Countries and the 5 World Religions

10:15 AM – 11:15 AM

The idea that nature has spiritual qualities is common in diverse cultural and religious contexts. In North American samples, evidence supports a link between ecospirituality and pro-environmental behaviors (PEBs). However, the generalizability of this claim remains untested. This study uses a large cross-cultural sample of religious individuals from 15 countries spanning the 5 world religions (N=11,186) to (1) estimate the link between ecospirituality and 3 PEBs: behavioral intentions to make sustainable decisions, policy support, and financial donations to an environmental organization; and (2) assess the pathways by which an ecospiritual worldview translates to PEBs. Pre-registered analyses showed that ecospirituality positively predicted each of the PEBs similarly across diverse cultural and religious populations. Even more, the link between ecospirituality and PEBs were consistently mediated by the same variables across cultures. In short, ecospirituality unites diverse cultural worldviews in motivating care for nature by fostering a sense of responsibility, gratitude, and efficacy, making it a potentially powerful foundation for global environmental stewardship.

The Price of the Status Quo: Paying More to Avoid Lifestyle Change in the Context of Climate Change Solutions

10:15 AM – 11:15 AM

Contemporary society faces unprecedented climate threats, yet progress toward decarbonization has been impeded by public resistance. From a rational choice view, this opposition may stem from concerns over economic costs, as climate solutions are often believed to entail higher expenses than fossil fuels. Informed by system justification theory, other research indicates that opposition may also be driven by threats solutions pose to the status quo, since proposals often require changes to entrenched lifestyles. These perspectives raise an important question: Would people rather bear financial costs or change their lifestyle in order to protect the environment? Using U.S. General Social Survey data from 1993 to 2021, (N = 7070), we found that people consistently reported greater willingness to pay higher prices to protect the environment than to accept cuts to their lifestyles. Notably, this pattern was not moderated by income, perceived financial situation, subjective socioeconomic status, or political orientation. The results underscore the role of status quo defense in driving climate opposition, even beyond economic costs.

Ecological Humility Inventory

10:15 AM – 11:15 AM

This investigation validates a self-report measure of ecological humility. Across 8 studies (N = 1724, seven pre-registered) the 10-item Ecological Humility Inventory was constructed. Study 1 generated traits used for item generation. Studies 2a-2c examined the face validity of the items in expert samples and the general population. Studies 3a-3b and 4a-4b provided evidence for the validity (construct, convergent, discriminant, predictive) and reliability of the scale. The inventory displayed psychometric properties that met stringent fit criteria (invariance and dynamic fit indexes). Higher scores correlated positively with constructs predictive of concern for nature (environmental identity, nature connectedness, awe, anthropomorphism of nature), virtues and prosocial tendencies (empathic concern, perspective taking, patience sincerity, fairness, modesty, honesty-humility). Scores negatively correlated with ecological and social dominance orientation, anthropocentrism, speciesism and human superiority beliefs. Importantly, scores predicted performance in an effortful proenvironmental behavioral task, controlling for environmental identity and nature connectedness.

How Climate Change Politicization Shapes Public Policy Support and Moderates Behavioral Intervention Effectiveness Across Nations

10:15 AM – 11:15 AM

Public support is essential for implementing effective climate policies, yet it varies across countries. We examined how national-level politicization of climate change shapes citizens' policy support and the effectiveness of policy support interventions. Drawing on expert evaluations and experimental data from over 40,000 participants across 31 countries, we identify substantial differences in climate change politicization. Average support for climate policies was higher in moderately and highly politicized contexts compared to low-politicization contexts. Interventions aimed at increasing policy support were only effective in moderate- and high-politicized countries. In moderately politicization countries, successful interventions boosted support equally across ideological lines. In high-politicized countries, some interventions effectively boosted policy support, regardless of ideological differences between their citizens, while others did so only among right-wing supporters. These findings challenge prevailing views on climate change politicization risks and highlight its nuanced role in shaping public responsiveness to climate action.

Lunch

12:00 PM – 1:30 PM

Lunch will be served in the meeting room. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

oGrilled Chicken Pesto Sandwich: Grilled Chicken Breast, Fresh Mozzarella, Oven Dried Tomato, Arugula, Basil Pesto, Ciabatta Roll

oRoast Turkey Caprese Pasta Salad: Rotini Pasta, Cherry Tomatoes, Fresh Mozzarella, Basil Pesto, Mixed Greens, Balsamic Glaze

oRoasted Vegetable Wrap (V): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto, Wrap (limited gluten free wraps available)

oMediterranean Chickpea Salad (VG | GF | DF): Crispy Chickpeas, Cucumbers, Tomatoes, Red Onion, Kalamata Olives, Feta Cheese (on the side), Mixed Greens, Lemon Vinaigrette

[161] Environmental Tradeoffs and Moral Dilemmas: The Role of Sacred Values in Environmental Decision-Making

1:30 PM – 2:20 PM

Although the language of trade-offs in environmental decision making is ubiquitous, few studies have examined how our underlying values and the moral imperatives attached to them inform and predict such decisions. Sacred values—which involve viewing certain principles as non-reducible and non-fungible—may be relevant in this context. We ask whether these values may play a role in people's willingness to endorse different environmental plans and policies in the context of a tradeoff. Participants are presented with 3 different scenarios for a development project that causes environmental harm followed by either monetary gain or benefit for humans in need. Results indicate the addition of an offset increases the acceptability of trade-offs, although this is attenuated for plans that lead to biodiversity loss. For those high in outcome-based (consequentialist) reasoning, this effect is enhanced. and Moral inclusion of nature reduces endorsement for plans that violate nature, regardless of whether there was an offset or human benefit. Those who sacralize values related to environmental protection are less willing to endorse transgressions regardless of the consequences of the plans.

[162] Discouraged from Decarbonizing: Racial Disparities in Electric Vehicle Sales

1:30 PM – 2:20 PM

Transportation contributes nearly a third of U.S. greenhouse gas emissions, highlighting the need for electric vehicle (EV) adoption. Yet ownership remains low, with racial disparities: Black and Hispanic consumers are underrepresented despite strong interest. Drawing on stereotype bias and cultural mismatch theories, we test whether discouragement in sales interactions drives these gaps. Implicit bias and in-group favoritism may shape perceptions of customer fit, while cultural mismatch can heighten sensitivity to rejection cues. Using California Clean Vehicle Rebate Project survey data (N=9,739), we examine whether minority EV buyers faced discouragement and whether experiences differed by sales model. Black, Hispanic, and Other races were more likely than Whites to be “talked out” of EVs. For Asians, race alone did not predict dissuasion, but Asian Tesla buyers were more than twice as likely to face discouragement as Asians buying non-Teslas. Findings extend research on stereotype bias beyond pricing and credit, showing how biased sales interactions can exclude minorities. Addressing these dynamics is key for equitable access to clean transportation and a green economy.

[163] Impact of Stereotypes and Activist Behavior on Perceptions of Environmentalists and Pro-environmental Actions

1:30 PM – 2:20 PM

Negative stereotypes associated with environmentalists and environmental activists may create obstacles to the environmentalist movement. In a past study we found that the modal prototype of an environmentalist is a young White woman and that participants hold more negative views of activists than non-activists. However, it is specific examples of activists versus non-activist behavior (e.g., protesting versus recycling) that generates different stereotypes, rather than just using the labels “environmentalist” and “environmental activists.” Now, we seek to replicate those findings by using more ecologically valid materials, considering how actor race affects evaluations, and adding behavioral measures to further examine how perceptions of environmentalists may impact actual pro-environmental behaviors compared to self-reported behaviors. We used a 2 X 2 between-subjects experimental design where we manipulated the race and engagement with activism of a female environmentalist’s Instagram profile. Preliminary findings indicate greater positivity toward non-activists compared to activists, and little evidence that target race affects judgments.

[164] Hexaco and Environmentalism

1:30 PM – 2:20 PM

In this paper, we investigate which personality dimensions provide a common psychological basis for environmental measures and socio-moral orientations (e.g., feeling connected to others, perceiving the environmental problem as moral). In a cross-sectional study (N = 634), we explored the associations between the HEXACO dimensions and a wide range of environmental measures as well as socio-moral orientations related to environmentalism. We found that Openness to Experience was the most prominent predictor of environmental measures, socio-moral orientations and the belief that climate change is caused by human activity. We further provide a comprehensive overview of how each personality dimension connects socio-moral orientations and environmental measures, highlighting the multifaceted nature of environmentalism. The findings underscore the role of individual differences in coping with the environmental crisis. Our paper replicates and extends previous research, contributing to the ongoing discussion on how differences in individual predispositions influence environmental engagement.

[165] Understanding and promoting pro-environmental behavior change through scope expansion

1:30 PM – 2:20 PM

Many pro-environmental behavior (PEB) interventions attempt to reduce psychological distance (i.e., how far away an object or event is from the self) towards climate change. However, this work is held back by theoretical and practical limitations: psychological distance cannot be reduced, and these approaches promote a self-centered set of solutions. Regulatory Scope provides a path forward, proposing that actions addressing distal concerns are promoted through expansive (vs contractive) scope, defined as the range of ends and possibilities considered in decision making. Our research directly tests this theory in the environmental domain. We show in 3 pre-registered studies (N=285) that expansive scope is associated with greater past PEB engagement, larger environmental donations, stronger environmental identity, and stronger future PEB intentions. In 5 pre-registered studies (N=702), we test novel scope manipulation interventions, showing that simulating the thinking of another person high (vs low) on scope promotes stronger (vs weaker) PEB intentions. Implications for intervention design are discussed, including expected findings from in-prep longitudinal field interventions.

[166] Are humans part of nature? Predictors of excluding humans from definitions of nature.

1:30 PM – 2:20 PM

This study explores how people define "nature" and which aspects of connection to nature (CTN) predict whether they include or exclude humans from this definition. We collected open-ended definitions of nature (N = 766) and scores on the DEEP CTN scale. Giving non-human examples was most common, followed by definitions excluding humans. Definitions including humans were least common. Using DEEP CTN sub-scales, we ran logistic regression to identify what aspects predicted human inclusion or exclusion. Those scoring high on depth of identity (self-construct including nature) were 1.3x more likely to include humans ($p = 0.04$, 95%CI = 1.01-1.70) and almost half as likely to exclude humans (OR = 0.66, $p < 0.001$, 95%CI = 0.50-0.87). Interestingly, those high in emotional CTN (deep empathy towards nature) showed a tendency to exclude humans, though this didn't reach significance (OR = 1.33, $p = 0.5$, 95%CI = 1.00-1.78). This suggests how people define nature, specifically whether they include humans, is intertwined with how their CTN is expressed.

[167] People in Cities Worried about Climate Change Discuss Nature Less Negatively Online

1:30 PM – 2:20 PM

In this mixed methods, exploratory study, our goal was to map potential geographical differences in the ways nature is discussed online and to test whether those differences are associated with a location's worry about climate change. We collected, read, and qualitatively coded N=20 threads from the subreddits of N=81 American cities (M=718 words per thread), and also recorded climate change worry scores for each city from the Yale Program on Climate Communications. Through our coding, we identified tone and emotion words as potentially important variables distinguishing high worry cities from low worry cities. We used LIWC analysis to give each city a score for positive and negative tone, positive and negative emotion words, and anxiety, sadness, and anger-related words. Negative tone ($r = -.225$; $p = .045$), negative emotion ($r = -.342$; $p = .002$), and anxiety ($r = -.241$; $p = .031$) were all negatively correlated with a city's worry about climate change. Positive tone and emotion words were not. This indicates that people in cities more worried about climate change talk less negatively about nature online. Qualitative examples and discussion are also provided.

[168] "Do as I say, not as I do" — Talking about Environmental Issues and Feelings of Hypocrisy

1:30 PM – 2:20 PM

Despite widespread concern, people rarely talk about environmental issues. We propose that this silence may stem from feelings of hypocrisy: speaking up about environmental issues can draw attention to one's own behaviors, which often fall short of one's pro-environmental convictions. This may create a fear of appearing hypocritical, discouraging people from voicing their convictions. Based on prior research, we specifically hypothesized that such feelings would reduce willingness to discuss the need for individual-level change but not system-level change. Informed by the findings of a pretest (N = 184), we developed an experimental paradigm with a hypocrisy induction and a control condition to examine these effects. Data were collected in an online study across Austria, Germany, Greece, the Netherlands, Slovenia, and the United Kingdom (total N = 2,105). Structural equation modeling revealed that the hypocrisy manipulation did not successfully change feelings of hypocrisy; however, feelings of hypocrisy were negatively associated with willingness to discuss both individual- and system-level change. This pattern of results holds when analyzing the data of each country separately.

[169] From innovation to emotion: How transformational salience in affective appeals shapes consumer responses toward recycled ocean plastic fashion

1:30 PM – 2:20 PM

Despite advances in transforming ocean plastic waste into sustainable products, consumer adoption remains limited due to perceived risks and emotional aversion, especially for items worn close to the body. Innovation appeals that highlight functional novelty aim to promote circularity, yet may fall short in changing behavior. Drawing on transformational salience and psychological proximity, this study examines how communication can enhance perceived value of recycled ocean plastic fashion. A 2 (innovation vs. affective appeal) $\times$ 2 (garment vs. accessory) between-subjects experiment among young Western European consumers tests the impact of appeal type and product proximity on attitudes and adoption intentions. Results show that affective appeals significantly improve responses to garments made from ocean plastic, countering prior disgust responses. Accessories elicit positive reactions regardless of appeal. Symbolic and emotional value perceptions mediate these effects, underscoring the power of emotionally resonant messaging in advancing circular fashion.

[170] Comparing effects of hopeful imagination to hopeful message on motivating pro-environmental attitudes and behaviors across different cultural contexts.

1:30 PM – 2:20 PM

The accelerating urgency of global climate change demands communication strategies that inspire collective action. Recent scholarship increasingly focuses on the effects of inducing hope, yet work on hopeful messages often suggests limited effects of these messages on motivating climate engagement. In this experiment, we investigate whether hopeful imagination tasks, guided exercises that help participants actively envision a thriving, sustainable future, motivate pro-environmental attitudes and behaviors more strongly than passive reception of hopeful messages and a control group amongst the American and Chinese publics. The rationale for this study is rooted in both psychological theory and practical necessity. Research on mental imagery and future thinking demonstrates that active imagination exercises can enhance motivation and behavioral commitment more effectively than verbal messaging alone. However, there remains a critical gap in empirical evidence comparing the relative effectiveness of experiential imagination tasks versus traditional message-based interventions in the climate context.

[171] Climate Change Perceptions, Personality Traits and Sustainable Health Behaviours in Singaporean Adults

1:30 PM – 2:20 PM

Climate change poses major environmental and health challenges, yet little is known about links with daily lifestyle behaviours. This study examined climate perceptions among 678 Singaporean adults in a digital lifestyle trial. Participants rated six items on climate importance, worry, personal and generational harm, and impacts on diet and activity using Likert scales, dichotomised as "high" versus "low." Diet and activity were measured via DASH score and the International Physical Activity Questionnaire. Among participants (Mean age=31.11±9.65 years;42.5% male;82.7% Chinese), 6.8% rated climate change as extremely important and 12.1% were very worried. More perceived a "great deal of harm" to future generations (63.9%) than to themselves (22.0%). Physical activity (39.7%) and diet (19.8%) were strongly affected by climate change; non-Chinese participants rated it more important and worrying. High climate importance was associated with greater DASH adherence (22.26 vs 21.22, p=0.007) but not total physical activity. Although widely acknowledged, climate change remains a low personal priority; concern for future generations may help drive sustainable, health-supportive behaviours.

[172] Imagining the Alternative: The Role of Mental Imagery in Environmental Cognition and Climate Action

1:30 PM – 2:20 PM

Climate change poses a significant threat to human health and well-being. As such, research is needed into the individual differences shaping engagement in climate action. Prior work has suggested that the ability to produce mental imagery may influence cognitive factors which facilitate environmental engagement, such as access to cognitive alternatives to the status quo. We conducted a study in a combined online and undergraduate sample to evaluate the potential relationship between mental imagery ability, environmental actions, and behavioral intentions. We used structural equation modeling to test a pre-registered path model of these relationships. While the model demonstrated good fit, not all the predicted relationships were significant. Additionally, we tested an alternative model which also demonstrated good fit. Follow-up studies will test these competing models. These results indicate that representations of climate related concepts may affect environmental behavior, however the degree to which mental imagery ability affects these relationships remains unclear.

[173] Cross-cultural value orientation and environmental behavior - A study from university students of Nepal and United States of America

1:30 PM – 2:20 PM

Studies have established that self transcendent values have a positive association with pro environmental behaviors and self-enhancement values have a negative association. However, few studies have asked whether this relationship between values and behaviors varies based on culture. To do so, we tested the link between egoistic, altruistic and biospheric value orientation and a range of environmentally relevant behaviors in two contrasting cultures: the US and Nepal. The results showed that in the US, consistent with past literature, biospheric value orientation positively predicts numerous pro environmental behaviors and egoistic value orientation negatively predicts pro environmental behaviors. Whereas, in the case of Nepal, we found that egoistic value orientation predicts pro environmental behaviors like purchasing sustainable products, donating money to environmental initiatives and volunteering for environmental causes. Likewise, in comparison to the US, biospheric value orientation in Nepal has a weaker association with environmental behavior. These results demonstrate culturally-specific relations between value orientation and environmentally relevant behaviors.

[174] Why Go Green? Unpacking the Motivational Reasons Behind Private and Public Environmental Actions

1:30 PM – 2:20 PM

Drawing on Self-Determination Theory (Deci & Ryan, 2000), this research explores motivations behind pro-environmental behaviors in Turkey, where an authoritarian political climate may inhibit participation in collective public actions. Study 1 (N = 375; Mage = 22.35; SD = 2.38) revealed that autonomous, but not controlling, reasons uniquely predicted private- and public-sphere behaviors, controlling for connectedness to nature and perceived environmental threat. Participants also responded to vignettes assessing their willingness to act sustainably at personal cost. Together, the results suggest that autonomous reasons predict both actual behavior and intention, even when time and effort are required. Building on Study 1, Study 2 (total N = 160; Mage = 23.55; SD = 7.17) used a six-week diary design and found that weekly variation in autonomous, but not controlling, reasons positively predicted weekly fluctuations in both behavior types. Further, perceived environmental threat also predicted between-person differences in such behaviors across both realms. These findings underscore the role of autonomous motivation in sustaining green behavior, even under restrictive conditions.

[175] Hope and Climate Change Engagement: Examining Relationships Between Hope Targets, Intentions, and Policy Support

1:30 PM – 2:20 PM

Whether or not people are hopeful about climate change is not solely important for a sustainable future (Geiger et al., 2023). Rather, the target of hope also relates to climate engagement. Our study explores relationships between hope and engagement with climate change. In an online survey, 1,898 U.S. adults wrote what made them hopeful about climate change and reported climate engagement (i.e., behavioral intentions and policy support). We implemented mixed-methods analyses to contextualize written responses with quantitative measures of climate change engagement. Qualitative analysis revealed six themes: science and technology, powerful actors, lay action, increasing awareness, denial hope (hope that the problem is overstated), and no hope. Statistical analyses showed that those with denial hope for climate change reported below-average climate engagement, while those who were hopeful about powerful actors, lay action, or increasing awareness for climate change generally reported above-average engagement. Our research supports scientists, policymakers, and community leaders who want to frame climate change to encourage engagement, policy support, and behavioral intentions.

[176] The Diminishing Effect of Social Norms Messages In the Context of Green Transportation

1:30 PM – 2:20 PM

Among the continued calls to action for social psychologists is to harness the power of social norms to promote sustainable behavior. To this end, researchers have created messages that highlight a social norm and observed whether individuals adjust their actions accordingly. However, many studies have used messages labeled as social norms messages while only asking people to do a behavior without referencing a social norm (e.g., Please wash your hands). To test the effect of these "behavioral requests" relative to norms messages, we conducted 2 field experiments in the context of green transportation. In Study 1 we encouraged bikers (N = 498) to signal when passing a pedestrian on a bike path. We found that any type of message was more effective at leading bikers to signal than a no-message control. In Study 2 (N = 422), we replicated Study 1 while also recording how far the pedestrian had traveled from the messages. We found that the further from the intervention, the weaker the effect of norms messages – and especially behavioral requests – on signaling. We identify how researchers can change behavior and offer new insights about the declining effect of norms interventions.

[177] Framing the Divide: Environmental Message Framing and Political Polarization in U.S. Print Media

1:30 PM – 2:20 PM

Bipartisan environmental legislation in the US was once common; however, in recent decades, environmentalism has become a polarized marker of political identity. Message framing has emerged as a strategy to appeal to diverse identity groups. Evidence points to the effectiveness of framing, but it has also been criticized for reinforcing ideological division. Likewise, critics have questioned whether environmental organizations are going far enough to frame appeals in ways that resonate with right-leaning audiences. In this analysis, we examine 300 environmental appeals published in widely read print magazines (Newsweek, Time, and National Geographic) from 1960 to 2019. Messages are coded by two researchers for hierarchical, individualist, egalitarian, and communitarian framing. We examine the prevalence of frames over time relative to political party holding office and relative to indicators of environmental values from long-term Gallup and Pew surveys. With this dataset, we seek to answer whether political identity frames are preceding or following changes in party leadership and how this reflects the contribution environmental advertisements are making to political polarization.

[178] Americans realistically assess public views of climate change as a national problem

1:30 PM – 2:20 PM

Public underestimation of other people's climate beliefs, worry, and support for action have been described as a false sense of reality. In contrast, we demonstrate that Americans (N = 1980) realistically assess other Americans' opinions about climate change as national problem: They are fairly accurate in estimating the percentage of Americans who believe climate change is a "very big" problem (46% vs 41%, estimate vs. actual, respectively), overestimate Republican opinions (29% vs. 13%), and accurately estimate Democrat views (66% vs. 67%). Their direct estimates of the size of the political divide on this topic are also reasonably accurate (50% vs. 54%). Moreover, they are sensitive to the extent to which Americans, Democrats, and Republicans endorse this opinion relative to 19 other potential top national problems. Our research challenges the prevailing characterization of climate-related second-order beliefs (beliefs about other people's beliefs), calls for attention to the topics that Americans think are most and least important, and has potential implications for communication about second-order beliefs as a means of motivating support for climate actions.

[179] Ingroup Bias in the Allocation of Infrastructure Projects

1:30 PM – 2:20 PM

Infrastructure projects have important effects on humans and the natural environment. The present work examines the interaction between project desirability and group membership, specifically whether it reveals ingroup bias in the allocation of project locations. Across two studies, 223 college participants completed an urban planning task that involved distributing infrastructure projects to available locations on a county map. Participants read that they worked for the City of Birchwood or the City of Pinecrest. Afterwards, they allocated 12 infrastructure projects (six positive, six negative) to one-of-three possible locations: Birchwood, Pinecrest, or outside the cities in Arbor County (16 or 18 total lots). The results showed that participants generally located more positive infrastructure projects in their own city rather than the other city, and more negative infrastructure projects in the other city rather than their own city. Importantly, group membership did not influence the number of positive or negative infrastructure projects allocated in the larger county. These results suggest that ingroup bias (rather than NIMBY) might influence the allocation of infrastructure.

[180] What Influences Stormwater Managers to Go Green?

1:30 PM – 2:20 PM

Despite evidence of green infrastructure's effectiveness in improving water quality and climate resilience, critical barriers to widespread adoption remain. Municipal public works departments—responsible for stormwater infrastructure planning, budgeting, and maintenance—play a key role in advancing these practices. To better understand the factors that influence green infrastructure decision-making, in-depth interviews were conducted with public works managers and engineers across Wisconsin in 2023 and 2025. Applying the Theory of Planned Behavior (Ajzen, 1985), one of the most widely used frameworks in the behavioral sciences, this project employed grounded theory methodology to qualitatively examine the beliefs, social norms, and perceived barriers shaping stormwater managers' decisions. This poster will present key findings, illustrate how they are informing a statewide survey, and discuss ways to support local green infrastructure adoption through targeted outreach.

[181] Expert consensus on high-impact strategies for environmental behavior change: a Delphi study

1:30 PM – 2:20 PM

Researchers studying environmental behavior change have developed and tested dozens of interventions to promote a shift toward more sustainable and environmentally friendly behavior. While this is a rich and dynamic body of literature, there is a lack of clarity on which interventions experts agree show the most promise for changing environmentally relevant behavior. I sought to understand expert agreement around "high-impact" strategies for environmental behavior change using a two-phase (phase 1 N= 18, phase 2 N= 14) Delphi process with a panel of experts in the field. In the first round, experts were asked to list three high-impact strategies for environmental behavior change, and in the second round, they were asked to rate the extent to which they agreed each strategy listed in the first round was high-impact. Of the initial 26 strategies gathered in the first round, there were only seven that the panel agreed fit the definition of being "high impact" (using a 70% threshold of consensus). These results help clarify what experts consider the leading contributions of their field to date, while also highlighting the most promising avenues for application and practice.

[182] Visible to whom: The relationship between social visibility and the performance of pro-environmental behaviors and differences based on audience social closeness

1:30 PM – 2:20 PM

Environmental behaviors are opportunities to display environmentalism to others and gain reputation. This research examined whether people are more likely to engage in environmental actions when they perceive them as being of high (relative to low) visibility. We tested how the relationship between visibility and behavior performance changes depending on the social closeness of the observer. Participants (N = 1000) rated 20 recurring environmental behaviors for how often they performed them, and their perceived visibility, in general, and to audiences of varying social closeness (i.e., family, friends, acquaintances, and strangers). Participants were more likely to report performing environmental behaviors that they perceive as highly visible, controlling for political ideology, gender, attitudes, environmentalist identity, and behavior difficulty and effectiveness. This relationship varies depending on the social closeness of the observer, such that visibility to socially distant audiences have a weaker association with behavior performance than socially close audiences. Results have implications for the Actor-Behavior-Observer model of the impact of social visibility.

[183] Reparation and Reciprocity: Mapping Kleinian Object Relations onto the Ecological Self

1:30 PM – 2:20 PM

This paper bridges object relations theory and ecopsychology to propose the Western psyche's relationship with the Earth reflects a pathological object relation. Drawing on Melanie Klein's model of the paranoid-schizoid and depressive positions, the Earth can be understood as a split object, idealized as nurturing "Mother Nature" yet persecuted through extraction and control. Ecological destruction thus mirrors psychic defense mechanisms of splitting and projection, enacted collectively to disavow dependence, grief, and mortality. Moving toward the depressive position involves mourning the harm done to the ecological "good object" and developing the capacity for ambivalence and repair. Acts of offering and reciprocity are reframed as reparative gestures: symbolic attempts to restore relationship with the more than human world and integrate disowned aspects of the self. Integrating Klein, Hillman, Fisher, and Lertzman, this model situates sustainability as psychological maturation, embodying the transition from defensive dissociation to relational responsibility with the living Earth.

[184] Toward Sustainable Diets: The Role of Empathy and Reactance in Responses to Meat Reduction Appeals

1:30 PM – 2:20 PM

Appeals to increase green behavior may elicit reactance among certain groups, though empathy may buffer reactance. This study explored whether empathy after viewing meat reduction messages indirectly leads to persuasion via reactance, across political groups. 1,281 US participants were randomly assigned to view a meat-reduction message that included an image of meat or no image and rated their empathy for the pictured animal, general empathy for animals, reactance, and attitudes and intentions related to meat reduction. Results revealed indirect effects of empathy for the pictured animal via reactance on meat-eating attitudes (effect = -.035 [-.056, -.017]) and intentions to order a vegetarian meal (effect = .063 [.039, .090]) as well as indirect effects for general empathy via reactance on intentions to reduce meat (effect = .079 [.052, .109]) and to order a vegetarian meal (effect = .090 [.066, .116]). Political party did not moderate these effects. Results suggest that greater empathy for animals relates to attitudes and intentions to reduce meat via mitigating reactance, across parties. Meat reduction messages targeting empathy may have potential to be broadly effective.

[185] Framing the Future of Carbon Removal: Who Says It Matters

1:30 PM – 2:20 PM

Along with reductions in CO₂ emissions, carbon dioxide removal (CDR) strategies are needed to meet the Paris Agreement's climate goals. One CDR strategy is direct air capture (DAC), where large fans draw air through a filter to remove CO₂ from the atmosphere. To facilitate large-scale adoption of DAC, both technological developments and social acceptance is needed. To increase social acceptance, stakeholders often use sponsored ads to promote DAC, and are motivated by different outcomes, which are reflected in the content of the ads. This study investigates how support for DAC technology is shaped by sponsored ads. We experimentally tested the influence of the source (oil company, DAC company, scientists, or an unknown source) and frame (economic benefits or climate benefits) of the ads on support for DAC development. We found that, (1) the source promoting DAC matters: support is highest when the source is scientific, and (2) the climate, but not economic, frame can be used to leverage support: people are less supportive when oil and DAC companies emphasize climate benefits. Findings are discussed in light of potential sensitivity to greenwashing.

[186] Framing the Facts: How Conditional Probabilities Shape Perceptions of Polarization on Climate Policy

1:30 PM – 2:20 PM

Public opinion data about climate change can be framed in multiple mathematically accurate ways, shaping whether climate policies are seen as either partisan or shared concerns. For example, the same data can highlight "Among Americans who believe the government should spend less on protecting the environment, about 84% are Republican and about 8% are Democrat.", or alternatively, "Among Republicans, about 20% believe the government should spend less on protecting the environment, and among Democrats, about 2% do." This study examines how individuals interpret such conditional probability statements and how communication goals and partisan identity influence their framing preferences. Participants are randomly assigned to imagine communicating with those who agree or disagree with their own political views, or for their own understanding. We predict that individuals communicating to their own side will prefer framings that emphasize intergroup differences, while those communicating to the other side will prefer statements that suggest intergroup similarities. These findings could reveal how subtle differences in statistical framing can intensify or reduce polarization.

[187] The Application of Ecofeminist Theory in Social Epidemiology to Address Perinatal Health Disparities in the Texas Borderlands

1:30 PM – 2:20 PM

This talk is based on a paper that examines the integration of social epidemiology, ecofeminist feminist thought, and qualitative works like Gloria Anzaldúa's *La Frontera/ The Borderlands* to inform a more equitable, culturally grounded, and ecologically aware approach to addressing health disparities among pregnant and postpartum Latinx women in the U.S.–Mexico borderlands. This talk emphasizes an interdisciplinary approach to developing the theoretical ground work for mixed methods research in social and sustainability psychology to holistically assess the unique needs of the Latinx American population by drawing from feminist philosophy, ecology, agricultural science, health psychology, public health, and medical humanities. Special attention is given to how mothers and caregivers navigate constrained food environments while exercising various levels of agency in decisions about family nutrition, pregnancy, and well-being while also dealing with exposure to environmental hazards

[188] Communicating the health implications of global environmental change: a mixed methods systematic review of health framing in environmental messaging

1:30 PM – 2:20 PM

Recent research suggests that framing global environmental change as a health issue may increase public engagement. This mixed methods systematic review synthesises existing evidence on the health framing effects in text-based environmental communication. We searched five databases (Web of Science, Scopus, PubMed, PsycINFO, and Communication and Mass Media Complete) from inception to 09 May 2025 and identified 46 articles (54 studies). Most studies were randomised controlled trials conducted among the public in high-income, English-speaking countries. Findings indicate that health-framed environmental messages are generally perceived as clear and helpful, particularly when emphasising mitigation benefits. Health framing also effectively increases threat perception, policy support, and health protective intentions, although its impacts on sustainable lifestyle changes and advocacy behaviours are less consistent. Future research should incorporate rigorous designs, diverse populations, and focus on long-term outcomes to obtain a clearer understanding of effective communication strategies at the intersection of global environmental change and health.

[189] Ecocentric Psychology: Path to Sustainability

1:30 PM – 2:20 PM

This paper introduces the concept of Ecocentric Psychology to strengthen the sustainability perspective in psychological work. The crisis we are experiencing is not exclusively environmental, but socio-environmental; this opens up possibilities for the discipline of psychology to use its knowledge and strategies to resolve it. It is an invitation to transition from self-care to eco-care and redefine our role as inhabitants of planet Earth; to stop being subjects of domination and consumption, instead committing to social justice, interdependence, and reconnection (cognitive, affective, and behavioral) with the natural world. It is also a call for environmental justice, as poverty and social injustice are associated with ecological deterioration. Environmental problems are caused by the individual and collective actions of human groups, orchestrated by their thoughts, feelings, and underlying values. This paper, based on critical thinking, ethical commitment, and a systemic vision, aims to provide an analysis of the role of emotions in pro-environmental behavior, identify psychological barriers to climate action, and present strategies for behavioral change.

Connecting Behaviors to Opinions: How Attribution of Environmental Behaviors Relates to Perceived Support for Climate Policies

2:20 PM – 3:30 PM

Despite widespread public support for climate mitigation policies, many people underestimate such support among other citizens. We explore one potential source of this misperception: attribution of others' (lack of) environmental behaviors. Across two correlational studies in the U.S., we examined the relationships among perceived prevalence of environmental behaviors, attribution of those behaviors, and perceived public opinions about climate change. Two key findings emerged: (a) attributing others' behaviors to environmental concern rather than to situational constraints was associated with greater perception of public support; (b) the negative correlation between observing others' environmentally harmful behaviors and perceived policy support was stronger than the positive correlation between observing environmentally helpful behaviors and perceived support. These findings suggest that a motivation to hold others accountable for environmental harm may shape perception of public opinion on climate change. Due to such motivation, observing others' green behaviors may not translate to an increased perception of public concern about the environment.

The disconfirmation framing advantage: Pro-environmental descriptive norm appeals are more effective when disconfirming the normativeness of an anti-environmental alternative

2:20 PM – 3:30 PM

Pro-environmental descriptive norm appeals typically confirm the majority status of a desired behavior (e.g., "85% use energy efficient appliances"). While such messages can effectively promote pro-environmental behaviors (PEBs), we suggest that disconfirmation framing is even more effective. Disconfirmation framing conveys a logically equivalent message but does so by emphasizing that most are not taking the alternative anti-environmental action (e.g., "85% do not use energy inefficient appliances"). We report the results of seven studies—online, lab, and field experiments—that support this assertion and provide evidence for two explanations of this disconfirmation framing advantage. First, disconfirmation framing capitalizes on negativity bias, which amplifies the persuasive impact of the norm. Second, disconfirmation framing discourages social loafing effects that are an inadvertent side-effect of confirmation framing. Specifically, people are less likely to infer that others are engaging in collective action toward a shared goal—an inference that can stimulate social loafing—when focused on the anti-environmental actions people have avoided than the PEBs they have adopted.

Correcting Climate Action Misperceptions: A Quiz-Based Intervention on Dietary Behaviors with Pro-Environmental Spillover

2:20 PM – 3:30 PM

Effective climate mitigation requires public action, yet even climate-concerned individuals misjudge the impacts of pro-climate behaviors, which may lead them to prioritize less effective ones. This study examined whether a brief heuristic-based intervention could correct misperceptions about dietary actions and increase intentions to engage in high-impact behaviors. Climate-concerned participants (N = 487) were randomly assigned to a control condition or an intervention comprising a trade-off quiz with corrective feedback on the impacts of dietary actions, along with a general heuristic for judging behavioral emissions impacts. The intervention significantly improved participants' accuracy in ranking dietary behaviors ($p < .01$, $d = 0.45$) and, to a lesser extent, climate actions overall ($p < .01$, $d = 0.34$), indicating positive spillover. It also increased intentions to engage in high-impact actions ($p = .03$, $d = 0.19$), though this effect was not mediated by improved ranking accuracy. These findings highlight both the potential and limitations of brief quiz-based interventions in correcting climate action misperceptions and strengthening impactful behavioral intentions.

Understanding when dynamic norms flourish or fail to promote sustainability

2:20 PM – 3:30 PM

What determines whether a trend grows into a prominent norm or fades away? While prior research has identified factors that moderate conformity to static norms, relatively little is known about moderators for dynamic norms. We propose that people's perceptions of a trend's Longevity (will the trend last?) and Universality (will it spread widely?) determine whether it will form into a norm. Across two studies on adopting pro-environmental technologies: heat pumps (N=320) and induction cooktops (N=940), perceived longevity and universality predicted stronger behavioral intentions. We then test if these findings replicate in an ongoing national sample in the U.S. (N=1,600) in EV adoption. This research will advance understanding of how and why social trends spread or fail to grow, offering psychological insights into the dynamics norms and social change.

PM Beverage

3:30 PM – 3:45 PM

With a little help from my friends: Social support, hope, and climate action

3:45 PM – 4:45 PM

Hope is a future-oriented emotion attuning people to the possibility of positive change, and thus could potentially catalyze societal climate engagement. A recent meta-analysis suggests that the relationship between hope and climate action is most robust when the target of hope is climate engagement (i.e. action hope) rather than climate change more broadly. Yet, this meta-analysis also suggests that commonly used short hopeful messages do not foster action hope nor climate engagement. This presentation examines an alternative source of action hope: receiving social support. Two studies test whether social support motivates climate action via increased action hope. Study 1 (online survey, N = 887) demonstrates that, as pre-registered, both instrumental and emotional support predict intentions to act and this is explained by action hope. Study 2 (N_educators = 84, N_contacts = 520) extends these findings in a field setting, demonstrating that social support recipients' action hope is also associated with social support reported by support providers (environmental educators) and that action hope again explains a possible relationship between social support and climate engagement.

The Central Role of Governmental Response Efficacy Beliefs in Mobilizing Collective Action

3:45 PM – 4:45 PM

Tackling global challenges like climate change requires both the capacity to act and the belief that action will be effective. Across two large, nationally representative U.S. samples (Study 1: N = 1,197; Study 2: N = 31,324), we show that response efficacy—the belief that actions will work—plays a central role in mobilizing climate engagement. Study 1 finds that governmental response efficacy is the strongest predictor of climate action across advocacy, political participation, financial contributions, and lifestyle change. While Republicans reported lower efficacy overall, their engagement was especially responsive to efficacy beliefs, revealing a cross-partisan pathway to mobilization. Study 2 tests 17 communication strategies and identifies a single, scalable approach: emphasizing the collective efficacy and emotional benefits of climate action. This consistently boosted personal, collective, and governmental efficacy across ideological groups, highlighting governmental response efficacy as a key driver of climate action.

Framing climate solutions as both Individual and Systemic boosts personal efficacy, climate personal and political intentions in the U.S. and the U.K.

3:45 PM – 4:45 PM

Public discourse on climate change often frames solutions as requiring either individual or structural action, overlooking how these levels interact to drive social change. For example, structural factors shape the choices available to individuals, while individual behaviors can in turn influence structures. Ignoring this dynamic may narrow how people think about solutions, discouraging the joint individual and collective efforts needed for meaningful climate action. This study therefore examines how Individual, Structural, or a combined “Mixed” climate solution framing differentially influence behavior, behavioral intention, and personal efficacy in the United States (n=3,054) and the United Kingdom (n=2,588). Across samples, the Mixed framing performed as well as or better than the Individual or Structural framing conditions, increasing personal efficacy and willingness to engage in both lifestyle and political actions. In the UK sample, Mixed framing also led to greater support for climate policies. These findings suggest that integrating individual and structural framings may be a more effective strategy for promoting public engagement and climate mitigation efforts.

Grassroots Partnerships for Local Environmental Justice Policy Action

3:45 PM – 4:45 PM

Environmental justice (EJ) and climate justice are global movements which require pressing, interdisciplinary research and action, but such research is still underrepresented in traditional psychological fields. This study highlights a Chicago-based community psychology research partnership with grassroots community organizations that yielded high impact action for EJ advocacy. A city-wide survey (N=249) was participatorily developed, measuring pollution exposure, health impacts, and policy recommendation and support. Participants reported high levels of exposure to various pollution burdens, such as transportation-related (71%) and industrial (64%) pollution. Almost half of the sample reported negative health impacts due to pollution exposure. Clear policy solutions were provided and 89% of participants claimed they would support future local EJ policy, demonstrating a level of solidarity across community areas in Chicago. These results were disseminated broadly, garnering local news attention and contributing to critical advocacy efforts by the partnering organizations. In all, this project demonstrates the power of participatory research for producing action towards EJ.

Fostering Neighborhood Resilience: A Novel Municipal Approach

3:45 PM – 4:45 PM

The escalating climate crisis requires sustainable behavioral shifts at scale, yet is also paralleled by an epidemic of loneliness that undermines collective capacity. This work presents the Nourishing Neighborhood Networks (NNN) program, a novel municipal initiative in Ann Arbor, MI. NNN is designed to simultaneously enhance climate resilience and social cohesion at the hyper-local level. The NNN program is structured around the Supportive Environments for Effectiveness (SEE) framework. Engaging key elements of Model Building, Being Capable, and Meaningful Action, NNN supports human informational processing and leverages innate motivations to understand, act competently, and authentically participate in making a difference. NNN employs a teams-based approach to reframe residents as competent, collective agents. This participatory model targets multiple behaviors through collective action—increasing durability and long-term community resilience. This presentation discusses the utility of the SEE framework for creating sustainable interventions, offering a theory-driven strategy for local governments to ally with community members for local climate action.

Behavioral Science for Sustainability: Princeton’s Energy Shift

3:45 PM – 4:45 PM

As universities pursue net-zero goals, infrastructure upgrades alone fall short of full decarbonization. This talk presents a real-world application of behavioral science at Princeton University, where Evidn conducted a Behavioral Systems Analysis to uncover psychological and organizational drivers of campus energy use. The initiative targeted three key areas—research labs, room scheduling, and sustainability communications—using gamified signage, classroom nudges, and a campus-wide identity-based narrative: The Power is Ours. These interventions led to measurable behavior shifts, including a 24% improvement in fume hood sash closures and a 57% increase in lights being turned off. This session will unpack the behavioral strategies behind these results, including co-design, trust-building, and navigating messaging fatigue. Attendees will gain replicable tools and guiding principles for integrating behavioral science into climate action, reframing campus communities as active agents in sustainability.

The Role of Active Hope in Verified Collective Action on the Climate Crisis

3:45 PM – 4:45 PM

Understanding what drives climate action has never been more urgent. Despite evidence of an intention-action gap, most research on collective action still relies on self-report scales and intentions instead of verified behavior. To address this gap, we conducted a 10-week longitudinal intervention study (N = 44). Participants learned about the climate crisis and worked with local grassroots organizations. Each week, we assessed their climate-related emotions, action intentions, and verified collective action. When analyzing climate emotions, the only variable that related to the quality of collective action was active hope: the stronger the sense of the importance of acting collectively now as preparation for future struggles, the higher the quality of their verified collective climate action. Unlike traditional measures of hope, which often include optimism or wishful thinking, active hope is about agency and commitment regardless of the outcome. Our findings highlight both the promise of active hope as a construct for future research and the value of verified behavioral measures for identifying the psychological factors that matter for real-world collective climate action.

Evolutionary Psychology Preconference

8:00 AM – 5:00 PM | Location: E271, Level 2

The SPSP Evolutionary Psychology (EP) Preconference—in its 24th year—provides a forum to discuss cutting-edge research detailing how social psychological processes have been shaped by social challenges recurring across human evolutionary history. Regularly among the top-attended preconferences, the EP Preconference attracts established researchers, new investigators, and students from around the world. Invited speakers present full-length research talks; data blitzes and poster presentation spots are competitive and feature scholars across career levels. Presented research covers a broad topic range, including cooperation, health, morality, aggression, social cognition, groups, close relationships, and personality. The EP Preconference fosters interdisciplinary collaboration between researchers from various domains of social, personality, cognitive, and developmental psychology, as well as anthropology and biology, providing an optimal forum for introducing psychologists to the ways in which evolutionary theory can cohere disparate findings, generate novel predictions, and ultimately enhance our understanding of psychology and behavior.

*PRECON (IN-PERSON)

Opening Remarks

8:00 AM – 8:10 AM

Seasonal Cycles in Human Cognition and Behavior

8:10 AM – 8:55 AM

Like other animals, humans evolved in ecologies characterized by seasonal cycles; and so, like other animals, human psychology is sensitive to seasonal changes in local ecologies. This talk will provide an illustrative summary of the wide range of cognitive and behavioral effects that seasons have on people, with an emphasis on recent research revealing seasonal cycles in moral values and intergroup prejudices. The talk will also discuss mechanisms underlying seasonal effects, and will highlight ways in which the tools of evolutionary psychology can yield new insights into the seasonal nature of human nature.

Flexible Minds and Social Chameleons: Different Forms of Unpredictability Pose Different Adaptive Problems

8:55 AM – 9:20 AM

Unpredictable environments shape cognition and behavior in systematic ways. While many studies emphasize deficits linked to harsh and unpredictable conditions, an evolutionary perspective suggests that organisms track and respond to specific ecological affordances in functionally relevant ways. Specifically, adaptive abilities may emerge to solve the unique problems posed by particular conditions. In line with this domain-specific logic, I show that childhood unpredictability divides into at least two distinct domain—resource versus social unpredictability—that predict divergent outcomes. For instance, resource unpredictability is linked to greater temporal discounting, whereas social unpredictability is associated with poorer physical health. Moving beyond outcomes examined in prior unpredictability work, I also investigate less examined adaptive abilities. Resource unpredictable conditions may foster the ability to find new uses for resources in order to maximize the utility of the resource. On the other hand, unpredictable interpersonal conditions may cultivate a set of “social chameleon” abilities, such as social mimicry, to help individuals blend in, increase affiliation, and reduce threats. Hence, environmental unpredictability is not one monolithic construct, and distinct domains of unpredictability carry unique implications for social behavior.

Reconstructing Human Population Histories Using Paleogenomics

9:40 AM – 10:25 AM

Recent advances in molecular biology, DNA sequencing technologies, and data analysis have facilitated the retrieval and sequencing of genomes from ancient humans (paleogenomics). In collaboration with fields like archaeology and anthropology, paleogenomics has provided critical insights into the genetic origins of diverse human populations, including the characterization of past migrations and genetic admixture between modern human groups and with extinct hominins like Neanderthals and Denisovans. Paleogenomics has also shed light on past socio-political structures and health and disease. My talk will cover select examples from diverse global contexts to illustrate the power of paleogenomics in reconstructing our species’ genetic history at both the global and local scales as well as discuss ethical considerations in the field.

Dark Side of Friendship: When Children Expect Others To Be More Upset at Friends

10:25 AM – 10:50 AM

Friendships require loyalty, we give and expect special treatment from friends. When we fail to meet these expectations, our friends get upset. Here we probe children’s (age 4-11, N=556) beliefs about how friends react to various behaviors to examine early beliefs about friendship. Study 1 tested how kids can use upset reactions to infer friendship. Children were told that a target person was upset at an agent: either because he made a mistake (dropped a cake) or remained neutral during an argument between the target and someone else. They were then asked who is the agent’s friend? For mistakes, older children thought the upset target was not the agent’s friend, in line with the idea that friends are more forgiving. However, the reverse was true for neutrality: older children thought the upset target was very likely the agent’s friend, aligning with the loyalty logic outlined above. However, younger children did not think the upset target was the neutral agent’s friend. In Study 2 we explored the reverse: who do children think is upset at a mistake or neutrality? Again, we found that older children (by age 8, but not younger) clearly treated these conditions differently, thinking the friend would be more upset at neutrality than a mistake. In Study 3 we replicated the age pattern for neutrality in both the US and China: older children thought friends would be upset at neutrality whereas young children did not. I discuss this work for current theories of friendship and how these concerns develop ontogenetically.

Lunch break

12:00 PM – 1:00 PM

Lunch will be served in the meeting room. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

oGrilled Chicken Pesto Sandwich: Grilled Chicken Breast, Fresh Mozzarella, Oven Dried Tomato, Arugula, Basil Pesto, Ciabatta Roll

oRoast Turkey Caprese Pasta Salad: Rotini Pasta, Cherry Tomatoes, Fresh Mozzarella, Basil Pesto, Mixed Greens, Balsamic Glaze

oRoasted Vegetable Wrap (V): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto, Wrap (limited gluten free wraps available)

oMediterranean Chickpea Salad (VG | GF | DF): Crispy Chickpeas, Cucumbers, Tomatoes, Red Onion, Kalamata Olives, Feta Cheese (on the side), Mixed Greens, Lemon Vinaigrette

Datablitz: Individual differences and social relationships - Multi-decade pathogen threat and social ties: Strengthening bonds, weakening bridges

1:00 PM – 1:20 PM

Identifying environmental factors that shape social connections is essential for understanding how networks form and change. How might the disease ecology of a place shape the composition of social networks, specifically bonding within homogeneous groups and bridging across heterogeneous groups? We addressed this question in three studies integrating county- and individual-level data with cross-sectional and longitudinal designs. Across 3,027 U.S. counties, greater pathogen threat (from 1979 to 2019) was associated with fewer GPS-tracked visits to public spaces that facilitate diverse encounters (e.g., sports centers, bars), and with social networks containing more bonding and fewer bridging ties (e.g., Facebook friends with similar socioeconomic status). Longitudinal analyses showed that increases in pathogen threat over time predicted declines in individuals' bridging behaviors such as volunteering and joining associations, as well as decreases in perceived social support. Together, these findings suggest that pathogen threat shapes social networks by fostering insular bonding at the expense of bridging ties and the support they provide, with implications for social well-being.

Datablitz: Individual differences and social relationships - Disgust Responses to Human Bodily Sounds: Cross-Cultural Variation and Universality

1:00 PM – 1:20 PM

How disgusted are people by others' bodily sounds? People prefer specific sensory information, such as sound, to identify those sick with contagious diseases. These sounds may elicit disgust to motivate interpersonal avoidance. If so, people living in places with higher socio-ecological disease threat (e.g., higher pathogen prevalence and population density) face more risk and thus may experience more disgust toward these sounds. Moreover, as transmission often relies on contact with human particulates, people may be especially disgusted by sounds caused by particulate expulsion from the body. In a study of 16,895 participants from 58 countries, participants rated disgust toward audio clips of bodily sounds, differing in degree of expulsion (e.g., coughing vs. chewing). People in countries with higher socio-ecological disease threat reported greater disgust to all sounds compared to those in countries with lower threat. Additionally, expulsion sounds were universally rated as more disgusting than non-expulsion sounds, consistent with an avoidance mechanism attuned to transmission risk. These findings demonstrate both universality and diversity in pathogen avoidance psychology.

Datablitz: Individual differences and social relationships - A fistful of metas: Comparing behavioral correlates of the pathogen disgust versus germ aversion scales

1:00 PM – 1:20 PM

Trait pathogen avoidance is generally indexed by two scales that are often assumed to be interchangeable: pathogen disgust (PD) and germ aversion (GA). We tested two hypotheses of this assumption. The first hypothesis is that scores on PD and GA should be strongly correlated. We conducted a meta-analysis of published research that used both scales (Study 1; $k=46$). Results showed only a modest correlation between PD and GA. The second hypothesis is that PD and GA should be similarly associated with other social processes, such as political orientation and sociosexual behavior. In Study 2, we conducted a pair of meta-analyses comparing associations between PD ($k=104$) and GA ($k=71$) and political orientation, with time of data collection as a moderator. Results showed that PD was associated with conservatism, but that GA was associated with liberalism after COVID-19. In Study 3, we conducted a pair of meta-analyses comparing associations between PD ($k=12$) and GA ($k=9$) and sociosexual behavior (SOI-B). Results showed that GA, but not PD, was negatively associated with SOI-B. Understanding the different profiles of these two scales can inform methodological decisions for future research.

[41] Artificial Intelligence, Fundamental Motives, and Evolutionary Mismatch

1:30 PM – 2:30 PM

In recent years, the intersection of artificial intelligence (AI) and psychology has garnered much attention, particularly following the advent of generative AI tools in 2022. These tools, capable of producing human-like text, images, and even deepening our understanding of cognitive processes, have not only captured the public imagination but also sparked new concerns and debates within the psychological community. While AI has been a subject of research for decades, the emergence of its generative capabilities has thrust AI into the spotlight. This work explores how AI is reshaping our understanding of human cognition and behavior, as well as its potential implications for psychological practice and research. Adopting an evolutionary mismatch framework, this article delineates how certain characteristics of artificial intelligence align (match) with our evolved motivational systems, facilitating the pursuit of fundamental goals such as mating or gaining access to job and status opportunities, while other characteristics of artificial intelligence are misaligned (mismatch) and could result in negative outcomes like stress and poorer mental health or fraud and political unrest.

[42] Collaboration is stabilized by the specialization of labor

1:30 PM – 2:30 PM

Humans excel at collaboration, an ability shaped by evolution to solve problems with linked outcomes requiring joint effort. Children and adults prefer to share resources equitably when acquired by collaboration, but not other types of cooperation. Yet key structural features of collaboration remain unexplored. Collaboration offers benefits like achieving otherwise unattainable goals and increasing productivity, but also costs like vulnerability to free-riders. Thus, labor organization likely affects how desirable collaborations are to join. Specialization of labor may be critical. Game theoretic analysis shows specialization can incentivize contribution by making roles essential, boost efficiency via task-specific skills, and deter free-riders by making them easier to detect. But do people intuitively understand this? To find out, participants imagined being stranded on an island, needing to prepare food collaboratively. They saw two plans: (1) Each person task-specializes or (2) they switch tasks. People expected more productivity and less free-riding with specialization, and preferred such collaborations. This suggests a well-designed decision-making system for collaborations.

[43] Factors underlying individual differences in reactive and proactive aggression

1:30 PM – 2:30 PM

Why are some people more aggressive than others? From an evolutionary perspective, some types of aggression can be viewed as adaptive strategies shaped by natural selection, but not everyone is equally prone to use aggression. This research investigates how personality traits and emotional mechanisms—key components of evolved psychology—predict individual differences in human aggression. Drawing on evolutionary theory, we distinguish between proactive (predatory) and reactive (defensive) aggression, common across species. Using structural equation modeling, we test how personality traits (Big Five and Dark Triad) predict aggression via emotional pathways, helping explain why some individuals escalate to violence while others do not. Understanding these evolved psychological profiles may improve our ability to explain, anticipate, and mitigate harmful behavior.

[44] Social Leverage: Individual Differences in the Endorsement of Gratitude

1:30 PM – 2:30 PM

Building on the logic of the recalibrational theory of anger, we argue that a systematically inverted relationship exists between the triggering conditions, inputs, outputs, and consequences of anger and gratitude, and we introduce the novel hypothesis that this inverted relationship between anger and gratitude extends to the individual difference characteristics that modulate the proneness of individuals to endorse and express each emotion. Where Sell et al. (2009) found evidence that physical strength in men and attractiveness in women—two ancestrally valid dimensions of social leverage—predict greater proneness to anger, we suggest that these dimensions of social leverage negatively predict proneness to gratitude. We report three studies (N's of 417, 309, and 728 adults, respectively, all recruited online) that serve 1) to develop and validate a novel measure of interpersonal gratitude; and 2) to test the hypothesis that physical strength in men and attractiveness in women correlate negatively with proneness to gratitude. Results indicate that physical strength in men and attractiveness in women correlate as expected with some but not all dimensions of proneness to gratitude.

[45] An evolutionary perspective exploration on fire and human mate-seeking behavior

1:30 PM – 2:30 PM

Fire played a pivotal role in human evolution, providing light, warmth, and cooked food. Fire is also often associated with dating or romance (e.g., candlelit dinners). Yet to date, the role of fire in mate-seeking has been underexplored. We hypothesize that in a mating context, fire-making functions as a costly signal deployed by men, communicating an individual's status and competence to potential mates. Past research has found that women tend to value a mate's resources and intelligence (a common indicator of competence) more than men do (Walter et al., 2020). Thus, we predict that men who make use of fire in a romantic setting should be perceived as more attractive, but not vice versa. Participants (N = 450) will read vignettes in which a moderately attractive opposite-sex target engages in romantic gestures with or without fire, then report their sexual attraction to the target. We predict that the presence of fire will heighten sexual attraction among heterosexual female perceivers, whereas this effect will be weaker or absent among heterosexual male participants.

[46] Do Ecology Stereotypes Override Race Stereotypes? A Focus on Asian and Latino Americans

1:30 PM – 2:30 PM

Previous research suggests that without ecological information, African American stereotypes reflect harsh ecologies, while White American stereotypes represent hopeful ecologies. When ecological information is provided, the race effect vanishes. The current study extends the prior work and examines this ecology-override perspective in the context of Asian and Latino Americans. Based upon a life history perspective, it was hypothesized that (1) without ecology information, Asian stereotypes reflected hopeful ecologies, highlighting slower life history strategies than those of White/Latino/African American. (2) Latino stereotypes reflected harsh ecologies, highlighting faster life history strategies than those of White individuals and similar to those of African Americans. (3) When ecological information is provided, the racial difference in ecology-related stereotype perception will decline or disappear. A 4x3 ANOVA tested these predictions. Results generally supported our hypotheses; however, more nuanced patterns emerged based on participants' political ideology. The findings will shed light on reducing racial bias in the US.

[47] People decide whether to share social information—and whether to share it accurately—on the basis of self-interest

1:30 PM – 2:30 PM

Why do people gossip? Here, we tested two hypotheses about how people might use reputational information to achieve social goals. The Indirect Reciprocity hypothesis proposes that people gossip about themselves and others accurately in order to reward cooperators and punish defectors. In contrast, the Reputation-Based Partner Choice hypothesis proposes that people share, withhold, and distort information in order to secure high-quality partners. We found that subjects were more likely to share information about others' (and their own) generosity in previous sharing games if they themselves had been generous rather than greedy. Generous people were most likely to gossip (and gossip honestly)—and greedy people least likely to gossip—when sharing and withholding gossip, respectively, were in their material self-interest. Greedy people were more likely than generous people to share dishonest gossip that might give them a competitive advantage. These results provide stronger support for the Reputation-based Partner Choice hypothesis, yet 30% of subjects shared information even when it did not pay to do so, suggesting that gossip is not driven exclusively by material considerations.

[48] Examining Stigma Toward Individuals Without Friends

1:30 PM – 2:30 PM

Humans have a fundamental need to maintain close relationships because they have long depended on the fitness-related benefits these bonds provide. The absence of such ties may signal poor partner value and reduced fitness prospects. As a result, individuals who lack connections, such as partners or friends, often face stigma, including social exclusion. Most research on relationship stigma has focused on romantic relationships, showing that romantically single individuals are often stereotyped negatively. Yet stigma in the friendship domain has been less explored. This study addresses this gap by examining perceptions of individuals without friends (friend singles). Here (N = 299), we examine whether friend singles are stigmatized more than individuals with friends, and even more than romantic singles. Results suggest that both romantically single and friend-single targets are stigmatized relative to non-singles, with friend singles being stigmatized the most. We also explore other moderating factors such as gender and attributions for singlehood. This research highlights potentially overlooked source of bias with implications for social support and loneliness interventions.

[49] Subjective Well-Being as Prediction Error in a Reinforcement Learning Model of Evolutionary Fitness

1:30 PM – 2:30 PM

We present a framework integrating evolutionary motives and reinforcement learning to examine how daily goal achievement relates to subjective well-being. Participants reported baseline motivation across 11 evolutionary domains and then rated their daily achievement for each goal, as well as affect and life satisfaction, over six days. Using reinforcement learning paradigms, we modeled how prediction errors updated perceived success on each goal and tested whether daily affect covaried with these errors, moderated by baseline motivation. We also examined whether life satisfaction related to prediction error on a latent evolutionary fitness construct, defined as the aggregate of motive-specific success, again moderated by motivation strength. This project bridges three research traditions: laboratory studies linking affect to prediction errors, longitudinal work connecting goal pursuit and well-being, and evolutionary models mapping diverse goals onto fitness-relevant motives. Combining these traditions offers an integrative account of how well-being is represented in a learning system guided by evolutionary fitness.

[50] Rape Fear is Target-Specific

1:30 PM – 2:30 PM

Sexual violence is hypothesized to select for psychological mechanisms producing emotions and behavior that mitigate its costs, including women's rape fear. Because avoidance entails opportunity costs, we tested whether women's fear is target-specific, tracking cost-benefit ratios of avoiding different classes of potential perpetrators. Using longitudinal data (N = 384; 73% women), we predicted that unspecified rape fear would most align with fear of stranger rape, as strangers pose the greatest cost of complete circumvention of mate choice. We hypothesized descending fear levels across strangers, acquaintances, friends, and romantic partners, reflecting increasing predictability and benefits gained from social relationships. Results showed women's unspecified fear most closely predicted fear of stranger rape ($p_{adj} < .001$), supporting target-specificity. These findings suggest that rape fear may be calibrated to social context, with implications for designing interventions that reduce fear without compromising safety.

[51] Women's intrasexual competitiveness, but not fertility, predicts greater competitive behavior toward attractive women across the menstrual cycle

1:30 PM – 2:30 PM

Women compete for mates and social status, but little is known about the mechanisms that underlie these behaviors. Previous work suggests that mating competition should be highest during fertility, so we hypothesized that women would show more competitive behavior toward a high, rather than low, mating threat competitor during ovulation. Given that social support is crucial for women's access to resources, we also hypothesized that women would show more competitive behavior towards a high, rather than low, social threat competitor following ovulation and possible conception. Women (N = 464) rated their likelihood of competitive behavior toward hypothetical mating and social competitors. Although women were more competitive towards the high mating and social threat competitors, cycle phase had no effect. Further, intrasexual competitiveness, but not estimated hormones or other personality variables, predicted stronger competitive responses to the high mating threat competitor. We found no effects for social competitors. These results suggest that in mating contexts, women's competition depends on dispositional competitiveness towards other women, not fertility.

[52] From contagion to conformity: Pathogen avoidance and the motivation to appear nonprejudiced

1:30 PM – 2:30 PM

Individual differences in pathogen avoidance have been linked to intergroup prejudice, but also to intragroup processes such as group-binding morality and conformity. Moreover, recent work has established a link between pathogen avoidance and politeness (an aspect of Big Five agreeableness), which is characterized by compliance with social norms. Such norm compliance may have been adaptive for group-wide pathogen defense. Today, one important social norm is to be nonprejudiced, either by internalizing this value or avoiding external displays of prejudice. In Study 1 (N=816), given the role of pathogen avoidance in intergroup prejudice and complying with social norms, we hypothesized that pathogen avoidance would be positively associated with an external, but not internal, motivation to respond without prejudice. Results show that pathogen avoidance was positively associated with an external, but not internal, motivation to respond without prejudice, even when controlling for political orientation. This finding indicates that while pathogen avoidance is linked to intergroup prejudice, it is also linked to complying with modern social norms to avoid external displays of prejudice.

[53] Examining Predictors of Opposite-Sex Distrust and Antipathy

1:30 PM – 2:30 PM

The purpose of this study is to investigate potential correlates of cross-sex hate and examine antipathy as a shared experience among men and women. Recent evidence revealed men feel discrimination against women has shifted towards men, suggesting a new form of sexism (Zehnter et al., 2021). Previous scales measuring traditional sexism may miss capturing a new form of antipathy shared in men and women. We aim to extend this research by identifying predictors of this phenomenon, potentially informing interventions to reduce cross-sex antipathy. Modern societies may lack positive opposite-sex role models, thereby restricting their perceived value to society and amplifying negative experiences with the opposite sex. To investigate cross-sex distrust, we will use a sex-neutral scale to evaluate participants' perception of the opposite sex in society, personal experiences with the opposite sex, family structure, and mate value. We anticipate higher opposite sex distrust will be associated with perceptions of the opposite sex as low value to society, more reported harmful experiences with the opposite sex, growing up with fewer opposite sex family members, and having lower mate value.

[54] Perceived Cooperation Need, Ecological Threats, and Norm Enforcement

1:30 PM – 2:30 PM

Past work has established the link between experiences of historical ecological threat and heightened norm enforcement, indexed by cultural tightness or right-wing authoritarianism. Researchers theorized that this arises as norm enforcement facilitates cooperation, which is necessary for addressing these threats. We directly test this hypothesis, by examining 1) whether perceivers think some threats require more cooperation to address than others and 2) whether threats that people perceive to require more (vs. less) cooperation to address lead to more norm enforcement. Across 2 studies, we find that participants consistently rank food scarcity, disease threats, and droughts as requiring more cooperation to address than outgroup threats, storms, and overpopulation. We then correlated the prevalence of each threat with norm enforcement at the country-level, using data retrieved from public databases. Consistent with the hypothesis that norm enforcement facilitates cooperation to address threats, preliminary findings across two studies show that, in general, threats that are perceived to need more cooperation exhibit higher correlations between threat-level and norm enforcement.

[55] Making Inferences Based on Aggression and Cooperation Towards Kin vs. Non-Kin

1:30 PM – 2:30 PM

Kin selection theory proposes that individuals who preferentially cooperate with kin over non-kin gain fitness advantages. In line with this theory, research has shown that humans are more altruistic toward their kin. Yet, recent studies have revealed an apparent paradox: that moderate forms of aggression are more common among siblings than non-kin (Kirsch et al., 2024; Varnum et al., 2025). We suggest that this reflects humans' differential treatment of kin, as uncooperative behavior toward relatives carries a lower risk of relationship loss or severe retaliation, given the indirect fitness costs such actions would entail for them. Consequently, aggression toward kin may be viewed as less diagnostic of one's broader behavioral tendencies and overall cooperativeness. We test this in a 2 x 3 design, where we present participants with vignettes depicting an actor acting either cooperatively or aggressively toward either a sibling, friend, or acquaintance. We hypothesize that for aggression and cooperation toward kin, participants will be less likely to make dispositional attributions about the actor, and less likely to believe that their behavior will generalize to other contexts.

[56] Arming for Family: Living Around Kin Predicts Gun Ownership

1:30 PM – 2:30 PM

Living with relatives, research shows, fosters a greater willingness to defend and fight for one's ingroup. In the U.S., where there is access to firearms, this protective psychology may manifest in the form of gun ownership, keeping one's family safe from the perceived dangers of the broader world. Using both U.S. county-level data ($N = 3,213$) and individual-level surveys ($N = 621$), we find that gun prevalence is higher in counties with greater intergenerational co-residence, and that individuals living with a greater number of their own children are more likely to own guns. This may be partially explained by our findings that gun owners reported a greater willingness to fight for their ingroup compared to non-owners. However, we find mixed results when considering the presence of older or extended relatives, suggesting the need to investigate potential moderators in future work. These findings highlight how kin-based relational ecologies can give rise to culturally specific protective behaviors, such as gun ownership in the U.S.

[57] The pretty pink tax: Are female victims of same-sex aggression viewed as more attractive than female victims of cross-sex aggression?

1:30 PM – 2:30 PM

Past research has generally found that people view attractiveness favorably. For instance, multiple studies have found that physically attractive individuals are less likely to be arrested for crimes compared to those who are not attractive. However, beautiful is not always good: many studies have found that there are multiple instances where attractive females are more likely to receive the brunt of aggression from other females, typically within the confines of intrasexual aggression. Women may aggress toward attractive same-sex others to level the playing field and make the mating market more competitive. In the present study, we explored how acts of aggression impacted perceptions of victim attractiveness. Participants viewed vignettes depicting a perpetrator aggressing toward a victim in which sex composition of the dyad was varied across conditions (e.g., female-female, male-female, etc.). Given that past research has found that females are more likely to aggress against attractive same-sex others, we hypothesize that participants will view the victims of same-sex female aggression as more attractive than victims of cross-sex aggression in which the victim is female.

[58] PetCAT: Extending Parental Care and Tenderness to Pets and Examining Associations with Political Ideologies

1:30 PM – 2:30 PM

The motivation to care for and protect children, commonly known as parental care and tenderness (PCAT), has been associated with social conservatism across cultures. It is unclear, however, whether social conservatism is associated with the basic motivation to care for and protect vulnerable entities, or if this association is unique to caring for children. To address this question, we adopted the PCAT-short questionnaire and created a parallel scale measuring the motivation to care for and protect pets (PetCAT). PCAT and PetCAT were positively correlated ($r = .42, p < .001$). In multiple regression tests, PCAT and PetCAT both significantly predicted social and economic conservatism, but in opposite directions. PCAT positively predicted social and economic conservatism, indicating that more parental care motivations were associated with higher levels of conservatism. PetCAT was negatively associated with social and economic conservatism, indicating that more pet care motivations were associated with lower levels of conservatism. The results imply that parental motivation extends to pets, but conservative political values are uniquely related to caring for children.

[59] Parental Status, Parental Care, and Parental Morals: How Parental Care and Tenderness Mediates the Relationship between Parental Status and Moral Foundations

1:30 PM – 2:30 PM

A burgeoning line of research suggests that parents hold strategic moral values, however, relatively few studies have examined the mechanism behind differences in moral values for parents and people without children. We tested whether parental care and tenderness (PCAT) mediated the relationships between parent status and binding moral foundations and individualizing moral foundations. In two studies, we found that PCAT partially (study 1) and fully (study 2) mediated the relationship between parent status and binding values, suggesting that PCAT may explain much of the association. Further, in both studies we found partial suppression patterns when accounting for PCAT in association with parent status and individualizing foundation. Parent status was unrelated to individualizing foundations before accounting for PCAT, but when accounting for PCAT, being a parent was associated with lower individualization values. While much of the current research has focused on the prioritization of binding values among parents, our results suggest that researchers should also investigate the potential threats of individualizing values to parents.

[60] Perceived life history mediates the relationship between perceived aggression and perceived dominance: A case for a fast and furious life history strategy

1:30 PM – 2:30 PM

How do acts of aggression affect perceptions of life history, and how might their relationship provide others with information about dominance? Previous work indicates that people interpret others' aggression as a dominance-seeking strategy. Here, we examine whether this inference is mediated by people's perceptions of others' life-history strategy. Individuals with a faster life history strategy are typically seen as more impulsive and opportunistic compared to those with a slow life history strategy. As dominance-striving is riskier and more volatile than other pathways to status, individuals with a faster life history strategy may be inclined to pursue this pathway. The current study explores whether perceived life history mediates the relationship between perceptions of aggression and perceptions of dominance. Preliminary findings suggest perceptions of life history partially mediate the relationship between perceived aggression and perpetrator dominance, providing some evidence that the relationship between dominance and aggression may not be as direct as previously thought.

[61] Holding On for Others: Rethinking Hoarding through Ecological Relatedness

1:30 PM – 2:30 PM

Hoarding is traditionally viewed as a maladaptive disorder, characterized by excessive accumulation for selfish reasons. Yet this may overlook contexts in which hoarding functions to benefit others. Inclusive fitness theory posits that behaviors enhancing the survival and reproduction of relatives can be evolutionarily advantageous, encompassing not only an individual's direct reproductive success but also indirect fitness gained by supporting kin. Recent work on ecological relatedness—the prevalence of kin in one's immediate environment—has shown to shape trust within one's community and pro-group behavior. Such motivations may extend beyond social attitudes to behaviors such as resource accumulation for kin in need. In Study 1 (N = 197), people who live around more relatives were more likely to hoard for others. In Study 2 (N = 2,229), a cross-cultural study spanning 11 countries, we generally replicated this effect across countries, but especially for people who live around younger (but not older) relatives. Together, these findings suggest that hoarding, often pathologized as dysfunctional, may serve a biologically adaptive function under ecological conditions.

[62] A Cross-Culture Comparison of Pathogen Avoidance and Group Boundaries

1:30 PM – 2:30 PM

Pathogen avoidance has been linked to negative attitudes towards outgroup members and stronger ingroup attraction. The present study examines how individual differences in pathogen avoidance were associated with ethnocentrism and attitudes about social group boundaries. Using Besample, we recruited participants across 12 non-Western countries. Across the whole sample, pathogen disgust was positively correlated with ethnocentrism whereas germ aversion was negatively correlated with ethnocentrism. Pathogen disgust and germ aversion were positively correlated with noticing group boundaries and a preference for socializing with people who are similar to themselves, but this differs by country. Pathogen disgust was also associated with a tendency to be more social overall. In some countries, germ aversion was negatively correlated with ethnocentrism as in the overall analyses, in most countries there was no association, and in one case there was a positive association. These initial differences between countries highlight the importance of understanding cultural variation in further developing the theoretical understanding of the link between pathogen avoidance and intergroup biases.

[63] Ecological Relatedness Matters More When Living Around Genetically Close Relatives

1:30 PM – 2:30 PM

Living around many (vs. few) family relatives activates interdependent psychologies that benefit inclusive fitness. Not all family members, however, are equally genetically related to oneself. Biological kin are genetically related to oneself, while affinal kin (e.g., in-laws) are not. Maternal kin are genetically related to oneself more certainly than paternal kin due to paternal uncertainty. Across two studies, we investigated whether people's psychology moves to benefit others in the local ecology, especially when living around biological (vs. affinal kin) or maternal kin (vs. paternal kin). The findings supported our predictions. Study 1 found that people who imagined living around biological kin reported more interdependent self-concepts and identified themselves more with the local community than those who imagined living around affinal kin. Similar to Study 1, Study 2 revealed that people who imagined living around maternal kin became more interdependent than those who imagined living around paternal kin. Overall, living around family relatives evokes interdependence, especially when living around genetically close relatives.

Datablitz: Prosocial Behavior and Morality - An Eye for two Ears? An Experimental Test of the Fungibility of Punishment Preferences

2:50 PM – 3:10 PM

Do people prefer the proverbial eye for an eye? Why? In 3 survey experiments across 12 countries (N = 2,482), participants read offense descriptions (stole hunting bows, gouged out man's eye, etc.) that occurred in a "remote community" and selected which punishment types (including options identical to each offense) and amounts would most satisfy them. For nearly every offense and every country tested, more than half of participants selected in-kind punishments (low fungibility). For such punishments, punishment amounts exceeded the original offense amount for almost every offense, by ~50%, and were perceived as most fair. Participants also indicated that they wanted the punishment they chose to "motivate the offender to behave better". This pattern is consistent with a punishment strategy designed not only to condemn past behavior or redistribute lost resources but to communicate an honest signal of deterrence and reintegration. We consider retributive sentiments, thus, as the output of a cognitive mechanism designed to deter the offender from re-exploitation by incentivizing the offender to more deeply value the implicit social contract between offender and victim party.

Datablitz: Prosocial Behavior and Morality - Sources of fitness interdependence associated with shared fate and cooperation across three levels of analyses: within-participants, dyads, and multi-attribute partner choice models

2:50 PM – 3:10 PM

Cooperation often relies on one's ability to discern in whom to invest their limited resources. One solution to this problem entails estimating one's fitness interdependence with others via shared fate. In past work among the Mayangna, a small-scale horticultural society in Nicaragua, we found that relatedness, commensality, and shared subsistence activities were uniquely associated with higher shared fate. Moreover, shared fate was associated with cooperation across seven fitness-relevant domains, statistically mediated associations between relatedness and cooperation, and had strong effects on cooperation (i.e., forgoing money to buy rice for a partner). The present work extends this research by replicating past findings in a new dyadic sample of Mayangna adults (N = 168), examines bidirectional effects among dyads playing a trust game, and allocation decisions of money, labor, food, and time across four partners. Results indicate that shared fate arises from sources of fitness interdependence and cooperation is proximally guided by shared fate. Shared fate thus offers a simple solution to partner choice dilemmas: Help partners if one has a positive stake in their welfare.

Datablitz: Prosocial Behavior and Morality - Too Good for My Own Good: Ultra-Prosocial People Are Less Desirable as Romantic Partners

2:50 PM – 3:10 PM

Costly signaling theory posits that individuals who help others are preferred as romantic partners because their behaviors signal resources and prosocial traits. However, what if they help others too much? Across four studies spanning 12 countries, we found that people who help others to an extreme extent ("ultra-prosocials") were actually less desirable as romantic partners, compared to those who help others in moderation (even though ultra-prosocials were highly desirable as community members). This was because ultra-prosocials were seen as having less available time as a romantic partner. We discuss the implications of these findings for how perceptions of available time and resources, rather than simple resources and qualities per se, may be more important in partner choice. Building on the patterns found in three studies conducted with the U.S., Study 4 extends the investigation to a cross-cultural context. It involved data collection from 11 countries, spanning Latin American, Asian, African, and European samples. This study aims to examine whether similar patterns emerge in non-WEIRD populations, thereby testing the generalizability of the findings beyond Western contexts.

The Evolution of Status: Extended Formidability and Coalition Coordination

3:10 PM – 3:35 PM

What is status for? Decades of work have catalogued how people gain status—via prestige, dominance, competence, or alliances—but far less has examined the structure of its cognitive representation, the ecological conditions that would have favored its evolution, or why natural selection would build a psychology that tracks status in the first place. We formalize status as an internal regulatory variable—akin to a welfare–tradeoff ratio (WTR)—that estimates extended formidability: the expected support an individual can mobilize in conflict and coordination, beyond their own dyadic strength. Using agent-based models, we compare agents who track only dyadic strength to agents who also learn dyadic WTRs and compress them into a status estimate when making alliance decisions. Across ecologies with multi party contests and repeat interactions, status-tracking reliably evolves, even with cognitive costs, because it enables pre-emptive side-taking, formation of minimally winning coalitions, and avoidance of losing fights. The result is not just more wins but fewer costly challenges and more stable hierarchies. On this view, prestige and dominance emerge as routes to the same computation: When forecasting support, people weigh both what you can do for them (prestige/competence) and how costly you are to cross (dominance/coercion). This model also yields testable predictions: Status sensitivity should be higher where conflicts are decided by coalitions; widely shared signals of rank should reduce miscoordination; and periods of turmoil should be foreshadowed by narrowing power gaps and rapid churn in perceived alliances.

How to Thrive in a World that Has Changed with a Brain that Has Not

3:55 PM – 4:40 PM

Wellbeing is a challenge in today's world because our environment has transformed dramatically but the human brain has not. Evolutionary scholars often study this mismatch examining how our ancient adaptations function in our modern world of infinite choices, from spending decisions to mate selection. What has received less attention is how today's social environment changes the way the brain works, creating chronic stress, low life satisfaction, emotional dysregulation, and numerous deficits to physical and mental health. More importantly, it is unclear what we can do about it. In this talk, I'll share a research-backed framework that can guide us toward greater wellbeing by aligning our ancient minds with our modern world.

Close Relationships Preconference

8:00 AM – 5:00 PM | Location: Lakeside Ballroom E354B, Level 3

The Close Relationships Preconference, part of SPSP for over 20 years, highlights cutting-edge research and theory in relationship science across social and personality psychology. The preconference features award addresses and talks; posters and data blitzes of new research; a graduate student networking breakfast; themed lunch tables; and a special discussion-oriented panel session. Our lineup includes multiple dynamic speakers with time for discussion, including the winners of the Rusbult Early Career Award and Graduate Student Research Paper Award. Our interactive panel session includes 3-4 presenters, followed by a moderated discussion. We select speakers and panel discussions to appeal to a wide audience beyond traditional relationship scientists (e.g., well-being effects, diverse relationships). Our posters and data blitzes allow researchers at any career stage, particularly students and early career researchers, to present their newest findings. The themed professional development lunch tables and graduate student-centered networking breakfast facilitate new connections and collaboration.

The influence of perceived and actual similarity on friends' closeness and conversations

9:25 AM – 9:32 AM

Close friendship is crucial to leading a healthier, happier, and more successful life. People befriend similar others, but they are imperfect at judging similarity—perceived similarity often diverges from actual similarity. Such misperceptions may explain unreciprocated friendships, yet little is known about which type of similarity predicts connection or behavior. I ask whether perceived or actual similarity in friendship expectations better predicts closeness and behavioral alignment, measured via laughter, agreement, nodding, and facial expression synchrony. Pre-existing friends ($N = 131$) completed surveys on their own and their friend's expectations. Dyads then discussed ways they are similar and different. Thus far, results indicate that friends' actual similarity in friendship expectations best predicts closeness, over perceived similarity and accuracy. Friends showed greater nodding synchrony when discussing differences versus similarities, moderated by actual similarity, with ongoing analyses examining other behaviors. This work highlights how misperceptions shape closeness and conversation, offering insights for enhancing friendship.

With a Little Help from My Friends: Social Approval and Relationship Quality in Intercultural Romantic Relationships

9:32 AM – 9:40 AM

Despite their growing prevalence, intercultural couples continue to experience social disapproval and discrimination from their social networks. In this study (N = 757), we examined how social approval from different sources (i.e., family, friends, society) predicts relationship quality and whether these effects vary by individual (i.e., cultural background, gender) and couple-level (i.e., cultural pairing, relationship length) characteristics. Friend approval emerged as the most robust predictor of relationship quality, especially for couples in which both partners belonged to minority cultures. In contrast, family approval was only important for Latinx and Middle Eastern partners and those in the earlier stages in relationships. These findings suggest that different sources of social approval can buffer or exacerbate relationship quality, depending on partners' cultural backgrounds and relationship length. By identifying which sources of approval matter most and for whom, these findings can inform culturally sensitive interventions and support systems for intercultural couples.

Shared Adversity Fosters Friendships and Buffers Against Adversity's Health Consequences

9:40 AM – 9:47 AM

Adverse life experiences are widespread and can have lasting consequences on health. While supportive relationships can buffer these effects, less is known about how people form such relationships. Because people tend to form relationships with similar others, it may be particularly beneficial to connect with those who have faced similar adverse experiences. Such shared adversity may offer unique empathy, understanding and more effective support. In a study of emerging adults participating in a summer bridging program before college (N = 182) we find that individuals are more likely to form friendships with others who share more of their adverse experiences. Furthermore, shared adversity attenuated the negative association between adversity and health, an effect mediated by increased social support. Together, these findings suggest that people selectively form friendships around shared adversity and that these relationships may protect against the health consequences of adversity by strengthening social support.

Singlehood-Related Negative Affect: Attachment Style and Priming Effects

9:48 AM – 9:55 AM

Staying single is increasingly common in the U.S. While singlehood can be fulfilling, it is often associated with distress and lower well-being. Recent work highlights the potential role attachment style plays in determining whether singles experience negative affect about being single. The existing work, however, is correlational and says little about causality. Here we experimentally examined the effects of attachment priming on singlehood-related negative affect. Study 1 employed a writing priming task. The manipulation was found to be ineffective, as no differences between attachment state were found. Results showed that negative affect was primarily predicted by trait attachment anxiety, even when controlling for general well-being, desire and pressure to couple. Study 2 tested an implicit priming method, which successfully increased state attachment anxiety only. Study 3 is testing the writing priming task effects on singlehood negative affect in a lab setting. The discussion addresses methodological issues concerning the priming technique. Overall, findings highlight the central role of attachment anxiety, whereas avoidance showed no consistent link.

Perceived Similarity in Preferences Predicts Romantic and Platonic Relationship Satisfaction

1:40 PM – 1:47 PM

Previous research finds that perceived similarity in traits predicts relationship satisfaction. We examined whether perceived similarity (agreement between an individual's beliefs about another person and beliefs about themselves) in traits and preferences (what one desires) predicts satisfaction. In Study 1, 88 heterosexual couples rated themselves and their partners on traits and preferences and reported satisfaction. Perceived similarity was indexed using a partial correlation controlling for actual similarity. Actor effects showed that individuals perceiving greater similarity in preferences reported higher satisfaction (men: $\beta = 0.23$, $p = .03$; women: $\beta = 0.23$, $p = .03$). A partner effect showed women's perceived similarity in traits predicted men's satisfaction ($\beta = 0.28$, $p = .01$). Women's actor and partner effect held with covariates. In Study 2, 495 adults (not dyads) reported on a close friend. Here, perceived similarity was a bivariate correlation and it predicted friendship satisfaction for traits ($\beta = 0.16$, $p < .001$) and preferences ($\beta = 0.28$, $p < .001$). Findings highlight that perceived similarity in preferences is also a key predictor of relationship satisfaction.

Perceiving to Provide: How Partner Attachment Perceptions Inform Buffering Behaviors

1:48 PM – 1:55 PM

Partners' reassurance is an effective regulatory behavior to buffer attachment anxiety, but we do not yet know how some partners come to provide reassurance. The current research assessed 1) whether partners accurately perceive one another's attachment (a potential precursor to partner buffering), and 2) whether perceived partner anxiety (PPAnx) and perceived partner avoidance (PPAv) predict reassurance provision. In two studies (Study 1 = 108 student couples, Study 2 = 147 community couples), partners showed moderate accuracy, a mean-level bias (systematically overestimating PPAnx and PPAv), similarity bias (projecting one's own attachment), and a complementarity bias (greater PPAnx as a function of one's own high avoidance; greater PPAv as a function of one's own high anxiety). Study 2 also showed that perceptions of a partner's attachment predict buffering behavior toward them. As expected, greater PPAnx (but not PPAv) predicted greater reassurance provision during stressor discussions and in daily life (a 10-day EMA). Together, these findings highlight the nature and potential importance of perceived partner attachment in buffering relationship insecurities.

Components of Connection: The Association Between Couple Chemistry and Relationship Outcomes

1:55 PM – 2:02 PM

Romantic chemistry, or an unspoken connection, is colloquially valued when pursuing a partner, but there are few empirical studies assessing its measurement and role over the course of a romantic relationship. Past work has found romantic chemistry included facets of compatibility, comfortability, unique connection, positive interactions and sexual attraction across single and partnered people. Given that romantic chemistry is described as a phenomenon that needs to be reciprocated by both partners, in a sample of couples ($N = 134$), we found evidence of strong dyadic measurement invariance, suggesting partners' responses are comparable and differences represent dissimilarity in their experiences of romantic chemistry rather than a measurement issue. We also found support for modeling romantic chemistry as a shared relational effect and that couple chemistry was associated with relationship satisfaction and commitment for each partner and couple level sexual frequency (i.e., Common Fate Model). Romantic chemistry is a multifaceted construct that is shared between members in a relationship and plays an important role in ongoing relationships.

Neural synchrony in the prefrontal cortex underlies shared memories in romantic couples

2:03 PM – 2:10 PM

Couples develop a shared story of their relationship over time. Although this joint narrative may have important consequences for the relationship, its neural bases remain unclear. Here, 41 couples engaged in a 10-minute "origin story" discussion, recalling how they met and their relationship trajectory, while undergoing functional NearInfrared Spectroscopy. We computed inter-subject correlation (ISC) in the prefrontal cortex, where greater ISC indicates greater neural synchrony. During this conversation, activity in the ventromedial prefrontal cortex, a region involved in constructing affectively meaningful, self-relevant autobiographical memories, was synchronized between partners. Further, couples who showed greater synchrony reported feeling closer post-conversation and viewing their story as a central part of who they are. Using sentence embeddings to quantify the semantic overlap between the conversation and each partner's subsequent recall, we found that couples with higher synchrony had greater overlap. Together, our findings suggest that shared narratives in couples are reflected in synchronized neural representations, reinforcing closeness and relationship identity.

[1] Development of the Broadened Fear of Being Single (B-FOBS) Scale and Its Implications for Relationship Outcomes

3:00 PM – 3:45 PM

Fear of being single (FOBS) is linked to maladaptive relationship behaviors, but the existing measure has limitations (e.g., different wording for single vs. partnered people). We developed the Broadened Fear of Being Single (B-FOBS) scale and tested it across four samples (total N=1,720). Study 1 (N=498) exploratory factor analysis (EFA) revealed two dimensions: present- and future-focused FOBS. Study 2 (N=702) confirmatory factor analysis (CFA) supported this structure and showed excellent reliability, convergent/discriminant validity, and measurement invariance across age, gender, relationship status, and sexual orientation. Study 3 (N=264) found that among partnered people, B-FOBS scores were associated with self-sacrifice (e.g., unwanted sex) and infidelity. Study 4 (N=256) showed that among recent singles, higher scores were associated with greater difficulty with post-breakup adjustment, more contact with ex-partners, and sexual fantasies about ex-partners. These findings establish the B-FOBS as a psychometrically robust and inclusive measure useful for capturing the link between FOBS and sexual/relationship outcomes both within and outside romantic relationships.

[2] Hugging a New Acquaintance Increases Social Interest

3:00 PM – 3:45 PM

Several decades of research indicate that social touch can have overall relational benefits. Here, we investigated whether touch, in the form of a hug, increases feelings of social interest between strangers. In this study, experimenters approached strangers across campus, asking them whether they wanted to participate in an experiment about touch. Participants were randomly assigned to be given a hug by the experimenter (the "Hug" group) or not given a hug (the "No Hug" group). Following this, the participant completed a survey on their demographics and feelings about hugging. After what appeared to be the end of the study, the experimenter invited the participant to view their vacation pictures, which was used as a measure of "Social Interest". The results from 330 participants revealed that participants in the Hug group exhibited significantly more Social Interest compared to those in the No Hug group. In addition, the degree to which participants in the Hug group reported liking the hug positively predicted Social Interest. These findings suggest that hugs between strangers may be an important first step in building interest and, later, forming new relationships.

[3] Decoding Interest: Examining the Behavioral Cues that Signal Interest in Conversation

3:00 PM – 3:45 PM

Feeling connected to others is a basic human need. When people form social connections, they want to feel that the person they are communicating with is interested in what they have to say. This study takes a data-driven approach to identify conversational features that are important in signaling interest. We recruited 27 pairs of strangers to engage in in-person conversations, guided by questions from the Fast Friends paradigm. All conversations were video- and audio-recorded, with speech transcribed. A separate sample of third-party observers (N=200) watched a random subset of the recordings and made second-by-second ratings of how interested participants appeared in their conversation partners. We extracted features from the recordings that captured facial expressions, head motion, vocal pitch, and semantic content of speech. Using this collection of features, we trained a machine learning model to predict interest ratings. We compare the relative importance of facial, audio, and semantic features in predicting interest and examine how this model can be used to predict conversational outcomes.

[4] Excluded for being single: Associations between relationship status-based exclusion and singlehood

3:00 PM – 3:45 PM

Social exclusion is a harmful, yet common, experience. Although research has examined exclusion across a range of contexts, less work has considered how ostracism (being ignored and excluded) extends to the domains of relationship status and singlehood (not being in a romantic relationship). Secondary analyses of survey data from 501 United States single adults explored how relationship-status-based ostracism is associated with other aspects of one's singlehood. Perceiving greater approval of one's singlehood from close others (parents and friends) was associated with fewer perceived experiences of exclusion. Greater relationship status-based ostracism was associated with stronger endorsement of relationship pedestal beliefs, greater investment in singlehood, and greater fear of being single. These associations indicate that exclusion attributed to one's singlehood is psychologically meaningful and that close others may constitute one context in which it arises. Together, the findings highlight both the correlates of relationship status-based ostracism for single people and the potential role of social networks as sources of this negative treatment.

[5] Achieving Belonging Needs Through Diverse Ways: Individual Differences and Consequences for Well-being

3:00 PM – 3:45 PM

Humans have a pervasive need to belong and be socially connected with others. A common way to meet this need is through close relationships. However, people can achieve a sense of belonging in other ways as well. With a diverse sample who ranged in age from 18 to 80+ and obtained from various sources, I examined the degree to which participants reported that they achieved their belonging needs through various ways, including close relationships, interactions with weak ties, group memberships, and miscellaneous other ways (e.g., pets). Also examined was how achieved belonging in the different pathways was differentially associated with a general need to belong, the Big Five personality characteristics, and an index of well-being. Results indicated that the participants achieved their need to belong through various pathways, with no differences found based on gender or age. However, the achievement of belonging needs in different areas was differentially associated with the general need to belong, Big 5 personality characteristics, and well-being. The results have implications for those in society who believe their belonging needs have been thwarted, which are discussed.

[6] Similarities and Differences Between Romantic Relationships and Friends-With-Benefits: An Interpretative Phenomenological Analysis

3:00 PM – 3:45 PM

What fundamentally differentiates romantic relationships from non-romantic ones remains a central question in relationship research. Friends-with-benefits (FWB) remain understudied despite their growing prevalence. Little research has compared the lived experiences of those navigating both FWBs and romantic relationships. Undergraduates (N = 11) with experience in both types of relationships completed semi-structured interviews. An interpretative phenomenological analysis revealed three superordinate themes: emotional investment and attachment, sexual intimacy and meaning, and communication and boundaries. Both relationship types involved sexual desire, yet emotional context transformed sexual meaning. Participants described FWB as emotionally empty and transactional, while romantic relationships involved deeper emotional reciprocity. Participants consistently sought relational privacy in FWB arrangements, contrasting with the social visibility sought in romantic relationships. These findings highlight dimensional rather than categorical differences in contemporary relationship experiences.

[7] Longitudinal changes in social network structure and composition among adolescents and young adults with cancer

3:00 PM – 3:45 PM

Background: Cancer creates isolation from family and friends, especially among adolescents and young adults with cancer (AYAs). In turn, the social networks of AYAs with cancer invariably change. In the present study we examine changes in the social networks of AYAs with cancer over time. Method: AYAs (N=50) completed a social network questionnaire at three timepoints (baseline, 3- and 6- months post baseline) capturing social network structure (network size), composition (member characteristics), and closeness at each timepoint. Wilcoxon signed-rank tests assessed changes over time. Results: AYAs (Mage=27.1) were majority female (60%), White (62%) and were on average 2.3 years since diagnosis. Social networks were significantly smaller at 6 months, contracting by 1.5 people over time ($Z=-2.7$, $p=0.01$), with significant decreases in friends ($Z=-2.2$, $p=0.03$), second-degree relatives ($Z=-2.7$, $p=0.01$) and in network closeness ($Z=-2.4$, $p=0.02$). Network composition remained stable. Conclusions: Results suggest that social networks of AYAs with cancer are contracting over time and point to specific subsets of relationships that may be more vulnerable to leaving AYAs social networks.

[8] Confronting Bias in Romantic Relationships

3:00 PM – 3:45 PM

Confronting racism is an important topic, but little research has investigated tradeoffs based on when the offender is a person of color's romantic partner. Our vignette study focused on how Black /African American participants think they would confront bias in a romantic relationship (N=92). The vignettes featured either a mild or more severe microaggression against Black/African Americans. They were asked about their emotions and imagined reactions to these scenarios. Participants rated they'd support staying calm especially for the mild scenario, asking questions to be clear what they meant before responding, educating their partner, explaining the emotional impact on themselves, trying to get them to empathize, focus on their comments (rather than focusing on them as a person), and discussing institutional racism with them. They were less likely to say they'd get help from others or to call them or their comments racist, though this was more likely for the severe scenario. These patterns indicate the delicate but important work of confronting bias when the offender is their romantic partner, but some of these same strategies may also reduce confronting's effectiveness.

[9] The Functions of AI Relationships: A Comparison with Social and Parasocial Relationships

3:00 PM – 3:45 PM

Prior work shows that social relationships offer interactive advantages, whereas parasocial ones (e.g., with celebrities) are limited by their one-sidedness. With advanced LLMs, people can form relationships with AI that allow reciprocal interactions. Do AI relationships function similarly to or differently from social and parasocial ones? Where does AI fit among relationship targets? In a 2x5 within-subjects design, participants nominated and rated targets varying in bond strength (strong/weak) and category (human, fictional character, AI, celebrity, object) on how effectively they satisfied epistemic, affiliation, and emotion-regulation needs. As expected, strong bonds outperformed weak ones, and social relationships outperformed parasocial ones across all needs. For AI vs. human, no significant differences emerged, suggesting AI is comparable to human in certain relationship functions. Compared with parasocial targets, AI performed better on epistemic need, with no differences for others. One caveat is findings are based on Ps who have relationships with all target types. Nevertheless, it indicates meaningful potential for AI relationships as they become more prevalent in future.

[10] The Effects of Transcutaneous Vagus Nerve Stimulation on Romantic Couples' Physiology and Behavior During Conflict

3:00 PM – 3:45 PM

Background: Conflicts with close others and subsequent affective reactions can have long-term consequences. Building on recent work using transcutaneous vagus nerve stimulation (tVNS), we examined if tVNS can modulate the emotional, physiological, and behavioral responses to a romantic conflict. Methods: Couples (N=134) were randomly assigned to tVNS or sham stimulation. Both partners received continuous stimulation for 15 minutes before and during a discussion about a recurring conflict topic. We examined each partner's respiratory sinus arrhythmia (RSA) reactivity to conflict and the partners' physiological and behavioral attunement to each other. Results: We found no condition differences in emotional experiences, but individuals receiving tVNS (vs. sham stimulation) experienced greater decreases in RSA. Further, couples in the tVNS (vs. sham) condition showed greater behavioral synchrony. Conclusions: This work provides experimental evidence supporting the role of the vagus nerve in modulating reactions to stressful social interactions, highlighting the potential of tVNS to subtly influence couple dynamics at a physiological and behavioral level.

[11] Who is Likely to Own a Sex Doll? Personality, Gender, and Sexual Behaviors as Predictors

3:00 PM – 3:45 PM

As technology evolves, human-like devices increasingly shape how people pursue intimacy and emotional connection. Synthetic companionship technologies, particularly sex dolls, provide a unique lens to understand these dynamics. Although sex doll use is often hypothesized to substitute for missing human connection, empirical evidence on the psychological and behavioral correlates of ownership remains limited. Our study examined demographic, relational, and behavioral predictors of sex doll ownership. Individuals who were male, less agreeable, or in non-exclusive relationships were more likely to own a sex doll, with most intending to use it for sexual purposes. Greater engagement in sexual fantasizing, masturbation, and moderate-frequency of porn consumption (several times a month or week) was also associated with a higher likelihood of ownership. These findings suggest that personality traits and sexual behavior patterns shape openness to technologically mediated sexual experiences, offering insight into evolving expressions of intimacy and autonomy in the digital age.

[12] Defining Beneficial Interpersonal Emotion Regulation Strategy Use by Relationship Outcomes

3:00 PM – 3:45 PM

Interpersonal emotion regulation (IER) is related to individual and relational wellbeing. Emotion regulation research often aims to identify "good" vs "bad" strategies; however use of any IER may be viewed as responsive by the target, and thus beneficial. It's also plausible that IER strategies that complement one's toolkit would be beneficial. During Fall 2024 73 first semester college roommate pairs reported on IER experiences with their roommate; indices of relational wellbeing; and mental and physical health at 3 times during the semester. At T1 overall frequency of IER and use of traditionally "good" strategies were positively associated with relational wellbeing. Frequency and complementarity of IER strategy use (strategies that contrast those typically used by the target) were positively associated with anxiety and depression, while use of "good" strategies was negatively associated with anxiety and depression. Effects of IER on change in relational and personal wellbeing over time were inconsistent and mostly nonsignificant. Findings highlight that defining "good" IER depends on the outcome; what's healthy for the individual may contrast what's healthy for the relationship.

[13] Maternal Acceptance and Tolerance of Child Emotion Expression Mediates the Relationship Between Violence Exposure During Early Childhood and Later Externalizing Problems

3:00 PM – 3:45 PM

Parent–child discussion of emotional events (reminiscing) may be a mechanism through which childhood adversity leads to later adjustment problems. Intimate partner violence (IPV) between parents, a widely accepted risk factor for adjustment problems, is associated with poor maternal reminiscing (e.g., Overbeek, 2022); however, it is unclear which specific aspects of reminiscing are affected and if these effects, in turn, contribute to later child maladjustment. In a longitudinal study of IPV exposed mothers and children from pregnancy into middle childhood (N=202), we evaluated these associations. We identified maternal acceptance and tolerance, characterized by the extent to which mothers accept and encourage their child's perspective during conversation, as the component of reminiscing that significantly mediated the association between children's lifetime IPV exposure and externalizing problems at age 7, controlling for other aspects of reminiscing and maternal language ability. These results suggest mothers whose children are exposed to IPV may have difficulty structuring interactions that validate their child's ideas and feelings, conferring risk for externalizing problems.

[14] Links Between Daily Emotions and Enacted Responsiveness

3:00 PM – 3:45 PM

Responsiveness is an essential element for successful and fulfilling romantic relationships. Although people often strive to be responsive to their romantic partner, their ability to do so may fluctuate daily as a function of emotion. We examined how daily emotional experiences are associated with a person's enacted responsiveness toward their romantic partner. Daily reports (N = 2,912) from cohabitating couples (N = 104 couples), using generalized additive models, indicated that daily emotions were associated with daily enacted responsiveness toward their romantic partner. Positive emotions consistently fostered greater responsiveness. Conversely, negative emotions were not uniformly detrimental; people experiencing mild-to-moderate negative affect remained attuned to their partner's needs, but beyond a certain threshold, negative emotions impeded responsiveness. Our results suggest that emotions shape responsiveness in nuanced ways and underscore the value of modeling non-linear patterns to capture tipping points in relationship maintenance that would otherwise go overlooked.

[15] The Wrong Kind of Right: Support from Close Others Can Harm When it is Invalidating

3:00 PM – 3:45 PM

When close others provide social support, it is seen as inherently positive, rooted in the goal of helping others. However, not all social support has been found to be beneficial. This study explores how invalidation — perceiving one's feelings, thoughts, or experiences as dismissed, misunderstood, or deemed unreasonable — may serve as a mechanism through which social support has negative individual and relational consequences. In this study, participants reflected on times in which social support either made their situation better or made it worse. We find that unhelpful social support was seen as more invalidating than helpful social support, and that this in turn was associated with worse relationship quality, more negative and less positive emotions, and lower self-efficacy. These findings provide insight into when social support is not beneficial and highlight the importance of the content of the helping behavior in support. As helping and support play a central role in everyday interactions, from friendships to clinical and organizational settings, understanding how and when it is counterproductive offers critical insight into promoting truly supportive environments.

[16] Assessing the joint function of empathic accuracy and projection in providing social regulatory support in daily life

3:00 PM – 3:45 PM

What predicts how we respond to a partner's emotional disclosures? Some theories emphasize empathic accuracy (i.e. accurately inferring a partner's mental states) while others highlight projection (i.e. providing the kind of support one personally prefers). Yet few studies have examined how these processes jointly influence the provision of social regulatory support with everyday stressors in close relationships. Using a 21-day dyadic daily diary (N = 119 dyads) and an APIM model, we tested both accounts. In line with empathic accuracy, people offered more advice on days when their partner wanted more advice ($b = 2.85$, $p < .001$). Additionally, people also gave more advice when they personally wanted more advice for their own (separate) problem ($b = 0.39$, $p = .03$). Although smaller in size, the projection results are notable given that partners faced different stressors and were not ostensibly aware of projection. We discuss these findings in relation to simulation theory, assumed similarity and chronic accessibility.

[17] One-Size-Fits-All or Friend-Specific? A Social Relations Model Approach to Social Support in Friendships

3:00 PM – 3:45 PM

When providing support in friendships, the research suggests that people should tailor their support to the specific person and situation at hand. However, it is possible that people have broader support-giving tendencies that persist regardless of the context. In the current study, we recruited friend groups consisting of four people, who each took turns providing support to one another regarding a stressor in their lives in a round-robin design (N = 328 participants, 87 groups, 522 dyads). We used the Social Relations Model to decompose the types of social support (e.g., emotional support, instrumental support etc.) to determine the extent to which the types of support people give primarily depend on the support giver, support receiver or the unique interaction or relationship. We found consistent evidence that social support is both a general tendency to provide particular types of support over others and a dynamic process that depends on the unique relationship or interaction. These results demonstrate that social support is not an entirely relational process and highlight the importance of accounting for different sources of variance in interpersonal processes.

[18] The Importance of Family Ties: How Family Support Shapes First-Generation College Students' Belonging

3:00 PM – 3:45 PM

First-generation, low-income (FLI) college students face persistent challenges in college, such as greater uncertainty about whether they belong. While FLI students often emphasize the importance of family support in qualitative work, little research has directly tested how this support impacts students' outcomes. Existing literature proposes that FLI families lack the academic experiences and capital necessary to support FLI students through college. Rather than this deficit perspective, in the current research we take a strengths-based approach to examine the broad range of support (both academic and non-academic) families may provide to FLI students. Across two studies (N1=158; N2=181), we find that although family academic support was unrelated to FLI students' outcomes, family non-academic support (e.g. practical, emotional) was positively linked to feelings of belonging. These findings highlight the importance of familial ties and examining different forms of family support beyond those typically recognized in higher education, as well as how integrating families into college can be a potential avenue for addressing the belonging gap FLI students face in higher education.

[19] Joy Brings Us Closer: How Shared Imagination Sparks Human Connection

3:00 PM – 3:45 PM

Shared positive emotions are powerful and crucial social factors that facilitate feelings of interpersonal closeness and bonding. The present study examined whether collaboratively imagining a shared positive future event with a partner, fosters social connection & affiliation through shared joy. Participants (N = 374) were randomly assigned to one of three experimental conditions: Coimagination, Individual Imagination, or General Description condition. After the task, participants rated their joy, perceived social connection (Inclusion of Other in the Self Scale), & affiliative motivation (e.g., desire to befriend or spend time with the partner). Structural equation modeling with bootstrapped mediation revealed that Coimagination evoked significantly greater joy than both comparison conditions. Joy, in turn, predicted stronger social connection and affiliative motivation, & indirect effects through joy were significant ($p < .05$), indicating partial mediation. These findings suggest that shared joy acts as a key affective mechanism linking collaborative imagination to interpersonal connection and bonding, emphasizing shared emotional foundations of social closeness and bonding.

[20] Pursuing Relationships or Avoiding Singlehood? Differentiating Singles' Fear of Being Single, Desire for a Relationship, and Satisfaction with Relationship Status

3:00 PM – 3:45 PM

Common measures of attitudes toward singlehood are framed in different ways, with some focused on desire for relational pursuit, some on satisfaction or contentment with singlehood, and others focused on negative affect or experiences associated with singlehood. The present research explores whether measures such as Fear of Being Single (FOBS), Desire for a Relationship (DFR), and Satisfaction with Relationship Status (SWRS) represent distinct perspectives associated with singlehood experiences or, conversely, a general attitude toward relationship status. In two samples of singles (N1A = 172, N1B = 257), the three measures loaded onto distinct factors. Exploratory analyses revealed distinct associations with well-being, relationship pursuit tendencies such as actively seeking a partner and willingness to settle in relationships, and perceived rewards/costs of singlehood and relationships. Results suggest that unique experiences of singlehood and relationships associated with FOBS, DFR, and SWRS reflect distinct motivational underpinnings. Researchers should consider the goals and implications of selecting different operationalizations of attitudes toward relationship status.

[21] Drained and self-doubting: The dyadic effects of attachment avoidance on relationship self-efficacy beliefs over time

3:00 PM – 3:45 PM

Relationship self-efficacy, or beliefs about one's ability to fulfill needs in their romantic relationship, significantly impacts satisfaction and longevity. Given that self-efficacy is shaped by perceived accomplishments and failures, accumulated experiences with a partner may alter these beliefs. The present research investigated whether having an insecurely attached romantic partner who reacts negatively to care-seeking and conflict resolution reduces relationship self-efficacy. A longitudinal Actor-Partner Interdependence Model assessed self-efficacy changes over 12 weeks in 220 couples. Results indicated that a partner's higher attachment avoidance precipitated a decrease in one's self-efficacy. Perceived responsiveness mediated this link, such that a partner higher in avoidance was perceived as less responsive, which in turn, predicted a decline in one's own sense of efficacy. Altogether, findings suggest that having an avoidant partner can weaken confidence in meeting relational needs, eroding self-efficacy over time through low perceived responsiveness. Broadly, this underscores the importance of considering dyadic interactions when examining relationship beliefs.

[22] The Importance of Own Attachment: Unpacking Anxiety's Functional Role in Relationships

3:00 PM – 3:45 PM

Adult attachment is closely linked to romantic relationship satisfaction, yet the relative contributions of individual attachment, partner attachment, and the compatibility between partners' styles remain unclear. Additionally, the distinct associations of attachment anxiety and avoidance on relationship outcomes have been underexplored. This study examined 501 Korean premarital couples using the Actor-Partner Interdependence Model to assess how attachment dimensions relate to satisfaction. Two key findings emerged. First, the actor's attachment style had the strongest association with satisfaction, surpassing the partner's attachment and dyadic combinations. Second, anxiety and avoidance were not equally detrimental; a context-specific mitigating pattern emerged at the dyadic level. Specifically, for couples that women reported high anxiety, the negative association between men's anxiety and their own satisfaction was attenuated. Therefore, individual attachment style accounted for satisfaction above and beyond a partner's attachment or the compatibility between styles, with anxiety proving to be less damaging and even protective compared to avoidance in certain contexts.

[23] Longitudinal changes in relationship functioning as predicted by actor binge drinking and partner self-regulation

3:00 PM – 3:45 PM

People may be able to rely on a romantic partner for support with achieving a challenging goal. Partners who are better at self-regulation may be more useful in this case. However, even if relying on a partner aids with goal progress, it may impact the relationship. Secondary data analyses of data from n=280 married or cohabiting couples (n=560 individuals) were used to examine how actor binge drinking interacted with partner self-regulation to predict changes in relationship functioning over 2 years. Participants completed tasks assessing executive cognitive function at baseline, and measures of alcohol use and relationship functioning at baseline, 1 year, and 2 years. We found a significant actor binge drinking x partner self-regulation interaction. Actors who decreased binge drinking reported poorer relationship outcomes with a less impulsive as opposed to a more impulsive partner. The opposite pattern of results was found for actors who did not decrease binge drinking. These results indicate that people might feel better about partners who are "useful" for working towards a difficult goal. Once the goal has been achieved, feelings towards the partner might change for the worse.

[24] Between Highest and Lowest: A Latent Profile Analysis of the Investment Model of Commitment Processes

3:00 PM – 3:45 PM

The investment model of commitment processes (Rusbult et al., 2012) posits that commitment to a relationship is a function of three independent and additive factors: satisfaction level, investment size, and quality of alternatives. The highest commitment occurs when satisfaction and investment are high, and alternatives are low. However, the model does not differentiate levels of commitment arising from non-extreme combinations of these factors. The current study examined how individuals in relationships cluster across these variables and how these combinations relate to commitment. Participants (N= 615) were adults currently in a relationship recruited from a university sample pool. Using Latent Profile Analysis (LPA), we identified 3 distinct profiles. The high commitment profile (52.6%) showed high satisfaction and investment, and low alternatives. The moderate commitment profile (41.9%) showed moderate alternatives and investment but high satisfaction. The low commitment profile (5.6%) showed moderate alternatives but low investment and satisfaction. We also examined how these profiles predict commitment, dissolution consideration, forgiveness, and relationship maintenance.

[25] The Role of LGBTQ+ Shared Identity in Shaping Support Quality for LGBTQ+ Identity-Related Stressors

3:00 PM – 3:45 PM

High-quality social support in close relationships can buffer the harmful health consequences of discrimination and stigma targeting LGBTQ+ people. One understudied factor that may influence support quality is whether LGBTQ+ people engage with support providers who share their LGBTQ+ identity when facing identity-related stressors. In Study 1, LGBTQ+ participants imagined disclosing an identity-related stressor to either an LGBTQ+ or non-LGBTQ+ friend. Disclosers anticipated that LGBTQ+ (vs. non-LGBTQ+) providers would offer support that was more helpful for appraising and managing the identity-related stressor, but equally responsive. In Study 2, LGBTQ+ and non-LGBTQ+ participants responded to a hypothetical text from an LGBTQ+ friend experiencing a stressor. Paralleling Study 1, coders rated LGBTQ+ (vs. non-LGBTQ+) providers as offering support that was more helpful for appraising and managing the stressor, but equally responsive. This work highlights how shared LGBTQ+ identity differentially shapes important indices of support quality. Moreover, our findings provide insight into how LGBTQ+ people can procure high-quality support for identity-related stressors from close others.

[26] Close Parental Relationships and Support-Seeking as Protective Factors in Depressive Symptoms for Anxious Solitary Children From 3rd Through 7th Grade

3:00 PM – 3:45 PM

Anxious solitary children, characterized by elevated social anxiety and withdrawal among familiar peers, often struggle to form and maintain close friendships. Limited peer connections may restrict the use of support-seeking coping strategies, making close parent-child relationships critical sources of resilience. Guided by an attachment-based framework, this study examined how anxious solitude, support-seeking intentions, and perceived security with parents shape depressive symptom trajectories from 3rd to 7th grade. Participants (N = 230, 57% girls) self-reported depressive symptoms, support seeking intentions, and perceived security with mothers and fathers. Peers nominated classmates for anxious solitude. Latent growth curve modeling revealed that for boys, mother and father security (individually and interactively) predicted depressive symptom levels and change over time. For girls, anxious solitude, support-seeking, and their interactions with parental security predicted initial levels and trajectories of depressive symptoms. Findings highlight the protective role of close and secure parent-child relationships in buffering anxious solitary youth from depression.

[27] So...what are we?: Defining the situationship and identifying its attributes, causes, and emotional outcomes.

3:00 PM – 3:45 PM

Background Recent dating culture has seen a rise in "situationships," a grey area past just being friends but falling short of a committed relationship (CR). Yet, little is known about the relational attributes, behaviors, and wellbeing outcomes that distinguish them from more established relationship types. Methods We take a mixed methods approach in a series of three observational studies. In Studies 1 and 2, undergrads completed surveys comparing experiences and perceptions of situationships, CRs, and hookups. In Study 3 we plan to analyze open-ended accounts of situationship experiences. Results Though situationships show levels of commitment and intimacy between those of CRs and hookups, they are also as low in sexual satisfaction as hookups, and as high in conflict as CRs. And, they provide fewer gains to self-esteem and less support than CRs. Low commitment readiness was both the top reason for and a key predictor of future situationship involvement. Discussion Despite their bad reputation, situationships remain pervasive. The current work characterizes them and begins to disentangle what qualities and contextual factors make them emotionally costly versus fulfilling.

[28] You Inspire Me: The Role of Romantic Partner Inspiration on Goal Pursuit and Relational Well-Being

3:00 PM – 3:45 PM

Romantic partners play a key role in goal support, and yet, no research has examined whether this may occur through inspiration, defined as transcendence and illumination of new ideas through an external source. We tested preregistered hypotheses that individuals who felt inspired by their partner would report better goal outcomes (e.g., increased goal progress) and feel greater relationship satisfaction in the moment and over time. In Study 1 (N=214 couples), romantic partners had an in-lab conversation about a relationship goal they wanted to achieve. Results showed that actor and partner inspiration predicted better goal (e.g., motivation) and relationship outcomes. In Study 2 (N=164 couples), couples were surveyed about multiple relationship goals over three months. Feeling more inspired by a partner on a specific goal, and across goals on average, predicted greater goal commitment and goal progress concurrently and three months later. Benefits could not be fully accounted for by happiness or trait-level inspiration. Altogether, this work highlights inspiration as a process through which romantic partners support goal pursuit and build satisfying relationships.

[29] Associations Among Relational Media Representation, Personal and Relational Well-Being in Same-Gender Relationships

3:00 PM – 3:45 PM

Representation in mass media is a fiercely discussed and debated topic. However, is the topic deserving of the attention it receives? How important is representation of minoritized characters to individuals possessing those identities? The current research addresses a component of this larger question that has previously been overlooked- representation of minoritized relationships, particularly, same-gender relationships. Across two studies we examine the associations between representative media and personal and relational well-being. In Study 1 (n = 238), we find a strong correlation between perceived representation and wellbeing for individuals in same-gender relationships but not for individuals in mixed-gender relationships. In Study 2 (n = 109), we find that perceived closeness with a specific couple depicted in media predict personal and relational well-being, but this effect is moderated by identity clarity. Results from the current work indicate a clear importance of representative media for well-being of individuals in minoritized relationships.

[30] Adult Attachment and Co-Rumination Outcomes in Romantic Couples

3:00 PM – 3:45 PM

Co-rumination is a dyadic emotion regulation strategy associated with both positive interpersonal benefits and negative intrapersonal outcomes, but recent work suggests that there may be individual differences in the effect of co-rumination. Attachment is a trait that influences how people respond to stress in interactions and may provide key insights into the individual nature of the outcomes from co-rumination. The current research examined the potential moderation of insecure attachment on the effect of a co-rumination manipulation. 139 romantic couples (278 participants) received instructions to either engage in co-rumination or discuss naturally, engaged in a problem discussion, then completed self-report measures of stressed and upset feelings, negative and positive affect, closeness, and perceived partner responsiveness. Results revealed that greater attachment anxiety was associated with greater stressed and upset feelings and negative affect, consistent with prior literature. However, attachment did not moderate any of the outcomes of the co-rumination condition. Future research should further examine the impact of individual characteristics on co-rumination outcomes

[31] How Network Diversity and Imagined Contact Shape Behavioral Intentions Toward Queer Individuals

3:00 PM – 3:45 PM

People's existing social networks can shape their attitudes and behaviors toward novel outgroup members. Individuals with more diverse networks may have greater exposure to outgroup members, and in turn, more positive behavioral intentions toward novel individuals. This study examines how imagined contact, network diversity, and gender identity impact cisgender individuals' behavioral intentions toward queer individuals. Participants were randomly assigned to a positive or neutral imagined interaction with a queer individual. We expected that in the neutral condition (but not positive), those with more diverse sexual-orientation networks would report more positive behavioral intentions than those with less diverse networks, with stronger effects for men. As expected, men in the neutral condition with more diverse networks reported greater willingness to approach novel queer individuals. This effect was not found in the positive condition. Interestingly, the pattern was reversed for women. These findings suggest that imagined contact and existing networks can shape behavioral intentions toward queer individuals, but the effect may vary across gender.

[32] From Ideology to Intimacy: Politics and Race in Online Dating

3:00 PM – 3:45 PM

How do people decide when to "swipe right" on a potential love interest? The current study experimentally assessed how people's decisions to swipe are influenced by their perceptions of a potential match's political beliefs and identity (e.g., gender, race). Participants (N = 676) were randomly assigned to view profile pictures with different visual cues (e.g., hobbies, flags) that were either politically neutral, conservative-leaning, or liberal-leaning. We examined how users' dating decisions were influenced by political and racial biases, specifically: 1) How do visual cues in profiles shape perceptions of political ideology and interest in matching? 2) Do interests in matching and perceptions of political ideology differ across race (participant and profile)? and 3) Are these effects moderated by political orientation, colorblind racial attitudes, or similarity beliefs? Findings suggest that visual cues have a significant impact on matching interests, depending on the leaning of the stimuli (e.g., conservative, liberal) and the user's own beliefs. These findings reveal how users rely on political symbols as heuristics when making snap judgments about potential partners.

[33] “I’m so proud of you!” Consequences of parental pride for children

3:00 PM – 3:45 PM

Parents often tell children that they are proud of them, but no research has examined the effects of such expressions on children. On the one hand, if parental pride expressions imply that parents' positive regard depends on achievement, children whose parents had expressed pride might feel increased positive affect when succeeding, but also increased shame, embarrassment, and physiological arousal when facing failure. On the other hand, if parental pride helps children create positive mental representations of parents' support, children whose parents had expressed pride should feel increased positive affect when succeeding, and decreased shame, embarrassment, and physiological arousal when facing failure. We pitted these theoretical perspectives against each other in an experiment in the Netherlands. As children (N = 300, age 8-13) successfully solved a puzzle, we randomly assigned parents to express pride or no pride. Children then worked on an unsolvable puzzle. We coded their emotions and tracked physiological arousal throughout the study. Results from pre-registered analyses will shed light on how parental pride expressions affect children's experiences of success and failure.

[34] Partners' interpersonal emotion regulation buffers the effects of intrapersonal emotion regulation difficulties in a diverse sample

3:00 PM – 3:45 PM

Intrapersonal emotion regulation (ER) and interpersonal emotion regulation (IER) are consistently linked to wellbeing. Though, these constructs are often examined separately, and little is known whether the association between IER and ER on wellbeing differs across LGBTQ+ populations. Using National Couples Health & Time Study (N = 3629), linear regression analyses examined the moderating effect of IER on the relationship between maladaptive ER and mental health outcomes, and whether these effects differed across sexualities. Adaptive IER and maladaptive ER predicted better and worse wellbeing, respectively. Moreover, there was a significant interaction between IER and ER, such that adaptive IER significantly weakened the positive relationship between poorer ER and worse mental health; however, this effect did not differ based on sexuality. The findings highlight the beneficial (direct and buffering) effects of IER on mental health. Similarities across sexualities have implications for how IER and ER research can generalize to LGBTQ+ populations.

[35] Affective Affection: Affectionate Touch to Facilitate Interpersonal Emotion Regulation in Romantic Relationships

3:00 PM – 3:45 PM

Affectionate touch (AT) refers to warm, non-sexual physical contact (e.g., hand-holding, stroking) used to communicate love and support (Jakubiak & Feeney, 2017). Prior work suggests that AT may have important interpersonal emotion regulatory (IER) functions in close relationships (Debrot et al., 2013), but few studies have directly examined this. To address this gap, we used a dyadic, multi-method approach to examine the link between AT and IER in a sample of 68 dating couples (88.2% mixed-sex, M=1.2 yrs together). Independent raters coded 5-minute interactions before and after one partner (target) completed a stressful task for AT initiated by the regulator (the partner not completing the task) towards the target in 15 second intervals (1=present, 0=not present) as well as the overall degree of AT exhibited by the regulator (1=not at all, 7=a great deal). We expect regulators who use more AT throughout and overall to be rated as more effective regulators by the target, and for AT to be associated with more positive and less negative affect for both the target and regulator. This research will add to our understanding of how AT is used to facilitate IER in romantic relationships.

[36] Relationship Identification and the Temporal Perception of Partner Transgressions

3:00 PM – 3:45 PM

Maintaining a satisfying romantic relationship can be challenging, particularly when faced with partner transgressions. Previous work has demonstrated that relationship identification – the degree to which individuals define themselves based on their close relationships-can buffer against the negative effects of such experiences. Yet, the mechanism underlying this protective effect remains unclear. In this study, 497 participants recalled a transgression by their partner and reported when the event occurred and how close or distant the event felt. Participants then reported on their relationship commitment and satisfaction. We compared objective time since the transgression with participants' subjective sense of its timing to assess time distortion. Results revealed that high identifiers were more likely to distort time, perceiving transgressions farther away in time than they actually were. Additionally, time distortion was found to be a mechanism through which high identifiers maintained satisfaction and commitment. These findings suggest that high identifiers may need to create temporal distance between the present and the transgression in order to maintain their relationships.

[37] Relationship Maintenance Knowledge and Self-Efficacy Among Single Young Adults Desiring a Committed Romantic Relationship

3:00 PM – 3:45 PM

While singlehood has been increasing and is the chosen status of many, some singles desire a committed romantic relationship. From 2,059 single young adults desiring a committed relationship, we assessed whether individuals know that given relationship maintenance strategies are beneficial to long-term relationship stability (maintenance response-efficacy) and whether they feel they can implement these strategies in their relationships (maintenance self-efficacy). We used the newly developed PRIME (Perceptions of Relationship Maintenance Efficacy) to measure these concepts and test several preregistered hypothesized associations. On average, singles were knowledgeable about the importance of and felt efficacious regarding enacting most strategies, should the time come to form a romance—a relevant factor for young adults' relationship education. Maintenance response-efficacy and self-efficacy were associated with the duration of recent past romances when scores were combined, but only self-efficacy was significant when examined independently. PRIME is the first self-report measure to permit assessment of individual's relationship maintenance efficacy while single.

[38] Clarifying Relationship Clarity: Scale Validation and Links to Loneliness and Well-Being in Single Young Adults

3:00 PM – 3:45 PM

Relationship clarity – the extent to which someone understands what they want in a relationship – plays a key role in initiating satisfying romantic relationships. In the current study, we validate the Relationship Clarity Scale (RCS; Author, 2024) across 4 samples of single young adults (N = 720). We test for construct validity, measurement invariance of gender differences, and convergent and discriminant validity using existing measures in the field. We then examine the experiences of single young adults who were engaging in dating activities and their reports of relationship clarity cross-sectionally (Study 1: N = 191) and longitudinally across three timepoints (Study 2: N = 184). Findings revealed that for single young adults who were actively dating, lower relationship clarity predicted increased loneliness over time, and this loneliness accounted for decreased life satisfaction. Lacking clarity about one's relationships goals and expectations engenders poor judgment and decision-making, as well as increased feelings of insecurity about relationship experiences that coalesce in feelings of loneliness, which in turn decrease life satisfaction.

[39] Holding on or moving on? How nostalgia shapes social adjustment in college

3:00 PM – 3:45 PM

Nostalgia is a sentimental longing for the past that motivates people to maintain old ties. Yet little is known about how nostalgia shapes friendship dynamics during major life transitions, such as entering college. Do nostalgic students devote more time to reconnecting virtually with old friends? Does this focus slow the formation or deepening of new college friendships and shape their sense of belonging? The current study tracked 210 first-year students over four weeks as they adjusted to campus life. Using intensive experience sampling, we captured their social behaviors, including who they interacted with and how (virtually or in person), and a daily list of potential new-college friends. Three times over the four weeks, students reported their nostalgia levels, sense of belonging, the size of their pre-college and new-college friendship networks, and their closeness to each friend. Structural equation modeling will test whether nostalgia predicts changes in network size and friendship closeness over time, and how these changes relate to students' sense of belonging. This study offers new insight into how nostalgia guides social adjustment during a major life transition.

[40] Forming Relationships Through Synchronous Interactions: A Dyadic, Prospective Study

3:00 PM – 3:45 PM

What predicts whether two people "click" and form a romantic relationship? I am conducting a multi-method, prospective study examining whether synchrony—the alignment of partners' thoughts, emotions, behaviors, and physiologies—predicts relationship formation. Using a dating app we developed for University of Michigan students, we are capturing rich behavioral data on early romantic interest, including swipe patterns, conversational synchrony (e.g., moments when people riff off each other's ideas, finish each other's sentences, or laugh together), and self-reported interest in specific matches. Matched pairs are then invited to the lab for a "first date," where we assess perceived and observed synchrony through self-reports, recorded interactions, and continuous cardiac measures. I will test whether greater synchrony during these early encounters predicts attraction and relationship formation over time, and whether perceivable forms of synchrony (e.g., shared laughter) are more predictive than less perceivable forms (e.g., physiological alignment). Together, this work advances understanding of the dynamic processes that foster initial connection and romantic compatibility.

Group Processes and Intergroup Relations Preconference

8:00 AM – 5:00 PM | Location: E450A, Level 4

Challenges for identity expression and development exist at every level of the human experience. At the broadest level, global uncertainties and intergroup histories contribute to experiences of prejudice and the historical oppression of marginalized groups. These same issues aggravate interpersonal interactions and threaten belongingness needs, and ultimately shape how people understand the self, operate in social contexts, and achieve success. From the changing nature of international relations and shifts toward nationalism to people’s experiences in their work, it is important to consider both policy and psychological mechanisms that facilitate social justice and support diversity, equity, and inclusion. The 2026 Group Processes and Intergroup Relations preconference seeks to address these mechanisms at all levels of individual and group experience by bringing together scholars who study social identity, inequality, stereotype threat, status, stress consequences, and ostracism through innovative methodologies.

Health Preconference

8:00 AM – 5:00 PM | Location: E451A, Level 4

Physical health ("Health") is essential to well-being. The role of social and personality factors in health is apparent in myriad ways, such as access to quality healthcare and individual health promotion, and the health domain provides a uniquely rich opportunity to elucidate social and personality processes. Evolving trends in approaches to health, as well as resources for its study, encourage insights from social and personality psychologists. The Health Preconference serves as a hub for SPSP attendees who investigate social and personality processes in health. This preconference facilitates interdisciplinary collaborations and knowledge exchange among a community of scholars in and across health, social, and personality fields. This year will feature pivotal and emerging research, opportunities to connect with fellow scholars, and access to professional developmental opportunities, with an emphasis on social and personality factors in healthcare contexts given Chicago's rich landscape of healthcare and medical education.

8:45 AM – 8:55 AM

College students commonly drink alcohol above moderation and get poor sleep, behaviors seen as socially rewarding or acceptable despite risks. Appearance-based interventions can counter these motives, yet few have targeted alcohol or sleep and none have used a dual approach. We tested an intervention using Future Face software among 298 college females reporting poor sleep and drinking above moderation. Participants randomized to alcohol, sleep, or combined conditions received health risk information and facial transformations showing effects of alcohol use, poor sleep, or both, while controls completed the post-survey only. ANCOVAs revealed that compared to control, the alcohol condition produced higher perceived vulnerability (PV), less favorable attitudes, and lower behavioral willingness (BW) and intentions (BI) to drink above moderation. The sleep condition only produced higher PV to poor sleep. The combined condition produced less favorable attitudes and lower BW and BI to drink above moderation, get poor sleep, and sacrifice sleep to drink. Findings support dual-behavior appearance interventions as feasible for addressing interconnected health risks in at-risk populations.

[1] Buffers and Mechanisms of Structural Stigma and Sexual Minority Health

9:00 AM – 10:15 AM

Structural stigma and regional bias have increasingly come to the fore as fundamental causes of health disparities. Indeed, a rapidly-expanding literature demonstrates that sexual minorities living in regions characterized by increases in or higher overall levels of discriminatory legislation and heterosexist bias exhibit poorer physical and mental health outcomes. However, potential buffers of and mechanisms linking structural stigma and health remain obscure. We utilized data from both large publicly-available datasets (Project Implicit, the US Census, MIT Election Lab, and Movement Advancement Project) and from Generations: A Study of the Life and Health of LGB People in a Changing Society, United States, 2016-2019, a longitudinal survey of a national probability sample of sexual minority Americans. More specifically, we hypothesized that social support from family, social support from friends, and subjective sexual and gender minority (SGM) community connectedness would each either moderate or mediate the relationship between state-level policy environments or county-level explicit and implicit sexuality bias and physical and mental health outcomes.

[3] Social and personality underpinnings of susceptibility to medical misinformation

9:00 AM – 10:15 AM

Medical misinformation (MM) represents a significant threat to public and individual health. Previous work on MM shows that superficial information processing is the main driver of susceptibility to MM; additional work suggests motivated reasoning and social influence may also play prominent roles. Guided by these theories, study 1 collected data from a politically balanced sample of participants from the US (N=270). A structural equation model was developed to examine the impacts of motivated reasoning, social influence, and heuristic reliance on susceptibility to medical misinformation about gender affirming healthcare. The model had good fit and showed that susceptibility to MM was primarily driven by motivated reasoning and social influence. In study 2, a balanced sample (N = 506) was recruited to conceptually replicate and extend the model to other forms of MM. Results from study 2 demonstrated excellent fit with similar patterns of significant drivers. Results from this work may enhance understanding of the primary factors influencing susceptibility to medical misinformation, while providing insight into means by which these pathways might be disrupted.

[4] Bridging Body and Brain: How Inflammation Links to Social Cognition

9:00 AM – 10:15 AM

Chronic inflammation contributes to most leading causes of death worldwide, and social connection plays a key role in regulating it. While social support is linked to lower inflammation, inflammation can, in turn, shape how we think about others—sometimes increasing withdrawal but also motivating approach to trusted others. To examine how inflammation affects social cognition we measured inflammatory cytokines (IL6 and CRP). We then collected ratings of connection with 15 social targets. Participants' neural activity was measured while making trait judgments about each of the 15 targets as well as themselves. Higher IL6—a measure of short-term inflammation—was associated with greater closeness to close others as well as reduced MPFC activity for close-others and reduced neural self–close-other overlap. In contrast, higher CRP—a measure of longer-term inflammation—was linked to feeling less similar to others and greater neural self–other overlap in the MPFC, PCC, and dMPFC. Previous research has shown that feeling closer with a target is connected to more MPFC activity as well as more self-other neural overlap in the dMPFC. Both IL6 and CRP dampened or even eliminated the tie.

[5] Understanding Perceptions of Acceptability, Favorability, and Coercion in Using Financial Incentives as a Policy for Promoting Vaccination

9:00 AM – 10:15 AM

There is a dearth of empirical research on how people perceive and respond to financial incentives as a policy for promoting vaccination. Which aspects of a financial incentive policy are seen more positively and more negatively? This pre-registered online study is a 2 (Timing of Policy: Start, Six month delay) x 3 (Justification for Policy: Increase Uptake, Increase Accessibility, None) factorial design with six pilot-tested messages meant to mirror a Canadian government social media vaccination promotion campaign that included a \$100 incentive for a vaccine. Specifically, we examine 1) whether the timing of the incentive program (introduced at the start of a vaccine campaign, introduced after six months) affects individuals' perceived acceptability, favorability, fairness, and coercion of the program such that a six-month delay is evaluated more negatively, and; 2) whether the justification provided for the incentive moderates this effect such that the effect of timing is attenuated when the incentive is justified in terms of accessibility compared to uptake. These results will build our understanding of how financial incentives are perceived and why they can be ineffective.

[6] Influencers are just like me! Similarity to body positive models reduces self-objectification

9:00 AM – 10:15 AM

Previous research has shown that viewing "body positive" social media posts—ones celebrating a diversity of body types, sizes, and abilities—improves mood, body appreciation, and self-image (Cohen et al., 2019; David et al., 2020; Talbot et al., 2021). However, for whom, and when, these effects occur, is still largely unknown (see Cohen et al., 2021; Rodgers et al., 2022). Using an experimental design, we showed undergraduate women real Instagram posts of "body positive" users who were pre-rated as either thin or heavy. We measured the perceived closeness of the participant to the influencer in the images, as well as weight- and body-related outcomes. We found that higher-weight participants showed a reduction in their state self-objectification after viewing the images, but only if they felt psychologically close to the thin influencers. Viewing heavier influencers, regardless of perceived closeness, did not affect participants' self-objectification. These findings suggest that while "body positive" imagery can be helpful for higher-weight women, such effects may occur only in situations of perceived proximity to thinness, thereby reinforcing weight-related societal standards.

[7] Do messages about science affect reactions to conflicting health information?

9:00 AM – 10:15 AM

Exposure to conflicting health information (CHI) can negatively affect people's beliefs about science and health recommendations. An initial study found that a message which helps people make better sense of the scientific process mitigated these effects. We conducted two pre-registered studies examining the timing of this message by varying whether it came before or after exposure to CHI. In study 1, Prolific participants were randomly assigned to read a message about science or sustainability either before or after exposure to CHI (n = 604). In study 2, Prolific participants were randomly assigned to read a message about science before or after CHI exposure or received no message at all (n = 223). Positive construal of science, counterarguing science, and knowledge of science were assessed. We found that when delivered after exposure to CHI, the message about science was effective at sustaining positive perceptions of science compared to receiving no message. However, there is mixed evidence for effectiveness when the science message is read before CHI exposure. Next steps and implications for interventions for CHI will be discussed.

[8] Reactions to Physicians' Genetic Explanations for Obesity

9:00 AM – 10:15 AM

As obesity is increasingly viewed as a biomedical disease, emphasis on the role of genetics in its etiology is likely to increase. There are also stark racial disparities in obesity in the US, with Black Americans bearing a disproportionate share of the health burden. One concern is that genetic explanations for obesity could bolster the misguided assumption that these disparities stem from genetic differences between racial groups. Little is known about how physicians who endorse genetic explanations are perceived by adults with obesity. In a completed study, U.S. adults with obesity viewed a description of a primary care physician who either did or did not emphasize genetic causes of obesity and its racial disparities. In the genetic condition, compared to the non-genetic condition, the physician was perceived as a less effective treatment provider, and participants identifying as Black or African American were significantly less interested in being treated by him. A planned follow-up study will test these effects in a larger and more diverse sample, examining how physicians' causal attributions for obesity influence perceived warmth, competence, and clinical effectiveness.

[9] Managing Medical Providers' Weight Stigma: Malleability Mindsets, Confrontation Effectiveness Beliefs, and Willingness to Confront

9:00 AM – 10:15 AM

Three studies examined whether and how patients' mindsets about weight stigma predict their willingness to confront physicians' weight-based discrimination. We reasoned that confrontation willingness might positively relate to (1) lay theories—viewing weight bias as malleable—, (2) metatheories—perceiving one's provider to hold a malleable mindset—and (3) effectiveness beliefs—believing strategies will improve care quality. Study 1 (N = 247), a cross-sectional study, suggested that metatheories—but not lay theories—might predict confrontation willingness when one believes that doing so will more effectively improve care quality. Study 2 (N = 226) then experimentally tested malleable (versus fixed) mindsets about physician bias, showing that malleable beliefs increase confrontation willingness. Study 3 (N = 225) then tested the effect of malleable metatheories on willingness but found no support for our expectations. Taken together, this research introduces physician-bias-malleability mindsets as a key component of doctor-patient relationships, pointing to future work that might examine how providers can invite patient self-advocacy by cultivating and signaling malleable mindsets.

[10] Health information seeking among emerging adults

9:00 AM – 10:15 AM

The aim of this study was to examine the patterns of health information seeking and usage among emerging adults. The Health Information National Trends Survey (HINTS 6) is a nationally representative survey designed to monitor changes in health communication usage across populations. Results indicate that emerging adults reported significantly different patterns of health-related social media use and perceptions of the utility of social media in making health decisions than older adults. Emerging adults were more likely to use social media, more likely to use information from social media to make health decisions, and more likely to report social media networks with similar views on health. These findings have important implications for public health education and communication strategies.

[11] An Integrative Review of the Role of Personality Processes in Health

9:00 AM – 10:15 AM

Personality robustly predicts health behaviors and outcomes. However, most personality process studies rely on trait-level data collected years or even decades apart, which makes translation to momentary behaviors in specific situations challenging. Work of this type is necessary for the development of health interventions. In this pre-registered study, we are using inductive qualitative methods to code processes discussed in book chapters, meta-analyses, and empirical papers in the psychology, behavioral medicine, health, and intervention literatures. Coding involved grouping similar processes together until saturation was reached. Our review found support for common theories/processes (e.g., situation selection and evocation) as well as others (e.g., identity development, memory processes) which are discussed less often. To our knowledge, this is the first pre-registered, systematic review of personality processes for health across all Big Five traits. Overall, this state-of-the-art study highlights the need for more studies of contextualized, situationally-constrained and motivationally-relevant behaviors to advance research on how and why personality is related to health.

[12] Improving Trust in Women's Symptoms Using a Novel Medical Chart Perspective-Taking Intervention

9:00 AM – 10:15 AM

Endorsement of gender stereotypes results in diminished trust in women's symptom reports and worse treatment recommendations. Perspective-taking can reduce stereotyping and improve trust, but implementation barriers (e.g., time) render current interventions impractical in medical settings. We are testing if shifting symptom documentation from 3rd to 1st person can be used as a novel medical perspective-taking intervention to increase trust in and improve treatment quality for female patients. We will test two versions of the intervention using a 3 (Perspective-Taking: Affective vs. Cognitive vs. None, between-subjects) x 2 (Patient Sex: Male versus Female, within-subject) design and sample 250 medical students. After viewing two charts written in their perspective-taking condition, participants will recommend a treatment plan and indicate trust in the patient. We predict that perspective-taking will increase treatment quality and trust in patient symptom testimony, that this effect will be greater for female patients, and that increased trust will mediate improved treatment quality. This intervention represents a time and cost-effective way to mitigate gender disparities in health.

[13] Variability in Activated Positive Emotion Predicts Drinking in Daily Life

9:00 AM – 10:15 AM

Emotional variability may play a key role in understanding daily alcohol use. This study examined within-person fluctuations in emotion and their association with drinking behavior among adults. Participants (N = 93; M = 41.2 years) completed seven days of ecological momentary assessment (EMA) via text message, reporting emotion seven times daily and alcohol use each evening. Emotion was measured using 16 items reflecting activated and deactivated positive and negative emotions, with daily intraindividual standard deviations capturing emotional variability. Alcohol use was categorized as no use or use that day, and heavy drinking as 4+ drinks women, 5+ drinks men. Across 600 person-days (92% compliance), greater variability in activated positive emotion was associated with higher odds of heavy drinking (OR=1.99, CI=1.25, 3.17). No other results were significant. These findings suggest that activated positive emotional variability but not variability in negative emotion, may increase risk for drinking, highlighting the importance of emotion regulation as a potential intervention target.

[14] Neither Running nor Resting: The impact of weight stigma on daily exercise and sleep

9:00 AM – 10:15 AM

Weight stigma, social devaluation based on body weight, is common among people with higher body weights. This stigmatization, and anticipation of this stigma, leads to worse overall health, including sleep and motivations to engage in exercise. However, little work has assessed these relationships longitudinally, and thus, temporal precedence has not been established. Thus, this study uses ecological momentary assessment (EMA) to assess the temporal relationship between weight stigma (and anticipated stigma) and subsequent sleep. Additionally, we will assess whether, on days with greater weight stigma and anticipated stigma, people are less likely to partake in light, moderate, and vigorous exercise. The sample included N = 130 female college students with higher body weight. They responded to 3 surveys a day over the course of 21 days. Controlling for BMI and autoregression, we will analyze the data using multilevel modeling to assess covariation between weight stigma, anticipated stigma, and exercise as well as lagged relationships between weight stigma, anticipated stigma, and sleep.

[15] Not All Coping Is Equal: Emotion Regulation Strategies and Same-Day Alcohol Use"

9:00 AM – 10:15 AM

Emotion regulation strategies may influence daily alcohol use, yet little is known about their real-time associations. In this study, 93 adults (M = 41.2 years) completed seven days of daily diary assessments via text message, reporting emotion regulation strategy use and alcohol consumption. Strategy use was measured with the Daily Emotion Regulation Strategy Use Scale (12 strategies). Alcohol use was categorized as no use or use, and heavy drinking as 4+ drinks for women, 5+ for men. Compliance was 92%. Procrastination and rumination were associated with lower odds of alcohol use (ORs = 0.59, 0.48) and heavy drinking (OR = 0.38 for procrastination). In contrast, using substances to regulate emotions was linked to higher odds of alcohol use (OR = 12.29) and heavy drinking (OR = 7.93). These findings suggest that not all maladaptive strategies uniformly increase alcohol risk and highlight the importance of assessing emotion regulation in daily life.

[16] Weekly pleasant support-giving experiences are associated with lower lymphocyte count in older African American adults

9:00 AM – 10:15 AM

Strong links have been established between social support experiences and inflammatory outcomes. We expand the current literature by investigating how age moderates the relationship between pleasantly rated social support experiences and lower lymphocyte count. The analytic sample consists of 223 African American participants from The Heart of Detroit Study (Mage = 65.17 yrs, SD = 5.48, range = 55 –75, 70% Female) who provided daily EMA responses 4 times a day, along with an intravenous blood sample at the end of the week. For each EMA response, participants described their current social environment, affective feelings, and social support experience. More frequent pleasant support-giving experiences predicted lower lymphocyte count; however, this effect was only significant for participants aged 70 and older. More frequent pleasant support-receiving experiences did not significantly predict lower lymphocyte count and there was no significant interaction with age. These preliminary results illustrate that support-giving experiences may be more predictive of lower lymphocyte count for older adults, however further analyses must assess the complete sample.

[17] "Dr. ChatGPT, what can I do to improve my health?": Exploring the Role of Personalization and Citation Quality in the Perception of AI as a Source of Health Information.

9:00 AM – 10:15 AM

As more people turn to AI for health information, understanding how such a source is perceived is critical (Lund et al., 2025). This study explored factors shaping perceptions of health messages attributed to ChatGPT, specifically compared to traditional sources. Across two studies (n = 658), participants consistently rated ChatGPT-attributed messages less positively than those to doctor. In study 1, personalization did not enhance perceived message effectiveness and source credibility when messages were from ChatGPT. In study 2, citation characteristics (relevant, irrelevant, none) of ChatGPT had no effect on perceived message effectiveness. However, ChatGPT was rated more credible when relevant citations were included (vs. none), though irrelevant citations made no difference. This effect was moderated by media health literacy: only participants with higher media health literacy were sensitive to citation relevance, rating relevant citations more credible than irrelevant and no citations. Overall, findings show that low perceived credibility may limit AI's effectiveness in health communication, and that personalization and relevant citations may, at present, do little to help.

[18] Improving Health Outcomes: How Emotion Regulation Strategies Influence Emotion Variability

9:00 AM – 10:15 AM

Higher emotion variability (EV) is linked to poorer health outcomes like inflammation and cortisol. Emotion regulation strategies may influence EV in distinct ways. Participants (N = 121; M = 41 years) completed seven days of ecological momentary assessment via text message, reporting affect seven times daily and emotion regulation strategies used each evening. Emotion was assessed via 16 items capturing activated/deactivated positive emotions (PE) and negative emotions (NE); EV was calculated by intraindividual standard deviations. Emotion regulation strategy use was measured with the Daily Emotion Regulation Strategy Use Scale (12 strategies). Acceptance, distraction, procrastination, and reflection were associated with activated and deactivated NEV. Experiential avoidance and substance use predicted NEV and activated PEV; rumination predicted NEV and deactivated PEV. Savoring was linked to activated PEV. Behavioral avoidance, social support, and reappraisal showed no associations; expressive suppression related to all EV indices. Identifying strategy-specific emotional effects may inform interventions aimed at reducing EV and improving health outcomes.

[19] Investigating the Effects of Attention and Expectancy in Open-label Placebo Analgesia

9:00 AM – 10:15 AM

Placebo analgesia has shown promise in treating pain, but practitioners are reluctant to prescribe deceptive placebos. Open-label, or honestly prescribed placebos, offer an ethical alternative. Open-label placebos seem to work largely through experimenter-manipulated expectancy, as well as social/environmental factors. Additionally, verbally guided attention to relevant placebo sensations might bolster pain relief. In the present study, expectancy and attention were experimentally manipulated within a 2 (expectancy: high/low) x 2 (attention: high/low) between-subjects design with a no-treatment comparison group. Pain was experimentally induced in all five experimental groups using the well-established cold pressor task. The primary dependent variable was pain tolerance. Data collection is ongoing (expected end-date March 2026, expected N = 120). We hypothesize that high expectancy will result in higher pain tolerance than low expectancy, and high attention will result in higher pain tolerance than low attention. Further, high expectancy conditions will display higher pain tolerances when they were in the high attention condition compared to the low attention condition.

[20] Social media and FoMO: nightmares for college student sleep quality

9:00 AM – 10:15 AM

College students' investment in social media (SM) may be facilitated by the fear of missing out (FoMO). SM use may impact sleep quality which can have adverse effects on well-being. We investigated the relationships between student SM use, FoMO, sleep, and numerous mental health variables. Data were collected from Psychology classes at a large Southeastern Research University across four cohorts from 2020-2024, (n=2055). On average, students spent > 4 hours per day using SM. FoMO was positively related to frequency of checking SM, $r = .215$, $p < 0.1$, and time spent on SM, $r = .191$, $p < .01$. More SM was correlated with worse sleep quality and less total average daily sleep, ($r_s = .116, -.091$), $ps < .001$. Heavier SM use was also related to higher levels of anxiety, stress, and depression ($r_s = .06, .149, .08$, $ps < .05$). In turn, worse mental health was significantly related to poorer sleep quality and less average daily amounts of sleep. A greater level of FoMO was related to lower sleep satisfaction, $r_s = -.105$, $p < .01$. This work supports the idea that SM and FoMO are related and may negatively impact student well-being, in addition to lowering perceived sleep quality and sufficiency.

[21] (Mis)Trust in Healthcare and Health Risk Information Avoidance

9:00 AM – 10:15 AM

Prior research finds that people are more likely to avoid health information if they believe powerful audiences such as health insurers may gain access to that information (Lipsey & Shepperd, 2019). This raises an important question – what is it about powerful audiences in a healthcare context that elicits avoidance? The present study aimed to test one hypothesis: lack of trust. 333 U.S. participants (Mage=56.4) recruited from ResearchMatch answered questions about their trust in the healthcare system, trust in insurance companies, and their belief in insurance companies' capacity to harm. Participants then said yes or no to a purported additional study where they could receive free genetic risk information, emphasizing that some forms of insurance may use the information to make coverage decisions. Contrary to hypothesis, neither insurance nor healthcare trust predicted the information decision. Capacity to harm approached significance, with more anticipated harm predicting higher likelihood of avoidance ($p=.073$). Demographic predictors and potential reasons for the non-significant link between trust and information avoidance will be discussed.

[22] Self-Other Differences in Decision-Making Across Medical and Social-Professional Domains

9:00 AM – 10:15 AM

Decisions often differ depending on whether people decide for themselves or for others. The present study aims to replicate the classic self-other asymmetry in medical decision-making (e.g., vaccination and cancer treatment) and test its generalization to socio-professional contexts (e.g., job offers and education). We implemented a 2 (Perspective: Self vs. Other) x 2 (Domain: Medical vs. Socio-professional) between-subjects design with Prolific participants. Participants were randomly assigned to one of four role conditions: Self, Doctor, Medical Director, or Parent (medical); Self, Career Coach, Economist, or Parent (socio-professional). Participants made two hypothetical decisions between more passive and more active options in their assigned roles. Across medical scenarios, non-patient roles showed a higher proportion of Active choices than Patient. Socio-professional the same directional pattern (more Active for "others" than "self"), though the effect appears weaker than in the medical scenarios. Self-reported qualitative data suggested that factors like responsibility, risk balancing, and emotions motivated the results.

[23] Affective associations and fear of discrimination explain sexual minority annual physical attendance

9:00 AM – 10:15 AM

Annual physicals are a strong predictor of improved health behaviors and outcomes, yet sexual minorities (SM) attend at lower rates than heterosexual individuals, which may contribute to disparities in preventive care and downstream morbidity. Minority stress theory suggests anticipated stigma and negative clinical expectations as barriers to care, while positive affect associated with care can increase engagement. The present study examined psychosocial mechanisms underlying this gap among lesbian, gay, and bisexual-spectrum adults. Participants were recruited via Prolific (N=200; Mage=39.16, SD=12.75; 61.9% SM) and completed measures of annual physical attendance, affective associations, physician trust, expectancies, and fear of discrimination. Consistent with prior work, SM participants were less likely to attend annual physicals. Parallel mediation analyses indicated that greater fear of discrimination and fewer positive affective associations significantly mediated the SM–attendance link. Findings suggest that reducing identity-related threat cues and intentionally cultivating positive emotional experiences in clinical encounters may increase routine care uptake among SM adults.

[24] A Pilot Study on the Mechanistic Relationship between Adult Attachment and Central Pain Processing

9:00 AM – 10:15 AM

Attachment-Pain research identifies insecure attachment as a correlate of heightened pain perception and chronic pain development. However, few studies have used laboratory pain measures to examine physiological pain pathways underlying these relationships. None have used measures of central nervous system sensitization (CS), a mechanistic marker and risk factor for chronic pain. In this pilot study, 33 community-sampled healthy volunteers completed quantitative sensory testing and measures of avoidant and anxious adult attachment. Avoidant attachment was associated with greater pain sensitivity as assessed using self-reported and laboratory tests of pain tolerance, but not CS. Results for anxious attachment were mixed, revealing a positive correlation with self-reported CS, but unexpectedly a negative correlation with laboratory-assessed CS. Future research aimed at identifying specific pain pathways influenced by attachment are needed. However, this pilot study takes a first step toward understanding how relational patterns affect neuroplastic pain pathways- essentially linking social-emotional regulation with central pain amplification.

[25] Experimental Inflammation and Status Avoidance: Evidence from a Vaccine Study

9:00 AM – 10:15 AM

Physical health is closely intertwined with social and psychological processes, yet the biological mechanisms connecting them remain unclear. This study tests whether mild immune activation influences social decision-making, focusing on status avoidance—the tendency to withdraw or defer within social hierarchies. Grounded in social psychoneuroimmunology, we examine whether experimentally induced inflammation promotes status-avoidant behavior. In a double-blind, placebo-controlled design, healthy adults receive either an influenza vaccine or a placebo across two lab sessions 24 hours apart. We assess cytokines (IL-1 β , IL-6, IL-8, TNF- α), salivary hormones (testosterone, estradiol), and behavioral indices of status-related decisions (competition, dictator, and approach-avoidance tasks). We hypothesize that participants in the vaccine condition will show higher cytokine activity and increased avoidance of status relative to placebo. Data collection is ongoing with a target sample of 50 participants. This research highlights how transient immune changes can shape social behavior, linking biological and social processes in health.

[26] A Mixed Methods Investigation of Health Goals and Family Dynamics among Latine Adults

9:00 AM – 10:15 AM

Latino/a/e/x (henceforth "Latine") individuals are one of the largest and fastest-growing ethnic minority groups in the U.S., comprising approximately 19% of the U.S. population. Despite comprising such a large segment of the U.S, Latine individuals are notably understudied in psychological science and disproportionately experience health disparities such as higher disease burden and late detection of disease. This pilot study leverages a mixed-method, community-based participatory research approach to identify the types of health goals Latine people have, barriers to pursuing these health goals, and how these health goals are discussed within Latine families. We discuss the development of a community advisory board of key stakeholders such as culturally-informed researchers, Latine-serving organizations, and local community members. Then, we present preliminary themes that resulted from focus groups of Latine community members about health goals. Ultimately, the present research will inform a larger mixed-methods study on this topic and eventually aid in the development of culturally-informed prevention and intervention techniques to promote health equity.

[27] Reappropriating Fat: The impact of self-labeling on weight-related social identity

9:00 AM – 10:15 AM

The word fat generally has a negative connotation and is used to stigmatize individuals with heavier weights, often leading to negative health consequences. Using an exploratory approach, 52 individuals who have used the word fat to describe themselves in a positive way were surveyed on their reasons for doing so. Additionally, 93 individuals who have observed others positively self-label as fat were surveyed on the reasons they think others do so. Results showed that reasons categorized as signalling solidarity with the group ("To enhance the power of overweight and obese people in society") were the least endorsed by self-labelers and observers, while reasons signalling individual self-worth ("to show other people that they (self-labelers) are comfortable with their bodies") were most frequently endorsed. Findings suggest that individuals may not see weight as being a part of their social identity. Our results can help future research better understand the relationship between the potential negative health outcomes associated with weight stigma and the role of reappropriating fat as a label

[28] Authenticity as a Moderater between Social Support, Stress, and Health in College Students

9:00 AM – 10:15 AM

College is a time of change and stress for students. This stress is associated with negative physical and mental health. Social support (SS) and belonging are factors that mitigate the effects of stress; however, this may change if a person cannot be authentic. This effect may be more pronounced in men, as they report lower SS and belongingness. Fraternities (frats) value brotherhood and unity; therefore, the relationship between SS (i.e., brotherhood) and authenticity (i.e., acting against unity) may be more at odds in frats. This study aims to determine the protective value of SS on the wellbeing of frat members and to determine if authenticity moderates this relationship. We surveyed frat members and assessed SS, authenticity, stress, and health and wellbeing. Data collection is expected to conclude by 10/31 with a minimum sample size of 150 individuals. Preliminary analyses (N=74) support that SS mediates the relationship between stress and wellbeing, and that authenticity moderates the relationship between SS and perceived stress. When authenticity is low, SS exacerbates, instead of mitigates perceived stress, and when authenticity is high, SS acts as a protective factor.

[29] "Beta, It's Probably Just Stress, Drink Some Water": Pilot Study of How South Asians Make Sense of Pain

9:00 AM – 10:15 AM

Beliefs, values, and social norms shape how individuals perceive, express, and manage pain. Among South Asian populations specifically, culture plays a central role in shaping how pain is understood, narrated, and managed. However, nearly all work on this population has been conducted in the UK and Canadian diaspora settings or has focused on immigrant populations. Through in-depth interviews and inductive reflexive thematic analysis, we sought to describe the cultural and religious values that inform pain meaning-making in first-generation U.S. South Asian women and examine how these values influence communication and coping strategies. Pilot study of two volunteers (N=2) revealed four major themes that illuminate the cultural meaning-making, suppression, emotional responses, and relational dynamics shaping their pain experiences. Latent in these themes was an interconnected web of moral, relational, and identity-shaping factors that both sustained and constrained these pain journeys. These initial findings contribute to our understanding of chronic pain as a culturally and relationally shaped experience- one in which meaning, silence, emotion, and social validation all intersect.

[30] Susceptibility to Health Misinformation in Older Adults: A Review

9:00 AM – 10:15 AM

The widespread circulation of misinformation, particularly health-related misinformation, has emerged as a significant threat to health outcomes. Misinformation is not only persuasive due to its emotionally appealing content and repeated exposure, but also because it exploits gaps in digital literacy, health literacy, and critical thinking. These vulnerabilities are pronounced among older adults, with some studies suggesting older adults may be more cautious about online content, while others highlight their vulnerability due to lower digital fluency or a tendency to prioritize perceived safety over skepticism. This paper synthesizes existing research to explore how misinformation is understood, who is most vulnerable, and what factors may shape individuals' responses. In doing so, it examines not only the spread and appeal of misinformation but also its effects on health decision-making and behavior. As online platforms become increasingly central to health communication, tailored interventions that address both cognitive and technological barriers will be crucial to ensuring older adults are informed and protected from the harms of misinformation.

[31] Validating the Rapid Mood Screener–Chinese Version (RMS-C) for Differentiating Adolescent Unipolar and Bipolar Depression

9:00 AM – 10:15 AM

Adolescent unipolar and bipolar depression share overlapping symptoms, often leading to diagnostic delays and inappropriate treatment (Malhi et al., 2023; Wozniak et al., 2025). This study evaluated the reliability and diagnostic validity of the Chinese version of the Rapid Mood Screener (RMS-C; McIntyre et al., 2021), a six-item self-report tool designed for rapid bipolar screening. A total of 167 adolescents aged 13–18 years (68 MDD, 99 BD) completed the RMS-C, Mood Disorder Questionnaire (Hirschfeld et al., 2000), and Hypomania Checklist-32 (Angst et al., 2005) at baseline and follow-ups. The RMS-C showed satisfactory test–retest reliability (ICC = 0.71–0.79) and good structural validity (CFI = 0.92). Using a cutoff of 4, the RMS-C achieved AUCs of 0.81 for BD, 0.78 for BD-I, and 0.82 for BD-II, outperforming the MDQ and HCL-32. These findings support the RMS-C as a brief, culturally adapted, and clinically efficient screening instrument for early identification of bipolar depression in adolescents, with implications for improving assessment accuracy in outpatient and school-based mental health settings.

[32] Between Self and Society: How Identity, Socialization, and Discrimination affect Mental Health in Black Adolescents

9:00 AM – 10:15 AM

Black adolescents have unique sociocultural experiences that shape their mental health (e.g., discrimination, identity development, racial socialization). While studies have separately examined how these variables relate to Black adolescents' mental health, few studies have jointly examined these processes. Using cross-sectional data from the NSAL Adolescent Supplement, we examined how three sociocultural variables (racial identity, experiences of racial discrimination, racial socialization) related to two mental health outcomes (depressive symptoms, life satisfaction). Results of two separate multiple regression analyses showed that higher private regard was related to lower depressive symptoms and higher life satisfaction. Comparatively, experiencing more discrimination was related to higher depressive symptoms and lower life satisfaction. Higher public regard was related to higher life satisfaction, and more racial socialization was related to lower life satisfaction. Centrality was not a significant predictor of either outcome variable. These findings highlight how systemic and interpersonal sociocultural factors shape Black adolescents' mental health.

[33] Remotely administered non-deceptive placebos improve self-reported health

9:00 AM – 10:15 AM

Research has shown that non-deceptive placebos (i.e., placebos delivered without deception) may be effective at improving both mental and physical health. However, it remains unclear whether remotely administered (i.e., via an online Zoom call) non-deceptive placebos can affect physical health. In a secondary data analysis of a randomized control trial of volunteers experiencing prolonged COVID-19 distress (N = 64), we examined whether remotely administered non-deceptive placebos can reduce self-reported measures of physical health after 2 weeks: somatic symptoms, fatigue, sleep disturbance, and sleep-related impairments. Compared to a no-treatment control group, non-deceptive placebos reduced somatic symptoms, fatigue, and sleep disturbance, but not sleep-related impairments. These findings suggest that remotely administered non-deceptive placebos may be an effective intervention for improving physical health. Future large scale studies are needed to determine the effectiveness of non-deceptive placebos in improving biobehavioral measures of health.

[34] Seventeen Years Too Long: Accelerating Scientific Application with Community Voices

9:00 AM – 10:15 AM

Research suggests that it takes seventeen years for published findings to reach and become adopted by communities, impeding the uptake of evidence-based, equitable practices. This slow and ineffective translation of science is compounded by a lack of sociocultural representation in research, a paradoxical observation given that social psychology is rooted in the belief that diverse lived experiences are the backdrop to our thoughts and behavior. One strategy for expediting the translation of science is to involve community as partners in the research process, an approach referred to as community-engaged research (CER). This presentation will draw on our experiences conducting an ongoing clinical trial that tests a diabetes-focused intervention and will demonstrate how CER can improve study design and bridge the theory-to-application gap. We will focus on two strategies, Community Engagement Studios and Community Advisory Boards and how they facilitate more effective, equitable and inclusive research. We will also discuss implementation barriers that psychological researchers may face, including training, time and resource constraints, productivity norms and institutional readiness.

[35] System Failure and Stigma: The Human Cost of the ADHD Stimulant Shortage

9:00 AM – 10:15 AM

The ongoing national stimulant shortage represents one of the most urgent and overlooked public health crises in the United States, disrupting the daily lives of millions who depend on ADHD medication to function. Building on our award-nominated cross-sectional study (American Public Health Association, 2025), this longitudinal extension examines how sustained medication scarcity affects mental health, productivity, and well-being across six months. Adults diagnosed with ADHD and prescribed a Schedule II stimulant report on medication access, stress, and functioning, as well as experiences of stigma and discrimination from pharmacies and medical providers. Using demographic and geographic data, the study also explores how socioeconomic and marginalized identities intersect with access barriers. Early findings will offer the first longitudinal evidence on the combined psychological and social toll of this shortage, revealing how systemic failure and stigma compound to threaten the mental health of an entire patient population.

A Transdiagnostic Approach to Assessing and Addressing Internalized Health-Related Stigma

11:20 AM – 11:40 AM

Research on health-related stigma is siloed, despite commonalities in stigma processes and harms across health conditions. The Health Stigma and Discrimination Framework calls for cross-cutting research to measure and address health stigma. This presentation will describe support for a "transdiagnostic" approach with the validation of a new measure of internalized stigma (Study 1) and pilot-testing of an intervention to reduce internalized stigma in adults with different chronic health conditions (Study 2). In Study 1, a new measure of internalized health-related stigma was validated among 300 adults with obesity, diabetes, HIV, skin diseases, chronic pain, and cancers, showing strong psychometrics and validity. In Study 2, a 12-week, group-based psychological intervention was developed and tested among 10 adults with these health conditions. Recruitment and retention goals were met, treatment acceptability ratings were high, and large effect sizes were shown in pre-post changes for measures of internalized stigma, mental health, and quality of life. A larger, ongoing clinical trial will further test the efficacy of this new cross-cutting approach to reducing internalized stigma.

Moderating Role of Feminist Identity in the Relationship Between Perceived Weight-Based Discrimination and Eating Behaviors Among Female U.S. College Students

11:20 AM – 11:40 AM

This study examined whether feminist identity moderates the relationship between perceived weight-based discrimination and eating behaviors among female college students in the United States. Participants were 446 young adults ($M_{age} = 20.38$, $SD = 1.75$; $M_{BMI} = 23.42$, $SD = 4.62$) recruited from a Southern California public university between June 2022 and March 2023. Using self-report measures, we assessed problematic eating behaviors and eating psychopathology separately. Perceived weight discrimination was positively associated with both problematic eating behaviors ($\beta = .46$, $p < .001$) and eating psychopathology ($\beta = .52$, $p < .001$). Importantly, feminist identity significantly attenuated the strength of these associations (problematic eating: $\beta = -.13$, $p = .02$; eating psychopathology: $\beta = -.10$, $p = .049$). Higher feminist identity weakened the strength of the link between weight discrimination and maladaptive eating. The results were robust to BMI and outlier exclusion. Findings suggest feminist identity may serve as a protective factor against the adverse eating-related consequences of weight discrimination.

Daily Objectification Predicts Alcohol Use in Diverse Sexual Assault Survivors

11:20 AM – 11:40 AM

Sexual objectification experiences (e.g., sexualized body gazes) may be a stressor for women who have experienced sexual assault (SA), potentially leading to craving and alcohol use to cope. Further, queer women may be disproportionately targeted and affected by objectification within cisheteropatriarchy, potentially leading to downstream consequences for alcohol craving and consumption. Within a three-week ecological momentary assessment design, participants (N = 82 women SA survivors, 1,804 total observations) reported on daily objectification experiences and current alcohol craving each evening, as well as past-day alcohol consumption each morning. As predicted, there was an indirect effect of experiencing objectification on later alcohol use via greater alcohol craving. There was not an indirect effect of queer identity on average alcohol use frequency via objectification and craving, but queer women experienced greater average craving than heterosexual women. Daily objectification experiences may be a proximal risk factor for craving and drinking among SA survivors with diverse sexual identities, with implications for trauma-informed and inclusive intervention efforts.

Identity, Masculinity, and Stigma: Understanding Barriers to Mental Health Care Among African American Men

11:20 AM – 11:40 AM

African American men are well documented to underutilize health care services. Although the reasons for this pattern are complex, research suggests that both historical mistrust of the medical system and sociocultural expectations of strength, rooted in intersecting racial and masculine identities, play key roles. These same factors may also influence attitudes toward mental health care. In this study, we examined how masculinity and racial identity importance interact to predict anticipated stigma related to mental health service use among 319 African American men. Results revealed a significant interaction: higher masculinity and stronger racial identity importance were associated with greater anticipated stigma. Furthermore, anticipated stigma mediated the relationship between these identity components and medical mistrust, perceived barriers to care, and willingness/comfort in seeking mental health services. These findings highlight some psychological mechanisms underlying African American men's disengagement from mental health care and suggest that identity-based stigma contributes to persistent disparities in help-seeking behavior.

Outstanding Submission Talk: Haley Mehlman

11:45 AM – 12:00 PM

The iterative nature of science introduces ambiguity and uncertainty. Public health experts, scientists, and practitioners face a dilemma: communicating with absolute certainty risks giving the impression of more certainty than may be warranted, but demonstrating intellectual humility (IH) may undermine public perception of experts' credibility. Across three studies (N=842) we find that the public views IH public health scientists as more credible than certain ones, with participants higher in scientific literacy showing a stronger preference for IH. However, the IH scientist's findings were viewed as weaker and less persuasive than results presented by certain scientists, regardless of scientific literacy. In a fourth study (N=108) we find that practitioners (N=56) and researchers (N=52) view IH as more credible but expect the public to prefer the certain scientist and to find their results more persuasive. This project has implications for theory around communicating uncertainty, as well as the links between credibility and persuasion, and can help guide initiatives for more effective health communication.

Lunch

12:00 PM – 1:00 PM

Lunch will be served in the meeting room. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

oGrilled Chicken Pesto Sandwich: Grilled Chicken Breast, Fresh Mozzarella, Oven Dried Tomato, Arugula, Basil Pesto, Ciabatta Roll

oRoast Turkey Caprese Pasta Salad: Rotini Pasta, Cherry Tomatoes, Fresh Mozzarella, Basil Pesto, Mixed Greens, Balsamic Glaze

oRoasted Vegetable Wrap (V): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto, Wrap (limited gluten free wraps available)

oMediterranean Chickpea Salad (VG | GF | DF): Crispy Chickpeas, Cucumbers, Tomatoes, Red Onion, Kalamata Olives, Feta Cheese (on the side), Mixed Greens, Lemon Vinaigrette

LUNCH

Beyond Direct Harm: Contextualizing Off/Online Vicarious Discrimination Experiences on Health

1:00 PM – 1:20 PM

With the rise of social media consumption, exposure to racial unfairness has extended into digital spaces, compounding the ways in which individuals experience race-based stressors. While studies link direct racial discrimination (DRD; i.e., firsthand experiences of racial unfairness) to health, recent findings suggest that vicarious racial discrimination (VRD)—the secondhand experience of racial discrimination—may be encountered more frequently than DRD and thus, also detrimental for health. However, lack of differentiation between DRD and VRD exposures hinders standardization and cross-study comparisons. In two studies, we aimed to identify the frequency and health impact of VRD, compared to DRD. Study 1 (N=147) was a cross-sectional survey that examined frequency patterns of off/online VRD/DRD exposure across various domains and their associations with health. Study 2 (N=144) used an 8-day ecological momentary assessment (EMA) to examine how off/online VRD/DRD exposure impacts same and next-day metrics of health. Findings clarify VRD/DRD similarities and differences, expanding our understanding of how racial discrimination affects health, even among those vicariously exposed

Personal growth and healthy blood glucose across 12 years: A mixed methods investigation

1:00 PM – 1:20 PM

Personal growth refers to continual self-improvement and has been identified as a key aspect of well-being. We used mixed methods to test the hypothesis that higher baseline levels of personal growth would be associated with lower (healthier) levels of blood glucose across 12 years. Data came from the National Child Development Study. Fifty-year-old participants wrote open-ended responses about their future. Two judges rated each response for the extent to which personal growth was evident. Interrater agreement was strong (Finn's $r = .87$), and ratings were averaged across judges. When participants were age 62, their blood glucose (hemoglobin A1c) levels were clinically assessed. Linear regression examined the association between age 50 personal growth and age 62 blood glucose ($N = 3,140$), adjusting for age 50 confounders (sex, education, occupational status, marital status, word count of responses, depressive symptoms, and diabetes diagnoses). Greater personal growth was associated with healthier blood glucose ($b = -.46$, 95% confidence interval = $-.84, -.08$). Midlife adults who show more personal growth have better glucoregulation in the transition to older adulthood.

Intrapersonal strategies alter health-relevant psychological factors about statin side effects

1:00 PM – 1:20 PM

Statins suffer from high rates of side effects which may be a result of the nocebo effect, where psychological factors increase symptoms. One possible intervention to combat this is nocebo education, which teaches about the nocebo effect. We propose that these interventions may be improved by providing patients with clear cognitive and behavioral strategies to combat their own nocebo effects. In a pre-registered study, online participants received either Conventional Nocebo Education (CNE), a novel supplemented Nocebo Education and Avoidance Tactics (NEAT) intervention, which included five strategies to reduce nocebo effects (e.g., Anxiety Reduction), or control material. Participants ($N=436$) then read about a statin medication and completed dependent measures. The NEAT intervention surpassed the standard CNE intervention, increasing feelings of control and information avoidance intentions, while decreasing global side effect expectations, side effect worry, information seeking intentions, and discontinuation intentions. This study finds that providing individuals with actionable cognitive and behavioral strategies to combat side effects strengthens current education interventions.

Promoting Biological and Psychological Health in BIPOC Young Adults: Findings from the Healing in Nature Study

1:00 PM – 1:20 PM

A 3-month NIH-funded longitudinal study (initial $n = 200$) examined the effectiveness of a park prescription program at promoting both the biological and psychological health of Black, Indigenous, and People of Color (BIPOC) young adults from the San Francisco Bay Area. Participants donated biospecimens (namely, saliva for telomeres [biological aging] and hair for cortisol [bodily stress]) as well as completed psychological measures (namely, state mood and restorative experiences in nature) for each of 3 visits to a secluded old-growth redwood forest in the area. Results showed that the hair cortisol concentrations were significantly lowered after the visits (pre to post)—indicating biological stress reduction—and that positive mood and feelings of restoration linearly increased while negative state mood linearly decreased across the 3 visits. These findings suggest that park prescriptions can provide a low-cost method by which to boost both biological and psychological health in this historically (and currently) under-served population for both health and medical science.

Intervention Science: Harnessing Psychology to Address Real-World Social Problems Preconference

8:30 AM – 5:00 PM | Location: E353A, Level 3

The Intervention Science Preconference brings together a community of researchers committed to leveraging rigorous science and psychological theory to help forge solutions to social problems. In 2026, we will showcase cutting-edge intervention research and methods, workshop unique challenges faced by intervention scientists, and facilitate critical discussion of pressing questions for researchers in this field. This preconference provides a platform for scholars to share insights on designing and conducting effective, theory-driven interventions, as well as best practices for collaborating with implementation partners. It also serves as a collaborative forum to connect with scholars committed to rigorous, applied research that addresses real-world challenges.

In partnership with The Agency Fund, we are also thrilled to announce, for the second year, a \$10k research award which supports psychological scientists developing innovative research agendas or interventions that expand human agency (particularly for the most marginalized). The award-winner will be announced at the Intervention Science Preconference event in Chicago.

Exploring Translational Effectiveness of a Strategic Resource Use Intervention by Examining Heterogeneous Engagement

9:20 AM – 9:40 AM

Psychological interventions have improved student performance in randomized trials, but to establish translational effectiveness, scientists need to distribute these interventions at scale and monitor students' actual use. By examining engagement heterogeneity, researchers can examine the psychological ingredients that support student achievement. Undergraduates (N=27,340, across 76 classrooms and 9 semesters) completed a strategic resource use intervention targeting self-regulation by prompting them to select study resources, explain each resource's purpose resource, and plan their use. Completing the purpose explanation was uniquely associated with increased exam scores. To understand the psychological process of students that benefited from the intervention, we examined their responses to the purpose explanation component using thematic analysis and subsequent word count dictionaries. Students' consideration of exam format, strategies targeting learning, and evaluating strengths/weaknesses were associated with increased exam scores, but social processes were not. Understanding heterogeneous engagement may help pinpoint the effective psychological ingredients in an intervention.

[1] We Have to Find Out How Long Our Interventions Last

9:50 AM – 10:00 AM

Much of Social Psychology is involved with interventions, experimental manipulations to change people's thoughts, feelings, underlying reasons for behaviors. In the majority of cases, these interventions are applied, $p < .05$ is attained, and that is the end. What we need to start doing is testing how long our intervention effects last. There is a large difference between an intervention that causes a change in behavior that lasts for a day versus one that changes attitudes for six months or more. Here we show the practical implications of interventions that have looked at the long term effects. We show the practical challenges with conducting longitudinal follow-up. We also discuss the implications of when intervention effects do not show long-term effects, which may be the norm rather than the exception. We end with a call for all researchers engaged in intervention research to test the longevity of their intervention effects.

[2] Leveraging LLM-Powered Generative Agents to Simulate Employee Responses to Organizational Wellbeing Interventions

10:00 AM – 10:10 AM

Organizations implement wellbeing initiatives with limited ability to predict employee responses. We developed an AI simulation using LLM-powered generative agents to forecast how knowledge workers respond to interventions over time. We integrate experience sampling data from 1025 workers (21,000 observations) with workplace monitoring from 500 employees to create personas simulating psychological wellbeing states . This provides a framework for examining heterogeneous treatment effects. Our methodology advances traditional models by leveraging large language models to generate emergent behaviors reflecting psychological complexity. Predictions rely on initial data from one-time surveys—not past psychological state scores — exemplifying real-world deployment where experience sampling is infeasible. Despite this, we achieve $r=0.734$ ($p<0.001$) correlation between predicted and actual work engagement. Predictions of state work engagement deviate less than one point -- with 50% of predictions fall within 10% error, with 26% achieving under 5% error. We are currently examining the fidelity of the simulation platform in predicting responses to workplace wellbeing interventions.

[3] The Pain Gap: Gender Disparities in Pain Treatment

10:10 AM – 10:20 AM

The relief of pain is a basic human right. We investigate whether pain treatment varies by patients' gender. Findings from the psychological literature reveal that laypeople tend to believe that women "exaggerate" their pain. If healthcare providers hold similar stereotypical views, then their pain management decisions may be similarly biased against women. To test our hypothesis, we analyzed over 32 million electronic health records from over 140 healthcare systems worldwide. Our findings reveal a systematic gender disparity: physicians are less likely to prescribe pain-relief medications to a man than to a woman with the same complaint, even when we control for the patient's pain report and demographic variables. Women's pain scores are less likely to be recorded by triage nurses, and they wait longer at the ER. Women patients' pain is also judged as less intense than men's by healthcare providers in response to a clinical scenario. The findings bear immediate implications for the healthcare system, as well as societal implications for gender inequality. We discuss how nudges and behavioral interventions can be used to reduce physicians' bias.

[4] Psychosocial intervention model: Emotional Support for Migrant Women

10:20 AM – 10:30 AM

Since 2023, the Universidad Iberoamericana Ciudad de México, in collaboration with Rincon Family Services and the Consulate General of Mexico in Chicago, has implemented the psychosocial intervention model "Emotional Support for Migrant Women", aimed at Mexican and Latin American women living in Chicago. The model is characterized by being culturally competent and replicable, allowing it to be adapted to different groups in migratory contexts. In addition, it strengthens processes of education, promotes a sense of community, accompaniment, and empowerment, especially in situations of vulnerability. The objective of this work was to evaluate the results of the intervention, developed over six consecutive workshops. Sixty psychology students were trained, under academic supervision, in psychosocial intervention with an ethical and intercultural approach oriented toward community well-being. This program directly benefited 200 migrant women. The results revealed a process of emotional strengthening and identity building among the participants, who reframed their migration experiences in terms of dignity, identity, autonomy, emotional control, and a sense of cultural belonging

[1] Developing Multipronged Interventions: Shifting Perceptions of Harm, Norms, and Efficacy for Climate Action

1:20 PM – 1:30 PM

Many social problems require interventions that target multiple psychological mechanisms. Climate actions, for example, are often challenging because they exemplify a triad of psychological barriers: (1) they have invisible or indirect harms that weaken moral urgency, (2) norm perceptions that signal social acceptability of unsustainable behavior, and (3) low perceived efficacy of sustainable alternatives. Past research has largely examined interventions to address these factors independently. The present work asks: can interventions overcome these barriers simultaneously? We test this in a policy-relevant context—climate warning labels on fuel pumps. Across three studies (two exploratory, one pre-registered replication, total N = 8,900), U.S. drivers were randomly assigned to view intervention labels with various combinations of harm, norm, and efficacy messages. Results suggest that climate warning labels, including some used today in cities, can increase both sustainable norm perceptions and behavioral intentions, but it may be harder for such labels to increase efficacy beliefs or attribute harm to unsustainable behavior in the absence of broader supportive structural changes.

[2] Drama-Based Upstander Intervention: An Elementary-School Based Field Experiment

1:30 PM – 1:40 PM

Biased-based bullying is related compromised health (Russell, et al., 2012,) increased absenteeism, and significant costs to public education (Baams, Talmage, & Russell, 2017). School-based bullying prevention programs increase bystander intervention but existing programs are most effective for high school students (Polanin, Espelage, & Pigott, 2012). We hypothesized that dramatic role play would help younger children practice 'upstander' behaviors and normalize these new behaviors. In a field experiment, we delivered 4 lessons from the Stand Up Act Out drama-based curriculum which was designed to develop children's upstander skills via role-play. The sample included 3rd and 4th grade students (n = 353, 48.9% girls) from six elementary schools in a California public school district. Experimental condition (randomized by school) predicted reported bullying incidents ('touched in a mean way', called names, left out, had things taken) such that participants reported less bullying at schools that had received the intervention. This effect held when controlling for grade and gender. Possible mechanisms (social norms, self-efficacy) are also examined.

[3] Low-Income Students' Transition to College: Heterogeneous Treatment Effects of Summer Bridging Programs

1:40 PM – 1:50 PM

First-generation, low-income (FLI) students report higher levels of stress and difficulty navigating campus resources. Summer bridging programs (SBP) aim to ease the transition to college, yet most research assumes uniform program effects across FLI students despite variation in their backgrounds. In a sample of FLI students (N = 227), we examine 1) the impact of a SBP on trajectories of capital (e.g., forming professional relationships) and well-being (e.g., anxiety) compared to non-participants and 2) whether effects vary by student background. SBP participation significantly improved both capital and well-being. Critically, we find that positive effects on capital and well-being were most pronounced for students from economically disadvantaged high schools. These findings reveal the importance of accounting for heterogeneity within FLI populations and highlight opportunities to tailor SBPs to students' pre-college contexts.

[4] The Rewards of Speaking Up: When Confronting Performative Policies Elevates Employee Standing

1:50 PM – 2:00 PM

Individuals perceiving gaps between empty diversity statements and reality face a dilemma: speak up and risk retaliation, or stay silent and compromise authenticity. Surprisingly, confronting performative policies enhances—rather than damages—one's standing. In a 2×2 experiment ($N \approx 600$), we examined the perceptions of challenging versus showing gratitude to company's performative diversity initiatives. Policy × Tone interactions emerged across eleven outcomes. Confronting performative policies boosted perceptions of authenticity, warmth, and competence while improving workplace outcomes from advocacy to social bonds. With genuine policies, gratitude outperformed confrontation. Authenticity mediates behavioral measures, revealing that truth-telling enhances support. Ongoing studies explore whether confrontation benefits extend to climate commitments (Study 2), how managers respond to employee dissent (Study 3), and actual behavioral consequences, including resource allocation and collaboration (Study 4). By demonstrating that truth-telling in organizations can be rewarded, our research illuminates pathways for dismantling the silence that perpetuates performative practices.

[161] Long-Term Translational Effectiveness of a Strategic Resource Use Intervention in Real-World Classrooms

2:45 PM – 3:20 PM

Social-psychological interventions have improved student learning and performance in randomized, controlled trials (RCTs). However, continuous evaluations of such interventions' use in the real world are essential for advancing real-world impact, informing policy, and refining both theory and future interventions. We report a large-scale translational effectiveness evaluation of a Strategic Resource Use intervention, which targets students' psychology of strategizing their resources for learning before exams. Tracking 53,299 college students' engagement with the intervention across 76 classrooms and nine semesters, we found that (a) using the intervention is associated with a 2.67 percentage point increase in exam scores ($d = 0.19$), (b) the intervention was 63% more effective during Covid-impacted semesters ($d = 0.26$), and (c) the intervention offers increased benefits to lower-performing students—reducing gender, first-generation, and racial achievement gaps. This work shows how translational effectiveness studies can complement RCTs, and are necessary for advancing theory and impact.

[162] A Spanish-language digital media literacy intervention improves misinformation discernment among American Latinos

2:45 PM – 3:20 PM

US Latinos are targeted with Spanish misinformation, but few resources exist to support them in discerning true from false information. We developed MediaWise en Español, a digital media literacy intervention designed with and for Spanish-speaking American Latinos, with MediaWise, Telemundo, and Univision. We conducted a longitudinal online RCT with Spanish-language-dominant American Latinos ($n=240$, 51% female, average age=34) testing its effects on digital media literacy knowledge and ability to discern claims online. Crucially, this study addresses a critical gap in misinformation studies by highlighting the importance of addressing both individual barriers (low digital literacy) and structural barriers (few multilingual resources). The intervention improved knowledge of skills like lateral reading in both the skills-only ($\beta=.58$, $p<.001$) and skills-plus-resources conditions ($\beta=.65$, $p<.001$) compared to control. It also improved discernment accuracy, when combined with native-language fact-checks ($\beta=.15$, $p<.001$). Our findings demonstrate how multilingual misinformation can be combated through both educational interventions and native-language fact-checking resources.

[163] Eliciting advice instead of feedback improves developmental input

2:45 PM – 3:20 PM

Most organizations encourage employees to provide feedback to one another to support learning, personal growth, and career advancement. However, employee feedback often fails to improve performance because it lacks concrete, specific guidance. In this paper, we demonstrate that encouraging input providers to think about the future leads them to produce more concrete developmental input. Across two pre-registered field experiments ($N = 89,552$ comments) and three lab studies ($N = 2,828$), people provide more concrete and actionable developmental input when they are prompted to provide future-looking "advice" rather than "feedback" (or compared to when they are simply reminded to be more concrete). We use a novel domain-specific machine learning algorithm to assess concreteness; and independent raters also found advice to be more useful and helpful than feedback. And in two lay theory studies yet we find that people and organisations consistently solicit feedback more often than than advice. Our data suggest that individuals and organizations have the potential to promote higher quality developmental input by attending to the temporal orientation that their input systems encourage.

[164] "Bridge or Sink": Reducing Partisan Animosity with a Cooperative Game Show

2:45 PM – 3:20 PM

Identifying scalable and engaging means to reduce partisan animosity is a pressing policy concern. Here, we test whether entertainment media can reduce polarization through passive exposure to cooperation between ideological opponents. We developed and tested the effectiveness of Bridge or Sink, a game show designed to model cooperative interactions across party lines. Contestants from opposing political parties collaborated on trivia challenges to build a bridge across a pool, earning money for correct answers and taking playful plunges for mistakes. In a pre-registered experiment ($N=1,307$), participants who viewed Bridge or Sink rated outparty members significantly more positively in morality, intelligence, likability, objectivity, and trustworthiness compared to viewers of non-political or competitive shows. These effects extended to feeling thermometer ratings and held after controlling for in-group shifts. Our findings show that entertainment-based interventions can meaningfully reduce partisan animosity through passive, engaging, and highly scalable exposure to positive intergroup interaction.

[166] Medical Dramas as Scalable Interventions for Climate Adaptation: Evidence from a RCT of Entertainment-Based Heat Risk Communication

2:45 PM – 3:20 PM

Extreme heat kills 489,000 people annually worldwide and is the leading climate-related cause of death in the U.S. As climate change accelerates, adaptation strategies are urgently needed, yet traditional public health messaging struggles to reach broad audiences. Can medical dramas, which command large diverse viewerships, deliver life-saving adaptation strategies at scale? In a preregistered longitudinal RCT (N=3048), participants either viewed (i) a Grey's Anatomy episode depicting extreme heat overwhelming a hospital, (ii) heatwave episode paired with climate-focused social media content, or (iii) a control episode. Viewing the episode significantly increased knowledge of heat-related health risks, concern about heat-related threats to health infrastructure, and support for heat-adaptive policies, with effects persisting for 2-3 weeks. Adding social media content boosted these effects, especially climate concern. Critically, entertainment value remained intact, showing that medical dramas can effectively serve as scalable interventions that personalize climate risks, normalize adaptation behaviors, shift policy support, and potentially save lives.

[167] Competitive Organizational Climates Increase Material and Symbolic Zero-Sum Beliefs

2:45 PM – 3:20 PM

Across five studies, we examine the impact of competitive organizational climates on organization members' perception that one employee's gain equates to another's loss (i.e., zero sum beliefs; ZSBs) for organizational resources. In Study 1, a competitive (versus collaborative or neutral) organizational climate increased ZSBs for both material resources that are inherently limited (e.g., money) and symbolic resources that are not necessarily limited (e.g., respect). Study 2 extended these findings to a real-world setting: MBA students who perceived a more competitive climate at their business school reported higher ZSBs for material and symbolic resources and engaged in less positive behavior toward the organization. Study 3 manipulated ZSBs to test whether they cause negative organizational behavior. Those who were exposed to high ZSBs were more likely to complete an organizational task for a rival company. Finally, Studies 4 and 5 provide support for two theoretically motivated interventions that reduced ZSBs in competitive organizational climates: signaling an abundance of material resources and signaling an abundance of symbolic resources, respectively.

[169] Stability and Universality in a UBI-like Scheme: Evidence from an Online Budgeting Simulation

2:45 PM – 3:20 PM

Amid renewed interest in Universal Basic Income (UBI), we tested how two design features of a UBI-like Additional Income (AI) scheme (stability: stable vs unstable; universality: universal vs means-tested) shape budgeting and psychosocial outcomes in low-income UK adults. A total of 550 participants completed an online budgeting task across four simulated months in which AI was paid regularly, inconsistently, or not at all. Stable AI prompted greater allocation of resources to future-oriented needs and reduced present-focused spending. Conversely, participants receiving unstable AI showed spending patterns similar to those of a no-AI control group whenever disbursements were withheld. Universality, by contrast, produced fewer notable effects in this short-term setting, suggesting that predictability can outweigh the distinction between universal and means-tested support when shifting participants' budget priorities. Psychosocial measures (subjective well-being, response efficacy, socio-economic shame) did not differ by condition. Exploratory analyses linked perceiving AI as sustainable with lower socio-economic shame, underscoring the importance of predictable support.

[170] Behavioral Systems Analysis: A Framework for Change Intervention

2:45 PM – 3:20 PM

Behavioral Systems Analysis (BSA) is a structured approach developed by Evidn to uncover the psychological, social, and organizational dynamics that shape climate-relevant behaviors. This session introduces BSA as a diagnostic and design tool for identifying high-leverage intervention points in complex systems. Drawing from work across sectors, we'll explore how BSA integrates stakeholder engagement, behavioral mapping, and systems thinking to guide evidence-based strategies. Attendees will learn how BSA reveals hidden friction, aligns interventions with local context, and builds trust through co-design. The BSA helps shift individuals and communities from passive awareness to active participation—making it a powerful tool for tackling the "last mile" of change.

[171] Centering Social Fit, Self-Concept Fit, Goal Fit, and Resource Fit as Core Elements of Students' Experiences of Belonging at School

2:45 PM – 3:20 PM

Promoting belonging in school has become a focal concern. Such efforts require a comprehensive, accurate understanding of what belonging means. In this theoretical work, I argue that social psychological research on students' experiences of belonging has overwhelmingly focused on their sense of social connection to others at school (social fit), while overlooking other factors essential to these experiences. Using research from beyond social psychology, I show that when students describe their experiences of belonging in school, their descriptions also emphasize the extent to which they experience support for their valued identities (self-concept fit), goals (goal fit), and basic financial, nutritional, and safety needs (resource fit). Furthermore, I demonstrate that the reason that these four forms of fit matter for belonging is because they enable students' social connections, identities, goals, and needs to feel natural, inconspicuous, and "right" when they are at school, and it is those feelings of "fluency" that ultimately produce a holistic experience that they belong. Implications for measuring belonging and for belonging-supportive interventions/policies are discussed.

[172] We are Not the Same: Asymmetry in Intergroup Meta-Perceptions

2:45 PM – 3:20 PM

Meta-perceptions - how we think others perceive us - profoundly shape intergroup dynamics. Negative outgroup meta-perceptions not only result from conflict but also perpetuate it. Therefore, meta-perceptions play a major role in interventions aimed at conflict reduction. Waytz et al. (2014) found that adversaries attributed their own group's aggressions to ingroup love (empathy for ingroup members) more than to outgroup hate (hostility towards the outgroup). However, these same individuals attributed outgroup's aggressions to outgroup hate more than ingroup love. This asymmetry was robust across contexts (i.e., Israeli Jews vs. Palestinians, U.S. Republicans vs. Democrats). We propose that escalating intergroup polarization may influence this bias, as outgroup animosity and perceived threat grow. Through a registered report framework, we aim to replicate and extend the asymmetry identified by Waytz et al. in the original populations, now embedded in more extremely polarized environments. We will also address key limitations of the original study. Investigating how polarization shapes meta-perception asymmetry is an important step in understanding how to reduce intergroup conflict.

[173] How AI Reframes Distress Across Communities: A Consistent and Context-Sensitive Language Shift

2:45 PM – 3:20 PM

Large Language Models (LLMs) are increasingly used in psychology to reshape emotions, anxiety, and self-expression. Prior research highlights AI's role in cognitive reappraisal (Gross, 1998) and self-presentation (Goffman, 1959), yet lacks psycholinguistic depth, often relying on self-report or single-domain studies. We analyzed 9,307 Reddit posts across 11 communities, each reframed by ChatGPT-4 ("You are a life coach; help me reframe."). Using LIWC and paired t-tests, we examined shifts in tone, structure, and authenticity, supported by Bayes Factors (BF10). AI reframes showed strong increases in tone (mean_diff = +44.15, $p < .001$, BF10 = 252.97; subreddit: antiwork) and complex vocabulary (BigWords: +13.47, $p < .001$, BF10 = 866.18; subreddit: OffMyChest). Authenticity rose modestly overall ($p < .01$), but varied by context. Notable shifts include reduced negation in depression (-2.16, $p < .001$), increased power terms in BreakUps (+0.623, $p < .001$), and lower clout in survivinginfidelity (-4.19, $p < .001$). These findings suggest AI reframes support reappraisal while reshaping linguistic identity.

[174] The Punitive Default

2:45 PM – 3:20 PM

Despite inconsistent success rates and negative outcomes, punishment remains a popular approach to solving social problems in America. One could argue the nation's largest institutions, not only the carceral system, but our educational and occupational institutions as well, are problematically and disparately punitive. Tough-on-crime responses and zero-tolerance policies have even resurged in the political sphere in recent months, as pushes for alternatives to punishment have receded. Do Americans have an unwarranted appetite for punitiveness? Across three studies, from three different contextual domains, we find participants born and raised in the U.S. err towards suggesting a punitive response to a wide range of misbehaviors which vary in their severity. Data also show little differentiation in punitive responses between American subgroups, suggesting the presence of a broader cultural phenomenon. One we term, the Punitive Default. What triggers it? What drives it? What might reduce its impact? A range of theoretically-supported interventions will be considered.

[175] A Cultural Explanation for Who Stays in Prison: Incarcerated Individuals' Causal Attributions and Parole Decisions

2:45 PM – 3:20 PM

Despite the apparent racial disparity in parole, the underlying cultural explanation has been understudied. We propose that the U.S. justice system, which endorses independent White American (WA) culture, expects offenders to give dispositional accounts about their crimes. This is mirrored in the Office of Appellate Defender's advice, encouraging offenders to use dispositional accounts. Yet, people from interdependent cultures (East Asian, Black, Hispanic Americans; EAA, BA, HA) would be used to giving situational accounts. In Studies 1-2 (total N=595), WA [vs. EAA, BA, HA] mock offenders were more likely to give dispositional accounts to request parole. In Study 3 (N=765), WA mock commissioners rated ostensible offenders who gave dispositional [vs. situational] accounts as less likely to reoffend. In Study 4, Natural Language Processing on 179 New York State parole hearing transcripts revealed that offenders who received [vs. denied] parole gave more dispositional, and less situational, accounts. These findings suggest that beyond previously studied racial biases, cultural mismatch between the U.S. justice system and cultural minorities may also contribute to racial disparity.

[176] Mapping Brain Drain to Inform Policy: A Data-Driven Framework for Understanding Scientific Migration

2:45 PM – 3:20 PM

The large-scale migration of scientists, or brain drain, is an urgent social problem with far-reaching effects on innovation, equity, and human capital. Wars, repressions, and funding crises continue to disrupt national scientific systems, from Germany in the 1930s to Ukraine today. In response, countries and organizations maintain ongoing initiatives to attract or retain researchers in times of crisis: e.g., the Choose Europe initiative and Scholars at Risk programs. Yet these efforts often precede a systematic understanding of who leaves vs. stays, and how science reorganizes after disruption. My project develops a large-scale, data-driven framework to analyze crisis-driven scientific migration with OpenAlex author-affiliation histories spanning 100 million scholars. Using Nazi Germany and the Ukraine war as benchmark events, I quantify exit and attrition rates of scientists after crisis and evaluate the consequences of leaving by comparing post-event productivity and collaboration outcomes of leavers vs. stayers. These cases establish a foundation for testing additional crises and generating evidence to inform future interventions that sustain global science under threat.

[177] Academic performance ranking's effect on student's psychological well-being and potential mitigation intervention.

2:45 PM – 3:20 PM

Class and grade level-wide ranking of students' academic performance is common practice throughout China. However, little is known about the effects of such ranking systems on students' psychological well-being. We use a scenario study to investigate the causal effects of academic performance ranking on students' sense of belonging, self-efficacy, growth mindset, and academic motivation at a Chinese public school. Sixth grade students (N = 324) at a Chinese public school are randomly assigned to read and respond to control condition with no ranking, low/high ranking, and low/high ranking + explanation. Our primary hypothesis is that both low and high academic ranking, compared to no ranking (control), induces stress and encourages a fixed mindset about self and intelligence, especially for low-ranking students. Moreover, we test whether a statement describing the purpose and reasoning for the ranking (low/high ranking + explanation) mitigates the negative impacts of ranking on students' sense of belonging, self-efficacy, and academic motivation. Potential implications on Chinese education policy, educator training, student mental health and flourishing are further discussed.

[178] Emergency Management Communications With the Deaf and Hard of Hearing

2:45 PM – 3:20 PM

Many Deaf and hard of hearing individuals face communication barriers during emergencies, putting them at additional risk. We aimed to reduce this risk through education, creating an emergency preparedness lecture for the DHH community. Our educational approach was informed by gathering data from Emergency Management professionals reflecting upon experiences with the deaf and hard of hearing and approaches that could be used to overcome issues found when working with individuals from this community. Our presentation included instructions on how to prepare a first aid kit, based on existing emergency preparedness literature and guidelines for broader communities, and tailored for the unique needs of DHH individuals through the inclusion communication tools such as live captioning technology and prewritten cards. Effectiveness of the educational approach was evaluated through feedback solicited from DHH attendees. We hope to use our results to inform intervention planning through disability-specific and DHH cultural lenses.

[179] Empowering Volunteer Teachers Through Culturally Wise Interventions

2:45 PM – 3:20 PM

Volunteer teachers are a backbone of rural education in China, yet high dropout rates remain a major barrier to sustained impact. While structural solutions abound, few field studies explore psychological interventions that resonate with local cultural values. We asked: can a culturally wise design reduce dropout by restoring agency in a collectivist context? In a 2×2 field experiment (N = 106; 78% women), we tested two supports with teachers at the Adream Foundation: (1) a mid-semester Belonging Intervention (Walton & Cohen, 2011)—a guided reflection on others' adversity framed as transitional, and on one's motivation to serve both self and community; and (2) Curriculum Scaffolding via structured lesson guides. Only the Belonging condition showed marginal dropout reduction (B = 0.56, p = .077). Emotional exhaustion predicted higher dropout (p = .07); growth mindset predicted lower (p = .054). Findings suggest that belonging-based interventions may be most effective when they resonate with cultural narratives and help teachers reconnect with personal meaning in emotionally depleted settings.

[180] Illusion of Control Revisited: Scarcity, Construal, and Structural Disadvantage

2:45 PM – 3:20 PM

We re-examine the illusion of control through the lens of Construal Level Theory. We distinguish between control over high-level aspects (e.g., goals, outcomes) and low-level aspects (e.g., immediate details). Scarcity contracts regulatory scope, drawing attention to short-term logistics and overweighting control over low-level aspects. This shift provides fleeting agency but obscures structural barriers that shape long-term trajectories. Across three sets of studies, we test (1) whether people prefer and feel greater agency from high-level control, (2) whether scarcity systematically redirects attention to low-level control, and (3) whether simple interventions can restore balance by expanding scope. Findings suggest that disadvantage does not reduce agency outright but reallocates it toward inconsequential details, sustaining inequality. By showing how scarcity reshapes perceived control, this project reframes the illusion of control as a cognitive mechanism through which structural exploitation perpetuates itself, and points to interventions that expand real opportunities for agency.

[181] More Than Pipes: The Role of Trust in Developing Community Ownership in Rural Water Supply

2:45 PM – 3:20 PM

The present research aims to understand the effectiveness of trust-based interventions employed through the Indian government's national policy - Jal Jeevan Mission - which aims to provide tap water to every rural household by promoting community ownership. Past research has shown that trust-based interventions lead to more self-reliance and empowerment of beneficiaries, yet research on their relationship with ownership remains scarce. To bridge this gap, we conducted in-depth qualitative case studies with focus groups and interviews consisting of 46 residents and 29 rural government members aged 15-45 years to examine whether trust plays a role in the development of social capital and enhances ownership of the village water supply system. Thematic content analysis of the collected data revealed that the high intrinsic motivation of individuals in key positions determines the true degree of community ownership and thus, the overall effectiveness of the policy. This research contributes to a deeper understanding of how theoretically grounded, trust-based policies pan out in real-world contexts and offers practical insights for creating sustainable policy interventions in the future.

[182] Shifting Cultural Attitudes on Sexual Objectification: Testing an Integrative System Justification Lens

2:45 PM – 3:20 PM

Sexual objectification of women is a ubiquitous sexist practice. Integrating theories on objectification and system justification, we tested whether harnessing the system justification motive would reduce support for sexual objectification. In the first correlational study (N = 404 mixed-gender), we found moderate to strong associations among support for sexual objectification, gender-related ideologies, and gender system justification. In the second experimental study (N = 376 men), men were randomly assigned to read about sexual objectification as a threat to the gender status quo that needs to be eradicated or a control condition. Men reported less support for sexual objectification when sexual objectification was framed as the threat, viewing sexual objectification as more harmful and less normative and stable compared to the control condition, which was moderated by gender essentialism. These findings provide preliminary evidence for sexual objectification as an integral part of the gender status quo and gendered patterns of support for sexual objectification. Harnessing system justification motives may provide a way to legitimize social change around this sexist practice.

[183] A Sea of Possibilities with Norm Networks: Contrasting Novel Intervention Approaches in the Context of Fish Consumption

2:45 PM – 3:20 PM

Social norm interventions have largely been developed with a single norm target. However, norm perceptions exist in complex networks, with many norms all influencing behavior. So, there is potential for novel intervention approaches that affect the same behavior. Using a 'Norm Network Approach' we develop and test interventions that are informed by norm networks in a domain influenced by many competing norms: fish consumption. In Study 1 (N=919) we establish a norm network via an online survey in the domain of fish consumption and use this to develop three types of norm interventions. Study 2 tested these interventions in an online survey (N=1,452) and found all interventions significantly reduced fish consumption intentions compared to a control. Finally, to assess effects on behavior in Study 3, a quasi-field experiment (N=2,144) asked participants to make a real choice between a vegetarian and fish dish. Compared to a control condition, the best performing norm intervention from Study 2 significantly shifted choices towards a vegetarian option. These studies show that norm networks can be used to develop a variety of interventions that shift the same behavior.

[184] Preconceived Notions of Controllability Drive Willingness to Help with Elder Financial Fraud: An Investigation of the Application of The Attribution-Emotion-Action Model of Attribution Theory

2:45 PM – 3:20 PM

Elder financial exploitation (FE) is a growing problem in the United States, costing up to an estimated \$36.5 billion annually. There are limited interventions beyond encouraging victimized older adults to seek help. One method to do this is through the support of loved ones, and this method is especially important to investigate since many financial decisions for older adults are made in conjunction with loved ones. Guided by the attribution-emotion-action model of attribution theory, we assessed whether perceptions of controllability of FE (POCFE) were associated with willingness to provide support in two studies. In Study 1, we assessed whether anger, sympathy, and social support outcome expectations (SSOE) mediated the relationship between POCFE and willingness to support (i.e., willingness to provide social support (WPSS) and willingness to provide general support (WPGS)). In Study 2, we also assessed willingness to provide financial support (WPFS) and factors that may influence preconceived POCFE like ageism and financial literacy. Preliminary analyses generally replicate Study 1. Overall, results suggest that interventions may be difficult due to preconceived POCFE.

[185] Closing the Gap: Strengthening Fidelity Measures to Improve Airmen Suicide Prevention Program Outcomes

2:45 PM – 3:20 PM

Wingman Guardian Connect program (WGC) is a network suicide prevention program developed in partnership with the US Air Force (USAF). Research has shown that this program reduces suicide risk scores, depression symptoms, and work problems (Wyman et al., 2020). To support the USAF's worldwide scale-up of the program, we conducted an implementation-effectiveness study to ensure the program's proven benefits are preserved long-term. Across fields, over 60% of implementation efforts of evidence-based programs fail (Wong et al., 2022), referred to as "voltage drop." To improve real-world application, it is crucial to develop fidelity measures to inform program scale-up. Using training audios from the USAF facilitators from early adopter bases, we implemented a revised fidelity measure for preliminary assessment. This measure included items from prior literature and new items modified to account for facilitator competency, a second component of fidelity that may be as important, or even more important, in program impact. Our study reports the ongoing process of refining the WGC fidelity checklist (Wyman et al., 2020).

[186] Toward Interpretable Depression Detection from Social Media: A Psychologically-Grounded Modeling Approach

2:45 PM – 3:20 PM

Depression affects over 300 million people globally (WHO, 2017), yet detection remains delayed or inaccessible for many. Social media offers a timely and scalable lens into psychological states, but most ML models remain black-box, limiting their use for early intervention. We introduce a cognitively-aligned, interpretable model trained on the SWDD dataset (Cai et al., 2023) and tested on 425 users from RedNote (Xiaohongshu) with PHQ-9 scores (Kroenke et al., 2001). The model captures three theoretically motivated features: (1) semantic embedding (sentence-level meaning), (2) semantic coherence (intra-post consistency), and (3) similarity to cognitive distortion texts (Beck, 1976; Burns, 1980). These signals are fused via multi-layer attention to predict PHQ-9–based binary labels. On training data, the model achieved $F1 = .63$ ($r \approx .58$) for depressed users; on RedNote, $F1$ dropped to $.35$ ($r \approx .34$), reflecting domain shift. Despite this, the model reveals markers of distorted or disorganized thinking, offering a theory-informed foundation for scalable, interpretable mental health screening.

[187] Diversity Is Better in the Abstract (Framing)

2:45 PM – 3:20 PM

Efforts to promote diversity often face resistance. This study tested whether framing diversity in abstract terms ("religious diversity") versus concrete terms ("having classmates from many different religious backgrounds") alters perceived benefits. Undergraduate participants ($N = 359$) were randomly assigned to one framing variation and rated the impact of diversity across eight domains (race, religion, gender, SES, sexuality, disability, nationality, politics). Abstract framing led to significantly higher perceived benefits than concrete framing across most domains ($ps < .05$), revealing a psychological barrier that may undermine initiative uptake. Support also varied by domain: sexuality and disability were viewed most positively, while religion and nationality were least endorsed. A promising future direction is to test whether intervention strategies that prompt reflection on why diversity is valued in the abstract can increase support for its concrete implementation.

[188] Helping Others Thrive: How Redemption Narratives Help Women Workers

2:45 PM – 3:20 PM

Workplace sexism affects 42% of women in the U.S., leading many to harmful coping behaviors with negative health impacts, like binge drinking or smoking. Our study explores the use of redemption narratives as a reappraisal strategy to mitigate these impacts. Redemption narratives (RN) are stories about overcoming adversity and growing from negative life experiences and hardships. We examined their effects on full-time women workers' affect, agency, and psychological safety compared to self-immersion coping tools when recalling sexism experiences. Results showed employing RNs resulted in significant increases in affect compared to baseline mood and compared to control, which only employed self-immersion. There were no significant differences between conditions in agency or psychological safety. Notably, participants in RN condition with stronger gender identification reported significantly higher affect scores post-treatment; event resolution was associated with higher agency; frequent sexism experiences were linked to lower agency. These results suggest RNs can improve emotional responses, but further research on coping mechanisms is needed to address agency, psychological safety.

[189] The Stereotype Content Model and Cybervetting: Effects of Anti-Sexism Content on Hireability Perceptions by Gender and Race

2:45 PM – 3:20 PM

Cybervetting—evaluating applicants based on their online presence—exacerbates gender and racial hiring bias, yet how identity-based advocacy shapes such bias is unclear. Using an intersectional lens and the Stereotype Content Model, we test how and through what mechanisms anti-sexism posts, gender, and race shape hiring evaluations. Prolific participants with hiring experience will assess a resume and cover letter paired with X/Twitter posts in one of six conditions: White men (anti-sexism vs. neutral) and White/Asian women (anti-sexism vs. neutral). Post valence and engagement cues are held constant. We predict (1) men posting anti-sexism content will be rated more hireable than men posting neutral content, mediated by higher perceived warmth and competence; (2) women posting anti-sexism content will be rated less hireable than women posting neutral content, mediated by lower perceived warmth; and (3) the hireability penalty will be greater for Asian (vs. White) women, mediated by a larger drop in perceived warmth. By identifying trait inferences as mediators from cybervetting to hiring bias, it offers leverage points for structured evaluations and stereotype-interruption prompts.

[190] Interventions as Culture Change

2:45 PM – 3:20 PM

Wise interventions are often conceptualized as tools for changing individuals' beliefs or behaviors. We contend that they can also be understood as intentional acts of culture change. Drawing on the culture cycle framework (Markus & Kitayama, 2010), we propose that interventions both reveal and reshape cultural meaning systems. We discuss three implications of this perspective. First, when an intervention is effective, it indicates that the idea it promotes is culturally available but not yet fully embraced or enacted. Second, a single intervention idea can be implemented at different levels of the culture cycle; though the entry point differs, the ultimate effects may be similar. Third, when interventions take hold, their effects often diffuse beyond individuals, altering relationships and institutional practices. Viewing interventions as efforts of culture change provides a broader theoretical lens for understanding when interventions are likely to succeed and how their effects may unfold across individuals, interactions, and institutions.

[191] Prosocial Utility Value Interventions in Chemistry: Differential Effects Across In-Person and Remote Contexts

2:45 PM – 3:20 PM

Utility Value (UV) interventions encourage students to connect course content to their personal values, enhancing motivation and achievement (Harackiewicz et al., 2023). A prosocial version, prompting reflection on how learning benefits others, can further strengthen effects, especially among URM students (Asher et al., 2024). We compared a standard UV and a Prosocial Plus version in two cohorts of an introductory chemistry course at San Diego State University. The courses occurred 1) in Spring 2020, when COVID forced a midterm shift to remote learning, and 2) in Fall 2020, when instruction was fully online. Students were randomly assigned to Control, Standard UV, or Prosocial Plus. In Spring 2020 ($n = 623$, in person), URM students scored higher on post-intervention exams in the Prosocial Plus condition ($\beta = 0.078$, $p = .036$). In Fall 2020 ($n = 386$, remote), there was a main effect of condition, with higher scores in Prosocial Plus than in Standard and Control ($\beta = 0.128$, $p = .021$). Results suggest prosocial framing boosts URM performance, mainly in-person. We are currently testing longer-term effects on STEM persistence.

[192] Can Utility-Value Interventions Promote Performance and Persistence in STEM in a Racially and Socioeconomically Diverse Context?

2:45 PM – 3:20 PM

Although utility value interventions (UVI) have shown promises to promoting performance and persistence in STEM, the majority of UVI studies have been conducted at predominantly white institutions. As a result, less is known about whether their effects can translate to contexts where underrepresented minority (URM) and first-generation (FG) students represent a substantial portion of the population. We implemented UVIs in two gateway chemistry courses in a racially and socioeconomically diverse Southwestern U.S. university. The sample consisted of 1038 students, of whom 33% were first-generation and 51% came from a historically marginalized groups (i.e., Latino, Black, and Southeast Asian). We are currently testing the effects of the UVIs on students' grades in the course and STEM persistence one year and two and half years after the intervention. We will also examine how the effects of the intervention vary based on students' URM and FG identities. We expect findings from the study to provide novel knowledge in terms of the boundary conditions of UVI when applied in educational settings with diverse student populations.

[193] Reducing Implicit, Explicit, and Behavioral Racial Bias Sustainably and Ecologically: The Learn Your Attitude Intervention

2:45 PM – 3:20 PM

Learn Your Attitude is an interactive intervention that integrates operant learning principles with a modified prejudice habit-breaking protocol to promote durable reductions in implicit, explicit, and behavioral racial bias. In a 3-wave longitudinal experiment (T1 vs. T2 vs. T3), 47 undergraduates were randomized to intervention or control to complete the Race IAT and explicit measures (i.e., Black Stereotypes, Malleability of Bias, etc.). At T3, behavioral responses (seat selection and collaboration preference following a confederate's biased remark) were directly observed and recorded. Although no inferential tests reached significance—reflecting low power due to a higher-than-expected attrition rate—trajectory plots and model-based means showed a T2 bump in d score that receded at T3, with the intervention dampening the T2 rise relative to the control; explicit and behavioral outcomes displayed concordant trends. The directionally favorable but imprecise effects motivate continued recruitment to obtain decisive estimates. We will test whether these encouraging preliminary patterns translate into reliable and durable reductions in racial bias, informing both theory and practice.

[194] Approaches and Information Relevant to Motivations to Become More Prosocial

2:45 PM – 3:20 PM

Although being prosocial has numerous benefits for individuals and society, people are less motivated to change their prosocial traits compared to other personality traits. This study explores whether and how researchers can motivate people to be more prosocial. 200 online participants completed the HEXACO personality measure and self-reported their initial prosociality change goals. They then received two types of information in random order and updated their prosociality change goals after each condition: 1) learning their own HEXACO honesty-humility scores (prosociality feedback), 2) reflecting on their own prosocial motivation. Participants also rated the effectiveness of information about benefits of prosociality provided by the researchers. This presentation will discuss the effectiveness of motivational information and report the impact of the interventions on participants as a function of baseline prosociality. Given the importance of motivation in personality change outcomes, this study will inform prosociality-related interventions about what approaches and motivational information are effective for individuals with different levels of prosociality.

[195] Mental Contrasting of Positive and Negative Futures Reduces Smartphone Use: Two Experimental Studies

2:45 PM – 3:20 PM

Guided by Fantasy Realization Theory (Oettingen, 2012), two studies examined how two forms of mental contrasting (MC), contrasting either a desired future with current obstacles or a feared future with a precious reality that could be harmed by excessive screen time, affect undergraduates' regulation of smartphone use. Participants' daily screen time was tracked for two weeks, with the first week as baseline. In Study 1 (N = 92; n (MC) = 46, n (Control) = 46), the results from a linear mixed effects model showed that MC of a positive future led to greater reductions in screen time across days than positive fantasizing, $b = -6.54$, $SE = 2.75$, $t(90) = -2.38$, $p = .019$. In Study 2 (N = 89; n (MC) = 42, n (control) = 47), MC of a negative future produced a similar pattern in the linear mixed effect model, $b = -12.34$, $SE = 4.67$, $t(87) = -2.64$, $p = .010$. Together, these findings suggest that both forms of MC can reduce smartphone use, potentially through distinct motivational mechanisms. This research leverages real-world behavioral data to advance understanding of mental contrasting as a self-regulatory strategy for promoting digital well-being.

[196] Disgust and Inflammation as Predictors of Inmate Effort in a Forensic Setting

2:45 PM – 3:20 PM

The willingness to exert effort during psychological assessments is critical in forensic contexts. For instance, indicators of attention and engagement are essential in psychopathy evaluations, where the validity of cognitive findings often depends on the effort provided (Wygant & Lareau, 2015). While both psychological and physiological factors shape effort, recent work highlights the role of inflammation in effort-related behaviors. Yet, one underexplored factor is whether pathogen threat influences inflammation and, in turn, willingness to exert effort among incarcerated individuals. This study investigates how pathogen cues affect willingness to exert effort. Using a pathogen exposure manipulation, participants will be randomly assigned to either a "dirty" room containing pathogen threat cues or a clean control room. Physiological measures including core body temperature and blood cytokines will assess inflammation, while questionnaires will evaluate willingness to exert effort. By identifying conditions that undermine effort, this research can inform policies and practices to improve the accuracy and fairness of forensic assessments.

Moral Psychology Preconference

9:00 AM – 5:00 PM | Location: E450B, Level 4

Building on a nearly 25-year legacy and a sold-out event last year, the Moral Psychology preconference returns to bring together some of the most exciting interdisciplinary work being done on morality by scholars from around the world—from social psychology to developmental psychology, philosophy, and more. The pre-conference will provide a focused day at the SPSP conference on the latest theoretical and empirical work on human values, judgments, and decisions in moral contexts—exploring how research in this space impacts both pressing societal issues and ongoing debates in ethics and psychological theory.

Religion and Spirituality Preconference

12:00 PM – 5:00 PM | Location: E258, Level 2

This preconference highlights research exploring when, why, and how religion and spirituality affect cognitive, emotional, and behavioral processes, as well as how these processes and surrounding social and environmental contexts in turn shape religion and spirituality. Integrating multi-method empirical research with interdisciplinary approaches, this preconference showcases state-of-the-field theory, methods, and research. This year, our focus is to “broaden the scope” of psychological research on religion, highlighting work that broadens access to data, broadens insights across cultures, history, and the lifespan, and broadens methodologies. Religions continue to be a central part of social life, cooperation, and conflict across cultures, and this preconference features cutting-edge research with real-world implications.

*PRECON (IN-PERSON)

Lunch

12:00 PM – 1:00 PM

Lunch will be served in the Exhibit Hall prior to the preconference starting at 1:00pm. Seating is available in the Exhibit Hall, Cafe on Level 3, and the Lobby on Level 2. *PRECON (IN-PERSON)

Welcome & Introduction

1:00 PM – 1:05 PM

OPENING

Across beliefs and borders: The importance of considering religion and nationality

1:05 PM – 1:25 PM

A Protestant in Brazil, a Protestant in the US, and a Protestant in Ghana may all share a religion, but their practices and beliefs look dramatically different. As religions spread, they intertwine with local culture to create unique blends of faith. Disentangling the relative effects of religion and national culture presents an exciting opportunity for psychologists of religion. In this talk, I will briefly present two projects at the intersection of national and religious identity. In the first, we examine how religious affiliation shapes the condemnation of immoral thoughts in five countries, finding that Americans are generally more permissive of immoral thoughts than co-religionists in other nations. In a second, we look at how ideal affect varies amongst Buddhists and Protestants living in the US and South Korea. Together, this work illustrates how religion and nationality jointly shape our psychology. I will close with suggestions for testing these dynamics in cross-cultural experiments and surveys.

Children’s Application of Religious Norms Across Cultures

1:25 PM – 1:45 PM

Religion is often associated with social cohesion and prosociality (Kelly et al., 2024; Norenzayan et al., 2014). Notably, religion can also be at the root of intractable and deadly conflicts when people from different faiths disagree over beliefs and practices. Religious conflicts can also arise within members of the same faith who disagree on certain religious practices or norms—norms that are introduced by religious authorities (e.g., gods or their human representatives, sacred texts) whose violation does not directly impact others’ welfare or rights (e.g., eating pork) (Atran & Ginges, 2012; Nucci & Turiel, 1993). But who do children expect their religious norms to apply to? And do these expectations vary across age and/or cultures? Recent research finds that older children and adolescents evaluate religious norms as being group-specific (Dahl et al., 2022; Srinivasan et al., 2019). We present ongoing work on how 3- to 12-year-old children (N = 1,821, Mage = 7.83 years) apply different kinds of norms to same-faith (e.g., Muslim) and other-faith protagonists (e.g., non-Muslim). Data were collected by a group of 50 researchers as part of the Developing Belief Network, an international collaborative consortium spanning 32 cultural groups, 6 religions, and 14 countries (see Weisman et al., 2024).

Cultural Variation in Moral Absolutism vs. Relativism: Religious Diversity as an Antecedent and Policy Bans as an Outcome

1:45 PM – 2:20 PM

Cultures differ in moral values, but do they also differ in meta-beliefs about whether morals are universal or context-dependent? Across six studies, we show variation in moral absolutism, identify religious diversity as an antecedent, and bans on moralized practices as an outcome. At the country-level, relativism correlated weakly with existing dimensions, rose with religious diversity, and predicted less support for bans (Study 1). At the regional-level, religious diversity predicted moral relativism across U.S. states, which in turn predicted the status of abortion bans, even after adjusting for ideology (Study 2). At the individual-level, across 20 countries, people raised by parents of different religions more often endorsed relativism and support against abortion bans (Study 3). Experiments found that exposure to religious diversity increased relativism which in turn reduced support for bans (Study 4-5). Analyzing film subtitles across cultures (e.g., Hollywood vs. Bollywood) demonstrated how relativism is culturally transmitted (Study 6). Together, these studies position relativism as a cultural dimension shaping moral beliefs and policy outcomes.

Religion shapes cultures of construing and regulating emotion

1:45 PM – 2:20 PM

One of the earliest observations in scholarship on religion, stemming from writers such as Durkheim and James, was the powerful connection between religion and emotion. Since then, work across diverse fields has established how religion impacts emotional experience and the role of transcendent emotion in religious worship. Yet, religion is not just an institution dealing in mystical emotional experience. It is also culture which shapes everyday emotional experiences, including how people conceptualize what emotion is and what to do with it. In this research, we sought to map religious cultures of emotion by turning to the “source code” of religions: canonical scripture. Across 198,000 sentences (roughly 2.5 million words) from canonical scriptural texts of 7 major world religions, we used natural language processing to identify the patterns of emotion beliefs, values, and regulation tools encoded in ancient religious texts, and map how these vary across religions. By doing so, we provide a systematic, comprehensive, and integrative picture of how scriptures, the historical fabric of religions, conceptualize emotion for the individuals and cultures embedded within them.

How do Religious Motivations Fluctuate in a Time of Identity Exploration? A Random-Intercept Latent Transition Analysis Approach

1:45 PM – 2:20 PM

Motivation has been identified as a multidimensional construct that fluctuates over time within-persons in different contexts, but no study to date has examined the temporal stability of religious motivations, particularly in college settings, where people regularly undergo significant religious change. Hence, guided by Self-Determination Theory, we conducted a random-intercept latent transition analysis using two halves of an undergraduate sample (N = 1,368) with four waves spaced six months apart. We identified four profiles (i.e., Fully Internalized, Partially Internalized, Controlled, and Amotivated) that were distinct on behavioral regulations (i.e., identified, introjected, and external) and religious practices (i.e., service attendance, prayer, and scripture reading). Participants were likely to transition to the more autonomous profiles over time, and the more autonomous profiles reported lower internalizing symptoms (i.e., anxiety and depression) compared to the more controlled profiles. These findings highlight the complexity of motivation patterns and temporal stability in a context that facilitates autonomous exploration of religious values.

In God We Trust, In AI We Ask: Religiosity and Moral Advice-Seeking in the Digital Age

1:45 PM – 2:20 PM

As generative AI chatbots increasingly influence everyday decision-making, understanding who turns to them for moral advice is an emerging question at the intersection of moral psychology, religion, and technology. This project investigates how religiosity influences openness to seeking moral advice from gen-AI chatbots, and how traditional moral frameworks intersect with new digital authorities. Across four studies with U.S. adults (Total N = 830), religiosity was positively correlated with interest in and frequency of seeking moral advice from gen-AI chatbots. This effect was fully mediated by participants’ overall tendency to seek moral advice from non-AI sources. Additional analyses indicated that perceived valence and authority of gen-AI chatbots as moral advice sources further accounted for this relationship. As gen-AI chatbots become a prominent moral advice source, this work highlights how enduring belief systems shape people’s interactions with emerging moral technologies.

Perceptions of Religious and non-Religious Doubters

1:45 PM – 2:20 PM

Given the growing rates of deconversion from religion, it is important to understand how people perceive religious ingroup and outgroup members who are thinking of converting to (or away from) their religion (i.e., religious doubters). Across three studies (N = 1379, one preregistered), we examined how ingroup and outgroup members perceive religious and nonreligious doubters. Study 1 showed that Christian and atheist participants were more likely to think that a doubter from the outgroup (atheists for Christian participants, Christians for atheist participants), compared to a doubter from the ingroup, would change their religion. Study 2 found that these effects are domain-specific and were not evident when the source of doubt was not related to religion. Study 3 provided further evidence that anticipation to become an ingroup member plays a significant role in people’s perceptions of doubters by extending the findings to Jewish doubters, an outgroup for both Christians and atheists. Theoretical and practical implications are discussed.

Using a polygenic approach for gene-culture studies: Religious salience as a case study

1:45 PM – 2:20 PM

Emerging gene-culture research suggests that certain variants of dopamine-signaling genes increase sensitivity to social and cultural environments. Prior work found that the effect of religious salience on prosocial behaviour was stronger among individuals with more dopamine-signaling variants of the DRD4 gene (Sasaki et al., 2013). The present study extends this work using a polygenic approach to test gene-culture interactions involving religious salience. Participants from diverse geographic (e.g., South Asia, Sub-Saharan Africa, Middle East/North Africa) and religious backgrounds (e.g., Hindu, Sikh, Muslim, Christian) were randomly assigned to a religious salience prime or control prime condition and completed an economic game measuring altruism (money given vs. kept). We genotyped six dopamine-signaling genes: DRD1, DRD2, Taq1A, DRD4, DAT1, and COMT. Consistent with past research, the religious salience prime increased altruistic behavior among those with more dopamine-signaling variants. Effects were consistent across regions and religions. Overall, our findings highlight the value of polygenic, cross-cultural approaches in gene-culture research.

End of world beliefs are common, diverse, and predict how people perceive and respond to global risks.

2:20 PM – 2:35 PM

Do you believe the world will end in your lifetime, and does that belief change the way you see existential threats? For many people, this question is real and pressing. End of world beliefs (EWBs) are historically and globally prevalent, but come in many flavors: How soon? What will cause it? Is it avoidable? What will come after? EWBs have been linked to a variety of social perception and behavior, from passive comfort to revolutionary violence. Yet research on EWBs is lacking. We present the results of 6 pilot studies (N=2079) and a pre-registered study (N=1409) that establish a framework for EWBs. A measure of EWBs was validated across 6 religious populations. We find that EWBs are common, vary along several meaningful dimensions, and are uniquely predictive of people’s risk perception, risk tolerance, and willingness to support extreme action to address the five most pressing global existential risks (i.e., economic, environmental, geopolitical, societal, and technological). Results support the idea that belief in apocalyptic narratives, irrespective of their accuracy, is consequential for how different populations confront concrete risks that threaten humanity today.

[81] Understanding Varieties of Religious Types via Latent Profile Analysis of MIDUS

2:45 PM – 3:30 PM

Religion and spirituality (RS) are complex constructs, consisting of various intersecting dimensions. These dimensions are often considered in isolation, but need to be understood as components of a greater whole. Using a national U.S. sample, this study examines how RS dimensions combine to form profiles of RS experience, and how these profiles differ by sociodemographic and psychological factors. Latent Profile Analysis (LPA) of the MIDUS Refresher sample used six dimensions, service attendance, private practice, religious identification, spirituality, religious coping, and daily spiritual experience, to identify distinct RS profiles. A six-profile solution emerged: Highly RS, Personal-Oriented, Organizational-Oriented, Moderate Engagers, Disengaged Identifiers, and Minimally RS. Profiles varied by sociodemographic traits, personality, optimism, and control beliefs. Findings highlight the heterogeneity of RS and provide a framework for understanding who falls into different profiles. Future work should examine how profiles interact with stressors such as discrimination or socioeconomic adversity to shape well-being and health, and how they shift across the life course and cohorts.

[82] Seeing Religions as Interconnected Predicts Recognition of Religious Bias

2:45 PM – 3:30 PM

How do people think about the relationships between different religions within a society, and how does that affect their recognition and responses to religious bias? In this research we expanded on the literature on diversity ideologies in racial/cultural domains to explore their applicability to religious identities. Across two studies (combined n = 260), we studied correlates of endorsement of three diversity ideologies: identity-blindness (colorblindness) minimizes the importance of religion, identity-awareness (multiculturalism) acknowledges the differences between religions, and polyculturalism highlights how faiths have interacted and influenced each other over time. Results showed that polyculturalism predicted greater perception of systemic bias (e.g., non-Christian employees must use their vacation days or take unpaid leave to celebrate their holy days, but Christmas/ Easter are considered holidays for everyone) as well as isolated cases of bias (e.g., a person assumes that all the intelligent people they meet are atheist). Polyculturalism also predicted respect for others’ values, lower essentialism, and greater willingness to take action to combat prejudice.

[83] Transforming Traditions: Reconnecting with America's Faithful

2:45 PM – 3:30 PM

This collaborative project examines how faith, belonging, and identity shape participation in U.S. churches, with a focus on younger adults and groups historically marginalized in religious spaces. We conducted a national online survey of N = 1,000 adults (July 2-Aug 19, 2025) with oversamples of lapsed Christians (n = 300), Baptists (n = 300), and LGBTQ+ adults (n = 300). The study asks: How do current churchgoers experience belonging and inclusion? What drives some to disengage while others remain? What factors influence willingness to return? What forms of support, spiritual guidance, community connection, service, or worldview clarity, might re-engage those who have left? Findings will offer insight into how faith communities might foster inclusion and meaningful engagement among younger and historically excluded populations.

[84] Correcting misperceptions about Evangelicals' immigration views increases non-Christians' willingness to engage

2:45 PM – 3:30 PM

U.S. Evangelical Christians are often linked with conservative politics and the Republican Party, a stereotype that obscures the movement, its diversity and may heighten Democrats' negativity toward Evangelicals (Xu et al., 2024). We conducted an online experiment with 1,960 U.S. adults to test whether correcting misperceptions about Evangelicals' immigration views would influence non-Christians' attitudes and behaviors. Non-Christians substantially underestimated Evangelical support for immigration policies balancing compassion and security. They predicted that only 36% of Evangelicals believe the U.S. has a moral duty to accept refugees, 50% want Congress to pass immigration reform laws, and 46% support a path to citizenship for undocumented immigrants. Each of these estimates is over 30 points below actual Evangelical agreement rates. Participants whose misperceptions were then corrected were more willing than controls to discuss their immigration views publicly. Addressing misperceptions about Evangelicals may promote more constructive engagement across religious and ideological lines.

[85] Attachment Styles and Well-Being: Testing the Correspondence vs. Compensation Hypotheses with Parental and God Attachment

2:45 PM – 3:30 PM

To examine how attachment to God reflects or compensates for early parental attachment quality (i.e., correspondence vs. compensation hypotheses), two studies identified latent profiles of attachment to mother, father, and God and tested associations with mental ill-being across time. Our original sample of 1,699 college students was randomly split to create two samples: exploratory (Study 1) and confirmatory (Study 2). Study 1 revealed three profiles supporting the correspondence hypothesis: Insecure Father Correspondence, Complete Insecure Correspondence, and Complete Secure Correspondence. In Study 2, these three profiles were replicated. ANOVAs and post-hoc tests showed that the Complete Insecure Correspondence profile reported the highest, Insecure Father Correspondence the second-highest, and Complete Secure Correspondence the lowest levels of mental illness symptoms at Time 2. However, ANCOVAs controlling for baseline mental health only showed a difference in depression between the Complete Insecure and Complete Secure profiles.

[86] Immediate Emotional Benefits of Religious Service Attendance: Evidence from a natural experiment at Easter

2:45 PM – 3:30 PM

Religious service attendance has consistently been associated with greater life satisfaction and positive emotions. However, most evidence comes from correlational and longitudinal studies based on long-term patterns of attendance, leaving open questions about the immediate effects of worship. In a pre-registered within-subject study, adult Christians (N = 138) completed surveys both at a control time (counterbalanced to be a few days before or after Easter) and directly after attending an Easter service. Participants reported higher satisfaction with life, self-transcendent positive emotions (e.g., awe, peace), lower negative emotions, greater love for God/others, and stronger gratitude to God after attending the service compared to the control time. By directly comparing experiences within the same individuals across worship and control contexts, this study provides rare quasi-experimental evidence that communal worship is followed by immediate improvements in emotional well-being.

[87] The Role of Trust in the Relationships between Higher Power Attachment and Well-being: A Regression and Mediation Analysis

2:45 PM – 3:30 PM

Trust is a vital quality of relationships linked to greater well-being. It is unknown, however, how the interplay of emerging adults' generalized trust in others, trust in their parents, and trust in a higher power relate to well-being. We recruited 152 undergraduates to report their attachment to a higher power, several trust dimensions (trust in their mother and father, viewing others as trustworthy, and their willingness to trust others), and their self-esteem, self-efficacy, and life satisfaction. Anxious (not avoidant) higher power attachment was negatively associated with multiple trust and well-being variables. In hierarchical regressions, anxious attachment to a higher power predicted lower self-esteem and life satisfaction. Trust in fathers (not mothers) and viewing others as trustworthy partially mediated the relationship between anxious higher power attachment and life satisfaction. These findings suggest that attachment to a higher power is related to well-being through complex paths involving different dimensions of interpersonal trust.

[88] Fasting & Flourishing

2:45 PM – 3:30 PM

People fast for a variety of reasons, some religious/spiritual and others for health, weight loss, or sports. We conducted three studies to investigate the benefits of religious vs. secular fasting. We hypothesized that religious fasters would experience more self-reflection and spiritual transformation, leading to higher scores on a multi-dimensional measure of flourishing. In Study 1, we surveyed 350 fasting vs. non-fasting Jews following Yom Kippur. In Study 2, we surveyed and compared the effects of Jewish fasting vs. non-religious fasting (N = 800). In Study 3, we experimentally manipulated thoughts of spirituality vs. health while completing an 18-hour fast (N = 294). We found that health fasting increased humility, whereas religious fasting increased religiosity and prosocial behavior, which were, in turn, predictors of self-reported life satisfaction and flourishing. When people fast and self-reflect on spiritual well-being, they often also become more committed to living a good life, more connected to others, and more likely to help others.

[89] Ethical Integration of Religion and Spirituality in Psychotherapy

2:45 PM – 3:30 PM

Religion and spirituality (R/S) are central to many individuals' identities, yet they remain insufficiently addressed within psychotherapeutic research and training. This presentation examines the ethical challenges and cultural implications of integrating R/S into psychotherapy, while proposing evidence-based solutions and highlighting potential benefits for clients and clinicians. Although 89% of mental health professionals value R/S competence, nearly half report minimal training, revealing a gap between awareness and practice. Guided by the APA Ethics Code (2017), this analysis addresses competence, client autonomy, and informed consent, emphasizing risks of bias, boundary issues, and inadequate assessment. Integrative frameworks, including Sulmasy's Biopsychosocial-Spiritual Model and Barnett and Johnson's Ethical Decision-Making Model, offer pathways for culturally responsive care. Findings suggest R/S-informed therapy grounded in cultural humility enhances coping, resilience, and alliance. Solutions such as training, supervision, and ongoing ethical reflection support more holistic and inclusive mental health care honoring the sacred dimensions of human experience.

[90] Spirituality is associated with fear of AI but not with its acceptance in Japan

2:45 PM – 3:30 PM

Authors: Anzu Tsunematsu, Jimpei Hitsuwari, Tasuku Igarashi, Shinji Yamagata, Ryota Takano

The rise of generative AI technologies such as ChatGPT has evoked both fascination and unease, reflecting the growing ambivalence toward intelligent machines that transcend human understanding. This study examined how spirituality—defined as a tendency to seek meaning and connection beyond the material world—relates to attitudes toward AI. A survey of 554 Japanese participants was conducted using the Attitude Toward Artificial Intelligence (ATAI) scale, which measures acceptance and fear, together with the Japanese Youth Spirituality Scale. Spirituality was positively associated with fear of AI, but unrelated to acceptance. Furthermore, this relationship was mediated by discomfort with ambiguity and not moderated by prior experience with AI use. These findings suggest that spirituality may heighten sensitivity to the transcendent and uncontrollable aspects of AI, leading individuals to experience fear rather than acceptance. By linking spirituality to responses toward emerging technologies, this research broadens the psychological study of religion to novel cultural and technological frontiers.

[91] Blaming God and the Devil for suffering

2:45 PM – 3:30 PM

This research investigated how people invoke supernatural explanations for misfortune. Specifically, we examined how beliefs about a victim's moral character influence attributions to God and the Devil, and whether perceptions of deservingness explain such attributions. Across two studies, participants read about a miscarriage involving a victim with varying moral character (Good, Bad, or Unspecified) and rated potential causes, including the roles of God and the Devil. Victims with good or bad moral character were compared to those with unspecified character. In Study 1 (n = 158), participants blamed the Devil when the victim was seen as either good or bad, as they deemed the victim deserving of the misfortune. Additionally, perceptions of deservingness influenced attributions to God's punishment, but only when the victim was seen as bad. In Study 2 (n = 260), participants attributed the misfortune to both God and the Devil regardless of the victim's moral character, based on perceptions of deservingness. Though supernatural attribution were low overall, these patterns of victim-blaming may contribute to maintenance of just-world beliefs.

[92] The role of political ideology in the relationship between perceived Whiteness and attitudes about Jews

2:45 PM – 3:30 PM

Amid the growing concerns of shifting demographics in the US, the question of whether minority groups fit the prototype of a “White” American has gained significance. In the present study, we examined how Americans perceive the Whiteness of Jewish Americans, who hold a complex ethno-racial position within the American hegemony, and what factors correlate with these perceptions. In an exploratory study of American adults (N = 212), participants indicated the extent to which they agreed that Jews are White, alongside measures of political ideology, feelings toward Jews, and perceptions of discrimination both toward and from Jews. While political ideology did not directly predict perceptions of Jewish whiteness, it moderated the association between Whiteness perceptions and attitudes toward Jews: among liberals, greater perceived Whiteness of Jews was associated with colder feelings toward Jews and greater endorsement of beliefs that Jews discriminate against others, whereas conservatives showed the opposite pattern. These findings highlight the role of ideology in understanding how notions of “whiteness” shape attitudes towards different groups in contemporary US politics.

[93] "They said that they spoke on behalf of God, but then nothing but hate came out of their mouths." Analysis of Young Adults' Perspectives of Ineffective Intergenerational Faith Practices from Caregivers and Churches

2:45 PM – 3:30 PM

Religious affiliation is at historic lows among young adults, and a reckoning of spiritual practices is changing in the United States and abroad (Nynäs et al., 2022). Reasons for disaffiliation include intellectual questioning, competing social commitments, or experiences of trauma or marginalization in church settings (Davis et al., 2023; McLaughlin et al., 2020).

To identify specific practices or moments that create disillusionment with Christianity, focus groups were conducted with 29 young adults in Oakland, Dallas, Chicago, New York City, and Minneapolis. Participants were diverse in race and ethnic identity (31% White, 59% African American, 10% Hispanic), gender (38% male, 52% female, 10% non-binary), and familial denomination. Qualitative responses were transcribed and coded through reflexive thematic analysis (Braun & Clarke, 2006).

Emergent themes included Authoritarian Parenting, Isolation from Peers and Family Members, Inability or Unwillingness to Address Existential Questions, and Hypocrisy in Church Communities. This presentation will explore themes, provide exemplifying quotes, and consider historical and cohort effects impacting faith development among Gen Z.

[94] Leaving Religion, Keeping Bias: Exploring Religious Disaffiliation and Transprejudice

2:45 PM – 3:30 PM

Transgender people in the U.S. face rising levels of bias, demonstrated by the 122 anti-trans bills passed in 2025 (Trans Legislation Tracker, 2025). Religion is often identified as a major source of transprejudice, with notable differences between religious individuals and those who are religiously unaffiliated. For instance, 87% of White Evangelicals hold anti-transgender views on gender, while 58% of religiously unaffiliated people have inclusive transgender attitudes (Pew, 2022). Although religiosity is declining in the U.S., attitudes and behaviors related to religion, known as religious residue, can persist after disaffiliation (Van Tongeren et al., 2021). Therefore, we explored whether transprejudice might serve as an example of religious residue that persists after disaffiliation. In a preregistered study of N = 330 U.S. adults (analyses pending), we hypothesized that individuals who disaffiliated from their religion in young adulthood would exhibit transprejudice than those who remain religious and more prejudice than those who have never identified as religious. This study adds to the growing body of research on religious residue and the sources of transprejudice.

[95] Catholics' Cognition About the Saints, Sin, Prayer, and the Afterlife

2:45 PM – 3:30 PM

Researchers have extended attachment theory to include attachment to God among religious believers. No research has examined attachment to saints who are uniquely important in Catholicism. We aimed to identify religious attachment patterns toward these figures in American and Filipino Catholics along with other measures of thoughts about God. We also asked open-ended questions about Catholic concepts of sin, prayer, and the afterlife. The questionnaire was administered to ~400 Roman Catholic respondents: ~200 from the US and ~200 from the Philippines. An analysis of US participants revealed hypothesized associations among the quantitative measures of cognition. Qualitative analyses of free responses about sin revealed macro-themes such as disobedience, moral wrong-doing, separation from God, and numerous specific examples. Prayer narratives yielded information about general prayer styles, contexts that elicit prayer, specific prayers used, and elements of judgment/salvation. The afterlife data revealed themes, some consistent with and others inconsistent with Catholic doctrine. Results contribute to our understanding of how people think about religious figures/phenomena.

[96] Starstruck and searching: Relationships between celebrity fandom, religiosity, spirituality, and meaning

2:45 PM – 3:30 PM

Although fans and scholars have connected the rise in celebrity fandom with the decline of organized religion, there is a lack of psychological research into this relationship. The present study considered the relationship between celebrity fandom, religion/spirituality, and meaning. Participants completed a survey on celebrity fandom, eudaimonic and hedonic preferences in music/media, meaning in life, spirituality, and religion. Study 1 participants (N = 209) were asked to think about their favorite celebrity when answering questions, and Study 2 participants (N = 201) were all fans of a celebrity musician. Spirituality and religiosity were positively associated with celebrity worship in both studies. Results indicated that celebrity fandom relates to the search for and presence of meaning in life. Study 2 showed fans were more interested in finding meaning than pleasure in the music; Study 1 found this result to be true only when considering music preferences, but not media consumption in general. Overall, results indicated a relationship between fandom and the search for spiritual meaning, and that this relationship may look different depending on intensity or type of fandom.

[97] Catholics' Cognition About God, the Virgin Mary, and Other Saints

2:45 PM – 3:30 PM

Researchers have extended attachment theory to include attachment to God amongst religious believers. No researchers have examined attachment to the Virgin Mary or to the other saints. In this study, we aim to identify religious attachment patterns toward these figures in American and Filipino Catholics. We composed an online questionnaire to examine various relational variables toward religious figures in Catholic faith. It included two measures of Attachment to God, Views of God Scale, and modified versions of the Integration of Thoughts about Partners Scale, and Inclusion of Others in the Self scale. Responses were analyzed using a variety of analytic techniques. The questionnaire was administered to 400 Roman Catholic respondents: 200 from the US and 200 from the Philippines. An initial US-based sample showed meaningful correlations between the Integration of Thoughts About God Scale and other God-attachment measures. The modified Inclusion of Other in the Self scale also revealed some insights into key differences in Catholics' perceptions of the figures involved in their religious beliefs.

[98] Analysis of Psychology of Religion Content in Introductory Psychology Textbooks

2:45 PM – 3:30 PM

Background: Past research on the representation of religion/spirituality in introductory psychology textbooks is dated.

Objective: Analyze religion/spirituality content in the nine most frequently purchased introductory psychology textbooks published within the last 5 years.

Method: The current study identified 27 terms that related to religion/spirituality and performed qualitative analysis of term's mentions in each textbook.

Results: Findings indicated that 100% of textbooks mentioned religion/spirituality, which represents an increase in mentions compared to past research. However, none of the textbooks included a specific section on the psychology of religion and spirituality. Overall, there was greater discussion-based coverage of religion/spirituality than research-based coverage, similar to past research findings, although the current study found a greater percentage of research-based discussion than previous research.

Conclusion: This study provides evidence that coverage of religion/spirituality is better represented in introductory psychology textbooks than past research, but organization and inclusion is still lacking.

Technological advancement is linked to reduced supernatural explanations

3:35 PM – 3:50 PM

Across cultures and history, people often invoke supernatural forces to explain events. We propose that technological advancement reduces supernatural explanations by increasing perceptions of human control. As technology enables people to better predict and manipulate their environment, divine intervention may be invoked less often in everyday life, even among the religious. We test this hypothesis using historical, correlational, and experimental methods across three studies. In Study 1, cross-temporal analyses of 40 small-scale societies show that supernatural explanations declined over time and were less common in more technologically advanced societies. In Study 2, religious Americans who viewed technologies as more reliable perceived greater human control and less divine control over the phenomena those technologies regulate. In Study 3, experimentally engaging religious Americans with an electric circuit increased perceived human control and decreased divine attribution for light production. Together, these findings suggest that technological advancement shifts causal reasoning from divine to human agency, replacing supernatural explanations with naturalistic ones.

Morality without monotheism: Surveying the religious world before world religions

3:50 PM – 4:10 PM

Throughout human history, humans have worshiped thousands of supernatural agents with different personalities and appearances. This diversity may have had implications for how collective cooperation, coordination, and conflict. But where did this diversity come from? And how did it change as colonialism reshaped the world? Through a global survey of 2,377 supernatural agents covering 114 religious traditions throughout history, we shed light on the dominant forces of religious diversity, and the way that colonialism reshaped religious differences.

The Development of Cross-Cultural Religious Belief: Insight from the Developing Belief Network

4:10 PM – 4:55 PM

Learning about religious cognition via first-hand experience can sometimes be time-consuming and costly. In this talk, I highlight the role of adult testimony as a mechanism for providing efficient and effective information transmission through focusing on insight from the Developing Belief Network: a cross-cultural global collaborative spanning 5 continents, 19 countries, and over 30 unique religious samples. By drawing on cross-cultural samples, I aim to highlight global universals as well as cultural-specific variability in the extent to which children attend to various testimonial features when acquiring religious belief. Such variability has broad implications for how religious information is acquired and then transmitted within and across generations.

LGBTQ+ Research Across the Globe Preconference

12:00 PM – 10:00 PM | Location: E350, Level 3

Join us for the SPSP Preconference on LGBTQ+ Research Across the Globe, taking place on Thursday, February 26, 2026, from 1 pm to 5 pm. This dynamic event unites scholars from diverse countries, backgrounds, and career stages to foster global collaboration and advance LGBTQ+ rights through research. Featuring keynote speaker Lisa Diamond and engaging blitz talks, participants will explore innovative ideas, build meaningful connections, and discuss strategies to address current challenges facing the LGBTQ+ community worldwide. This preconference emphasizes inclusivity, mindful of language and cultural differences, offering a welcoming environment for all. Attendees will participate in small group discussions, poster sessions, and networking opportunities designed to spark collaborations across borders. Join us in shaping the future of LGBTQ+ research—whether you're looking to share your work, find partners, or simply connect with like-minded scholars committed to social justice. Don't miss this opportunity to be part of a vibrant, supportive global community working toward equality and understanding.

Economic Inequality and Social Class Preconference

12:00 PM – 5:00 PM | Location: E352, Level 3

The preconference on Economic Inequality and Social Class is back!

Join us for a long-awaited reconvening of researchers looking at psychological questions relating to social class and inequalities in income/wealth in their social, cultural, economic, and political dimensions. This preconference will feature a keynote address, two panels (one on social class and one on economic inequality), and early career flash talks (/data blitzes), with time for discussion and networking across established and early career researchers.

Come along to consider how social psychology can shed light on the core of group-based inequality: who has what in society

***PRECON (IN-PERSON)**

Lunch

12:00 PM – 1:00 PM

Lunch will be served in the Exhibit Hall prior to the preconference starting at 1:00pm. Seating is available in the Exhibit Hall, Cafe on Level 3, and the Lobby on Level 2. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

oGrilled Chicken Pesto Sandwich: Grilled Chicken Breast, Fresh Mozzarella, Oven Dried Tomato, Arugula, Basil Pesto, Ciabatta Roll

oRoast Turkey Caprese Pasta Salad: Rotini Pasta, Cherry Tomatoes, Fresh Mozzarella, Basil Pesto, Mixed Greens, Balsamic Glaze

oRoasted Vegetable Wrap (V): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto, Wrap (limited gluten free wraps available)

oMediterranean Chickpea Salad (VG | GF | DF): Crispy Chickpeas, Cucumbers, Tomatoes, Red Onion, Kalamata Olives, Feta Cheese (on the side), Mixed Greens, Lemon Vinaigrette

Opening Remarks

1:00 PM – 1:05 PM

Speaker

Jennifer Sheehy-Skeffington

Keynote: A Functional Approach to the Psychology of Inequality

1:05 PM – 1:35 PM

Inequality is a defining challenge of societies across history, and psychology research can support understanding of its persistence and impacts. In this talk, we advance scholarship by understanding inequality in terms of psychology's function in producing structures of domination or promoting resistance to those structures, rather than situating inequality as caused by deficits in individual behavior and psychology. I review scholarship on domination and resistance that highlights the utility of this functional lens, as well as its potential to advance understanding of inequality. I then provide four steps that researchers can take to study inequality from a functional lens: questioning causal assumptions of existing psychological models that focus on deficit-based mental states; studying impacts of inequality rather than intentions of actors in unequal settings; embracing immersive methods and practices that engage with the complexity of structural inequality; and applying research that uses cross-level analytic techniques to examine relationships between individual psychology and societal structures.

Refining Social Class Psychological Models: Evidence from a Large-Scale Study

1:35 PM – 1:50 PM

In a preregistered, large-scale replication across four countries (USA, France, Switzerland, India; $N = 33,536$), we re-examined 35 central hypotheses about the effects of social class spanning the self, relationships, cognition, emotion, social behavior, and decision-making. Results indicated that about 50% of effects proved robust. Conclusions were broadly consistent across social-class measures and across countries. We identified that hypotheses grounded in proximal features of social-class contexts—(1) constraints, (2) uncertainty, and (3) status asymmetries—tended to be supported, whereas hypotheses based on a distinction between a more general “self- versus other-” psychological orientation were not as well supported. Instead, it seems that individuals from higher social classes have enough resources to be oriented toward both the self and others.

Social Class-Based Interactions: Insights from Physiology and Behavior

1:50 PM – 2:05 PM

Although everyday contexts offer opportunities for contact across socioeconomic status (SES) lines, little is known about how such interactions may unfold naturally. We examined social attunement in dyadic conversations between unacquainted adults drawn from a U.S. community sample ($N = 130$ dyads) who were paired with either similar- or different-SES partners. Attunement was indexed using physiological linkage—how strongly one’s moment-to-moment physiological changes is predicted by the partner’s physiological changes over time. Across interaction types, lower-SES individuals exhibited stronger physiological linkage, suggesting heightened attunement to partners across SES. Participants also appeared more comfortable when interacting with lower-SES partners, though SES was unrelated to dominance during conversation. Despite these real-time patterns, post-interaction ratings reflected a consistent preference for similar- over different-SES partners. Together, these results indicate that lower-SES individuals may engage more other-focused processes during social interactions, even as broader in-group preference persists.

Reasoning about social relationships reduces class differences in tests of cognitive aptitude

2:05 PM – 2:20 PM

We argue that reasoning tests often privilege abstract styles of reasoning as a “neutral” benchmark and provide a poor match to social-cognitive competencies promoted in working-class contexts. We evaluate this hypothesis in archival data from an international study of mathematical aptitude ($N = 158,216$), a pre-registered nationally-representative experiment on logical deduction ($N = 781$), and an integrative data analysis (IDA) combining data from Study 2 with three supplemental studies ($N = 2,269$). In Study 1, reasoning items higher in social-relational content (i.e., mentions of people) yielded smaller class-based performance gaps among eighth-grade students from 46 countries. Study 2 and the IDA experimentally replicate and extend these findings, demonstrating that reframing an abstract reasoning task to recruit social-cognitive skills reduces class-based performance differences among adults. Our results support a cultural-psychological account of reasoning performance and highlight inclusive approaches to testing as a way to attenuate class-based performance gaps.

How Children’s Social Class Contexts Predict Their Imagined (and Actual) Futures

2:20 PM – 2:35 PM

Children use school as a way to imagine and strive toward their futures. We analyzed thousands of essays written by children in Britain in the late 1960s about what their lives would be like when they were adults. We used a bottom-up approach to explore naturally occurring topics in these essays, and tested how these topics varied with children’s social class context and their adult outcomes. Higher education was the most prevalent topic in these children’s essays, particularly among children whose fathers—and maternal grandfathers—had higher status occupations. These same children were also especially likely to write about teaching, medicine and the military. Children whose fathers and maternal grandfathers had lower status occupations were especially likely to write about making money, but also about family and daily responsibilities. Moreover, children who wrote more about higher education and less about money-making tended to achieve education, status and income, even controlling for their family backgrounds.

Cumulative Inequality Aversion

3:00 PM – 3:05 PM

People seem to both prefer and to be averse to income inequality. Surveys reveal a preference for some inequality (e.g., Ariely & Norton, 2011), while lab experiments show aversion to unequal outcomes (e.g., Shaw & Olson, 2012). Scholars argue that people care less about inequality itself and more about whether they perceive it as fair (Starmans et al., 2017). Because most people view meritocracy as fair, they tend to accept inequality that results from a merit-based process as also fair (Tyler, 2011). Yet real-world advantages accumulate across stages—school quality, university prestige, and job placement, amplifying early advantages. We hypothesized that highlighting this cumulative nature of the inequality generating process would reduce the perceived fairness of meritocracy. In a pre-registered study ($N = 1,109$), we found that participants rated the fairness of meritocratic processes ($\beta = -0.34$, $p < .001$) and their unequal outcomes ($\beta = -0.49$, $p < .001$) as significantly less fair when cumulative inequality was made explicit. These findings reveal what we call "cumulative inequality aversion": people reject meritocratic inequality once they see how advantages stack over time.

(Under)estimating Unearned Advantage and Disadvantage: Insights From a Gamified Experiment

3:05 PM – 3:10 PM

The absence of clear metrics to disentangle merit from privilege in real-world contexts (e.g., college admissions) makes it easy for dominant groups to deny its existence. We address this with a field experiment, by directly manipulating a quantifiable, unearned dis/advantage, devoid of social identity confounds: participants were randomly assigned to a closer (advantage) vs farther (disadvantage) starting line, in a solo game of cornhole. Successful throws earned raffle tickets for a monetary prize, and could be kept/donated. Our data shows that while individuals can acknowledge their privilege, they fail to translate its impact on actual outcomes: disadvantaged participants accurately guessed how well they'd perform from the closer line, but advantaged participants undermined the impact of disadvantage by overestimating their performance from the farther line. Lastly, despite (unfairly) earning more, advantaged participants donated similarly to disadvantaged ones, and favored inequality-blind (vs redistributive) approaches. Thus, even in a low-stakes game where the advantage was clearly visible and illegitimate, individuals failed to understand and correct for their privilege.

Social-Class Selective Learning Reinforces Pro-Upper-Class

3:10 PM – 3:15 PM

Examining what fuels pro-upper-class bias, we identified a novel mechanism: social-class selective learning. Using a reinforcement learning model, across four studies ($N = 966$), we found that people learn better about positive features of upper- [vs. lower-] class targets by focusing more on the dimensions favoring upper-class targets. Specifically, when upper- and lower-class targets produce the same rewards but upper-class targets are more generous, participants learned better about their generosity [vs. reward]; when generosity levels are equal across all targets, but upper-class targets produce greater rewards, they learned better about their reward [vs. generosity]. Learning of more generous upper- [vs. lower-] class targets led them to show greater explicit and implicit pro-upper-class bias, as well as more lenient punishment for other upper- [vs. lower-] class offenders. This suggests that people readily generalized the learned positive trait from the specific upper-class targets to other upper-class members, benefitting them in social and moral domains. This did not occur for the lower class, suggesting social-class selective learning reinforces the pro-upper-class bias.

Social Mobility Beliefs Predict Competence Stereotype Gap Between Classes

3:15 PM – 3:20 PM

The poor are stereotyped as less competent than the rich. This competence gap may reflect attributions of class disparities to inherent ability differences. Beliefs about social mobility—the perceived likelihood of moving up or down society—may shape this gap. When mobility is seen as high, people may be more likely to attribute class differences to dispositional causes, thereby stereotyping the poor as less competent and the rich as more competent. To test this, two experiments were conducted with a Singapore undergraduate sample (n = 260) and an online UK sample (n = 201). Mobility beliefs were manipulated by randomly assigning participants to high or low mobility information. Participants then made attributions of social class and rated rich and poor on competence. Across experiments, high mobility information increased internal attributions for both targets, but only external attributions of rich targets. Moreover, high mobility reduced competence ratings of poor targets as compared to low mobility, and this was mediated by higher internal attributions. As people tend to overestimate mobility, correcting such beliefs may lessen competence stereotypes of the poor.

How to Make Participants Feel Richer (But Not Poorer)

3:20 PM – 3:25 PM

Across two preregistered studies and 936 American adults, we replicated Studies 1 and 2 from Brown-Iannuzzi et al. (2015), and found that the false feedback manipulation used (the Comparative Discretionary Income (CDI) Index) can elevate people's feelings of subjective socioeconomic status (SSES); in other words, we made people feel wealthier, and found this effect to be directional, as we were not able to make people feel poorer. Our work demonstrates that the false feedback procedure seen here is a tool that can be used to inflate how a person feels about their own (subjective) socioeconomic status, and thus provide a dependable way to investigate the causal effects of SSES. While it was important for us to directly replicate the original studies, a limitation of our work was that we were not able to tease apart the pieces of the false feedback manipulation package, to see which elements may contribute more, less, or not at all to the manipulation's effect.

Burdened Bonds - First-Generation Students' Cultural Mismatch Experiences Strain Their Relationships to Their Parents

3:25 PM – 3:30 PM

First-generation students commonly experience a sense of being caught between “two worlds”: their social background and academia. Such mismatch experiences are known to contribute to academic inequalities. Here, we show they can also cause inequalities at home, burdening parental relationships. Studies 1-2 (N=354, 274) show that first-generation students' heightened mismatch experiences predict lower parental relationship quality, resulting in a generation-status-gap with first-generation students reporting lower relationship quality. Using qualitative methods, Study 2 also sheds light on the extent to which mismatch experienced at home may cause friction with parents. Analyses highlight a feeling of “not being understood by parents”. Experimental Study 3 (N=282) focused on mismatch experienced at university. Results showed that the activation of such a mismatch (e.g., feeling like one was not raised with skills expected at university) led students to feel less close to their parents – an effect that was mediated by worsened feelings about students' upbringing.

Forecasting Love Based on Class: Social-Class Stereotypes Within Romantic Contexts

3:30 PM – 3:35 PM

How do beliefs about romantic happiness vary by social class? This study examined people's stereotypes about how social class and gender shape judgments of who makes whom happiest in romantic relationships. Participants (N = 473; 249 from the United States and 224 from South Korea) were randomly assigned to view a male or female target described as low-, middle-, or high-class. They then indicated the expected social class of the partner who would make the target happiest. Results revealed strong assortative-matching stereotypes: people believed that relationship where the couple has similar social standing as happier than those with class disparities. However, this belief varied by both social class and gender. Specifically, high-status woman was expected to pair with equally high-status partners, whereas high-status man was considered acceptable with lower-status partners. Low-status woman was also more likely to be predicted to “marry up” than low-status man. These findings highlight the intersection of social class and gender stereotypes in lay theories of romantic happiness.

Differential Value-Wellness Associations in the Unequal World: Social-Focused Values for the Privileged, Personal- Focused Values for the Disadvantaged

3:35 PM – 3:40 PM

Amid increasing global inequality and diverse value systems, this study examined how economic resources at both individual and country levels moderate the associations between values and wellness (i.e., subjective well-being and health). Using data from the World Values Survey across 75 countries, the findings challenged the prevailing assumption that a social focus is inherently more adaptive for the economically disadvantaged. Instead, results suggested that personal-focused values were more advantageous in low (vs. high)-resource contexts. At the country level, the negative association between self- enhancement and wellness was attenuated or reversed in lower HDI countries. At the individual level, self-enhancement and openness to change were more positively—or less negatively—associated with wellness among lower-class individuals, while self-transcendence and conservation were more strongly associated with wellness among higher-class individuals. These findings highlight the context-dependent nature of value-wellness relationships and the social responsibility of those from more affluent backgrounds.

Core Cognition and Motives for Social Hierarchy among Preverbal Infants and Preschoolers and Their Relation to Political Ideology

3:45 PM – 4:00 PM

Navigating the tension between social hierarchy and equality forms an enduring challenge of human societies and politics, suggesting that core cognition and motives for (learning) navigating hierarchical/egalitarian ecologies might have evolved. Indeed, findings from several labs over the last 1,5 decade confirm that preverbal infants and toddlers represent social hierarchy and equality while adult motives for between-group hierarchy versus equality (i.e., Social Dominance Orientation, SDO) reflect both ecological and heritable genetic influences, forming a behavioural syndrome with other psychological phenomena that serve to monopolize in-group territory and resources. Our most recent evidence demonstrates that preverbal infants, too, ascribe group dominance motives to minimal novel agents, and that three-year-old boys (but not girls) themselves prefer a member from the more, rather than less, formidable group. These gendered coalitional formidability motives mirror those found in SDO across cultures. In fact, adult males also prefer the larger group and its members when using equivalent minimal 'preschool' stimuli, while individual differences in such preferences for the largest group relate systematically to SDO, RWA, and key political attitudes such as support for social welfare and immigrant persecution. Together this empirical record converges to suggest that rich and nuanced core cognition and motives for social hierarchy (versus equality) may form an intuitive social grammar for the negotiation of rights and resources that is political ideology and psychology.

How Children Explain Inequality -- and Why It Matters for Their Responses to Economic Gaps

4:00 PM – 4:15 PM

Children routinely encounter stark economic inequalities, but how do they explain these gaps -- and do their explanations shape what they think should be done (if anything)? I will present two preregistered meta-analyses synthesizing research on children's explanations for inequality and their downstream attitudes. The first meta-analysis pooled 74 effect sizes from 30 papers (N = 13,059, ages 4–17), revealing a striking developmental pattern: Younger children strongly favored inherent explanations (e.g., ability, effort), whereas older children increasingly invoked extrinsic, structural factors (e.g., unequal opportunities). The second meta-analysis pooled 50 effect sizes from 21 papers (N = 10,785), showing that extrinsic explanations reliably predicted more egalitarian responses -- seeing inequality as unfair, supporting redistribution, and choosing to rectify unequal distributions (d = 0.33). I will discuss implications for fostering structural understandings of inequality without undermining children's sense of agency.

Psychology of the Centaur State: How Inequality Structures Neoliberal Experience

4:15 PM – 4:30 PM

Despite inequality skyrocketing under neoliberalism, psychological research has tended to conceptualize its psychological impact as uniform. In contrast, Loïc Wacquant describes neoliberalism as a centaur "which presents radically different faces at the two ends of the social hierarchy: a comely and caring visage toward the middle and upper classes, and a fearsome and frowning mug toward the lower class". We use this concept of the centaur state to trace the bifurcated nature of psychological experiences under neoliberalism across two domains: mental health and criminal justice. In multiple empirical studies, we find that the relationships between neoliberalism (measured as both ideology and structure) and the outcomes of interest (i.e., mental health; attitudes toward police) are moderated by race and economic precarity. The implications for the psychological study of neoliberalism and inequality are discussed.

Megastudy Testing 20 Treatments to Increase Support for Wealth Redistribution

4:30 PM – 4:45 PM

Economic inequality in the US has reached unprecedented levels and poses substantial negative consequences for societies and individual behavior, including reduced economic mobility and growth and democratic erosion. Yet public support for policies aimed at redistributing wealth remains low. This project investigates whether behavioral science interventions can increase support for redistribution. Using a megastudy design, we tested 20 interventions in a nationally representative U.S. sample (N = 30,356), with a follow-up survey 3 weeks later (N = 24,094) to assess durability. Our outcomes focus on attitudes toward general redistribution and a wealth tax targeting the top 0.1%. Many interventions increased support. The most effective strategies visualize inequality, highlight past redistributive policies, or emphasize elite cues, with similar patterns for wealth tax support and added effects from deservingness heuristics. Although treatment effects decline over time, many remain significant and meaningful, showing that redistributive preferences are elastic and responsive to behavioral interventions.

Social Cognition Preconference

12:00 PM – 5:00 PM | Location: E353B, Level 3

The Social Cognition Preconference, sponsored by the International Social Cognition Network (ISCON), spotlights emerging research that uses the methods and theories of social cognition to address diverse psychological phenomena. This year, the program highlights social cognition from basic mechanisms to applications. Our program features a range of cutting-edge research from several invited speakers, a distinguished keynote speaker (Dr. Serena Chen), ISCON best paper and early career award winners, and a graduate student poster session.

*PRECON (IN-PERSON)

Lunch

12:00 PM – 1:00 PM

Lunch will be served in the Exhibit Hall prior to the preconference starting at 1:00pm. Seating is available in the Exhibit Hall, Cafe on Level 3, and the Lobby on Level 2. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

oGrilled Chicken Pesto Sandwich: Grilled Chicken Breast, Fresh Mozzarella, Oven Dried Tomato, Arugula, Basil Pesto, Ciabatta Roll

oRoast Turkey Caprese Pasta Salad: Rotini Pasta, Cherry Tomatoes, Fresh Mozzarella, Basil Pesto, Mixed Greens, Balsamic Glaze

oRoasted Vegetable Wrap (V): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto, Wrap (limited gluten free wraps available)

oMediterranean Chickpea Salad (VG | GF | DF): Crispy Chickpeas, Cucumbers, Tomatoes, Red Onion, Kalamata Olives, Feta Cheese (on the side), Mixed Greens, Lemon Vinaigrette

Welcome & Introduction

1:00 PM – 1:15 PM

Session 1

1:15 PM – 1:30 PM

Speaker

Evava Pietri

Associate Professor | University of Colorado, Boulder

Session 2

1:30 PM – 1:45 PM

Speaker

Nicholas Alt

Assistant Professor | Occidental College

Session 3

Gender Preconference

12:00 PM – 5:00 PM | Location: E353C, Level 3

The Gender Preconference brings together emerging and classic approaches to the social psychology of gender. Presentation formats include invited talks, data blitzes, and posters. This year's three sessions will focus on (1) masculinity and guns, (2) gender identity and personal expression across time, and (3) the action of (de)gendering—"gender as a verb." Weaving through these sessions, additional themes of intersectionality and gender expansive gender identities will be in focus. Five-minute data blitz talks will highlight innovative work on "hot topics" of interest.

*PRECON (IN-PERSON)

Lunch

12:00 PM – 1:00 PM

Lunch will be served in the Exhibit Hall prior to the preconference starting at 1:00pm. Seating is available in the Exhibit Hall, Cafe on Level 3, and the Lobby on Level 2. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

oGrilled Chicken Pesto Sandwich: Grilled Chicken Breast, Fresh Mozzarella, Oven Dried Tomato, Arugula, Basil Pesto, Ciabatta Roll

oRoast Turkey Caprese Pasta Salad: Rotini Pasta, Cherry Tomatoes, Fresh Mozzarella, Basil Pesto, Mixed Greens, Balsamic Glaze

oRoasted Vegetable Wrap (V): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto, Wrap (limited gluten free wraps available)

oMediterranean Chickpea Salad (VG | GF | DF): Crispy Chickpeas, Cucumbers, Tomatoes, Red Onion, Kalamata Olives, Feta Cheese (on the side), Mixed Greens, Lemon Vinaigrette

Personality Science Preconference

12:30 PM – 5:00 PM | Location: E270, Level 2

The Personality Science Preconference showcases new directions in personality and individual differences research across diverse topics, methodologies, and samples. Programming will include traditional symposia, an early career data blitz, a poster session, and ample opportunities for open discussion, encouraging active involvement by all attendees. Given that personality psychology is the study of similarities and differences in individuals' experiences, we will feature programming that intersects with social, cultural, clinical, health, biological, organizational, and community psychology and beyond. Join us!

*PRECON (IN-PERSON)

Lunch

12:30 PM – 1:00 PM

Personality development beyond the Big Five: Humility and Courage across the lifespan

2:40 PM – 3:40 PM

Personality development research is a thriving field within personality science. However, much of our understanding of these trends (e.g., the maturation principle and the disruption hypothesis) is derived from research on the Big Five traits. In the present study, we provide a fine-grained portrait of age-graded differences in personality traits beyond the Big Five across the lifespan. Specifically, we shed light on year-by-year differences in the development of Humility (Study 1) and Courage (Study 2) with a large-scale cross-sectional dataset ($n=2,025,004$). Employing multigroup confirmatory factor analysis, ANOVAs, and multilevel modeling, we examine mean-score differences in Humility and Courage from age 10 to 70 across the entire sample, and for temporal (e.g., pre-COVID, COVID) and geographical (10 countries across 5 continents, 6 US states) subsamples. Across the two personality traits, we find some convergence in their development (maturation principle) and discrepancies (disruption hypothesis) relative to the Big Five, with greater temporal and cultural variability. These findings call for further efforts to expand the literature beyond common personality taxonomies.

The Genetics of Personality Self-Perception are Biologically Coherent and Related to Positive Life Outcomes

2:40 PM – 3:40 PM

Self-specific personality variance (SSPV) captures one's personality assessment unique to their perspective which does not overlap with others' assessments of them. Though past research has begun to explore SSPV phenotypically, genetic investigation into SSPV is scarce. Leveraging two large genetic datasets (N = 500,000 .Ài 1,100,000 self-reports, N = 21,986 other reports), we used GenomicSEM to extract an SSPV factor, examine its structural properties, and characterize its nomological network. We found that SSPV was heritable and largely operated through a common latent factor. SSPV was genetically and positively related to a wide range of external subjective (e.g., well-being), objective (e.g., educational attainment), and self-enhancement (e.g., social desirability) outcomes, and was negatively associated with self-deprecation (e.g., low self-esteem). SSPV was also indicative of healthy psychological functioning (e.g., lower risk for psychiatric disorder diagnosis) and positive physical health (e.g., less hospitalization). This work suggests that unique self-perspective is not solely measurement bias to be removed, but a consequential, unitary, and biologically-based phenomenon.

Genetic liability to big 5 personality traits are associated with childhood environments, behaviors, and biology

2:40 PM – 3:40 PM

The Big 5 personality traits, Extraversion, Agreeableness, Conscientiousness, Neuroticism, and Openness, are moderately heritable correlates of complex behavior, biology, and health (Schwaba et al 2025). These domains generally stabilize in young adulthood, but the childhood correlates that may contribute to the development of adult personality remain poorly understood (Bleidorn et al., 2022). We conducted a phenomewide association study (PheWAS) to estimate the environmental, behavioral, and biologic correlates (nphenotypes=1,271) of polygenic indices of adult Big 5 personality among 5,556 children in the Adolescent Brain Cognitive Development (ABCD) Study at 2 time points (ages 9-11; 11-13). Despite not directly measuring Big 5 traits, there was marked correspondence between genetic liability scores and behavioral and environmental measures, such as associations between genetic liability to neuroticism and child mental health measures and genetic liability to extraversion and impulsivity items. In addition to demonstrating portability across development, our results suggest that genetic propensity to personality captures meaningful individual differences in youth behaviors.

Linking pathological personality trait to workplace behaviors: using co-twin control to understand pathways

2:40 PM – 3:40 PM

Personality predicts behaviors, but there is a clear dichotomy in the literature between some using personality traits (e.g., Big Five) as the focal construct and others using personality disorder/pathology. We aim to bridge these two traditions by presenting preliminary result on the link between pathological personality traits, as measured by the 52-item version of the Personality Inventory for DSM-5 (PID-5) and self-reported workplace behaviors. 4,193 participants from the Colorado and Minnesota Twin Study (COMN) completed a self-report survey including constructs of our interest. We will conduct co-twin control analyses, which control between-family effects while testing whether twins with higher levels personality pathology have proportionally less prosocial workplace behavior than their co-twins with lower levels of personality pathology. We will also conduct biometric twin models to decompose between- and within-family variance in and covariance between PID-5 traits and workplace behavior. These findings will help us understand personality pathology in non-clinical settings, including whether such associations are independent of other confounds shared by twins.

Beyond density distributions: Testing the predictive validity of personality as a dynamic system

2:40 PM – 3:40 PM

Dynamical systems theory approaches to personality recast personality traits from mere aggregates of behaviour to equilibria to which personality returns upon perturbation. These frameworks enable us to conceptualize people not only in terms of their typical behavioural tendencies (attractor location), but also in terms of their reactivity to situational forces (attractor strength), affording a more systematic examination of personality variability than has been previously pursued. However, so far there is little in the way of empirical evidence as to whether these parameters constitute distinct, stable, and consequential features of a person. To address this, the present work uses behavioural and experience sampling data (n=241) to pit attractor strength and location against traditional personality measures (global self-report and state density distribution parameters) in the prediction of 13 distal life outcomes. Doing so, we build towards a firmer understanding of how the dynamics of one's personality shape the course of one's life.

The cultural shaping of self-presentation

2:40 PM – 3:40 PM

During high-stakes interpersonal evaluations, such as job interviews, individuals strategically manage and present self-related information to shape others' perceptions and reinforce goals and values that they use to define themselves. Does culture influence which "foot," individuals put forward in self-presentation? College applicants to a private university in the Mid-Atlantic region of the U.S. are prompted to write about themselves in their applications. Text analysis was applied to these self-essays from 2019 to 2025 to examine cross-cultural differences in self-presentational styles. Controlling for applicants' gender, intended major, science degree status, and standardized test scores, Asian American applicants ($n = 18,001$) were more likely to comment on their behaviors rather than their mental processes, used fewer agentic traits (such as confidence), and referenced moral and family processes more often than their Euro-American counterparts ($n = 30,402$); an interdependent self-presentational style was significantly associated with a higher likelihood of admission. This work calls attention to the cultural shaping of self-presentation in high-stakes decision contexts.

The Content, Structure, and History of English Trait Words

2:40 PM – 3:40 PM

Trait words are the currency helping us understand and represent both real and perceived differences between people and groups. Here, we advance our understanding of traits by revealing new insights into their content, structure, and evolution using large language models and human raters. Across four studies, we: (a) introduce one of the most comprehensive trait lists to-date (2,847 trait words); (b) establish normative human ratings of these traits (from $N = 3,070$ English speakers) along 24 empirically-derived dimensions; (c) detect a four-factor structure of Fitness, Agency, Communion, and Traditionalism (FACT) from these dimensions; and (d) reveal systematic differences in the coherence, valence, and historical evolution of these dimensions and factors. We show that the FACT model covers significantly more traits than previous models like the Big Five (96% vs. 79%). Moreover, these four factors differ in their coherence, valence, and historical usage. Our paper showcases new methods for discovering and analyzing trait words, and provides a new functional constructionist theoretical perspective on the structure, content, and evolution of trait language.

Do Volitional Change Goals Predict Growth? Evidence from a Large-Scale Well-Being Intervention

2:40 PM – 3:40 PM

Do volitional personality change (VPC) theories extend to well-being growth? We test two VPC claims: (1) change goals predict growth and (2) goal-aligned behaviors facilitate change. We analyzed data from Pathways to Happiness, a 4-week online intervention ($N=4373$). Participants selected change goals targeting well-being characteristics: resilience (handling stress), compassion, mindfulness, connection (improving relationships), happiness, and purpose. Change goals predicted perceived and actual change in corresponding characteristics at check-in and post-test. However, effects were stronger for perceived than actual change, suggesting goals motivate perceptions exceeding measured growth. Using independent ratings ($N=685$), we identified activities best/least aligned with each characteristic. Goal-holders completing highly-aligned activities perceived greater improvement than those completing poorly-aligned activities, but actual change did not differ significantly. These findings extend VPC beyond personality traits to well-being, highlighting the need to differentiate subjective perceptions from objective change in interventions where participants hold strong growth expectations.

Tandem virtue development: Latent growth trajectories of welcoming accountability, patience, and courage in goal pursuit

2:40 PM – 3:40 PM

Informed by philosophical virtue theory, we tested developmental trajectories of the tendency to welcome accountability to other people in tandem with patience and courage. We sampled 870 US undergraduates pursuing personally-identified goals ($N = 1,996$ goals) across four timepoints in two years. Multi-level bivariate latent growth curve modeling disaggregated between-person patterns from within-person goal-level patterns for the three virtue measures. All three virtues' slopes were nonsignificant, meaning virtues showed no uniform patterns of change for the sample. The slope of welcoming accountability was associated with the slopes of patience and courage so closely at the between-person level that a combined slope parameter was created, indicating virtues developed collectively. Importantly, at the within-person goal-level, the slopes of the virtues were not associated; in the context of pursuing particular goals, virtues developed distinctly. Results suggest that collective character growth, stagnation, or decline occurred for the whole person, yet specific goals call for specific virtues.

How Personal Values Shape Daily Stress: A Multilevel Value-Situation Analysis

2:40 PM – 3:40 PM

Understanding what drives everyday stress is crucial for psychological well-being. Yet the role of personal values in shaping stress responses remains surprisingly understudied. We developed a model integrating Schwartz's (1992) theory of basic human values with psychological situation characteristics (Oreg et al., 2020) to predict stress appraisals (Lazarus & Folkman, 1984) in daily life. In an experience sampling study, 303 participants reported their personal values and completed three daily reflections over five consecutive days ($K = 3,520$), reporting on the situation they were in, the values it expressed or conflicted with, its familiarity, and stress. Results showed that for benevolence and power values, the interaction between personal values and the values the situation expressed predicted familiarity, such that conflicted patterns were perceived as less familiar. This, in turn, predicted higher stress. Moreover, the link between familiarity and stress was stronger for those who prioritized security and weaker for those who valued stimulation. Findings show that personal values shape daily stress by predicting familiarity and moderating its effect on stress.

We Are What We Watch: Genre Preferences and Personality

3:40 PM – 3:55 PM

Movies provide consumers the opportunity to engage with inspiring or relatable stories. People's attraction to certain movies may stem from the ways their narratives reflect people's personalities. As such, research shows that personality is tied to movie genre preference (e.g., favoring drama and being more neurotic), and people seek out characters with whom they share personality traits (e.g., people high on dark triad traits like villains). Two studies ($N = 658$) further establish the individual differences tied to movie preferences. Study 1 ($N = 158$) correlated participants' Netflix viewing data to Big Five personality traits. Findings revealed correlations between watching Crime movies and Openness to experience ($r = .20$), and watching Romance movies and Extraversion ($r = .18$). Study 2 ($N = 500$) expands the results of Study 1 by testing the relationships between viewership and traits, including personality, attachment, and dark tetrad. Together with the results of Study 1, the eventual results of 2 will provide insight into the extent to which media consumption reflects aspects of the self.

[121] The effect of Dark Triad traits on customers' moral intentions

4:00 PM – 5:00 PM

We investigate the factors affecting participants' moral intention to report a billing error in retailing situations. Study 1 is an online survey implementing a 3 (Agent) x 2 (Learning) between-subjects design. 478 participants read a vignette describing an error made by either a human, an automated robot or a self-checkout machine, provided with or lacking the ability to learn from reported mistakes. They then evaluate their intention to report the billing error and subjective guilt. Of interest, results fail to replicate previous literature concerning the effect of Agent on participants' moral intentions, while we unveil an effect of Learning. Agents provided with the ability to learn from reported errors elicited higher guilt and moral intention to report such errors. Noteworthy, while Machiavellianism and Psychopathy scores - from the Short Dark Triad - were associated with reduced moral intentions, Narcissism yielded an opposite pattern, highlighting relevant individual differences. This has important real-world implications in everyday retailing scenarios. Study 2 is to be conducted. All studies fully follow research best practices and clearly answer RQs.

[122] Moral Relativism Recast: MARS validation and Flexible Harm Inference.

4:00 PM – 5:00 PM

People's moral philosophies, i.e., whether they lean toward relativism or absolutism, shape not only policy stances on politicized issues, but also how they interpret everyday conflicts. Yet, no validated scale has systematically captured this distinction. We advance a new conceptualization of moral relativism that unifies measurement and mechanism. Across 4 studies, we formalize relativism as variability across individual, societal, and situational beliefs, developing the Moral Absolutism and Relativism Scale (MARS). In Study 1 (N=649), factor analyses supported a three-factor structure. Study 2 (N=201) established predictive, discriminant, and concurrent validity and strong test-retest reliability. In Study 3 (N=202), the three subscales showed distinct predictive power for domain-specific vignettes. Study 4 (N=100), drawing on dyadic morality, found that relativism correlated with lower perceived victim vulnerability and reduced assignment of agent and patient roles. Together, these studies recast relativism as a flexible, multi-domain mode of harm inference, offering a validated scale and a new lens on moralization and ideological conflict.

[123] Harmoniously Authentic: The Development and Validation of Outside Roundness and Inside Squareness Self-Perception Scale

4:00 PM – 5:00 PM

Authenticity is a central concept in self and identity but less is known in its manifestation in Majority World contexts. Recent theories state that in Confucianism, authenticity is construed as a balanced integration of integrity and moral consciousness (Inside Squareness, IS) and the pursuit of interpersonal harmony through moderate and adaptive behavior (Outside Roundness, OR; Du et al., 2025). However, this framework lacks empirical support and respective measurement tools. In this study, we extend this line of work by devising and validating the Outside Roundness and Inside Squareness Self-Perception Scale (ORISSPS), based on 786 Chinese participants. A 14-item 2-dimensional scale was finalized, demonstrating high reliability, construct and criterion validity, as well as meaningful nomological correlations. Specifically, while trait authenticity is only predicted by IS and not OR, a more culturally relevant measure of Balanced Authenticity and psychological adaptation constructs (e.g., meaning in life, self-esteem) are predicted by both dimensions. This research contributes to a more inclusive and generative knowledge of understanding and measuring authenticity.

[124] Existential Isolation and Incel Traits: Implications for Well-being

4:00 PM – 5:00 PM

Recent work has begun to examine personality traits that define an "incel," (i.e., involuntary celibate) and their risks to well-being. Yet, the social factors associated with these traits, and potential interventions, remain unclear. The present research tested whether dispositional existential isolation (i.e., perceptions of being alone in one's subjective experiences/worldview) is one such determinant and explored its implications for unpartnered men's well-being. In Study 1, we examined links among existential isolation, incel traits, and negative self-perceptions; in Study 2, with meta-dehumanizing and misogynistic perceptions; and in Study 3, whether I-sharing could improve mental well-being. Across these studies, more existentially isolated, unpartnered men exhibited more incel traits, reported more negative self-views, and perceived more negative evaluations from women. However, I-sharing feedback may be effective for attenuating such outcomes. Findings existential isolation is common among men with more incel traits, and highlights addressing this as a potential pathway to improve unpartnered men's well-being.

[125] Examining the Longitudinal Impact of Substance Use on Crime in People with High Psychopathy

4:00 PM – 5:00 PM

Investigating the antecedents of crime is crucial to developing effective prevention programs and protecting public safety. Prior research has established that both psychopathic traits and substance use independently contribute to criminal behavior, though few studies have examined how substance use contributes to criminal outcomes over time among individuals with high psychopathy in community settings. In this longitudinal study, data was collected from a unique pool of participants scoring in the 95th percentile of psychopathic traits through a 501(c)3 nonprofit, yielding one of the most diverse high psychopathy samples to date (N = 190). Using a cross-lagged panel model, we expect greater self-reported substance use to increase the likelihood of committing a crime at a one-year follow-up. Early life factors which may influence initial rates of substance use will also be considered in analysis. The present research has important implications for clinical practice and the criminal justice system.

[126] Being Yourself: Self-Perceived Personality Consistency and the Feeling of Authenticity

4:00 PM – 5:00 PM

Self-consistency is often seen as key to authenticity, yet research shows inconsistencies in how it is defined and measured, creating ambiguity in its link to authenticity. The present study aims to quantify four distinct conceptualizations of self-consistency and the links of each to state and trait authenticity simultaneously. Using a daily reconstruction method, around 200 undergraduate students reported on three social interactions per day, rating their state personality, contextual demands, and state authenticity. Four types of consistency are tested: 1) across-context consistency, the extent to which state personality remains stable across situations; 2) within-context consistency, personality stability when interacting with the same individuals across settings; 3) state-trait consistency, the similarity between state personality and trait self-perceptions across contexts; and 4) state-context consistency, the match between state personality and contextual demands. We examine how these distinct forms of self-consistency relate to authenticity and whether culture moderates these links, advancing understanding of self-consistency's role in authentic self-expression.

[127] Validating the Short Version of the Moral Foundations Questionnaire-2 across Cultures

4:00 PM – 5:00 PM

Moral Foundations Theory has recently undergone a theoretical refinement. Moral Foundations Questionnaire-2 (MFQ-2) was developed to operationalize six moral foundations (care, equality, proportionality, loyalty, authority, purity) based on these refinements. Here, we validate its short version (MFQ-2-S) across 5 studies. In Studies 1-3, we use factor analytic methods to explore and validate the factor structure of MFQ-2-S. In Study 4, we establish criterion validity of MFQ-2-S by investigating the relationship between its scores and 18 criterion variables. In Study 5, we establish measurement invariance of the questionnaire across 10 diverse populations, in addition to exploring the higher-order structure of moral foundations. Our results indicate that MFQ-2-S is reliable and valid across different populations. We also conduct a single paper meta-analysis of gender and ideological differences found in our samples, replicating prior work on gender and political differences in endorsement of moral values. In sum, MFQ-2-S provides an efficient way of studying 6 moral values with 24 items.

[128] Evaluating Measures of Experiences with Social Structures in Relation to the Big Five and Big Six Personality Domains and Facets

4:00 PM – 5:00 PM

There is renewed interest in environmental influences on personality, yet research linking people's experiences with social structures and their accompanying information-processing tendencies to the Big Five and Big Six personality domains remains under-integrated. In this preregistered study, we collected cross-sectional survey data from a diverse sample (N=1040) via CloudResearch. We assessed experiences with social structures using widely cited measures from social, personality, and developmental psychology, and measured personality using the BFI-2 and HEXACO-60. We used structural equation modeling to examine associations among these variables. We observed frequent correlations for information-processing tendencies, reflecting links with how people navigate complex, emotionally salient environments. We also observed moderate to strong correlations for experiences of power, identity, and justice. Overall, our findings underscore the importance of considering systemic contexts within personality research.

[129] Trauma, Care, and Morality: Emotions as the Link Between Childhood Adversity and Moral Foundations

4:00 PM – 5:00 PM

ACEs are prevalent predictors of poor health outcomes in adulthood, but their impact on moral foundations remains underexplored. The study examined the effects of ACEs on adult morality and proposed affective personality traits and caregiving factors as possible mediating mechanisms. The researcher administered a survey to a global sample of N = 376 English-speaking adults, comprised of four validated survey measures that assessed retrospective and present experiences, traits, and character styles. The survey assessed ACE exposure, evolved caregiving practices (EDNH), an affective personality measure (ANPS), and the Moral Foundations Questionnaire (MFQ-20). Results from group comparisons between high-ACE (≥4) and low-ACE (≤3) subjects indicated significant differences, with the high-ACE group tending toward higher Individualizing and lower Binding moral foundations scores compared to low-ACE subjects. SEM indicated a mediated link between ACEs and MFT, where positive personality traits and heightened EDNH scores predicted both Binding and Individualizing moral foundations. These results suggest early nurturance promotes positive emotional development, shaping moral proclivities.

[130] Sensory Processing Sensitivity and Internalizing Symptoms Across the Pubertal Transition

4:00 PM – 5:00 PM

Puberty is associated with an increase in internalizing symptoms among girls. Sensory Processing Sensitivity (SPS), a trait that captures an individual's sensitivity to their environment, may make girls more susceptible to internalizing symptoms. The stability of SPS across puberty and its reciprocal associations with internalizing symptoms (anxiety, depression, and stress) are unknown. The current study included girls (N= 300; ages 10 to 14; 81% White) from a larger longitudinal study. Participants completed PROMIS measures and the Highly Sensitive Child scale at three timepoints (T1=pre-menarche, T2=post-menarche, T3 = 1 year after T2). Dyadic cross-lagged panel models indicated that SPS showed moderate rank-order stability from T1-T2 ($\text{Ces,}\hat{\alpha}\hat{\alpha}.39$) and strong stability from T2-T3 ($\text{Ces,}\hat{\alpha}\hat{\alpha}.66\hat{\alpha}.69$). Internalizing symptoms were moderately stable (anxiety $\text{Ces,}\hat{\alpha}\hat{\alpha}.49/.53$; stress $\text{Ces,}\hat{\alpha}\hat{\alpha}.45/.47$; depression $\text{Ces,}\hat{\alpha}\hat{\alpha}.47/.44$). SPS predicted depression from T1,ŪT2 ($\text{Ces}= .15, p=.006$, surviving FDR). None of the paths in the anxiety and stress models were significant. SPS appears to be trait-like among early adolescent girls, and high SPS may be a susceptibility factor for the onset of depressive symptoms among girls.

[131] From Early Experiences to Overcontrol: A Longitudinal Study of Overcontrol using Machine Learning

4:00 PM – 5:00 PM

Overcontrol, a pattern of excessive self-constraint, emotional inhibition, and low risk-taking, represents a maladaptive form of self-regulation that can contribute to psychopathology and unhealthy interpersonal functioning. Prior research using children and adolescent samples have identified biological, behavioral, and environmental predispositions as crucial predictors. However, less is known about how different factors manifested through one's complete developmental trajectory integratively contribute to the emergence of overcontrol over time. Using data from the National Longitudinal Survey of Youth (NLSY), this study leverages machine learning models to examine how chronological developmental experience, including family and parental status, parental dynamics, social interactions, and school environments, predict later expressions of maladaptive self-regulation. The findings demonstrate superior predictive performance using full developmental history in predicting maladaptive self-regulation relative to traditional cross-sectional analysis. The results pose potential strategies for early identification and prevention in educational and clinical settings.

[132] Feeling Good Leads to Stable Play: Reciprocal Feedback between Gaming and Well-Being

4:00 PM – 5:00 PM

Video games are a ubiquitous form of leisure with complex connections to well-being. Using a large longitudinal dataset (N = 7,618; 74,422 player-days), we applied a dynamic -SEM approach to estimate continuous-time effect sizes and draw implications for same-day, next-day, and between-person associations between playtime and well-being, enjoyment, autonomy, competence, focus, and immersion. On days when players gamed more, they reported slightly higher levels of affective functioning compared to their typical well-being ($r = .05, p < .001$). However, this same-day association did not persist over time. In contrast, higher well-being predicted slightly more play the following day ($\text{Ces} = 0.02, p < .01$), consistent with a "feel-good-return," pattern. Location,Ūscale models showed that individuals experienced modest increases and greater stability in well-being on days they played more, suggesting gaming may temporarily elevate and stabilize affect. Event-specific effects (e.g., progression, equipment unlocking) and behavioral tendencies (e.g., idle time, regularity) illustrate how design features can shape short-term psychological experiences.

[133] Trait and Aggressive Driving in Driving Simulator

4:00 PM – 5:00 PM

In this study, 39 undergraduate psychology students from the University of West Florida participated for course credit. They completed assessments on boredom proneness and the FFM traits of conscientiousness, neuroticism, and extraversion. Participants also reported past driving violations (e.g., DUI, speeding, texting, at-fault collisions) and completed the Dula Dangerous Driving Index (DDDI), which measures Risky, Aggressive, and Negative Emotional driving tendencies. A timed, frustration-inducing driving scenario was conducted using the STISIM Drive simulator. Of the 39 participants, 8 had prior traffic citations. Among them, citations were significantly related to extraversion ($r = -.52$), neuroticism ($r = .46$), and DDDI Aggressive Driving ($r = .58$). Their citation history was also marginally related to aggressive simulator behavior ($r = .69, p = .06$), suggesting real-world habits may transfer to simulated driving. In the full sample, simulator aggression was significantly linked to DDDI Risky Driving ($r = .37$) and low conscientiousness ($r = -.43$). These results support personality-based screening as a tool for identifying risky drivers.

[134] Is cognition like emotion: Peak versus typical expressions in daily life

4:00 PM – 5:00 PM

Recent evidence shows cognitive performance varies within people, challenging the assumption that individual differences in intelligence are stable (e.g., Aschenbrenner & Jackson, 2024; Lovden et al., 2007; Schmiedek et al. 2013). Subsequently, the view that cognitive measures assess individuals' maximum cognitive ability, instead of their typical cognitive level, has been put into question (e.g., Vaughan & Birney, 2023). In the present work, we aim to examine within-person distributions in cognitive performance with respect to these two views. The maximal-level view implies cognitive performance is negatively skewed around individuals' true capacity, with contextual factors (e.g., stress) serving to reduce functioning rather than enhance it. The typical-level view implies a normal distribution, with contextual factors driving cognitive performance above and below typical levels. Our preliminary findings support the maximal view of cognitive expression, unlike the manifestation of personality and emotions which typically fall under normal distributions. This conclusion, however, does not hold for all measures, highlighting the functional differences across cognitive measurements.

[135] Big Five Personality Trait and Major Life Goal (Co-)Development: Findings from a Longitudinal Study of German Adults

4:00 PM – 5:00 PM

Previous cross-sectional and longitudinal research has shown that the Big Five personality traits are associated with major life goals across adulthood. However, prior research has not included all types of major life goals relevant to lifespan development (e.g., Physical Health goals), and we do not know whether existing stability, change, and co-developmental patterns of the Big Five and major life goals generalize across sociocultural contexts. We replicate and extend prior research by using longitudinal data from a sample of 3,023 German adults (58% female; baseline age M=19.55) spanning 18 years (with eight waves, spaced biennially). Results showed that although rank-order stability and mean-level change of the Big Five and major life goals generally mirrored findings from prior work, some nuances emerged in the co-developmental patterns. For example, greater increases in Openness to Experience were associated with greater decreases in Prosperity goals. We discuss contextual implications of the Big Five and major life goal (co-)development across types of goals, culture, and timescale.

Mindworks: The Science of Thinking, A Chicago-only Experience During SPSP 2026

3:00 PM – 5:00 PM | Location: Offsite

Mindworks is a public-facing discovery center and active behavioral research lab in downtown Chicago, approximately a 15-minute ride from the convention center. Operated by the Roman Family Center for Decision Research at the University of Chicago Booth School of Business, Mindworks invites visitors to explore how people think and decide while participating in real studies that advance behavioral science. Participation in these studies helps researchers better understand human behavior, while participants earn prizes and contribute to advancing science.

Mindworks will provide a continuous shuttle loop between the McCormick Convention Center and Mindworks on Thursday, February 26 from 3:00–5:00 PM or drop in on your own (hours listed here: <https://www.chicagobooth.edu/mindworks/visit>). A visit to Mindworks lasts about 30 to 60 minutes, depending on how many studies you'd like to take. Capacity is limited (45 at a time).

Celebrating SPSP's 2025 Awardees: Ceremony and Reception

5:15 PM – 6:00 PM | Location: Lakeside Ballroom E354A, Level 3

The SPSP Awards Program recognizes individuals in the personality and social psychology community for their career accomplishments, outstanding research, dedication to the field and commitment to their communities. This year the awards program will celebrate our 2025 class! You can expect guest appearances from SPSP leaders as they speak about the considerable impact of this year's recipients.

[A] Masculinity in Community: Analyzing Identity Construction Discourse in r/JordanPeterson

5:59 PM – 6:59 PM

GROUPS/INTERGROUP PROCESSES

In recent decades, the quest for meaning among men has emerged from what scholars call a “crisis of masculinity” as men have become disillusioned with shifts in gender roles, perceived losses of socioeconomic power, and other symptoms of cultural change. In the so-called manosphere, online figures have attempted to gain popularity by addressing these struggles among men. One such figure is Jordan B. Peterson, a Canadian psychologist and author who writes extensively on self-help topics as they relate to men’s experience of power and satisfaction in their daily lives. The current study analyzes every post from Peterson’s subreddit community from 2017–2024 (n=123,791) to understand relationships between thematic content, sentiment, and engagement. Our findings reveal four distinct timeframes in which group identity shifts to maintain stability through oppositional engagement with feminist and LGBTQ+ movements while channeling collective grievances into individual self-improvement. This study reveals gendered uncertainty-identity processes within neoliberal self-help communities, with implications for online radicalization and masculine politics.

[B] Triage Decisions in Crisis: Moral Foundations as Predictors for Resource Allocation

5:59 PM – 6:59 PM

MORALITY

Triage is the process of allocating limited resources, most commonly associated with medicine, but similar principles (e.g., zero-sum thinking) can be applied to various scenarios (e.g., politics, education, war, the economy, and social issues). Moral Foundations Theory (MFT) is a framework for understanding morality that proposes that moral intuitions are based on a finite number of foundations (Graham 2013). MFT has come to be associated with political psychology, since “individualizing” foundations (care and equality) are predictive of liberal ideologies, and “binding” foundations (authority, loyalty, purity, and proportionality) are predictive of conservative ideologies (Graham 2009). To examine if moral foundations predict support for group prioritization in hypothetical triage, we asked participants if and how they would prioritize certain demographic groups. Individualizing foundations were predictors for prioritizing historically disadvantaged or marginalized groups (low SES, non-citizens, unemployed, non-White, incarcerated) and groups typically perceived as vulnerable (children, women, the elderly). In contrast, binding foundations were predictors for prioritizing those typically advantaged in a status quo hierarchy (high SES, citizens, and employed individuals) and groups traditionally protected (women and the elderly). In situations with scarcity, moral foundations drive decision-making, resulting in a fundamental disagreements about who deserves to survive and vastly different outcomes depending on who performs triage.

[C] Cultural Differences in the Effect of Relationship Closeness on Self-Disclosure

5:59 PM – 6:59 PM

CULTURE

Self-disclosure is typically regarded as an essential component of interpersonal relationships in the West; however, this assumption does not necessarily hold true across different cultural contexts. This study aimed to examine how relationship closeness and information valence influence patterns of self-disclosure to various targets in European Canadian, Chinese, and Mexican samples. Utilizing an online survey, participants classified targets according to closeness and rated their likelihood of self-disclosure for four scenarios to eleven different targets. The results revealed distinct cultural patterns, with Chinese participants showing overall lower disclosure tendencies compared to Canadian and Mexican participants and showing particularly lower tendencies in the context of negative information to close others. Mexican and Canadian participants showed similar levels of expressiveness; however, Mexican individuals demonstrated significantly smaller valence effects compared to both Canadian and Chinese individuals. Through the inclusion of factors such as information valence and relationship closeness, findings from this study are expected to deepen the current understanding of self-disclosure across various cultural frameworks. This study addressed the current lack of research on self-disclosure tendencies in Latin America, contributing to a broader cross-cultural understanding beyond the East and West, as well as offering insight into the different kinds of interdependence.

[D] Predicting Midlife Outcomes Across 20 Years: The Roles of Life Goals, Personality Traits, and Cognitive Ability

5:59 PM – 6:59 PM

PERSONALITY PROCESSES/TRAITS

Objective: What predicts long-term success and well-being in adulthood? While personality traits and cognitive ability are well-established predictors, motivational orientations such as life goals have received less attention. Building on the framework of Stoll et al. (2017), this study examined how college students' life goals, Big Five personality traits, and SAT scores combine to predict key midlife outcomes in health and well-being, achievement, and relationship domains two decades later.

Method: Data came from the Berkeley Longitudinal Study (BLS). At baseline in 1992, 508 undergraduates provided data on life goals, personality, and SAT scores. Twenty years later, 237 participants (age $\approx$ 41) completed a follow-up survey on their life outcomes. Hierarchical regression analyses evaluated the unique and combined contributions of goals, traits, and ability, while accounting for demographics and socioeconomic background.

Preliminary findings: Personality traits emerged as the most consistent predictors. Life goals showed more domain-specific predictive power but were less pervasive than personality traits. Cognitive ability showed minimal associations beyond other factors.

[E] Digital Signals: Emoji Use and Racial Impressions

5:59 PM – 6:59 PM

STEREOTYPING/PREJUDICE

Skin-tone-modified (STM) emojis have been widely used since their launch in 2015, yet little research has examined how they shape social perceptions. This study investigates how STM emojis (light, tan, dark) and the non-STM yellow emoji influence perceptions of an online interaction partner's racial identity and social impressions. In a between-subjects design (N = 280), participants engage in an online chat with a pre-programmed "interaction partner" who uses one of four emojis. Participants then report the partner's perceived race, provide explicit evaluations (e.g., stereotype content, global impression), and complete an innovative emoji Implicit Association Test. We test whether (a) STM emojis function as racial cues (e.g., users of the light emoji are perceived as White), (b) skin tone of the emoji influences how positively or negatively the user is evaluated, and (c) the yellow emoji is perceived as racially neutral - not signalling any racial group memberships. This study explores how subtle digital signals may reinforce or disrupt racial assumptions in online spaces.

[F] Less is More When Time is Scarce: How Time Poverty Enhances Minimalistic Consumption Through Increased Need for Order

5:59 PM – 6:59 PM

APPLIED SOCIAL PSYCHOLOGY

Minimalistic consumption, characterized by reduced possessions, sparse aesthetics, and mindful curation, has recently gained prominence. While prior research has examined demographic and dispositional factors, less is known about how subjective psychological states, such as time poverty—the feeling of “having too much to do but not enough time”—shape this behavior. We propose that time poverty fosters a heightened need for order, which in turn drives preferences for minimalistic consumption (Fennis & Wiebenga, 2015; Gong et al., 2023). Minimalism thus functions as a compensatory strategy, helping time-poor individuals restore structure.

Study 1 (N = 200, Mage = 33.86, SD = 5.91, 40.5% female) employed a recall-based manipulation of time poverty and measured need for order alongside three behavioral indicators of minimalism: choices between sparse vs. cluttered aesthetics, number of possessions selected, and resistance to impulse purchases. Results showed that time-poor participants preferred sparse aesthetics and fewer possessions, with mediation analyses confirming that these effects were mediated by need for order.

Study 2 (N = 200, Mage = 28.72, SD = 7.46, 66.5% female) replicated the findings using a scenario-based manipulation and a validated 12-item minimalism scale. Again, time-poor participants exhibited stronger minimalistic tendencies, particularly for sparse aesthetics and limited possessions, with need for order mediating these effects. In addition, the mediating role of need for relaxation has also been excluded.

Study 3 (N = 260, Mage = 29.73, SD = 7.27; 69.2% female) tested whether minimalistic environments alleviate the need for order. In a 2 (time poverty: high vs. low) × 2 (room style: sparse vs. maximalist) design, time-poor participants showed stronger preferences for sparse environments, and exposure to minimalist spaces reduced their heightened need for order. This demonstrates minimalism’s compensatory function under time poverty.

Across three studies, we show that time poverty enhances need for order, and then fosters minimalistic consumption, which as a way to cope with disorder. Theoretically, this work links subjective time poverty with sustainable consumer behavior and identifies need for order as the key mediator. Practically, the findings suggest that retailers can support time-poor consumers by adopting minimalist design principles and offering products that reduce decision fatigue.

[G] Nature connectedness and healthy eating: The possible role of self-control

5:59 PM – 6:59 PM

APPLIED SOCIAL PSYCHOLOGY

Nature connectedness has been shown to promote healthier eating behaviors, yet the underlying mechanisms remain underexplored. The present study investigates self-control, informed by stress reduction theory and attention restoration theory, as a critical mediator in this relationship through three studies. Study 1 (n = 200) employed a cross-sectional survey, confirmed the positive association between nature connectedness and healthy eating behaviors, while providing preliminary evidence for the mediating role of self-control. Study 2 (n = 193) employed an online experiment to manipulate nature connectedness, providing causal evidence that heightened nature connectedness enhanced self-control, which in turn led to healthier food choices in a lunch scenario. Study 3 (in progress) adopts a three-wave longitudinal design with two-week intervals to provide stronger causal claims regarding the mediating role of self-control. Together, these studies provide robust evidence for the role of self-control as a key psychological mechanism underlying the positive effects of nature connectedness on healthy eating behaviors. Our research suggests that nature-based interventions targeting self-control enhancement may serve as an effective approach for promoting sustainable healthy eating behaviors.

[1]A Dyadic Analysis of Self-report and Informant-report Social/Emotional Functioning

6:00 PM – 7:00 PM

CLOSE RELATIONSHIPS

Assessments of the health and functioning of older adults are often measured using the reports of someone close to the focal participant (informant-reports). While informant-reports are commonly used for cognitive outcomes, less research has used this technique for other outcomes (e.g., social/emotional functioning in daily life).

This study addressed these gaps in prior research by utilizing an Actor-Partner Interdependence Model to test the differences in a participant's life satisfaction, financial capacity, and daily functioning across multiple domains as reported by themselves (self-report) and a close other (informant-report) at baseline and after participation in a 16-week exercise intervention protocol.

[2] "Caras vemos, Corazones no sabemos." How Stereotypes and Perceptions Shape our Judgements on Intersectional identities within the Latinx Community.

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Whereas previous work has shown that judgments of perceptually ambiguous social categories (e.g., sexual orientation) vary as an influence of perceptually clear social categories (e.g., race and gender), there is limited research on how perceptions of Latinx identities vary as an influence on other ambiguous social categories. The present research examines how various perceptions and stereotypes overlap cognitively and shape judgments of the Latinx community. Study 1 showcases, through a Q-sort task, that when perceivers are thinking of Latino men, they are more likely to closely associate them with straight/gender typed groups. For Latina women, it was only for gender types, with no difference in sexual orientation. Study 2 predicts through the perceptions of faces, when target faces were rated as more gender typed, participants provide more straight categorizations for Latinx targets compared to white targets. However, the predicted effect will reverse when target faces are rated as gender atypical. Collectively, these findings begin to unpack perceptions of intersectional identities to further understand the mechanisms by which perceivers make judgments about Latinx identities.

[3] /n/ or /m/? : Do listeners rely on these phones to form to form their sexual orientation decisions?

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Prior research demonstrated that, upon hearing a single phone, listeners differentiated between gay and straight male talkers of American English. Moreover, when presented with many different consonants, listeners relied on a single token of /n/ to form their judgments, but did not rely on /m/.

The purpose of the present investigation is to further examine an unexplored class of phonemes: nasals. To that end, listeners judged a talker's sexual orientation upon hearing isolated tokens of /n/ and /m/. The results demonstrated that listeners relied on all tokens of /n/ to form their judgments. The results for /m/ were mixed. For some tokens, listeners did rely on /m/, and for some other tokens, listeners did not rely on /m/; we concluded that these judgements may be modulated by vowel context.

We hypothesized that listeners may rely on /m/ if it is given more attention. Prior experiments presented listeners with many consonants, and their attention was divided among various consonants. Here, listeners were only presented with two consonants and, presumably, each consonant received greater attention. An increase in attention could explain the contradictory results.

[4] ‘American=Male?’: Implications of Asian American Intersectionality on National Identity

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Empathy is a primary driver of prosocial behavior, and a foundational skill for building close interpersonal relationships. Empathy has the power to motivate altruism towards those in need, foster connection in the midst of conflict, and even bridge racial, political, and geographic divides. The problem is, we don't empathize with all "others" equally. The empathy we are born with is directed primarily towards our ingroup, and empathic bias towards racial outgroup members has been clearly documented. Fortunately, it's possible to expand our circle of empathy and develop more "inclusive" empathy towards diverse groups.

Empathy is a skill that can be fostered in the classroom, and preliminary research suggests empathy training can provide a host of positive outcomes. This paper presents the results of a cross-cultural qualitative study exploring how schools in the US, Italy, Germany, and Ecuador foster empathy. In particular, practices aiming to promote "inclusive" empathy—that which includes outgroups on various dimensions such as race, class, gender, sexual orientation, religion, ability, appearance, and species (ecological empathy)—are highlighted.

[5] “Shame on the Family, Shame on Herself”: Understanding Community Reactions to Sexual Violence Among Latinas and White American Women in the U.S.

6:00 PM – 7:00 PM

CULTURE

In the United States, Latinas experience some of the highest rates of sexual violence but the lowest rates of disclosure compared to other racial and ethnic groups. This cross-cultural, scenario-based study examines how cultural values shape responses to sexual violence among Latina and White American women, focusing on gendered expectations, prescriptive norms (what participants believe should happen), and descriptive norms (what they believe would happen). It also explores whether differences are rooted in dignity versus honor values and marianismo (the ideal of femininity and purity in traditional Hispanic cultures). Results suggest Latinas perceive stronger cultural barriers to disclosure—reporting greater shame, judgment, and reduced support—despite holding similar personal attitudes on disclosure and community responsibility to White participants. While not observed quantitatively, open-ended responses often referenced honor and marianismo as more relevant for disclosure decisions among Latinas. Findings underscore the need for culturally sensitive approaches, suggesting interventions should address stigma while fostering survivors' hopes for supportive community responses.

[6] A Dark Future: How Future Oriented Thinking in Extremists Groups Fuels Intergroup Conflict and Extremists Policies

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Future oriented thinking (i.e. cognition towards upcoming states and events; Atance & O'Neil, 2005) has been associated with positive outcomes such as national prosthagia (i.e. a sentimental longing for a future state of one's nation) predicting positivity toward social change (Armenta et al., 2022). Yet, for extremists whose views oppose social cohesion (e.g. White nationalists) their future orientated goals may oppose social functioning, suggesting a negative effect as future oriented thinking gives them hope for a future where they can enact and achieve their goals.

Our Qualtrics survey study will be given to n = 700 participants, determined via power analysis, via Prolific (completion by December 2025). Using multiple regression via SPSS PROCESS Macro (Hayes, 2017), we predict higher White nationalism will predict greater support for physical violence, authoritarianism, collective action for White nationalism, and extremist policies, through the serial mediating effect of increased national prosthagia and national hope.

If our hypothesis is supported, findings would have implications for how extremism functions and show unique negative aspects of future oriented thinking.

[7] A meta-analysis of social, psychological, and behavioral interventions for community-based infectious disease prevention and treatment

6:00 PM – 7:00 PM

META-ANALYSIS

Social determinants play a crucial role in health outcomes, yet the impact of social interventions on promoting health remains largely understudied. This research conducts a systematic literature review of social, psychological, and behavioral (SPB) interventions implemented in community settings to prevent and treat infectious diseases, including Influenza, COVID-19, HPV, and HIV. The goal is to assess the average effect size of SPB interventions and investigate between-study factors that moderate their efficacy. Preliminary search identified 37 eligible studies, and 4 of them were coded and analyzed. The results show that the average effect size of interventions was $g = 0.21$, reflecting a small positive effect on health outcomes. Continued coding and analysis of the dataset will provide greater insight into the conditions under which SPB interventions promote health behaviors in community settings by clarifying contextual, methodological, and disease characteristics that shape their effectiveness.

[8] A new cognitive-behavioural approach to acculturation research

6:00 PM – 7:00 PM

CULTURE

Structural stigma and regional bias have increasingly come to the fore as fundamental causes of health disparities. Indeed, a rapidly-expanding literature demonstrates that sexual minorities living in regions characterized by increases in or higher overall levels of discriminatory legislation and heterosexist bias exhibit poorer physical and mental health outcomes. However, potential buffers of and mechanisms linking structural stigma and health remain obscure. We utilized data from both large publicly-available datasets (Project Implicit, the US Census, MIT Election Lab, and Movement Advancement Project) and from Generations: A Study of the Life and Health of LGB People in a Changing Society, United States, 2016-2019, a longitudinal survey of a national probability sample of sexual minority Americans. More specifically, we hypothesized that social support from family, social support from friends, and subjective sexual and gender minority (SGM) community connectedness would each either moderate or mediate the relationship between state-level policy environments or county-level explicit and implicit sexuality bias and measures of health and well-being among sexual minorities.

[9] A Rose by Any Other Name Would Smell as Sweet”: The Historical-Emotional Identity Construction of Assyrians and Kurds

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Emotions play a vital role in shaping individual and community identities. Traumas and social exclusion throughout history significantly influence identity formation. This study examines the emotional experiences of Assyrian and Kurdish communities in Turkey to understand how emotions are constructed within their social and cultural contexts. For this purpose, a qualitative study involving 6 Assyrian and 6 Kurdish participants was performed. The interviews were audio recorded with the participant's consent and subsequently transcribed. The data were analyzed using the MAXQDA 24.0 software and the content analysis method. The Assyrian and Kurdish participants' emotional and identity-related experiences were evaluated from individual and societal perspectives. It was observed that social and political events, especially the Seyfo Massacre, which is often described as "social pain", shaped the collective memory of Assyrians in a deeply emotional way. Prominent emotions expressed by Assyrian participants include pain (■ ■ ■ ■ ■ harufo), fear (■ ■ ■ ■ ■ zuhtho), sadness (■ ■ ■ ■ ■ Hiznitiye), anger (■ ■ ■ ■ ■ kahir), and pride (■ ■ ■ ■ ■ kubbar). Kurdish participants noted that the political atmosphere after the 1980s clearly influenced their collective-emotional memory. The emotions expressed by Kurdish Turkologentag 2025 97 participants predominantly included anger (Hêrs), pain (Êş), exhaustion (Nemabûnî), pride (Fêz), and fear (Tîrs). The pain and anger resulting from historical discrimination were often mitigated by a sense of solidarity and pride within the community. Assyrians and Kurds expressed that embracing their identity was a source of pride. They linked their sadness over not speaking their mother tongue to the difficulty in forming emotional connections when using Turkish, highlighting the negative effects this has on identity construction. This study contributes to a better understanding of Assyrian and Kurdish groups' identity and emotional experiences in Turkey. Historical events that resonate within these groups' collective memories are critical in constructing their identity and emotions.

[10] A tale of two selves: How (Bi)cultural Identities Relate to Suppression of Emotions

6:00 PM – 7:00 PM

CULTURE

Cultural frame switching occurs when bicultural individuals shift their values and attributions in the presence of cultural cues, including language. Research has examined how cultural frame switching may impact cognition, personality, and values. Yet little research has explored how cultural frame switching may impact what people believe about and how they regulate their emotions. This quasi-experiment examines the effect of language-primed cultural frame switching (writing about an emotional experience in Chinese vs. English), and level of cultural identity, on beliefs about emotions and emotion regulation in Chinese–English bilinguals. Although we did not find main effects of the language prime, preliminary findings show that both Chinese and American cultural identity predict greater suppression. American cultural identity also predicts stronger beliefs that emotions should be controlled. Should-beliefs are significantly correlated with suppression. Secondary analyses will examine the relationship between Chinese and American cultural identities (e.g., via Bicultural Identity Integration) and incorporate qualitative analysis of emotional experience responses in the prime.

[11] “Is This the Real Life?” The Language of Real and Imagined Narratives

6:00 PM – 7:00 PM

SOCIAL COGNITION

Humans gain information through others' testimony, and therefore must apply epistemic vigilance to avoid misinformation. Vigilant appraisal is required to assess others' shared experiences: which parts of a recounted story were real, and which were exaggerated or imagined? We examine these questions in a corpus of real and imagined narratives (N = 1,052 authors; 2,054 narratives) with similar surface attributes. We fitted models for differentiating narrative types using computational linguistic analyses. Human evaluators (N=820) classified narratives as real or imagined. Humans and a Language Model achieved above chance performance, with the Language Model outperforming humans. Imagined narratives had more “realistic” features than real narratives: greater episodic details, concreteness, spatial elements and informal language. Human evaluators were only partially attuned to features that correctly discern real and imagined events, struggling with subtler styling cues. These results demonstrate different representations of real and imagined events, instrumental in assessing others' memories.

[12] AI chatbot as source of social support

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

We interrogate the notions that stereotypes cause prejudice, that stereotypic information is part of the representation of prejudice, and that the connections among stereotypes, emotions, and prejudice are durable over time. In five experiments (total N = 1060), we find the connection between stereotypes, emotions and prejudice fades rather quickly with time. We generate novel prejudices through evaluative conditioning, exposing participants to stereotypic information that indicates a specific negative emotion. Endorsement of the specifically induced emotion is high at first, but much reduced five days later, becoming nearly indistinguishable from other negative emotions. Meanwhile, prejudice levels remain relatively high. We show that connections between stereotypes and prejudice fade rapidly (although the prejudice does not), and that specificity of emotions degrades quickly. Memory for stereotypic information can mostly disappear while the prejudice remains. These data suggest that, absent reinforcement, the representation of prejudice towards a group is rapidly winnowed down to valence; durable prejudice representations seem to be a simple representation of negative affect.

[13] AI in the Wild: A Meta-Analytic Evaluation of Depression Detection from Social Media Data

6:00 PM – 7:00 PM

META-ANALYSIS

Amid rising global mental-health needs—one in eight people lived with a disorder in 2019 (WHO, 2022)—equitable detection tools are as vital as treatments. Social-media mining with machine learning offers “just-in-time” depression-risk estimates, but validity and ethics remain under-tested. Narrative reviews outline the terrain (Chancellor & De Choudhury, 2020) but leave two questions: What is the pooled accuracy, and do current practices justify trust? This meta-analysis synthesises 2022–2025 studies on social-media depression prediction, estimating accuracy and testing moderators.

Across 67 studies, pooled performance is strong ($r \approx 0.80$) and rises in 2024 ($p < .001$), driven by Transformer-based and multimodal systems ($p < .001$). Gains are uneven: post-level detectors improve most ($p < .001$), user-level severity lags, and outcomes hinge on label source and platform as much as model size—underscoring a gap between leaderboard gains and clinically reliable signals. To address it, we propose a Psych-Aligned Evaluation Framework mapping predictions to validated symptom dimensions and adding four tests: clinical validity, test–retest reliability, explainability, and ethical alignment.

[14] Am I Losing My South Asian Identity, or Is It Evolving? Investigating the Generational and Cultural Shifts Among SAARC Immigrants in the U.S.

6:00 PM – 7:00 PM

CULTURE

Cultural orientation, whether emphasizing individualism or collectivism, profoundly changes the way individuals think, relate to others, and navigate. This study examined orientation differences of the understudied population of South Asians among 1st-, 1.5th-, and 2nd-generation immigrants (N=168) using the Culture Orientation Scale. The analyses from the cross-sectional, quantitative research design revealed 1st-gen participants scored higher on horizontal collectivism (valuing equality within groups) than 2nd-gen participants (Mdiff=2.66, SE=0.91, $t(165)=2.93$, $p=.011$, $\eta^2=0.05$). Also, 1st-gen participants scored higher on vertical collectivism (valuing hierarchy within groups) than 1.5th-gen (Mdiff=6.79, SE=1.76, $t(165)=3.86$, $p<.001$, $\eta^2=0.17$) and 2nd-gen participants (Mdiff=5.72, SE=1.01, $t(165)=5.68$, $p<.001$, $\eta^2=0.17$). This suggests that South Asian immigrants relocating to the U.S. later in life strongly value respect for elders and authority and mutual in-group support more than immigrants who moved earlier in life. Implications for this study include helping immigrants with acculturation, reducing intergenerational conflict, and creating culturally responsive practices.

[15] Dissociating within-trial stimulus and response conflict in the decision to shoot

6:00 PM – 7:00 PM

STEREOTYPING/PREJUDICE

Authors: Tiffany Ito, Bruce Bartholow

Conflict monitoring theory posits the coactivation of multiple response options drives discrepancies in task performance. Specifically, following high-conflict relative to low-conflict trials, people upregulate cognitive control systems to respond accurately. Such conflict adaptation frameworks are useful for understanding how individuals adjust behavior in the face of conflict after-the-fact; however, overcoming conflict in the moment can be critical. For example, in the First-person Shooter Task (FPST; Correll et al., 2002), images of Black and White men who are either armed with handgun or unarmed (e.g., holding a cellphone) are presented to participants, who must make split-second decisions to either “shoot” or “not shoot” accordingly, mimicking police-suspect scenarios. This task reliably elicits a bias to shoot unarmed Black targets more readily than unarmed White targets. The goal of this work was to examine the extent to which this bias emerges primarily because of an imbalance in managing the response conflict inherent in deciding between the “shoot” and “don’t shoot” options. White undergraduates (N = 99, 65 male) completed the FPST while EEG was recorded. ERP indices of early disambiguation of stimuli (N2) and response conflict (N450) were derived and disaggregated into their between- and within-person components to examine within-trial implementation of behavioral bias control. On a given trial, larger N2 amplitudes (relative to one’s own average) were associated with decreases in accuracy bias regardless of suspect race. Larger N450s were associated with relative increases in accuracy bias, but only for White suspects. Results suggest a dissociation between early stimulus-mediated conflict and later response-mediated conflict processes that are critical for behavioral bias control in-the-moment.

[16] Stereotyping and Racial Perception of Multiracial Individuals

6:00 PM – 7:00 PM

STEREOTYPING/PREJUDICE

The present study (N=246) examines how the perception of multiracial individuals varies across different multiracial identities, and how exposure to racial stereotypes of different valence influences social perception of multiracial individuals. Participants were assigned to three conditions with varying exposure to racial stereotypes and were tasked with assigning multiracial individual profiles to a single racial category, in addition to evaluating the profile's typicality in relation to four racial categories. Findings indicate differential racial perception outcomes for multiracial individuals of different backgrounds, with Black multiracial individuals being subjected to the most inaccurate evaluation of their identity. In addition we find distinct influences of positive and negative valence stereotypes on the social perception of multiracial individuals. Our studies implications for stereotyping and identity denial are significant to multiracial individual's mental health and quality of life, making further exploration of the subject matter paramount.

[17] And They Were Roommates... Roommate Diversity and Flexible Thinking Outcomes

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Decades of research show that intergroup contact not only improves cross-group relations and reduces outgroup bias (e.g. Pettigrew and Tropp, 2006), but also benefits a person's cognition. For example, students who come back from cross-cultural experiences studying abroad demonstrate increased creativity and flexible thinking (Benet-Martinez, Lee, & Leu, 2006; Maddux & Galinsky, 2009). Recently, several universities have adopted randomized roommate policies, resulting in an increased likelihood of being paired with someone of a different race. We ask if this everyday, structured form of intergroup contact can also boost flexible thinking. Using data from two cohorts of first-year students (N = 3,595)—one before and one after a randomized roommate policy implementation—we found that the policy increased cross-race roommate pairings. Those with an other-race roommate reported higher openness to diversity, stronger critical thinking skills, greater creativity, and richer interpersonal connections. Thus, by institutionalizing intergroup contact through randomized roommates, universities can offer a pathway to increased flexible thinking for all students.

[18] Anti-Intellectualism and Meta Perceptions

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Anti-intellectualism can be loosely defined as a general distrust and disdain for intellectuals and their way of thinking. Anti-intellectualism is scantily studied in psychology but is prevalent as a concept in the world today. Our current head of health and human services has continued to cast doubt on the scientific community at large to the detriment of the health of the country. We believe that an antecedent to anti-intellectualism is negative meta-perceptions. We designed a study to manipulate meta-perceptions whereby students read a fake article showcasing professors having positive or negative perceptions of students. We then asked the students to respond to measures of outgroup trust and anti-intellectualism. We anticipate that participants in the negative meta-perception condition will endorse anti-intellectualism to a greater degree. Data collection is not complete at this time, but preliminary analyses indicate that people appear to be susceptible to the manipulation of meta perceptions and display more anti-elitism when these perceptions are negative.

[19] Anti-Jewish and Anti-Muslim Prejudice in the United States after October 7th, 2023

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Attitude research has generated a plethora of "implicit" measures to index evaluations of social groups, yet these measures have only ever been combined using coarse statistical models. This project draws existing data from four tasks assessing implicit evaluative information (Bar-Anan & Nosek, 2014) and relates them to each other under a unified computational model that accounts for behavior in terms of underlying processes like attitudes, response caution, and information processing speed. Each participant finished two of four tasks: Implicit Associations Test (IAT), Brief IAT, Evaluative Priming task (EP), and Affect Misattribution Procedure (AMP). We create/use adapted versions of the Tug-of-War Model (Alaukik et al., 2024) to simultaneously model data from the four tasks, along with higher-order latent constructs describing implicit attitudes. This "joint" modeling process not only improves psychometric properties (e.g., reliability, validity), but also provides a unified theoretical account of how latent implicit attitudes can mechanistically explain behavior on multiple established implicit measures of attitudes.

[20] Antisemitism and Antizionism Among American College Students

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Psychological research on antisemitism remains sparse despite compelling evidence that it remains a pressing social issue (Anti-Defamation League, 2024). Recent protests over the war in Gaza have raised accusations of and concerns about rising antisemitism on college campuses, particularly among politically left-leaning students. This study examined the relationship between political ideology, antizionism, and antisemitism among American college students.

Fifty-two students completed measures of political ideology, right-wing authoritarianism (RWA), left-wing authoritarianism (LWA), and the Generalized Antisemitism Scale (Allington, Hirsh, & Katz, 2022), which includes subscales for antisemitism (hostility toward Jews) and antizionism (opposition to the state of Israel).

Political ideology was significantly related to both: conservatism predicted greater antisemitism, while liberalism predicted greater antizionism. Mediation analyses revealed that the political ideology–antisemitism link was fully mediated by RWA while the political ideology–antizionism link was fully mediated by LWA. These findings highlight distinct ideological pathways to prejudice and the importance of distinguishing political critique from bias.

[21] Are Narcissistic People Easier to Fall For? A Speed-Dating Study

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Little research has focused on how ethnic-racial socialization messages from inside and outside the home collectively impact immigrant youth's identity. Thus, in a mixed-method study we examine what profiles of ethnic-racial socialization exist among immigrant youth and how they impact their identity. We asked immigrant youth (N=672) between 14 and 18 years about the ethnic-racial socialization messages they receive at home, school, and from others. We find three profiles of ethnic-racial socialization amongst immigrant youth, which differentially impact their racial identification. Additionally, in follow-up semi-structured interviews (n=30) we asked immigrant youth what it means to be a member of their ethnic group in the U.S., the impact it has had on them, and how they feel about their identity. Our qualitative findings contextualize and highlight the complexity regarding how important and positively immigrant youth view their ethnic-racial identity in relation to their racialized experiences. Our findings offer a person-centered understanding of immigrant youths' racialized experiences that can be utilized to inform positive identity development among immigrant youth.

[22] Are zero-sum beliefs and non-zero-sum beliefs one-dimensional? Focusing on factor structure

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Zero-sum beliefs, defined as the view that one's gain is another's loss, have been identified as an antecedent of high hostility and low compassion. These beliefs have been assumed to be unidimensional, encompassing both zero-sum perceptions (i.e., another's gain is one's loss) and non-zero-sum perceptions (i.e., both individuals can benefit). However, this assumption has not been fully validated. This raises two key questions: a) Do strong zero-sum perceptions imply weak non-zero-sum perceptions? b) Do measures consisting solely of zero-sum perceptions predict outcomes as effectively as those that include both? This study addresses these questions by using the Zero-Sum Belief (ZSB) scale, which includes both zero-sum and non-zero-sum items. A total of 357 undergraduates completed measures of ZSB, compassion goals, and general trust. Factor analysis of the ZSB items revealed that a two-factor model, consisting of a zero-sum factor and a non-zero-sum factor, provided a better fit than a one-factor model. Moreover, compassion and trust were not correlated with the scale composed solely of the zero-sum factor, but were associated with the scale that included the non-zero-sum factor. These findings suggest that zero-sum and non-zero-sum perceptions are not simple opposites, underscoring the importance of including non-zero-sum items when measuring zero-sum beliefs.

[23] Escaping Indoors: VR Nature Mimics Some Benefits of Real Outdoor Exposure

6:00 PM – 7:00 PM

MENTAL HEALTH

Authors: Alison Jane Martingano; Elizabeth Ellair; Caden Vercimak; Katie Barlow

Previous research has documented the wide-ranging benefits of spending time in nature (Vermeesch et al., 2024). Given increasing urbanization and limited access to natural environments, this study examined whether virtual reality (VR) can serve as a viable alternative to physical nature exposure. Participants spent six minutes either in a local forested arboretum, in a VR simulation of the same arboretum recorded with a high-fidelity 360° camera and presented through a VIVE Pro 2 headset, or in a VR urban control filmed inside a university building. We measured restoration, vitality, and mood across these conditions. Preliminary analyses (N = 47) showed that both VR and physical nature produced significantly greater restoration compared to the urban control (p 's < .01). However, only physical nature significantly improved positive mood (p = .008), while only VR nature significantly reduced negative mood (p = .024). No group differences emerged for vitality or stress. Overall, these findings suggest that VR nature can replicate several of the psychological benefits of real nature exposure, while also providing unique advantages in reducing negative mood.

[24] Assessing Acculturation in Adolescence: A Systematic Review of Acculturation Measures

6:00 PM – 7:00 PM

CULTURE

Acculturation refers to the gradual process of a series of cultural and psychological changes that individuals undergo when they are exposed to different cultural environments from their own. Because Adolescence is a critical period in one's identity development where race and ethnicity become more salient, it is critical to ensure there are adequate measures available to assess the potential negative effects of acculturation (e.g., low self-esteem and behavioral problems) that adolescents from racially and ethnically marginalized groups may be more vulnerable to. The present study reviews existing measures of acculturation normed on adolescents to illuminate the gaps in the literature and inform the features of a more ideal acculturation scale by conducting a systematic search to capture the existing measures and coding each measure item based on four different models of acculturation. Our preliminary analysis reveals that many of the currently available measures use outdated language, lack cross-cultural generalizability, and rely on stereotypes that do not accurately reflect acculturation status.

[25] Associations Between Perceived Post-Traumatic Growth and Mental Health: A Synthesis of the Meta-Analytic Evidence

6:00 PM – 7:00 PM

META-ANALYSIS

The literature on the benefits of experiencing growth following adversity (or post-traumatic growth [PTG]) is marred by predictive validity concerns. Specifically, some studies show a positive relationship between PTG and mental health, while others show either a negative or no relationship. To address this lack of consensus, we conducted a quantitative synthesis of the meta-analytic literature on the topic.

In total, 18 meta-analyses were reviewed. Several variables – including the operationalization of PTG, well-being outcome, type of trauma, and time since trauma – were considered as moderators of effect size. Preliminary analyses found heterogeneity in effect sizes based on type of well-being outcome. PTG was positively associated with closely-related constructs like resilience, but this link was weaker to broad well-being. Moreover, while some negative associations between PTG and psychopathology such as depressive symptoms were reported, a few studies reported positive associations. This heterogeneity in the relationship between PTG and mental health corresponds to the uncertainty regarding the information captured by perceived PTG assessments.

[26] Associations of Psychosocial Factors with Institutional Confidence in U.S. Sample

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

This pre-registered study examined associations between age, sex, race, educational attainment, Big Five personality traits, political beliefs, subjective numeracy, life satisfaction, subjective social status, and confidence in social institutions to act in the public benefit. Correlational analyses were used to assess the relationship between and among each predictor and institutional confidence variables. Path modeling using SEM was used to test the direct and indirect effects in a sample of 615 participants. The resulting model had acceptable fit. Results indicated that being older, more conservative, having greater life satisfaction and being conscientious and agreeable is related to greater confidence in police officers and the military. Being less conservative, preferring more liberal media, and being more open predicts greater confidence in scientists and journalists. The associations of being older, having greater educational attainment, less conservative political beliefs, and higher subjective numeracy with confidence in elected officials, journalists, and scientists were found to be maintained, in part, by a preference for more liberal news/information sources."

[27] Attachment Styles and Suicidality in BPD patients

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Background: Borderline personality disorder (BPD) carries a high suicide risk, making it important to identify mechanisms contributing to this vulnerability. This study examines which

insecure attachment style is most linked to suicidality in BPD and whether attachment to specific figures (parent, peer, partner) further differentiates risk.

Method: In 279 adult inpatients with BPD, attachment was assessed via the ECR-S and suicide risk via the SBQ-R. One-way ANOVAs examined SBQ-R differences across attachment styles for each target (mother, father, partner, friend).

Results: No main effects for suicide risk were found across attachment styles, but subset analyses showed significant differences in the mother and partner groups. Suicide risk was higher for fearful than secure or dismissive attachment to

the mother, and higher for preoccupied and secure than dismissive attachment to the partner.

Conclusion: Attachment to specific figures influence suicidality in BPD, indicating clinical value in assessing attachment styles.

[29] Attributions of Advantage Distinguish Feelings of Privilege and Entitlement

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Issues of social inequalities and social justice often invoke beliefs about whether relative social group advantages reflect privilege or entitlement. The current research examined whether recipients of relative advantage may perceive it as a privilege or an entitlement based on attributions of their advantage in two studies. Study 1 employed a correlational design (N=407) and found that individuals high on self-rated entitlement were more likely to attribute advantages held by entitled others to their individual qualities and less likely to attribute them to external factors, compared to individuals high on self-rated privilege. In Study 2 (N=185), individuals who were experimentally induced to receive and attribute an advantage in a salary negotiation task to internal reasons (i.e., ranked at the top) reported stronger entitlement, while those induced to attribute their advantage to external reasons (i.e., random assignment) reported stronger privilege. Furthermore, internal attribution increased perceived deservingness and reduced anger through greater perceived entitlement, but not perceived privilege. We note limitations on power and ecological validity of our findings.

[30] Awe as self-transcendent: an exploration of awe's relationship to immortality

6:00 PM – 7:00 PM

OTHER

Awe has been described as a self-transcendent emotion with qualities similar to peak and mystical experiences. Qualities of awe and other self-transcendent experiences overlap with theoretical definitions of sense of immortality, but the relationship between these two areas of research is understudied. The present research found preliminary evidence for a relationship between awe and sense of immortality. The nature of the relationship depended on how awe was manipulated and measured, suggesting differences in their ability to reliably induce and capture aspects of awe related to immortality.

[31] Behavioral Signatures of Personality in Expansive and Contractive Media Use

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

People differ in how much they explore their environments—some seek novelty, others prefer the familiar. These explorer vs. returner patterns manifest in a wide variety of domains and ecologies, including physical mobility, food choices, and music listening, and are linked to both personality (e.g., openness) and well-being. Today, people spend about 4 hours daily navigating digital environments on smartphones, yet measuring expansive vs. contractive patterns use in smartphones remains difficult: the same content can appear across multiple apps, and a single app may contain diverse content. Drawing from media ecology, we propose a theoretical and methodological reconceptualization of media use as “movement through a structured environment.” Using 236,000+ hours of smartphone use from 257 participants over a year, paired with fortnightly surveys of..., we adapt mobility research techniques to extract features like total distance and k-radius of gyration in CLIP embedding space. We then test associations with personality and affect using mixed-effects models. Our approach introduces a novel method for identifying behavioral signatures in everyday digital life.

[32] For GPT-Image-1, Who is Human?

6:00 PM – 7:00 PM

GENDER

The category “human” refers to all individuals who belong to the species homo sapiens. In their self-reported beliefs, most humans agree; although, on measures of implicit cognition, dominant social groups see “human” as referring to their own (ethnic/racial) group. We optimistically asked: Will an image generation model (GPT-Image-1) include all homo sapiens in the category “human”? Instead, executing 100 queries each for 7 prompts to “render a realistic image” of a human [person, human being, individual, somebody, anybody, and random other], we found that GPT-Image-1 exhibited startling levels of bias. On all occasions, except when prompted with a random other, the model's output was almost exclusively male, with human and individual producing 100% images of men. All terms except random other elicited largely 30-something (100%) White (97%) males. The model's training data surely contain more diverse human representations. Why is there extreme bias? Will it be considered important enough to engineer AI toward accuracy? The presence and magnitude of this White/Young/Male default in a dominant model is alarming and serves to alert creators to set basic ethical standards.

[33] Beyond Shared Identity: Collective Liberation as a Pathway to Solidarity Among Antagonistic Minority Groups

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Many people "put something on in the background" while doing daily activities. One reason for using media in the background is for emotion regulation (Kampfe et al., 2010; Zillmann, 1988). However, the emotion regulation process is more complex than prior investigations into background media have shown. This study uses the Emotion Regulation Process Model (Gross, 2014) to explore the phenomenon. We hypothesized that situational modification—adding a background media while performing an overwhelming or boring task—will be associated with regulation of the negative emotion. We also hypothesize that this modulation would be associated with persistence on the task.

Participants at a Midwestern U.S. university (N = 575) filled out a survey in which they reflected on a time in the past year where they completed a) an overwhelming and b) a boring task while listening to audio or video content in the background (within-subjects). They answered whether the media made the overwhelming [boring] task less overwhelming [boring] and whether this helped them persist on the main task.

The addition of the media improved the negative emotions, though there were some mixed results for video content. In turn, this emotional modulation was associated with participants feeling that their motivation to continue on the main task improved. Both hypotheses were supported. These findings have implications for interventions and education on media use recommendations for university students.

[34] Biculturalism and Cultural Frames on Body Idealizations in East Asian American Women

6:00 PM – 7:00 PM

CULTURE

This study explores biculturalism and cultural frames on the body ideals that East Asian American women adhere to. While the thin ideal is globally pervasive, literature suggests it is more extreme in East Asian cultures. Bicultural Identity Integration (BII) – how harmonious and blended individuals perceive their dual cultures as – affects responses to cultural contexts, leading individuals to shift between cultural frames depending on present cues. Lower BII individuals tend to display a contrast effect, endorsing frames opposing contexts. University participants were randomly assigned to an East Asian or American framing condition and responded to open-ended questions tailored to activate their assigned cultural frame before completing validated measures of body idealization and BII. Data collection is incomplete, but preliminary analyses show interaction effects between BII harmony and cultural condition in best body, desired body, and desired fitness idealizations, aligning with congruence and contrast effect trends. These highlight the potential role of harmony and context when approaching affective and identity-heavy constructs like body ideals.

[35] Black Individual Conversation Content Preferences in Intergroup Interactions

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

The purpose of this research was to examine Black individuals' willingness to discuss conversation topics varying in core content dimension (i.e., intimacy, controversy, race-relatedness, positive valence, competence potential, warmth potential) as a function of partner race and role. Black participants (n = 284) were randomly assigned to interact with an ostensible Black or White gender-matched partner in a study on perceptions of online communication. Subsequently, they rated the degree to which they would be willing to answer or ask pilot-rated topics in conversation with their partner. Using a data analytic approach similar to previous research (Johnson et al., 2009), a mixed regression model uncovered in part that Black participants were more willing to discuss intimate, controversial, and positively-valenced topics with White than Black partners, but less willing to discuss race-related and competence potential topics with White than Black partners. Findings are consistent with social psychological theoretical frameworks (e.g., stereotype threat) and have downstream implications for Black individuals' perceptions and experiences in intergroup interactions.

[36] Blessing or Curse? Compliment Perception through the Lens of Evil Eye Beliefs

6:00 PM – 7:00 PM

CULTURE

Our cognition and lived experience continuously inform each other. As a process involving reasoning, interpretation, and sociopolitical decision-making, critical consciousness is informed by cognition. Yet, critical consciousness has primarily been studied through developmental and experiential lenses. The present analysis explores whether cognitive skills like critical thinking, perspective taking, social intelligence, emotional regulation, metacognition, and locus of control predict CC's components. A multiple linear regression analysis showed that critical motivation was predicted by critical thinking and moral metacognition. Critical action was predicted by critical thinking, perspective taking, and internal locus of control. Gender and race also influenced CC, with men and white participants reporting lower CC. These findings suggest that fostering certain cognitive skills may be a promising pathway for developing critical consciousness, informing future educational and community-based interventions. The results also open new avenues for integrating cognitive perspectives into CC research.

[37] Bridge or Sink: Reducing Partisan Animosity with a Cooperative Game Show

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

What drives someone to donate a kidney to a stranger? Prior research links certain personality and cognitive traits that distinguish "extraordinary altruists" from the typical population, but little is known about their developmental origins. Here we examine an unusually altruistic decision that can be expressed in childhood: the decision not to eat animals. Across two studies, we compared independent vegetarians (i.e., vegetarians raised in non-vegetarian households), family vegetarians, and non-vegetarian adults (N = 284) and children ages 8–11 (N = 236), assessing empathy, disgust sensitivity, cognitive reflection, fearful facial recognition, social dominance orientation (SDO), and speciesism. Independent and family vegetarian adults were less speciesist, lower in SDO, and higher in disgust sensitivity and empathy. Although we expected independent vegetarian children to show especially distinct traits, they differed little from others. Both independent and family vegetarian children were less speciesist than non-vegetarians, with no difference on other measures. These findings suggest dietary choices may reflect specific moral values rather than broad psychological traits.

[38] Can Large Language Model Replicate Cultural Differences in Socio-ecologies?

6:00 PM – 7:00 PM

CULTURE

Large language models (LLMs) are increasingly applied in psychological research. Previous studies indicate that LLMs can partially replicate cross-cultural personality differences. This study aims to verify whether LLMs can predict nation-level differences in socioecology—specifically relational mobility (defined as the freedom to form and choose interpersonal relationships). We prompted four models (ChatGPT-4o, Claude-Sonnet-3.5, DeepSeek-V3, and Hunyuan-Turbo) via API to respond to a standardized relational mobility scale as if they were typical residents of 39 countries (50 times each). After averaging model outputs and comparing them to empirical data, ChatGPT-4o best approximated actual scores ($r = .46$, lowest MSE). Claude showed weak cultural differences ($r = .12$), potentially due to the over-regularization during the human feedback reinforcement learning procedure. DeepSeek and Hunyuan showed significant deviation from empirical data, likely due to insufficient cultural coverage in training datasets. Findings indicate that LLMs can replicate cultural differences in social ecologies, though prediction performance varies widely across models.

[39] Child Abuse and Emotional Intelligence Predict Cluster A Personality Disorder Characteristics

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Prior research shows a positive correlation between ACEs and personality disorders (PD) but has not examined cluster A PDs (Björkenstam et al., 2017). We investigated relationships between childhood maltreatment, emotional intelligence (EI), and cluster A characteristics. We hypothesized that child abuse would predict more cluster A PD characteristics and EI would be a protective factor. A diverse sample of 402 U.S. adults (M age = 38.7, SD = 13) completed an online survey. Regression showed that childhood maltreatment predicted paranoid, $F(11, 384) = 8.32, p < .001, R^2 = .19$, schizoid, $F(11, 384) = 5.79, p < .001, R^2 = .14$, and schizotypal, $F(11, 384) = 5.76, p < .001, R^2 = .14$, characteristics significantly better than demographic covariates, and adding EI significantly increased prediction. EI was protective. Emotional abuse was the strongest risk factor for paranoid and schizoid, whereas sexual abuse most strongly predicted risk for schizotypal. Our results showed that childhood maltreatment history increases risk of developing cluster A personality characteristics and EI serves as a protective factor.

[40] Civic Honesty in Context: Trust, Mafia Influence, and State Resilience

6:00 PM – 7:00 PM

LAW

Civic honesty, the moral standards that define citizens' commitment to the public good, is fundamental for cooperation and collective well-being. Prior research highlights trust in institutions and fellow citizens as predictors of civic honesty, but most evidence comes from the Global North, where state authority is secure. Less is known about contexts where governance is contested by criminal organisations. This study tests whether country-level mafia influence and state resilience moderate the relationship between trust and civic honesty. We analysed data from 132,602 individuals across 84 countries using multilevel modelling with an extended Johnson–Neyman technique. Institutional trust predicted higher civic honesty in contexts with weaker mafia presence and stronger states, but this association reversed where mafia influence was high and institutions fragile. Interpersonal trust was negatively linked to civic honesty only in low-resilience states. These findings show that the effects of trust on civic honesty depend on broader political and criminal contexts. Future research should consider how criminal governance and state fragility reshape the meaning of trust.

[41] Community Blaming Attributions Fuel Indifference and Barriers to Justice for Native Women Victims of Sexual Violence

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Native American women experience the highest rates of sexual violence of any U.S. ethnic group yet are rarely considered in the psychological literature. Past research has identified attributions that negatively shape sexual violence outcomes for women broadly, but no investigations have assessed attributions unique to Native women/communities. Two studies (N=1408) revealed that when explaining high rates of sexual violence towards Native (vs. White) women, participants relied heavily on negative racial stereotypes and deficits about Native communities (i.e., community blame). The current work investigates psychological consequences of Native community blaming. Study 3 (N=385) found that endorsement of community blaming was associated with more victim apathy and therefore less victim support. Community blaming was also associated with greater assimilative attitudes leading to less trust in Native-led institutions, more protective paternalism, and more victim support. These results suggest that community blaming not only breeds indifference to sexual violence against Native women; it insidiously affords attitudes that diminish Native people's agency to protect their communities.

[42] “Is Compassion More Effortful Than Empathy in Everyday Social Interactions?”

6:00 PM – 7:00 PM

EMOTION

Prosocial emotions are cognitively effortful. In this research, we tested if compassion or empathy is perceived as more effortful, and if this perceived effort is related to social well-being. In lab-based Study 1 (n = 373), college students more frequently avoided situations requiring compassion than those requiring empathy, and compassion was rated as more effortful and aversive than empathy. In diary-based Study 2 (n = 178), Prolific workers reported on prosocial emotions, perceived effort, and social well-being in up to five social interactions over the past 24 hours. Empathy was negatively correlated with the perceived effort and aversiveness of social interactions. Compassion had comparatively stronger positive associations with helping behavior and social connection relative to empathy. These findings suggest that while compassion is perceived as more effortful than empathy, compassion is more strongly associated with social well-being outcomes in everyday life. Diary-based Study 3 (ongoing; n = 300) will attempt to extend this research by further isolating the perceived effort of prosocial emotions themselves rather than to the overall social interaction.

[43] Connecting the CAD Triad to Obsessive-Compulsive Personality Traits

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITs

Rigid perfectionism, a core characteristic of obsessive-compulsive personality traits (OCPT), is on the rise, particularly among college students. This study extends extant findings that OCPT share connections to negative emotionality by examining relations between Rozin et al.'s (1999) contempt, anger, and disgust (CAD) triad and those traits. There are theoretical links between OCPT and the three emotions in the CAD triad, including stubbornness and rigidity, anger in response to threatened control, and strict morality. College students from a Southern U.S. university (N = 681) completed self-report measures of OCPT and impairment associated with those traits. In addition, they completed self-report measures of the broad proneness toward positive and negative emotional states, as well as narrower measures of contempt, anger, and disgust. Among the CAD emotions, only contempt accounted for unique variance in OCPT and impairment beyond shared variance with the broad proneness toward positive and negative emotionality and the other CAD emotions. Study results indicate that contempt merits further attention to elucidate how it may impact OCPT and associated impairment.

[44] Construal Level's Influence on Trait Reliability

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITs

Construal Level Theory explains how psychological distance affects a person's thoughts, behaviors, or emotions. Our study specifically considers a person's self-perception across time. Prior to completing the Big Five Personality Test and the Regulatory Focus Questionnaire, participants completed a short prompt to prime them for either a high or low construal level. The study was designed to determine test-retest reliability of the questionnaire results of a participant when moderated by their construal level. We hypothesized that participant's answers would be more consistent when prompted to think about themselves ten years from now, rather than ten days, which would more likely result in compensatory behaviors. The administrations took place 4-6 weeks apart. The collected data from 351 participants—173 of whom returned for part two—should provide useful insight into the effects of construal theory on testing.

[45] Coping profiles and their associations with happiness and loneliness: A multigroup latent profile analysis in the USA and Japan

6:00 PM – 7:00 PM

CULTURE

Prior research shows that individuals who frequently use approach-oriented coping strategies achieve better well-being than those who rely on avoidant strategies or disengage from overall coping. Yet, it remains unclear whether these coping profiles and their associations with well-being appear across cultures. To address this, we conducted a multigroup latent profile analysis of 503 American and 506 Japanese participants, examining coping profiles and their associations with happiness and loneliness. Across cultures, three profiles emerged: avoidant, approach, and disengaged/low. Individuals with the approach profile reported the highest happiness and lowest loneliness, whereas those with the disengaged/low profile reported the lowest happiness. The avoidant profile fell in between. The proportion of participants in each profile did not differ across cultures, and happiness and loneliness showed no differences between American and Japanese participants within the same profile. These findings suggest that coping profiles and their associations with well-being are largely consistent across cultures, with approach coping being more beneficial than avoidant or disengaged/low coping.

[46] COVID-19 and Linguistic Complexity in Science: An Analysis of Nature Articles

6:00 PM – 7:00 PM

CULTURE

Did the onset of COVID alter the complexity of scientific thinking? To help answer this question, we evaluated the complexity of almost 4,000 scientific journal articles supported by the Nature portfolio from 2018-2023. We collected articles across 9 timeline stages and scored them for defensive complexity and integrative complexity via the well-validated AutoIC system. Descriptive results revealed (1) an increase in defensive complexity (associated with belief defense) after the onset of COVID, and (2) a decrease in integrative complexity for two stages after COVID's onset before returning to baseline. Isolating the specific effect of COVID's onset, pre-registered segmented regression models that controlled for autoregression yielded a statistically significant increase in defensive complexity after COVID's onset, whereas the effect of COVID's onset on integrative complexity was less consistently significant. These results suggest that, although scientists maintained relatively high levels of complexity throughout, COVID nonetheless altered the complexity of scientists' thinking in ways consistent with research on the effects of stress on cognition.

[47] Cultural Acceptance of Emotional Displays in Leaders

6:00 PM – 7:00 PM

CULTURE

Do we really want to know what our supervisors feel? Leaders' emotional displays are often not private, and they function as social signals, shaping followers' behaviors and perceptions of the leaders as authentic and effective. While prior studies suggest that followers prefer a leader who expresses positive emotions (as opposed to suppressing them), this may not necessarily extend to contexts involving negative emotions. Additionally, research has primarily focused on Western contexts when cultural psychology implies that the same emotional expression can be interpreted differently across cultures. The current study will use vignettes to examine whether cultures (Germany vs. Taiwan) impact followers' perceptions of leader authenticity and effectiveness in positive (vs. negative) situations based on how expressive (vs. suppressive) leaders present their emotions. We hypothesize that Western participants will rate highly expressive leaders as more authentic and effective, while East Asian participants will prefer leaders who show low expressive emotions, particularly for negative emotions. Results will have implications for cross-cultural leadership practices.

[48] Cultural and religious ingroup-outgroup distinctions and trust in ingroups and outgroups.

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

The ingroup-outgroup distinction is a key factor for intergroup attitudes (see Gaertner & Dovidio, 2000). Previous research proposed that more collectivistic (e.g., Triandis, 1995) or more religious (e.g., Shaver et al., 2018; Tan & Vogel, 2008) people tend to emphasize the ingroup-outgroup distinction, and this can lead to more negative attitudes toward outgroups (see Altemeyer, 2009). We compared the levels of trust in ingroups and outgroups among people in Sweden (individual-oriented and nonreligious), Italy (individual-oriented and religious), China (group-oriented and nonreligious), and Iraq (group-oriented and religious) and examined how the levels of trust in ingroups and outgroups were predicted by group-orientation and religiousness in these cultural/religious groups, controlling for gender, age, education level, and income level. As predicted, across cultural/religious groups, more group-oriented and more religious people showed a higher level of trust in ingroups and a lower level of trust in outgroups, but the effect of group-orientation was stronger than the effect of religiousness on the levels of trust.

[49] The Effects of Religiousness, Political Conservatism, and Sexism on Attitudes toward Abortion: Cross-Cultural Comparisons

6:00 PM – 7:00 PM

CULTURE

Attitudes toward abortion are shaped by cultural, legal, and moral factors and vary across countries and cultures (Osborne et al., 2024). We predicted that religiousness, political conservatism, and sexism would be predictors of attitudes toward abortion across cultures, but the effect of each predictor would vary depending on each country's histories, systems and policies and given cultural norms and values. We examined the effects of religiousness, political conservatism, and sexism on attitudes toward abortion in Brazil, India, Japan, Russia, Turkey, and the US, controlling for age, education level, and income level. We found that religiousness was the strongest and most consistent predictor. Religiousness was a significant predictor in the US (large effect), Brazil, India, Russia (small to medium effect), and Turkey (small effect). Political conservatism was a significant predictor in the US (about large effect) and Turkey (medium effect). Sexism was a significant predictor in Russia (small to medium effect) and Japan (small effect). We discussed each country's historical, legal, and cultural backgrounds in relation to our findings.

[50] Cultural Conceptions of Agency: Thematic Analysis of Media Coverage during the 2022 FIFA World Cup in Latin America and the Anglosphere

6:00 PM – 7:00 PM

CULTURE

Individuals may explain their actions as driven by their own influence (disjoint agency) or by others' (conjoint agency), with agency framed as internal and stable or external and context-dependent. American individuals tend to endorse disjoint agency, whereas East Asian individuals endorse conjoint agency, yet less is known about other collectivistic groups, such as Latine people. Using a coding scheme adapted from prior work, we examine variation in concepts of agency in Latin America and the Anglosphere through an analysis of player descriptions in media coverage of the 2022 FIFA World Cup. Our key question is to investigate whether Latine individuals have a more conjoint or disjoint model of agency compared to individuals from the Anglosphere. All data have been collected and preliminary analyses have been conducted using data from the U.S. and Wales, which show that journalists most often highlighted personal values, beliefs, and background (9.2%) and positive performance evaluations (9.8%) in descriptions of American and Welsh athletes. These findings are consistent with the idea that Western cultures emphasize personal and positive attributes of the self.

[53] Cultural Differences in Post-Separation Conflict and Attachment Styles

6:00 PM – 7:00 PM

CULTURE

This study investigated the associations between perceived parental alienation, bicultural identity integration (BII), and adult attachment in emerging adults. A sample of 150 undergraduates completed self-report measures assessing parental alienation, BII dimensions (harmony, blendedness, conflict, compartmentalization), adult attachment (closeness, dependence, anxiety), and ethnic identity (exploration and commitment).

Maternal alienation significantly predicted lower bicultural harmony and greater attachment insecurity, reflected in lower closeness and dependence as well as higher anxiety. Paternal alienation was significantly associated with reduced closeness and dependence, but not with anxiety. Specific paternal behaviors (e.g., loyalty induction, contact interference) were differentially related to bicultural harmony.

Gender did not moderate associations with ethnic identity, nor did BII dimensions predict ethnic identity levels.

These findings highlight the distinct psychological consequences of maternal versus paternal alienation and underscore the particular sensitivity of bicultural harmony to relational stress within the family.

[55] Cultural essentialism in different ethnic groups

6:00 PM – 7:00 PM

CULTURE

Research on cultural essentialism, the belief that different cultural groups have unchangeable characteristics, conducted in various cultural contexts have tended to treat countries and cultures as singular units, overlooking differences in essentialist beliefs within country borders. However, within countries, there have been demonstrated sub-group variances in cultural dimensions (Tung, 2008; Coon & Kemmelmeier, 2001) and personality traits (Foldes, Duehr, & Ones, 2008; Brown, Englert, & Sisarich, 2005) across different ethnic and racial groups. It is reasonable to expect that ethnic and racial group differences would also appear in cultural essentialism, however currently there is insufficient empirical evidence to make such a determination. This is also a relevant research topic given the current socio-political climate surrounding ethnic group relations in several regions of the world. In this study, we aim to examine whether different ethnic-cultural groups in the U.S. possess different levels of essentialism, and the associated outcomes stemming from these differences.

[56] Cultural Self-Construals and Prefrontal Dynamics of Positive Emotion Regulation: An fNIRS Study

6:00 PM – 7:00 PM

CULTURE

Cultural self-construals, shaped by individualism and collectivism, influence how positive emotions are regulated through strategies such as savoring and suppression. Independent-oriented cultures typically emphasize amplifying positive affect, while interdependent-oriented cultures often favor down-regulation to maintain social harmony. This study examined the neural underpinnings of these processes using functional near-infrared spectroscopy (fNIRS). Thirty-seven undergraduates completed self-report measures of independence, interdependence, empathy, and bicultural identity integration before engaging in randomized savor and suppress tasks with standardized positive stimuli. Results revealed significantly greater prefrontal cortex (PFC) activation during savoring compared to suppression. Within international students, ventromedial PFC activation was strongly correlated with bicultural identity integration scores, suggesting that frame switching between cultural values enhances neural engagement in positive emotion regulation. Additionally, PFC activation negatively correlated with vertical collectivism, indicating cultural moderation of regulatory strategies. These findings extend prior evidence of PFC involvement in emotion regulation to culturally shaped regulation of positive emotions, highlighting the dynamic interplay between cultural identity and neural mechanisms of affect. Future research should incorporate broader cultural samples, varied emotion modalities, and both positive and negative affective domains to deepen understanding of culture–emotion–brain interactions.

[57] Cultural Variation in the Prioritization of Justice versus Interpersonal Responsibilities

6:00 PM – 7:00 PM

CULTURE

Using moral dilemmas involving conflicts between justice and interpersonal responsibilities rooted in filial piety, we tested 349 Chinese, 355 Japanese, and 349 American participants, hypothesizing that Chinese would be more likely than Americans to prioritize care for their mother, with Japanese falling in between. We also examined the potential effects of relational mobility and self-distancing on reducing prioritization of care for the mother, as suggested by previous research. The results showed that higher levels of relational mobility ($b = -.20$, $p = .026$) and self-distancing ($b = -.08$, $p = .014$) were associated with lower prioritization of care for the mother. As predicted, Chinese participants (89.1% and 78.3%) prioritized care for their mother significantly more than Americans (70.6% and 44.2%) in both low- and high-conflict situations. Unexpectedly, Japanese participants (low: 39.1%, high: 21.6%) prioritized care for their mother less than both groups, suggesting that they may instead prioritize the public self by considering others' eyes and adhering to public laws, a different form of interdependence from Chinese.

[58] Cultural-Cognitive Pathways to Family Functioning: Dialectical Thinking and Empathy among Chinese Immigrant Mothers

6:00 PM – 7:00 PM

CULTURE

Research has documented how cultural differences in empathy are associated with family functioning. Empathy, comprising cognitive (understanding others' beliefs) and affective (understanding others' feelings) dimensions, plays a crucial role in enhancing communication, reducing conflict, and fostering emotional bonds within families. Yet, little is known about how culturally grounded cognitive styles shape empathy in immigrant contexts.

This study investigates how dialectical thinking—a cognitive style emphasizing contradiction and change—predicts empathy and family functioning among Chinese immigrant mothers (N = 394). Regression analyses showed that dialectical thinking predicted both cognitive and affective empathy, even after controlling for demographics. In turn, both empathy dimensions predicted stronger family relationships, though higher empathy—especially affective empathy—was also associated with greater parental stress. Structural equation modeling confirmed indirect pathways from dialectical thinking to family functioning through empathy. These findings highlight dialectical thinking as a cultural-cognitive resource with complex implications for empathy and family functioning, offering new insight into immigrant family life during adolescence.

[59] Culture as Miscalibrated Interpersonal Concern: How Misjudged Perceptions Undermine Support Seeking Across Societies

6:00 PM – 7:00 PM

CULTURE

People sometimes hesitate to seek support from others because of interpersonal concerns, even when such concerns are unwarranted. These concerns vary across societies and shape cross-country patterns of support seeking. In this study, we hypothesized that people in Japan, compared with those in the United States, would overestimate the negative interpersonal consequences of seeking support. Across four cross-country studies using recalled events, hypothetical scenarios, and friend-dyad reports (total N = 2,852), we found that Japanese participants were more likely than U.S. participants to overestimate the burden they would impose on a friend. In Japan, but not in the U.S., support seekers also underestimated how happy friends would be to help and overestimated the negative impacts of seeking support on their relationship. Importantly, Japanese supporters viewed support seeking no less favorably than their U.S. counterparts, suggesting that the cultural ethos of "not causing trouble to others" may create unjustified barriers to support seeking in this low-mobility society. These findings broaden our understanding of cross-country differences in support seeking and highlight how miscalibrated interpersonal concerns can shape social relationships across societies.

[60] Cultures of honor and attitudes toward the criminal justice system

6:00 PM – 7:00 PM

CULTURE

In the United States (US), cultures of honor (COH) emerged through historical and contextual dynamics that help identify patterns of aggression and retaliation. It is theorized that COH coincide with weak legal institutions, however little is known about their empirical association. We assess this association across two studies. In Study 1 (N = 49 US states (excl. Hawaii)), we used publicly available data and found strong, positive correlations between state-level COH and incarceration rates, fatalities by police, value of militarized equipment, and quantity of militarized equipment. In Study 2 (ongoing; Ntarget = 200), we are surveying US adults to determine whether perceptions of COH are associated with attitudes towards carceral institutions. Together, these studies suggest that the presence of strong legal institutions does not necessarily reduce honor norms; if anything, they can co-exist. The studies call for a re-examination of the widely theorized but seldom tested assumption that COH are created and sustained in contexts with weak legal institutions. Perhaps it is less of a question of whether institutions exist, but whether they are perceived to be legitimate and fair.

[61] What is facial “Afrocentricity”? A computational analysis of Black Prototypicality

6:00 PM – 7:00 PM

SOCIAL COGNITION

Individuals with Afrocentric (Black prototypical) facial features experience inequities in health and criminal justice systems, even when targets are White (Hagiwara et al., 2013; Eberhardt et al., 2006; Blair et al., 2002; King & Johnson, 2016). However, whether “Afrocentricity” is conceptualized consistently across races remains unclear. Do people use the same features to determine “Afrocentricity” in Black and White faces?

In 2 studies (N = 390), we collected ratings of Afrocentricity of synthetic Black and White faces (Todorov & Oh, 2021). We then created computational models of Afrocentricity separately for White and Black faces to determine if people use the same features to judge across target race.

Results showed only moderate overlap in the features participants used between races to determine Afrocentricity, with stronger correlations between same-category models than different-category models. Differences were driven both by feature weights and features used to judge Afrocentricity, with masculinity affecting ratings in Black but not White faces. Determining how racial prototypicality is represented across races clarifies what we measure when studying “Afrocentricity.”

[62] Defining family: The use of heteronormative language in surrogacy laws

6:00 PM – 7:00 PM

LAW

We conducted a comprehensive review of all U.S. surrogacy laws. We coded whether these laws (a) prohibit commercial surrogacy; (b) utilize heteronormative language, or (c) utilize gender-inclusive language. Then, we used Project Implicit data to examine state levels of anti-gay bias and state voting behavior to examine political lean of the state. We used these measures as predictors of the use of heteronormative language in U.S. surrogacy laws. We found that 44% of states fail to regulate surrogacy by statute. Antigay implicit bias significantly predicts the use of heteronormative language in surrogacy laws ($\beta = -.16.11$, $p = .04$, $\eta^2 = .08$, 95% CIs [$<.001$, .26]). There is some support for the relationship between partisanship and the use of heteronormative language in surrogacy laws ($\beta = 0.06$, $p = .05$, $\eta^2 = .07$, 95% CIs [$<.001$, .24]). As a state's voting behavior becomes more democratic, the inclusivity of their surrogacy law increases. Overall, examining heteronormative language in family law is necessary as it greatly reduces LGBTQIA+ parents' access to the same mechanisms as heterosexual parents.

[64] Differential Spontaneous Warmth/Competence Inferences Among Black and White Targets

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Traits are spontaneously inferred from other people's behavior via spontaneous trait inferences (STIs). However, little work examines if stereotypes impact STIs. Additionally, recent work shows that STIs impact perceiver behavior. We tested if target race (White vs Black) and warmth/competence stereotypes impact STIs and perceivers' intentions to approach (warmth-related) and recruit (competence-related) targets. Participants (N = 104) formed STIs for White and Black targets, but these inferences differed based on stereotypes. Positive warmth (e.g. warm) and negative warmth (e.g. cold) STIs were found for White targets whereas positive competence (e.g. intelligent), negative competence (e.g. stupid), and negative warmth STIs were found for Black targets. Because most participants identified as White (70%), these results align with the primacy of warmth effect for White targets and an outgroup negativity bias for Black targets. Additional data on participants' intentions to approach and recruit targets will be analyzed by SPSP 2026. We discuss these results in the context of race-based spontaneous impressions and trickle-down consequences for racial discrimination.

[65] Discrimination Experiences Among People in Different Regions

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Discrimination has long been established as a harmful experience associated with adverse outcomes. The literature has yet to clearly establish how experiences of discrimination differ within and between groups, and how regional characteristics might affect discrimination. The present research begins to answer these questions. In Study 1, we adopt a data-driven approach to develop a discrimination classification system, finding four classes of discrimination "types." We applied and validated this system with data from Study 2 (N = 425), in which participants of multiple social groups completed a three-week daily diary study reporting their daily experiences of discrimination. In Study 3 (N = 5829) we implemented a retrospective design to specifically target the geographic variation in discrimination experiences implicated in Study 2. Alongside replicating various patterns previously demonstrated in the literature, we uniquely find evidence that White people experience discrimination differently than minoritized groups. Further, we forward the "lightning rod hypothesis", positing that people experience more discrimination when relatively unique in their local environment. Together these findings help to better describe discrimination experiences, which may inform future models of experiencing prejudice and discrimination from the perspective of those most affected.

[66] Disgust Drives Explicit, Blatant Dehumanization

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Despite its powerful link to outcomes as severe as support for mass violence, the psychological antecedents of dehumanization remain unclear. The emotion of disgust has long been suspected as a key driver, but causal evidence is scarce. Across three studies (N = 1535), we test disgust's role in fueling explicit, blatant dehumanization. In two within-subject survey experiments, we first distinguish disgust's unique and robust influence on dehumanization from that of other discrete negative emotions like fear (Study 1) and anger (Study 2), as well as from general affective prejudice. We then demonstrate disgust's causal impact on dehumanization using an experimental emotion regulation paradigm (Study 3): participants instructed to amplify (vs. suppress) their emotional reaction to an extreme disgust-eliciting video stimulus more severely dehumanized an associated outgroup. Moreover, dehumanization mediated the effects of disgust amplification on support for punishment and containment of the targeted group. We situate these findings within a social functionalist framework, suggesting dehumanization serves as a mechanism through which disgust shapes intergroup conflict.

[67] Do Black and White parents underestimate other parents' interest in cross-race friendships?

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Authoritarianism is a growing concern across nations. Existing measures of authoritarianism typically use a three-factor model consisting of authoritarian aggression, authoritarian submission, and conventionalism. These measures also have notable weaknesses and limitations. In addition, the aggression component of authoritarianism is a particularly salient threat to vulnerable groups. Accordingly, the current research developed and validated a modern unidimensional scale of authoritarian aggression. Study 1 established the factor structure and internal reliability of the 15-item scale. Study 2 examined the convergent and discriminant validity of the scale using a range of relevant sociopolitical measures and established an initial nomological network. Both studies used paid online convenience samples. The practical and scholarly implications of these findings are discussed.

[68] Do Psychological Interventions Reduce Intergroup Victimhood and Support for Violence? An Intervention Tournament

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

This study explores employees' implicit theories of wise management. Semi-structured interviews were conducted with 26 employees from an industrial organization, analyzed using Interpretative Phenomenological Analysis. Results revealed three core dimensions of wise management: intrapersonal attributes (e.g., moral reasoning, emotional balance), interpersonal behaviors (e.g., empathy, team development), and job-related skills (e.g., foresight, problem-solving). These domains formed the basis of the Tripartite Model of Wise Management (TMWM), consisting of nine managerial styles, ranging from "wise manager" to "self-centered ineffective," illustrating variations in wisdom-related competencies. TMWM expands existing leadership frameworks by integrating ethical self-regulation with strategic and relational capacities. It offers a more dynamic and value-oriented approach to management, emphasizing not only how managers act but also why they act in a particular way. This framework informs management development, assessment centers, and selection processes by capturing the complexity of wise behavior in contextually demanding environments.

[69] Do threat and group membership impact recollection over time?

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Research shows memory biases for positive ingroup and negative outgroup members. Work on memory consolidation shows that impressions are encoded into long term memory via sleep. We tested if threat impacts initial impressions and impression longevity using a minimal group paradigm. Participants were randomly assigned as an over estimator or under estimator via an estimation style test. They then formed impressions about ingroup or outgroup targets that were threatening (i.e. angry) or not (i.e. happy) by reading news articles that included a headshot and the target's group membership. Later the same day and 48 hours later, participants' memory about targets was assessed using the remember/know task. We hypothesized that recollection would be higher for negative outgroup members (vs negative ingroup) and positive ingroup members (vs positive outgroup), and these effects would persist after sleep. An a priori power analysis indicated 80 participants are needed to achieve 80% power. We have data from 50 participants and will complete data collection soon. Data will be analyzed by SPSP 2026. Results will be discussed in the context of stereotype and prejudice formation.

[70] Does Friendship Quality Moderate the Effectiveness of Digital vs. In-Person Social Support on Stress Recovery?

6:00 PM – 7:00 PM

PSYCHOPHYSIOLOGY/GENETICS

Text-messaging is a common way young adults communicate, yet little is known about whether digital social support buffers stress responses and how friendship quality may shape its effectiveness. We tested whether friendship quality moderated in-person and text-messaged support on cardiovascular and psychological reactivity to stress. Female undergraduates ($n = 49$, $M_{age} = 20.33$) completed an anticipated speech task with a same-gender friend who was randomly assigned to provide in-person ($n = 14$), text-messaged ($n = 17$), or no social support ($n = 18$). Friendship quality was measured for both participants ($M = 4.89$, $SD = 0.89$). Multilevel growth curve models with planned contrasts examined stress responses. Results showed that friendship quality moderated in-person support: Participants with moderately supportive friends had reduced diastolic blood pressure (DBP) reactivity, whereas highly supportive friends increased DBP, suggesting performance pressure. When comparing digital with in-person support, recovery was linked to higher positive emotions in both, but in-person support was most beneficial with weaker friendships, while digital support was most effective with stronger ones.

[71] Does Trait-Truthful Communication Influence How People Perceive Situations?

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

This research examines whether trait-truthful communication predicts the extent to which individuals perceive situations as relevant to truthfulness. Honesty is a valued trait (Hartley et al. 2016), and previous research has identified truthfulness—defined as “expressing one’s beliefs accurately and faithfully”—as a core component of honesty and has studied it as a moral trait (Reynolds et al., 2025). According to the explanatory side of Whole Trait Theory (WTT; Fleenon & Jayawickreme, 2015), traits emerge from interactions between internal and external factors, such as interpretations of situations. Based on WTT, we predict that individuals higher in trait-truthful communication (measured through the trait-truthful communication scale; Reynolds et al., 2025) will rate written ambiguous scenarios as more relevant to truthfulness compared to individuals with lower levels of trait-truthful communication. We aim to sample at least 250 adult U.S. residents recruited from Prolific. These findings will contribute to understanding the explanatory side of WTT and further connect virtue research with personality psychology.

[72] Echoes and Insights: How Gossip Relates to Perceived Authenticity in Others

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Gossip plays a significant role in human communication and connection, offering valuable insights into how an individual’s authenticity is perceived by others. This study explores the relation between five types of gossip and perceived authenticity, with gender as a moderating factor. A total of 276 participants were asked to think of four individuals they knew as follows: a man and a woman who do not gossip and a man a woman who did gossip. When asked to think of a person who gossiped, they were asked to think of a person who gossips for one of possible reasons consistent with prior research on motivations for gossiping. Results indicated a significant main effect of gossiping (regardless of type) on perceived authenticity, as well as a main effect of target gender, with women being perceived as gossiping more than men. Additionally, significant main effects were found for type of gossip. Gossiping for social enjoyment or to negative influence another’s reputation was negatively related to authenticity, whereas gossiping to protect one’s group was positively related to authenticity. Implications are discussed.

[73] Effects of Hispanic and Asian Population Growth

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

The United States is growing increasingly racially diverse even as current deportations near 1,500 per day, signaling intensified anti-immigrant sentiment (Sun, 2025). Prior work has shown that making Hispanic/Latinx growth salient increases conservatism among non-Hispanic participants (Craig & Richeson, 2018), but whether reactions differ for immigrant groups stereotyped as both low economic status and foreign (Hispanic/Latinx) versus foreign but higher in economic status (Asian) remains unclear (Zou & Cheryan, 2017). In a preregistered experiment (N=450), White U.S. adults read about Hispanic/Latinx growth, Asian growth, or non-immigration control information, then reported perceptions of changes in their status, realistic/symbolic threat, and racial attitudes. We predict that Hispanic/Latinx growth will elicit expectations of Hispanic/Latinx gains and Whites’ losses across economic and cultural status (replicating Craig & Lee, 2022), whereas Asian growth may elicit similar but attenuated responses given higher economic status stereotypes. This study offers insight into how demographic change along economic and cultural dimensions shapes status threat and racial attitudes.

[74] Effects of One's Own Voice on Narrative Transportation via Identification

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Previous studies have shown that transportation (entering the story world) can influence listeners' attitudes and behaviors. One factor contributing to transportation is the similarity between the listener and the character, possibly via identification (adopting the character's perspective). However, little is known about the effects of voice similarity, including the listener's own voice, which is the most similar to their own. This study examined how voice similarity influences identification and transportation. A total of 424 Japanese participants completed an online experiment in which they listened to audiobook excerpts in either their own or other's synthetic voice (self- or other-voice condition). They then rated similarity, identification, transportation, enjoyment, and intention. Indirect effects of similarity via identification were tested using mediation analysis. Results showed that perceived similarity enhanced identification, which in turn promoted transportation, enjoyment, and intention. These mediation effects were observed in the other-voice group but were limited in the self-voice group, suggesting that the impact of similarity depends on the voice condition.

[75] Emotional and Personality Predictors of Violent Media Engagement

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Violent media presents a paradox: people are often distressed by violent content yet remain drawn to it. While most research emphasizes violent media's effects on aggression, less is known about why people consume it. Personality traits likely shape this engagement and its emotional impact. The present study will test how morbid curiosity, neuroticism, and anxiety influence reactions to violent content in real time. Undergraduate participants (N=100) will complete trait measures (Morbid Curiosity Scale, TIPI-Neuroticism, GAD-7, PANAS) before being randomly assigned to read either a violent/negative or neutral/positive Wikipedia article. They will complete comprehension checks, repeated affect surveys, and a free navigation task in which hyperlink clicks are coded by valence. We expect morbid curiosity to predict greater exploration of violent links and more positive engagement. Neuroticism, particularly when paired with morbid curiosity, may foster conflicted engagement as participants are drawn to violent content despite heightened negative affect. Findings will clarify how curiosity and anxiety jointly drive paradoxical media use, advancing theory and informing digital well-being interventions.

[76] Emotional Experience of Relief and Joy in Japan and the U.S.

6:00 PM – 7:00 PM

CULTURE

Cross-cultural studies have often shown that individuals in East Asian cultures report experiencing positive emotions (e.g., joy) less frequently than their Western counterparts. However, research on specific emotions such as relief, which reflects the improvement or calming of negative situations, remains limited. Relief may be particularly salient in Japan, where socioecological (e.g., natural disasters) and interdependent cultural contexts have fostered an avoidance orientation. In this study, we examined the experiences of relief and joy in Japan (n = 103) and the U.S. (n = 100). Participants described situations in which they felt each emotion and reported the frequency of these experiences. Results showed that Americans reported experiencing joy situations more frequently than Japanese participants. By contrast, no cultural difference was found for relief, suggesting that Japanese experience relief as frequently as Americans, despite the general cultural differences in positive emotional experience. Furthermore, content analyses of the situations provided insights into cultural similarities and differences in the contexts that elicited these emotions.

[77] Emotional hypersensitivity as the ‘superpower’ of highly emotionally intelligent individuals

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Emotional intelligence (EI) acts as a magnifier of emotional experience, enhancing perception and processing of emotional cues. The high sensitivity of emotionally intelligent individuals manifests in attentional bias toward emotional faces, heightened discrimination of subtle cues, stronger mimicry, and lower detection threshold. This sensitivity might yield benefits, but also costs through resource consumption. We tested this idea among 374 vocational school students. Four profiles emerged. Profile 1: highest EI, low unpleasant/high pleasant emotions reactivity, frequent adaptive regulation. Profile 2: medium high EI, high reactivity for both emotion types, flexible adaptive and maladaptive regulation. Both profiles predicted higher life satisfaction, intrinsic motivation, and engagement, yet Profile 2 also showed higher physical strain. Profile 3: average EI, high negative reactivity, maladaptive regulation. Profile 4: low EI, low reactivity, little regulation—the least functional. Results highlight the advantages and limits of EI linked reactivity and the pivotal role of emotion regulation in turning hypersensitivity into the ‘superpower’ of emotionally intelligent individuals.

[78] EMPATHY AS A PREDICTOR OF STRESS CONTAGION

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Empathy allows individuals to understand and resonate with others’ emotions, while stress contagion occurs when one person’s stress triggers a stress response in another. Although each construct has been studied independently, little research has examined their potential interaction. This study proposes to investigate whether trait empathy predicts susceptibility to stress contagion. Participants will complete the Interpersonal Reactivity Index (IRI), Stress Numerical Rating Scale (SNRS), State-trait Anxiety Inventory (STAI), listen to either a stressed or neutral speaker audio stimulus, and complete post-viewing self-report and physiological assessments. Changes in heart rate and skin conductance, as measured via Galvanic Skin Response (GSR), will index physiological stress responses. It is hypothesized that participants high in trait empathy will show greater stress reactivity—both self-reported and physiological—when exposed to the stressed speaker audio stimulus. This research may deepen understanding of how dispositional empathy influences emotional transmission, with potential applications in clinical, educational, and occupational settings.

[79] End of world beliefs are culturally diverse and shape perceptions of pressing issues

6:00 PM – 7:00 PM

CULTURE

Functional decline – reduced physical or cognitive abilities that limit one’s capacity to perform common daily tasks – affects over 12% of U.S. adults. Individuals with functional limitations experience reduced social participation and worse psychological health. This study examined civic obligation—the motivation to engage in and contribute to the community—as a novel protective factor against physical decline-related distress. Using the Midlife in the U.S. (MIDUS) data, we tested whether civic obligation moderates the relationship between functional decline and well-being. Results showed that functional decline negatively predicted well-being beyond aging effects. Civic obligation, however, contributes positively to well-being. Crucially, higher civic obligation most strongly protected well-being among those with severe functional limitations, even when controlling for participation in various civic activities. This buffering effect complements existing models by demonstrating that psychological orientation toward civic duties, rather than behaviors alone, shapes well-being. Implications for designing accessible civic engagement programs for vulnerable populations are discussed.

[80] Environment Impressions Enable Accurate Inferences of an Environment's Inhabitants

6:00 PM – 7:00 PM

OTHER

Environments are rich in information that people can use for multiple purposes. One source of such information is the environment's inhabitants themselves—they shape the environment and by doing so leave behind cues. The present research builds on the Environment Impressions Model to demonstrate that people can use environment impressions of density and desirability to form inferences about an environment's inhabitants. Further, by using information from public databases such as the US Census and Project Implicit, we additionally demonstrate that such inferences are accurate. Overall, our results suggest that people exhibit both consensus and accuracy in their inferences of an environment's inhabitants, thereby highlighting the important role environment impressions play in everyday life.

[81] Escaping into Pixels: How Personal Traits and Cultural Values Shape Short Video Platform Usage

6:00 PM – 7:00 PM

CULTURE

The rapid proliferation of short-form video platforms (SVPs) like TikTok has raised concerns about their impact on mental health, cognitive development, and cultural engagement, particularly among younger users. This study investigates how personal traits (e.g., self confidence, stress) and cultural values (e.g., individualism vs. collectivism) interact to shape SVP usage, employing a quantitative approach with a multicultural sample of 246 Canadian undergraduate students. Results revealed a moderate correlation between individual recognition and self-confidence, with self-confidence paradoxically predicting negative digital impact due to

heightened self-exposure. Stress-driven users exhibited escapist tendencies, while cultural hybridity emerged in self-expression, blending individual validation and communal cohesion.

Two distinct pathways were identified: Confidence-Driven Recognition (showcasing achievements) and Stress-Driven Recognition (compulsive validation-seeking), both amplified by platform algorithms prioritizing visibility. Despite limitations like gender imbalance and a Western-oriented multicultural sample, the study advances Cultural Dualism in SVP Engagement, a framework integrating cultural psychology and behavioral addiction theories. Findings underscore the need for platform designs that balance visibility with well-being and culturally informed interventions to mitigate digital harm.

[82] Ethnic Identity, Self-Esteem, and Cultural Values Among Asian American Young Adults: The Role of Mainstream and Ethnic Media Consumption

6:00 PM – 7:00 PM

CULTURE

This proposed study examines how mainstream and ethnic media exposure influence ethnic identity, self-esteem, and cultural values among Asian American young adults.

Asian Americans are among the most digitally connected populations in the U.S., with 68% of English-speaking adults online "almost constantly". Yet mainstream American media continue to offer limited or stereotyped portrayals of Asian Americans, which may contribute to lower self-esteem, internalized bias, or cultural detachment. Conversely, ethnic media often provide more affirming representations, strengthening cultural identity and reducing feelings of marginalization.

This study proposes a survey-based analysis of 500 Asian American adults between 18-25 recruited via social media, student organizations, and national Asian American interest groups. Participants will report their weekly hours of engagement with both mainstream and ethnic media across multiple formats. Measures will include the Multigroup Ethnic Identity Measure, the Rosenberg Self-Esteem Scale, and the Asian Values Scale. Statistical analysis will be conducted using structural equation modeling to identify both direct and indirect relationships between media exposure and identity-related and self-esteem outcomes.

We expect that greater exposure to mainstream U.S. media will be negatively associated with self-esteem among Asian American participants, a pattern previously identified in a study of Indian Americans. In contrast, we hypothesize that exposure to ethnic media will be positively associated with stronger ethnic identity. Ethnic media often provide culturally affirming content that fosters a sense of belonging, reinforces heritage values, and promotes the expression of cultural practices.

It is also expected that increased exposure to mainstream media will correlate with greater endorsement of individualistic values, while ethnic media exposure will be associated with stronger adherence to collectivist values. This expectation is grounded in cross-cultural analyses showing that U.S. media promote themes of independence, personal achievement, and assertiveness, while ethnic media, such as Korean dramas or Chinese films, highlight familial duty and social harmony.

[83] "Respect is earned, not given": Analyzing masculine honor ideology and dominance and prestige-motivated outcomes

6:00 PM – 7:00 PM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Masculine honor ideology is the idea that men act aggressively or violently toward women and others to achieve a masculine, dominant reputation. Previous research shows that men higher in masculine honor seek higher status and use prestige (e.g. respect, honor) or dominance (e.g. aggression, force) to achieve it. Using a variation of the prisoner's dilemma—a game where participants (anticipated n=300) are assigned to another player they can choose to compete or cooperate with to maximize a monetary reward—we aim to analyze behavioral outcomes of said motivations for men higher in masculine honor. We predict that men higher in masculine honor using dominance will be more likely to harm others for personal gain, while those using prestige will cooperate unless provoked. The prestige-based outcomes we anticipate could reveal a more positive side of masculine honor ideology, suggesting that these men endorse respect and politeness toward others unless proven otherwise. This extends previous research on masculine honor and status, and understanding the motives behind these men's status seeking can help us see how context impacts decisions to endorse norms of politeness versus dominance.

[84] Making You The Fool: How People Emphasize or Discredit Political Knowledge and Outgroups When Given False Feedback

6:00 PM – 7:00 PM

GROUPS/INTERGROUP PROCESSES

Research indicates that people enhance their social identity by promoting their own ingroup and disparaging an outgroup. In a time of polarization, political opinion has become an agent for this intergroup behavior. Across two studies (study 1, n = 491; anticipated study 2, n = 300), we examined how participants respond to false feedback on tests that relate to two politically-charged issues, abortion in study 1 and Blue Lives Matter in study 2. Participants reported their political affiliation and stance on the matter, and completed a knowledge test about the given topic. They received false feedback after each question (if correct, they were told they got it wrong and vice versa), and were told that they scored similarly to their group. We then asked participants to reflect on the importance of the item and how bad it is to get it wrong. Consistent with our hypothesis, participants emphasized the questions they got "right" and downplayed the value of questions they got "wrong". It was also consistent that participants excused errors of the ingroup, yet disparaged the outgroup for their errors. The resulting study expands literature on intergroup relations in a political context.

[85] Evaluating listening: A new coding tool to assess conversational listening

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

The quality of one person's listening in a conversation has meaningful psychological effects on the speaker. However, speakers and listeners often have different perceptions of listening quality, and each appears to be poorly calibrated. Thus, there is a need for an objective indicator of conversational listening quality. We developed a theory-derived tool for coding listening based on behaviors associated with its three dimensions: attention, comprehension, and positive intentions. We hypothesized that this coding tool could serve as an effective alternative to other measures of listening and could even act as a manipulation check for studies that utilize trained listeners. We predict that the listening ratings provided by the tool will be consistent between coders and will demonstrate validity by correlating well with self-reports of listening across studies that used both trained and untrained listeners.

[86] Examining Filipino Psychological Tendencies

6:00 PM – 7:00 PM

CULTURE

Compared to European Americans, Filipinos are often considered interdependent like East Asians. However, it is unclear whether they are interdependent in the same way as East Asians. Here, we tested 119 Filipino and 120 European American college students in tasks examining their cognitive style, self-enhancement, everyday emotional experiences and expression of emotions. Results showed that Filipinos are significantly more holistic and self-effacing than European Americans. In this way, the Filipino pattern is similar to that of East Asians. However, Filipinos experienced disengaging (e.g., pride) emotions more than engaging emotions (e.g., feelings of closeness). There was also a trend such that Filipinos tended to link their happiness more to emotions that promote social disengagement rather than engagement. These initial results suggest the possibility that Filipinos may be distinct from East Asians in the domain of emotions, where they seem more like European Americans. These findings have implications for the need to re-examine the homogeneity among Asian groups.

[87] Examining the Sexual Identity Disclosure Process Among Black Queer Femmes and Their Families

6:00 PM – 7:00 PM

CULTURE

Queer identity development theories often overlook the intersectional experiences of Black queer femmes (BQF; African diasporic people expressing non-normative femininities who identify as queer), limiting their relevance for this population. Traditional models emphasize "coming out" to family as central to identity integration but often fail to capture the layered realities of BQF, who navigate both racial/ethnic and LGBTQ+ identities. This study aimed to: 1) explore BQF disclosure experiences with family, 2) examine family responses and 3) identify factors shaping acceptance. Using a dyadic interpretative phenomenological approach, semi-structured interviews with 5 BQF-family member pairs (n=10; Mage=37.9, 25-68 years old) were analyzed. Eight meta-themes were identified: minority stress, culture, conflation of gender and sexuality, views on acceptance, proximity to queerness, facilitators of acceptance, enacted heterosexism, and relational closeness. Findings underscore the role of culture, religion, relationship strength, and queer representation in shaping acceptance, and highlight the need for intersectional approaches to support BQF and their families.

[88] Explaining the Interpersonal Perceptions of Dark Triad Traits

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Previous research suggests that people can accurately judge others' personality profiles by observing social behavior. However, few studies have examined which behavioral cues unfamiliar observers rely on to identify dark triad (DT) traits: psychopathy, Machiavellianism, and narcissism. In the present study, approximately 100 undergraduate participants will be recorded during an unstructured interaction with a confederate. Individuals who have no prior acquaintance with the participants will view these recordings to assess self-other accuracy for each DT trait by correlating participants' self-reports with other-reports. Additionally, trained research assistants will use the Riverside Behavioral Q-Sort to rank the relevance of specific behavioral cues to each participant. Analyses will identify which cues unfamiliar judges associate with DT traits and which cues are most strongly related to self-reported DT traits. Finally, these sets of cues will be compared to determine the extent to which the cues used by judges align with those that are associated with self-reported DT traits.

[89] Exploratory and Confirmatory Factor Analysis of the Multidimensional Humility Scale

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Humility is linked to improved relationship satisfaction and higher life satisfaction. Due to self-enhancement or modesty concerns, few self-report humility measures exist. We aimed to develop the Multidimensional Humility Scale and minimize these biases. Based on prior research, we generated 90 behavior and belief-focused items avoiding the word "humble." In our first study, 624 participants completed a survey and we conducted two exploratory factor analyses. Across both analyses, 38-items loaded on six factors: cultural humility, self-acceptance, self-suppression, limit-recognition, other-focus, and low superiority. All factors displayed acceptable internal reliability, aligning with the hypothesized factors. For validity checks, we assessed correlations with social desirability and the Honesty-Humility subscale of the HEXACO-PI-R. Three factors were positively associated with social desirability, albeit weaker than Honesty-Humility was. All factors had weak positive correlations with Honesty-Humility. In our next study, for which 322 adults participated, we will conduct confirmatory factor analysis and further validity checks.

[91] Exploring personality and moral foundations across varying political identities.

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Our research aims to further understand the relationships between personality traits, moral foundations, political identity, and opinions on historical political policies. Using the Big Five (DeYoung et al., 2007), Moral Foundations (Ataari et al., 2023) and Conservatism/Liberalism scale (Everett, 2013), we have surveyed a Southeastern American sample –a population which is underrepresented in personality research. We also developed a novel scale assessing endorsement of historically authoritarian political policies. Results indicate there is a strong, positive relationship between Conscientiousness and support of authoritarian policies, as well as between Social Conservatism and support of authoritarian policies. However, results also determined that only the Binding Foundations (loyalty, authority, and purity) served as a predictor of authoritarian policy support. Other findings include a strong positive relationship between Liberalism and Openness, between Liberalism and the Individualizing Foundations, as well as a strong negative correlation between authoritarian policy support and the trait of Openness. These findings suggest that certain moral foundations and personality traits may align with authoritarian policy preferences, contributing to our understanding of political polarization in the United States. Future research by our team includes the expansion of measured personality factors to determine other underlying relationships existing within varying political identities.

[92] Exploring Socioeconomic Correlates of Loneliness: A Community-Augmented Meta-Analysis

6:00 PM – 7:00 PM

META-ANALYSIS

Most research on the effects of BDSM (Bondage/Discipline, Dominance/Submission, Sadism/Masochism) activities has focused on longer activities, leaving a gap in research on how individuals react to short BDSM activities. Thus, the goal of this study was to explore how BDSM practitioners react to brief BDSM experiences. Ninety-four participants completed a questionnaire pre and post participation in a 5-minute BDSM activity. Results of paired samples t-tests showed that ratings for feeling proud were significantly higher post-activity compared to pre-activity. Ratings of emotions of shame significantly decreased post-activity compared to pre-activity. Ratings of feelings of closeness with other conference attendees increased post-activity compared to pre-activity. Finally, moderation analyses revealed a significant interaction for the relationship of feeling proud pre and post activity on years in the community. The results show increases in positive emotions and decreases in negative emotions after engaging in a brief BDSM activity compared to before the activity. Finally, the relationship between feeling proud pre and post activity was moderated by years in the community, such that those who were newer in the community felt an increase of pride post activity compared to those who had been in the community longer.

[93] Exploring Suicidal Attitudes among Korean Immigrants: Latent Profiles and Effects of Cultural Traits

6:00 PM – 7:00 PM

CULTURE

This study examines the suicidal attitudes among Korean immigrants in the USA through the lens of Korean cultural traits, focusing on two research questions. First, what latent profiles of suicidal attitudes would emerge among Korean immigrants? Second, how could Korean cultural traits—Relationism, Agency, and Complex-flexibility— influence the probability of membership in these profiles? A survey was conducted with 495 Korean immigrants in Los Angeles area (male = 247; Mage = 52.3, SD = 13.4). Latent Profile Analysis (LPA) identified four latent profiles of suicidal attitudes: rejection-prevention, rejection-uncertain, permissive-understanding, and moderate. Multinomial logistic regression (ref = rejection-prevention) showed that Relationism lowered the odds of belonging to the permissive-understanding and moderate profiles, whereas Agency and Complex-flexibility increased the odds of belonging to the permissive-understanding profile. The implications of the findings were discussed in terms of the role of cultural traits in suicidal attitudes and the need for culturally informed intervention and prevention.

[94] Exposure to System-Critical vs. System-Justifying Films Shapes Beliefs About Poverty and Wealth Inequality

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

In organizations with limited diversity, decision-makers may assign teams by spreading underrepresented employees across teams—a practice we term team-level diversity dispersion. While they may have well-intended reasons, it may result in what we refer to as solo status team configuration patterns, where stigmatized (e.g., Black) employees are consistently placed in solo status positions across a set of teams. This research examines both the antecedents and consequences of this practice. We find that decision-makers prefer solo status team configuration patterns because they prioritize team-level diversity dispersion (Studies 1-2). However, when observing these patterns, Black prospective employees trust and desire to join the organization less because they anticipate their racial identity will be exploited (Study 3). A brief intervention in which decision-makers take the perspective of a stigmatized employee in a solo status position reduces the likelihood of creating a pattern of solo status team configurations (Study 4). This work extends research on solo status and tokenism, as well as research on diversity in teams and perspective-taking.

[95] Face Orientation and Temporal Metaphors Shape Social Impressions

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

People often form impressions such as “warm” or “dominant” after only a brief glance at a face. Yet these impressions do not necessarily reflect actual traits, as they may be shaped by factors such as facial orientation or lighting conditions. Prior research suggests that conceptual metaphors, such as the idea that time flows from left to right, can influence impressions of faces with different orientations. The present study examined whether individual differences in conceptions of temporal flow affect impressions of left- versus right-facing individuals. Fifty-three Japanese participants evaluated Asian faces oriented toward the upper left or upper right and answered questions about temporal flow. Overall, left-facing faces were more often perceived as gazing toward the past, while right-facing faces were perceived as gazing toward the future. Participants who viewed the past, present, and future as linearly connected or mutually related showed this typical pattern. In contrast, those who considered only the present and future as related, or who endorsed other conceptions, were more likely to perceive right-facing faces as oriented towards the past. These findings suggest that individual differences in temporal conceptualization modulate impressions derived from facial orientation and underscore the role of culturally shaped conceptions of time in social impression formation.

[96] Facets of Conscientiousness and Academic Functioning in Students

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Ample research has shown conscientiousness to be a predictor of academic achievement. However, which specific facets contribute to this relationship is unexplored. Data measuring academic hurdles in 150 college-going students (Meanage 21.8 years, 82% female) was used. Using Conscientiousness (C; BFI-2; $\alpha = .85$), academic motivation (AM; AMS; $\alpha = .91$) and test anxiety (TA; TAI-SF; $\alpha = .96$), a regression analysis examined which facets of C (Organization, Productiveness, and Responsibility) significantly predicted TA and AM in these students. Productiveness alone emerged as a unique predictor of AM ($\beta = 0.22$, $t(144) = 2.08$, $p = .04$), suggesting this facet may be driving associations at the trait level. In contrast, while C significantly predicted TA ($\beta = -.19$, $t(147) = -2.32$, $p = .02$), none of the facets were found to be unique predictors. Although generalization may be limited to college students, these results significantly contribute to the literature on the predictive power of levels of personality (domains or traits) for varying life outcomes (i.e., Möttus et al., 2017).

[97] Faith, Nation, and Feeling: Exploring Cultural Differences in Ideal Affect

6:00 PM – 7:00 PM

CULTURE

Affective states, which refers to how individuals want to feel or actually feel, can be influenced through cultural contexts such as nationality and religion. Western cultures and religions tend to value high-arousal positive (HAP) emotions such as excitement due to the cultural emphasis on independent self-construals. On the other hand, East Asian cultures and religions may value low-arousal positive (LAP) emotions such as serene more due to the emphasis on calmness and peace (Tsai, 2017). However, it is relatively unclear how belonging to a HAP religion in a LAP country (and the converse) might shape ideal affect. This research seeks to investigate how religious and national identity contribute to cultural differences in ideal affect. In this study, we will examine differences in ideal affect among Christian and Buddhists living in the US and South Koreans through a survey that measures affective states and religious involvement to explore the mechanisms, such as religious rituals, which underlie ideal affect. We are expecting to find Korean Buddhists and Korean Americans to report a stronger preference for LAP, while American Christians and Korean Christians have a stronger preference for HAP. These findings can help inform about how religious and national identity may affect people's emotions, providing implications on ways to manage these emotions.

[98] Falsely Accused of the Unthinkable: The Stigmatizing Effect of Being Falsely Accused of Child Sexual Abuse

6:00 PM – 7:00 PM

LAW

Being falsely accused of a crime, particularly sex crimes, carries profound social stigma that undermines finding employment, housing, and maintaining relationships. Although child sexual abuse is profoundly underreported and under-prosecuted, there is accumulating evidence that hundreds of wrongful convictions have occurred in relation to child sexual abuse. Alarmingly, 85% of the known exonerations from child sexual abuse in the United States involved a false accusation and a non-existent crime. While maintaining a victim-centred approach, we investigated the stigmatizing effects of being falsely accused of child sexual abuse on an accused person. Across four preregistered studies ($N = 1,189$), we demonstrate that child sexual abuse and rape elicit stronger offence dislike and social stigma than other offences, and that this stigma attaches to a falsely accused person at the mere hint of an accusation. Consistent with Vidmar's (1997) generic prejudice theory of juror bias, dislike of an offence type predicted greater presumptions of guilt and desire for social distance from an innocent accused person, extending the theoretical assumptions of generic prejudice to the context of false accusations. Our findings contribute to both the theoretical role of offence-based stigma in eroding the presumption of innocence and the practical implications of how sexual allegations are investigated and publicly communicated.

[99] Friends or Lovers?: Implicit Evaluations of Interracial Romantic Relationships

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Interracial couples are increasingly common, yet little is known about how they are evaluated. We used the Implicit Association Test to examine attitudes and stereotypes about these relationships. Although romantic couples generally elicit positive associations, study 1 shows that participants implicitly evaluate interracial couples more negatively than same-race couples. This effect persists even when the same-race couples are all Black, highlighting the strength of the “same-race is good” bias over and above the known “White is good” bias, and extending beyond past work. In Study 2, Black participants displayed stronger anti-interracial bias than White and Asian participants, diverging from patterns typically seen in race IATs. Study 3a further shows that same-race couples are more strongly associated with romance than friendship compared to interracial couples, while Study 3b finds that even replacing friendship with sibling, only slightly increases associations between interracial couples and romance. Together, our results ultimately highlight a persistent and robust same-race preference in how people implicitly evaluate romantic relationships.

[100] From Ancient Indian Wisdom to Organizational Science: A Scoping Review of Triguna Personality in Indian Psychology Across Contemporary Psychosocial Domains

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

In recent years, there has been a growing interest in exploring psychological models rooted in culture and tradition, particularly within the Indian context. The concept of Triguna, originating from ancient Indian thought, especially the Samkhya school of philosophy, offers a unique lens to understand human behavior through three fundamental qualities: Sattva, Rajas, and Tamas. This scoping review tried to examine how this traditional framework is being applied in modern psychology to better understand various psychosocial domains in both personal and professional life in India. To address this, we conducted a scoping review aimed at connecting age-old wisdom with the current needs and challenges of contemporary psychological science, while exploring the association between Triguna personality and diverse psychosocial dimensions. A comprehensive search of empirical studies published in English between 2013 and 2025 was conducted using the PRISMA-ScR framework across Scopus, Web of Science, PsycNet, and supplementary manual searches with appropriate filters. Out of 473 identified records, 10 studies met the inclusion and exclusion criteria. From these, five major themes were identified: (1) Triguna and Mental Health & Well-Being, (2) Triguna and Personality Structure: Cross-Cultural Validation, (3) Triguna and Organizational Behavior, (4) Triguna and Adaptive & Maladaptive Coping Styles, and (5) Triguna and Creativity & Ethical Leadership. The findings show that, theoretically, Triguna bridges ancient Indian psychology with contemporary behavioral science. Practically, it offers valuable applications such as workplace wellness initiatives, mindfulness and yoga-based interventions, Guna-based counseling, personality-specific leadership training, and mental health support. Future research should focus on validating Triguna-based assessments across diverse populations and exploring their integration into clinical, educational, therapeutic, and organizational development settings.

[101] From Paddy to Pillows: How Agricultural History Shapes Sleep Norms

6:00 PM – 7:00 PM

CULTURE

East Asians are often found to sleep shorter durations, yet the underlying reasons remain unclear. This study investigates whether historical agricultural practices help explain this pattern. Building on Talhelm’s rice theory—which argues that paddy rice farming in southern China required more labor and coordination than wheat farming in the north—we test whether people from rice-farming regions sleep less today. Using the China Family Panel Studies (CFPS; n = 9,520), we linked provincial-level rice cultivation percentages to self-reported nightly sleep duration. Linear models controlling for age, gender, income, and latitude show that higher rice cultivation predicts shorter sleep. These findings suggest that deep historical ecology continues to shape present-day sleep behavior, potentially through cultural norms of restraint that developed in rice-farming regions.

[102] From Roots to Reach: An Integrative Supervision Philosophy Grounded in Relational Depth, Cultural Systems, and Motivation

6:00 PM – 7:00 PM

CULTURE

This supervision philosophy for counseling therapy integrates multiple theories through a plant system metaphor to support relationally attuned, culturally responsive, and developmentally grounded supervision. Self-Determination Theory forms the roots, emphasizing autonomy, competence, and relatedness as conditions for supervisee growth. Bronfenbrenner's Ecological Systems Theory and the ADDRESSING model represent cultural and systemic soil, while Interpersonal Process Therapy circulates emotional meaning. Cognitive Behavioral Therapy serves as the leaf system for cognitive insight, and ACT and DBT are adaptive tendrils promoting flexibility and values-based decision-making. A central contribution is reframing resistance as "root entanglement"—a relational-cultural response to unsafe or constrained conditions. Supervisors are encouraged to expand emotional safety rather than eliminate resistance. Techniques include session review, IPR, CBT-based restructuring, and cultural reflection. This model offers counseling supervisors a whole-person, theory-informed approach to support supervisee identity, well-being, and professional growth.

[103] From Words to Food - A Cross-Cultural Study of Parental Apologies and Forgiveness

6:00 PM – 7:00 PM

CULTURE

Although apologies are widely recognized as a tool for repairing relationships, little is known about how parents apologize to their children, especially across cultural contexts. In the present research, we examined if and how Chinese and Canadian parents apologize to their children after a wrongdoing, focusing on verbal vs. nonverbal apologies. In Study 1, we investigated university students who reported their parents' apology tendencies, whereas in study 2, parents reported their own apology tendencies. The results were consistent across studies. Canadian parents were more likely than Chinese parents to apologize verbally to their children in real-life transgressions. In response to hypothetical transgression scenarios, Canadian parents again were more likely to offer verbal apologies, whereas Chinese parents were more likely to offer no apology or to apologize non-verbally. Different types of apologies also had culturally specific emotional and relational effects. Although students from both cultures were likely to forgive after a verbal apology, Chinese students were more forgiving towards non-verbal apologies compared to Canadian students. Chinese students also reported greater closeness to their parents after a non-verbal apology than did Canadian students. These findings provide a unique perspective on communication and conflict resolution patterns in parent-child relationships and highlight the importance of considering cultural context when studying the meaning and impact of an apology.

[104] Does social media app use explain why liberals are unhappier than conservatives?

6:00 PM – 7:00 PM

MENTAL HEALTH

Recent work suggests a partisan "well-being gap," with liberals reporting lower well-being than conservatives. One possible explanation is that liberals use social media more frequently, which may undermine their well-being. We test whether social media usage mediates the relationship between political orientation and well-being at the momentary, weekly, and monthly levels. Participants (N = 1,578) reported their political orientation in a one-time survey. They reported their social media use (i.e., minutes spent on social media platforms in the past hour) and affective well-being (i.e., how they felt at that moment) in ecological momentary assessments up to seven times a day over one month (i.e., 120,599 total assessments). They also completed weekly reports of their social media usage using their smartphones' screen time app (i.e., Hours spent on social media platforms in the past week), as well as monthly well-being reports (i.e., life satisfaction, loneliness, and affective well-being). By analyzing data from multiple sources at multiple temporal levels, this study clarifies whether and which everyday social media habits contribute to partisan differences in well-being.

[106] Future in Peril: Linking White Identity and White Nationalist Beliefs

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

White nationalism (WN), political polarization, hate crimes, and intergroup violence are increasing in the United States (ADL, 2024). This research uses a multi-methods approach (qualitative, survey, experiment) to examine how existential threats to the White race motivate support for WN, especially among those strongly identified with Whiteness. Study 1 analyzed 50 quotes from 10 White nationalist websites (e.g., blogs, manifestos, discussion forums), identifying themes of a bleak racial future and racial threat through web-scraping and qualitative analysis. Study 2 used a national survey (N=653) measuring White identity, WN, and perceptions of a grim racial future. Study 3, an experiment (N=291), manipulated demographic shift reports predicting bleak futures for Whites, young people, or no prompt. Results show collective hopelessness and perceived racial threat pervade White nationalist spaces. Study 2 showed that strong White identity predicted greater support for WN, especially when the future seems bleak. Study 3 replicated this and showed that, like in WN forums, stoking people's bleak perceptions effectively increased support for WN. Ideas for intervention are discussed.

[107] Getting Back on Track: How Apologies Promote Forgiveness and Self-Forgiveness by Repairing Moral Perceptions

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

After an interpersonal offense, how do perceptions of the transgressor's morality affect the apology-forgiveness process? Prior work has shown that morality is central to our impressions of others and our own identity. However, less is known about how apologies restore victims' perceptions of transgressors' morality or transgressors' own moral self-perceptions, and whether these perceptions predict forgiveness and self-forgiveness, respectively. Across four experiments (Ns = 376; 593; 595; 813), we found that when victims received an apology (vs. no apology), they perceived the transgressor as more moral, and in turn, were more forgiving of the transgressor. In a fifth study (N = 424), we tested both victim and transgressor perspectives. Replicating Studies 1–4, the apology (vs. no apology) increased moral perceptions, which in turn predicted forgiveness and perceived forgiveness. However, perspective moderated effects on self-forgiveness. For victims, the apology (vs. no apology) increased perceptions of morality, which in turn was positively associated with perceptions of self-forgiveness. For transgressors, the apology (vs. no apology) increased perceptions of morality, which in turn was negatively associated with self-forgiveness. Together, these studies offer insight into how apologies foster moral restoration after wrongdoing from both perspectives.

[108] Holistic and Yet Logical: A Distinct Cognitive Profile in the Middle East

6:00 PM – 7:00 PM

CULTURE

While the dimension of analytic versus holistic cognition has characterized cross-cultural variation along the East–West axis, with Westerners being more analytic and less holistic than Easterners, little is known about the nature of cognitive variation beyond East Asian and Western cultural boundaries. In this study, we tested a unique cognitive configuration in the Middle East, based on the expectation that individuals in this region are highly interdependent, leading to holistic thinking. At the same time, this region has rich historical traditions of debate, negotiation, and trade, which may foster cultural attunement to logical reasoning. Consistent with this prediction, we found that Turkish and Kuwaiti participants were highly holistic, comparable to East Asians, while also showing logical reasoning. This combination of holistic and logical cognition, previously undocumented in other regions, underscores the need to broaden the scope of cultural psychology beyond the conventional East–West framework.

[109] Home, School, Both or Neither?: The Role of Acculturation Strategies in First-Generation, Low-Income Students' Outcomes

6:00 PM – 7:00 PM

CULTURE

Being empathetic (and seen as such) aligns with perceiving one's relationships as high-quality. Across two studies, we examined whether relationship quality (RQ) shapes accuracy and bias in empathy judgments, as well as the sources of these judgments. In Study 1, we ran Truth & Bias models predicting bias in empathy judgments in friend dyads (NDyad=290). Empathy was underestimated ($b=-.17$, $p<.001$) and shaped by one's own empathy ($b=.24$, $p<.001$) and the target's empathy ($b=.22$, $p<.001$). Higher RQ was linked to higher empathy perceptions ($b=[.19-.41]$, $ps<.001$). In Study 2, we applied Social Relations Models to groups ($N=189$) of four friends ($N=756$) who rated each other on empathy and RQ. Empathy judgments were again shaped by one's own ($r=.32$, $p<.001$) and targets' empathy ($r=.19$, $p<.001$). Sources of empathy and RQ judgments mostly stemmed from unique relationship perceptions (62-66%), assimilation (20-27%), and consensus (7-18%). These judgments covaried, such that judging others as empathetic (and being seen as such) was associated with higher RQ. These results demonstrate a relationship-specific nature of empathy judgments and the role RQ plays in accuracy and bias.

[110] Honor Norms, Cognitive Risks: Gaps in Memory Aging and Alzheimer's Disease Knowledge among Honor Endorsing Individuals

6:00 PM – 7:00 PM

CULTURE

Despite growing interest in cultural risk factors for Alzheimer's disease (AD), US honor cultures have largely been neglected within examinations. One method for improving our understanding of AD risk and developing effective education and intervention strategies is to identify deficits in the public's memory aging knowledge. To this aim, we examined associations between US adults' ($N = 998$) endorsement of honor culture norms and knowledge regarding normal, pathological, and AD-specific memory aging. After controlling for demographics (e.g., age) and factors relevant to memory aging knowledge (e.g., dementia experience), we found that greater honor endorsement was (1) associated with worse normal, pathological, and AD-specific memory aging knowledge, and (2) specifically linked with worse knowledge related to AD risk factors, symptoms, treatment and management, life impact, and caregiving. This study advances our understanding of deficits in the public's memory aging knowledge within the context of US honor cultures. Findings have implications for AD risk among honor endorsing individuals and highlight a need for developing culturally relevant education and intervention efforts.

[111] Horizontal Hostility: Addressing Internal Bias and Social Division Within the LGBTQIA+ Community

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Horizontal hostility occurs when marginalized subgroups express negative attitudes toward other marginalized subgroups within a shared superordinate group. This can emerge when subgroup members view other identities as closer to the mainstream or threatening to their subgroup's distinctiveness. This study examined how subgroup versus superordinate identity salience influences attitudes toward bisexual and transgender individuals. Participants ($N = 51$) were randomly assigned to either project or align their subgroup identity with the superordinate LGBTQIA+ category and then completed measures of perceptions, prototypicality judgments, and likeability toward bisexual and transgender individuals. Results showed that subgroup projection significantly influenced perceptions of prototypicality ($p = .038$), and prototypicality significantly predicted likeability ($p = .005$). These findings suggest bisexual and transgender individuals are more positively regarded when viewed as representative of the LGBTQIA+ community, highlighting the central role of prototypicality in shaping attitudes within communities.

[112] How “They” See “Us”: Visualizing Social Identity Threats’ Impact on Meta-Representations of Racial Outgroup Members

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Across three studies, we used reverse correlation to visualize the facial features Black and White people expected racial ingroup and outgroup members to associate with their racial group (i.e., meta-representations) to test hypotheses derived from social identity threat theory. Specifically, Black (Study 1A) and White (Study 1B) participants generated meta-representations of Black and White people. Results revealed that both Black and White participants’ meta-representations of racial outgroup members were rated as less warm, less competent, and more aggressive than those of racial ingroup members. Study 2 tested whether an identity safety cue (i.e., the racial diversity of a target’s friendship network) led to a more positive meta-representation of an outgroup member. Findings indicated that Black participants generated a meta-representation of a White male who had a diverse friendship network (i.e., 2 Black and 3 White friends) that was rated as warmer, more competent, less aggressive, and less dehumanized than that of a White male with a homogenous friendship network (i.e., all White friends). The importance of face perception for social identity threat research is discussed.

[113] How do People’s Stress and Romantic Relationship Quality Predict their Ability to Pitch Themselves for a Job?

6:00 PM – 7:00 PM

OTHER

Research suggests that family and home stress can spill over into the workplace, influencing both job satisfaction and performance (Sanz-Vergel et. al, 2015). Yet, little research has examined how people’s relationships with their romantic partner, and the ways couples handle stress, may shape their performance in a job interview context. To address this gap, we analyzed self-report and observational data from 156 romantic dyads, in which either one or both partners took part in a mock job interview. Specifically, we measured how much support people perceived from their partners during an in-lab stressor and their overall relationship quality. Trained coders evaluated participants’ job speeches on four dimensions: confidence, smoothness, preparedness, and content quality. We anticipate that people who report higher relationship quality and more support from their partners during a stressor will perform better during the job interview. These results will make a novel contribution to relationship science and organizational studies by shedding light on how people’s romantic relationship experiences spill over into their performance during job interviews.

[114] How Learning Goals And Liberal-Conservative Friendships Could Improve Interpolitical Interactions

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

In an increasingly polarized and divided world, people in interpolitical interactions can experience social identity threat and anticipate negative interaction outcomes. The present study explored whether an interaction partner’s political friendship diversity and interaction goals impacts experiences of social identity threat and negative interaction outcomes. In the online experimental study, liberal participants in the United States (N = 366) anticipated interacting with a conservative partner who either had a politically diverse friendship network (vs. a politically homogeneous friendship network) and adopted a learning goal (vs. no goal). Having a partner with a politically diverse friendship network reduced participants’ social identity threat and their anticipated interaction challenges. In addition, having a partner who adopted a learning goal reduced social identity threat and interaction challenges in the homogeneous friendship network condition, but not in the diverse friendship network condition. This research suggests that having a partner who adopts a learning goal can improve interpolitical interactions in the absence of interpolitical friendship diversity.

[115] I'm Sorry... Again... and Again: How Apologies for Repeated Offenses Impact Apology Sincerity, Trust, and Forgiveness

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Apologies are powerful tools for reconciliation, but do they lose their effectiveness when offered for recurring offenses? While prior research shows that apologies can restore trust and promote forgiveness following isolated offenses, little is known about how apologies function in the context of repeated wrongdoing. In the current research, we tested how perceived response sincerity, trust, and forgiveness are affected by apologies for repeated (vs. single) offenses. In Study 1 (n = 575), participants imagined receiving an apology or no apology after either an isolated offense or three similar offenses. Results showed that perceived response sincerity, trust, and forgiveness were greater following an apology for a single (vs. repeated) offense. Among those who experienced repeated apologies, these outcomes decreased after each apology, revealing diminishing returns for consecutive apologies. Furthermore, the reduced effect of apology (vs. no apology) on forgiveness for repeated offenses was serially mediated by perceived response sincerity and trust, supporting our proposed theoretical model. Study 2 will use live offenses to replicate and extend these findings.

[116] Ideal Selves in Fiction: Projected Self-Discrepancies and Admiration of Fictional Characters

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Why do people feel drawn to fictional characters? Social psychological theories of self-discrepancy and ideal self-concept suggest that individuals may admire characters who embody traits they aspire to but perceive as lacking in themselves. In the present study, participants (N = 101) first named their favorite fictional character, then rated both that character and themselves across 27 dimensions of personality and character strengths. The order of self- versus character-ratings was randomized. Results showed that participants consistently attributed higher levels of valued qualities to their favorite fictional characters (M = 4.08, SD = 0.60) than to themselves (M = 2.06, SD = 1.00). A paired-samples t-test confirmed this difference as statistically significant, $t(100) = 16.02, p < .001$, with a large effect size ($d \approx 1.59$). On average, characters were rated 2.02 points higher than the self (95% CI [1.77, 2.28]). These findings support the view that admiration for fictional characters reflects, at least in part, a projection of one's ideal self, offering a window into the psychological mechanisms underlying parasocial attachment and media-based identification.

Keywords: fictional characters; ideal self; self-discrepancy; social identity; parasocial relationships; character strengths

[117] Identifications and Intergroup Bias among Young Adults undergoing Socio-Political Transition

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

People are increasingly using chatbots powered by large language models (LLMs) for tasks ranging from coding help to emotional support. Differences in algorithms and training data suggest chatbots will express distinct and stable personality profiles. In two studies, we examined impressions of Big Five personality traits of three popular LLMs: ChatGPT, Google Gemini, and Microsoft Copilot. In Study 1, N = 248 participants read chatbot responses to personality-relevant prompts (without knowing they were chatbot-generated) and rated the author's traits. In Study 2, N = 229 undergraduates interacted with each chatbot for 5 minutes, then rated the chatbot's personality; chatbots also rated their human partners. Participants agreed about chatbot traits and differentiated between them. When unaware responses were chatbot-generated, participants assumed similarity in traits at levels comparable to impressions of people—but not after direct interaction. Chatbots conveyed stable, distinctive personality traits and rated humans with moderate accuracy. We discuss how these impressions may shape trust, social judgments, and future human–chatbot relationships.

[118] Identifying Motivational Patterns for Collective Climate Action among Indigenous Peoples: A Latent Profile Analysis

6:00 PM – 7:00 PM

CULTURE

The current project demonstrates the usefulness of a Legal Moral Matrix (LMM) to understand tolerance for unwelcome speech. Results revealed that legal and moral judgments about controversial speech may be more similar than commonly believed. Data from the Foundation for Individual Rights and Expression's annual poll of social and political attitudes was used to validate the LMM as a conceptual framework for visualizing attitudes. Over 150,000 volunteers participated (spanning 2020-24). There were 16 questions to gauge moral tolerance for potentially offensive speakers, and 4 questions to measure the legality of speech obstruction. Scores provided coordinates for graphic illustration of moral and legal judgments on a Cartesian grid, revealing differences were significant, but graphically proximate and numerically small. Effect sizes for political ideology were medium to large, with liberals and conservatives revealing expected biases on hot-button issues, but the explanatory usefulness of race and gender was negligible. Mapping moral and legal judgements about controversial speech may provide shared space for a discussion of our similarities, rather than our differences.

[119] Impact of Patient-Physician Identity Concordance on Latina Women's Comfort with Preventive Healthcare

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Latina women face many health disparities arising from an underusage of preventive care, highlighting the need to find ways to improve their healthcare engagement. Research finds doctor-patient racial concordance increases trust and receipt of preventive care for Black patients, with gender concordance having similar benefits for White women. We used a 2 (Doctor Race: White vs Latino) x 2 (Doctor Gender: Male vs Female) within-subjects design to examine how racial and gender concordance impact Latina women's trust in a doctor and comfort receiving preventive care. 150 Latina women viewed profiles for two doctors, selected from the four possible race x gender combinations. For each doctor, subjects completed measures of trust and their comfort receiving care. Latino doctors were trusted more than White doctors ($p < .001$), regardless of doctor gender. However, subjects were more comfortable receiving care from female versus male doctors ($p < .001$), regardless of doctor race. Our findings suggest that racial and gender concordance may affect different factors tied to healthcare engagement and stress the need for future work to assess patients' attitudes and behavioral intentions.

[120] Impacts of a White Politician's Reputation on the Perceptions of His Use of Racial Dog Whistles

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Racial Dog Whistles (DWs) are seemingly race neutral terms (e.g., "inner cities") that are used to prime stereotypes (e.g., Black = crime) while giving the speaker plausible deniability against accusations of racism (e.g., "I didn't say anything about race"). The purpose of our 3 (type of DW; Regular DW, Joke DW, and no DW) x 3 (speaker reputation; racially sensitive, insensitive, control for Study 1 and humorous, non-humorous, control for Study 2) two study package is to examine DWs in the context of humor and test potential effects of speaker reputation. We predict that those with greater belief in negative Black stereotypes will have more positive perceptions of the White politician when he uses a DW (but not a joke DW). We predict these effects will be the strongest when he has a humorous (rather than non-humorous) and racially sensitive (rather than racially insensitive) reputation. We also predict the greatest blowback (i.e., being perceived as racist) in the non-humorous and racially insensitive conditions. This may suggest that DWs may be more subtle (and more likely to affect perception) when perceivers have less reason to suspect racial(ist?) intentions from a speaker.

[121] Impossible Knowledge: Perceptions of Individuals who Claim Familiarity with Fake Terms and the Role of Individual Differences

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Previous research suggests individuals sometimes claim familiarity with non-existent terms, a phenomenon called overclaiming. However, little work has examined how others perceive overclaimers. Across two studies, we investigate how individuals view targets who do (vs. do not) overclaim and how this perception is moderated by individual differences in personality. In Study 1, participants read vignettes of a professor overclaiming, not overclaiming, or a control condition, and rated their perception of the target's warmth and competence. In Study 2, participants viewed a video of a person explicitly overclaiming (vs. not) and rated the target on the same measures. Across both studies, participants completed measures of their own overclaiming tendencies, as well as measures of their personality traits (e.g., narcissism, intellectual humility, Machiavellianism). Data collection is currently ongoing, although preliminary results show that those who overclaim are seen as less warm and competent than non-overclaimers and the control target. These findings have implications for research on social perception and impression formation.

[122] Imposter Syndrome and Future Anxiety in East Asian Emerging Adults :The Role of Internalized Perfectionistic Standards and Cultural Expectations in Personality Development

6:00 PM – 7:00 PM

CULTURE

This study examined the association between imposter syndrome and future anxiety among Taiwanese generation Z, with particular attention to how culturally shaped patterns of personality development may increase vulnerability to these experiences. A total of 202 participants completed an online survey assessing four dimensions of imposter syndrome and perception of future anxiety. Analyses conducted using JASP revealed that female students reported significantly higher levels of imposter feelings and future anxiety than male peers. Regression models showed that gender moderated the relationship between imposter beliefs and future anxiety. Qualitative data from a female focus group were thematically analyzed to explore personality-relevant developmental pathways. Participants described internalized perfectionistic standards, social comparison sensitivity, fear of disappointing others, and self-worth tied to achievement. These traits were shaped by Asian cultural norms that emphasize modesty and academic excellence. Results suggest that imposter syndrome might reflect a culturally embedded personality constellation that amplifies anticipatory anxiety and self-doubt in East Asian emerging adults.

[123] Influences of Phenotype and Identification on Ratings of Multiracial Trustworthiness

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Multiracial individuals often navigate fluid racial identities, but this flexibility can elicit negative evaluations. It is unclear whether such evaluations are influenced by phenotype. This study examined how phenotype (Afrocentric/Eurocentric/ambiguous/none) and identification (Black/White) shape trustworthiness ratings of Multiracial faces. Participants (N = 999) viewed a vignette of a Multiracial student transferring to university who identified as either Black or White accompanied by a face image. Images were created by morphing a Multiracial face to be more prototypically Black or White (or not morphing) via PsychoMorph. A significant main effect of racial identification emerged, $p = .002$, $\eta^2 = .01$: Black-identifying targets were rated more trustworthy than White-identifying targets. No significant effect of phenotype was found, $p = .531$, $\eta^2 = .002$, nor was there a significant interaction, $p = .728$, $\eta^2 = .001$. Findings suggest people may penalize Multiracial Black-White individuals who identify as White, but not those who identify as Black. Identity, more than phenotype, may influence how trustworthy Multiracial individuals are perceived.

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Understanding why wealthy individuals give can help move resources toward worthy causes. Despite growing interest in the role of high-net-worth (HNW; ≥\$1M) and ultra-high-net-worth (UHNW; ≥\$30M) individuals in shaping society, the motivational landscape of elite giving remains poorly integrated across disciplines. We conducted a comprehensive literature search using wealth-related terms (e.g., “high net worth,” “billionaire,” “elite”) and donor-related terms (e.g., “philanthropy,” “altruism,” “generosity”). From 2,194 records, 47 quantitative and qualitative sources were eligible. Using grounded theory, we iteratively coded donor-reported motivations, identifying three external (need, social, data-driven) and three internal (emotion, identity, impact-driven) motivations, spanning a Responsive–Deliberative dimension from spontaneous to planned giving. We then extracted quantitative endorsement rates, supported by qualitative interviews. Wealthy donors report diverse drivers, including family traditions, direct requests, passion, gratitude, and guilt. While deliberative giving dominates prior research, it appears as only one among many motivations.

[125] Interdependence and cooperation in daily life across three societies: A triangulation approach to disentangle the effects of relational mobility and collectivism

6:00 PM – 7:00 PM

CULTURE

To evaluate societal progress, people compare the present to either a past starting point or an ideal future goal, each yielding different conclusions. Framing the present relative to the past emphasizes how far we’ve come, whereas focusing on the future highlights how far we have yet to go. Building on this framework and prior work by Eibach & Ehrlinger (2006, 2010), we examined how temporal reference points shape perceptions of progress and prejudice toward LGBT individuals. In Study 1 (N = 202), LGBT participants perceived less progress and more prejudice than non-LGBT participants. These differences were mediated by greater future-oriented anchoring among LGBT individuals. Study 2 (N = 301) experimentally manipulated reference points. Across both LGBT and non-LGBT participants, those in the past condition perceived more LGBT progress than those in the future or control conditions. This increased sense of progress indirectly predicted lower perceptions of systemic prejudice. Findings underscore the power of temporal framing in shaping social judgments and suggest the generalizability of this mechanism beyond perceptions of racial and gender progress.

[126] Investigating Racial Differences in Tonic Electrodermal Activity among Black and White Participants

6:00 PM – 7:00 PM

PSYCHOPHYSIOLOGY/GENETICS

Electrodermal activity (EDA) reflects changes in skin conductance from stress or arousal, consisting of tonic and phasic components. While increasingly used in research and wearables, racial disparities in EDA remain underexplored. Black participants are often labeled “non-responders” due to lower scores, leading to exclusion and reduced generalizability. We report significant racial differences in tonic EDA from a relatively large sample (N=139) of Black (n=72) and White (n=67) adults (18–59) recruited for a study on police attitudes. EDA was recorded at 1000Hz from the non-dominant hand with Ag/AgCl electrodes during a 6-minute baseline of ambient traffic noise. Black participants showed significantly lower tonic EDA (M=4.13μS, SD=2.49) than White participants (M=7.95μS, SD=3.19), p<.001. This pattern held across gender: Black women (M=3.92μS) vs. White women (M=8.76μS), p<.001; Black men (M=4.63μS) vs. White men (M=7.16μS), p<.001. Findings provide strong evidence of racial disparities in tonic EDA even without stimulus-driven changes, highlighting the need for inclusive measures and revised definitions of “non-responders” to avoid racial bias.

[127] Is Loneliness Increasing Over Time in Japan?: A Cross-Temporal Meta-Analysis

6:00 PM – 7:00 PM

META-ANALYSIS

Loneliness and social isolation have become a crucial issue in Japan, yet no study has examined how loneliness has changed over time. This study conducted a cross-temporal meta-analysis to address this gap. Studies were identified from PubMed, Web of Science, J-STAGE, and CiNii; exclusion criteria were missing means, absence of the University of California, Los Angeles (UCLA) loneliness scale, unclear year of study, duplicate data, and lack of sample size or clear scale use. We identified an overall increase in loneliness between 1983 and 2023. The rise was notable among adolescents. Regression analysis indicated that developmental stage, number of scale items, and type of Japanese translation of the UCLA loneliness scale were related to loneliness score. Although male participants consistently reported higher loneliness, a significant increase over time was observed only among female participants. Furthermore, loneliness rose following the COVID-19 pandemic. Some social indicators were associated with changes in loneliness over time. These findings indicate various contributing factors, but the underlying causes remain unclear, revealing the need for further research.

[128] Is the Dark Triad Darker Beyond “Straight” Lines?

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Prior research on personality and sexuality (cf. Semenyina et al., 2024) has explored potential associations between the Dark Triad traits (narcissism, Machiavellianism, and psychopathy) and sexual orientation, with mixed findings. Using Legate and Rogge's (2019) sexual orientation classification system, we examined whether Dark Triad traits differ across orientation categories. Prolific® participants ($N=99$, $Mage=39.1$, $SD=12.56$) were classified as heterosexual ($n=37$), heteroflexible ($n=12$), bisexual ($n=19$), or homosexual ($n=29$). Supporting our first hypothesis, men scored higher on Dark Triad traits than women, $F(1,95)=6.22$, $p=.014$. Contrary to our second hypothesis, heteroflexible women did not score higher on Dark Triad traits than bisexual, homosexual, or heterosexual women, $F(3,89)=.033$, $p=.992$, $\eta^2=.001$. No significant gender $\times$ orientation interactions emerged. Findings support gender differences but are inconsistent with prior studies reporting orientation-based differences (e.g., Jonason & Luoto, 2021). Continued examination of individual differences across sexual orientations is important for understanding factors that may influence mate-seeking behaviors in diverse groups.

[129] Is There an “I” in Team? Racial and Gender Differences in Teamwork Strategies in the U.S.

6:00 PM – 7:00 PM

CULTURE

The popular saying “There's no ‘I’ in team” encourages Americans to place a team's needs ahead of individual goals, which is essential to effective teamwork (Wageman et al., 2012). While culture thoroughly influences the degree to which individuals tend towards independent (i.e., focus on one's unique goals and preferences) or interdependent (i.e., focus on the needs of others and the environment) ways of being, few studies have shown how culture influences teamwork. To examine which groups of Americans follow this popular guideline most during teamwork, we tested whether the use of influencing (e.g., “influence others with your ideas”) and adjusting (e.g., “adjust your views to fit with others”) strategies might vary depending on one's race and gender. We hypothesized and found that women use adjusting strategies more and influencing strategies less than men. Furthermore, when asked to choose between the two strategies, BIPOC women are less likely to use influencing strategies than White women, BIPOC men, and White men, while White men are most likely to use these strategies. Based on our findings, only some racial and gender groups adhere to the popular adage “There is no ‘I’ in team.” We can foster inclusive and equitable teamwork environments by teaching team members to value and utilize both independent, or influencing, and interdependent, or adjusting, strategies for teamwork.

[130] Is this your work? Students who seek AI versus human help face perceptions of reduced competence

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Promoting belonging in school has become a focal concern. Such efforts require a comprehensive, accurate understanding of what belonging means. In this theoretical work, I argue that social psychological research on students' experiences of belonging has overwhelmingly focused on their sense of social connection to others at school (social fit), while overlooking other factors essential to these experiences. Using research from beyond social psychology, I show that when students describe their experiences of belonging in school, their descriptions also emphasize the extent to which they experience support for their valued identities (self-concept fit), goals (goal fit), and basic financial, nutritional, and safety needs (resource fit). Furthermore, I demonstrate that the reason that these four forms of fit matter for belonging is because they enable students' social connections, identities, goals, and needs to feel natural, inconspicuous, and "right" when they are at school, and it is those feelings of "fluency" that ultimately produce a holistic experience that they belong. Implications for measuring belonging and for belonging-supportive interventions/policies are discussed.

[131] It's Hard Out Here for an Authoritarian: Authoritarians' Vulnerabilities Make Their World a Scary Place

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Research on authoritarianism has long explored its relation to threat and authoritarians' perceptions of living in a dangerous world. While much of this research has examined the authoritarianism-threat nexus in terms of authoritarian individuals' enhanced perceptions of threat signals or endorsement of authoritarian reactions/leaders in response to exposure to threat, we propose a threat-generation perspective. Essentially, we suggest individuals higher in authoritarianism possess features conducive to generating a dangerous world. In this study (N = 461), we tested whether both right- (RWA) and left-wing authoritarianism (LWA) predict various outcomes consistent with generating existential (e.g., threats to safety, such as being victimized and scammed) and epistemic threats (e.g., holding false beliefs) via chronic features associated with authoritarianism: namely, enhanced gullibility, reduced cognitive reflectiveness, and enhanced agentic narcissism. Results supported the threat-generation perspective for LWA but not for RWA. Only people higher in LWA were more susceptible to online scams, pseudo-profound bullshit, and indicated more frequent past victimization; such effects were reduced upon accounting for their enhanced gullibility, reduced cognitive reflectiveness, and enhanced agentic narcissism. These data suggest that at least people higher in LWA may be prone to generating a threatening world.

[132] It's a Dog Eat Dog World: How Beliefs about Animals Are Used to Justify Human Inequities

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

The present research explores the form and function of Human Creatureliness Beliefs (HCB). Low levels of HCB reflect the belief that humans are not true animals; high levels of HCB reflect the belief that humans are highly typical members of the animal kingdom. We theorize that HCB can, by construing humans as animals who share instincts and other traits with non-human animals, function as a legitimizing ideology normalizing individuals' negative behavior and inequitable societal structures. The legitimizing power of HCB is thought to rest in their tendency to foster the appeal to nature fallacy (natural behaviors are inherently ethical) and the immutability fallacy (natural behaviors cannot be changed). As an initial step in testing our theory of creatureliness beliefs, we are constructing a scale capturing the extent to which individuals harbor HCB and, additionally, use them for hierarchy-enhancing purposes. After the collection of open-ended responses conveying participants' thoughts regarding the connection between humans and non-human animals, we will utilize topic modeling to extract common themes in responses. Once we have established themes and items for the scale, we will then begin testing HCB against related constructs, such as Social Dominance Orientation.

[133] Japan–China Comparison of Help-Seeking and Willingness to Help: A Two-Sided Scenario Study

6:00 PM – 7:00 PM

CULTURE

Previous research has shown that East Asians are less willing than Westerners to seek social support, often attributed to relational concerns (e.g., Taylor et al., 2004) and empathic concern (Zheng et al., 2021). Yet little is known about differences within East Asia. We directly compared Japanese and Chinese adults on both sides of a request using an online vignette experiment. Japanese adults in their 20s (n = 240) and Chinese adults living in Beijing in their early 20s (n = 218) evaluated four scenarios varying need (high/low) and burden (high/low)—giving a ride to the nearest station, lending manga, helping with overtime work, and making a purchase on the requester's behalf—across four partners (senior, junior, close friend, stranger). After each vignette, participants reported perceived imposition and willingness to accept (recipient role), and felt guilt and intention to request help (requester role). Across scenarios and partners, Japanese participants anticipated more guilt and showed lower intention to request help than Chinese participants. On the recipient side—especially under lower-need requests—Japanese participants perceived greater imposition and were less willing to help. The results clarify within–East Asian differences, pointing to higher perceived interpersonal costs among Japanese requesters and recipients.

[134] Japan-US comparison of university students' interpersonal communication skills: Focusing on relational and psychological factors

6:00 PM – 7:00 PM

CULTURE

Japanese and American university students were compared on their use of direct and indirect communication strategies across situational and relational contexts. These contexts were varied according to situations that varied by face threats, relational targets that varied by intimacy, and power discrepancy levels. We examined relational mobility/stability and self-regulatory focus to determine whether they influence the use of direct and indirect strategies. A total of 538 university students (255 from Japan and 283 from the United States) participated in the online survey. Results showed that Japanese students preferred indirect strategies more than American students, and as predicted, they were more sensitive to intimacy, power distance, and face threat in their choice of strategies. Relational mobility and self-regulatory focus both influenced strategy use and mediated the cultural differences observed. The findings were discussed in terms of their potential to serve as an explanatory framework for communication competence and interpersonal skills.

[136] Leadership Pursuits Shape Facial Impressions of Attractive Women in Hiring

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Sexual objectification of women is a ubiquitous sexist practice. Integrating theories on objectification and system justification, we tested whether harnessing the system justification motive would reduce support for sexual objectification. In the first correlational study (N = 404 mixed-gender), we found moderate to strong associations among support for sexual objectification, gender-related ideologies, and gender system justification. In the second experimental study (N = 376 men), men were randomly assigned to read about sexual objectification as a threat to the gender status quo that needs to be eradicated or a control condition. Men reported less support for sexual objectification when sexual objectification was framed as the threat, viewing sexual objectification as more harmful and less normative and stable compared to the control condition, which was moderated by gender essentialism. These findings provide preliminary evidence for sexual objectification as an integral part of the gender status quo and gendered patterns of support for sexual objectification. Harnessing system justification motives may provide a way to legitimize social change around this sexist practice.

[137] Lessons Learned from a Review of Laboratory Studies of Personality Disorders

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Personality disorders, whether characterized dimensionally or categorically, are arguably best understood (and most accurately described) in the context of situations that highlight the dysfunctional nature of their responses. However, personality research has historically underutilized the kind of laboratory investigations that would map most closely onto this situational view of personality disorders. Therefore, we conducted a review of the "laboratory challenge" literature in which participants with personality disorders undergo a triggering situation and the predicted dysfunction is measured. The current study describes lessons learned from this endeavor; in particular, we highlight common samples, measures, and designs/paradigms, and offer some comments regarding patterns of results.

[138] Living and Dying by the Sword: Exploring the Connection Between Honor Culture and Age Adjusted Mortality in the United States

6:00 PM – 7:00 PM

CULTURE

A culture of honor refers to a social system where one's reputation is central to their self-worth. Empirical evidence and theorizing links U.S. Honor Culture to negative health outcomes. In this investigation, we sought to assess the association between U.S. Honor Culture and age-adjusted mortality for 10 common causes of death in the United States. Using a statewide assessment of Honor Culture and age-adjusted mortality data collected between 2018-2023, we found that statewide honor culture was associated with an increase in age adjusted mortality for several causes of death even after we controlled for social factors such as income inequality, state unemployment levels, access to medical care, and state government funding of health services. Our results also indicated that statewide honor culture was robustly associated with premature death among both White and Non-White Americans. Consistent with prior research, these relationships were particularly strong among White Americans compared to Non-White Americans.

[139] Longing for the Past: A Rising Trend of Nostalgia in the U.S.

6:00 PM – 7:00 PM

CULTURE

A rising conservatism has been witnessed in the U.S. in recent decades. We wondered whether nostalgia—a bittersweet, sentimental longing for the past—has also become more prevalent. To explore this possibility, we analyzed the annual frequency of nostalgia-related words in English-language books from 1979 to 2019 using the Google Books Ngram corpus. Two lexicons were employed: one developed by researchers (Chen et al., 2023) and the other generated by artificial intelligence. Time-series regression analyses, with year as a predictor, revealed significant upward trends in the frequency of nostalgia-related words for both lexicons. For the AI-generated dictionary, $b = .08$, $SE = .01$, $p < .001$, 95% CI [.08, .09]; for the researcher-defined dictionary, $b = .08$, $SE = .01$, $p < .001$, 95% CI [.07, .09]. These findings suggest a growing societal engagement with nostalgia since 1979. We tentatively interpret this linguistic shift as a reflection of broader sociopolitical dynamics, particularly resurgence of conservative ideologies in Western society. Future study may empirically examine these possibilities.

Keywords: nostalgia, conservatism, cultural change, social change, U.S.

[140] Looking Beyond the Institution: Examining First-Generation, Low-Income Students' Cultural Mismatch in Both College and at Home

6:00 PM – 7:00 PM

CULTURE

As AI-generated faces become increasingly realistic, people face growing challenges in distinguishing real from synthetic content, raising concerns about misinformation and eroded social trust. Across two eye-tracking experiments, we tested how different viewing strategies influence detection accuracy. In Study 1 (N = 90), participants performed at chance level, with a primary focus on internal facial features (e.g., eyes, nose, mouth)—an intuitive but ineffective strategy. In contrast, greater attention to external features (e.g., clothing) was associated with better discrimination. Notably, we observed a divergence between human and machine strategies: human fixation on regions deemed diagnostic by deep-learning algorithms (e.g., hair) did not improve performance. In Study 2 (N = 123), we experimentally manipulated viewing strategies and found that the external-feature condition consistently yielded the highest accuracy, outperforming both internal-feature and holistic scanning conditions. These findings underscore the need for human-centered perceptual training and demonstrate that effective detection may require overriding intuitive but flawed heuristics.

[141] Maladaptive Conscientiousness: Clarifying When it Predicts Maladaptive Outcomes

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

People often judge others based on what they wear. Indeed, many view those who wear firsthand luxury as high status, but this perception comes with a warmth penalty. As demand for secondhand luxury rises, how do social judgments shift when luxury is purchased secondhand instead? Across seven empirical studies (N = 3,632; six pre-registered), we examine how secondhand (vs. firsthand) luxury affects warmth and status ratings. We find that people are less likely to disclose secondhand luxury purchases, anticipating a status loss and no gain in warmth. Contrary to expectations, secondhand (vs. firsthand) luxury buyers are seen as warmer yet relatively lower in status. Grounded in the Stereotype Content Model, we show that secondhand luxury buyers appear warmer because they seem less wealthy and less attention-seeking. Although secondhand luxury signals less wealth and thus incurs an overall status penalty, it retains full cultural capital, a source of status, per Bourdieu's theory (1984). Notably, this preserved status exceeds that of non-luxury. In interpersonal contexts (e.g., dating, networking), secondhand (vs. firsthand) luxury yields social gains by calibrating warmth and status.

[142] Masculinity in East Asians versus White Americans: Cultural Differences in Masculine Norm Perception and Potential Links to Social Anxiety

6:00 PM – 7:00 PM

CULTURE

Compared to European Americans, people from East Asian societies are stricter about upholding social norms, as they are more "culturally tight." Here, we test whether this cultural difference extends to masculine norms. Masculine norm violations involve feminine behaviors performed by men ranging from putting on makeup (Non-Relational) to cleaning the home (Relational). We predict that Relational Masculine Norm Violations (e.g. investing in childcare or performing domestic chores) may be more acceptable for East Asians compared to European Americans. We had 368 East Asian and European American participants rate the perceived inappropriateness of Normal Behaviors and Relational Masculine Norm Violations via an online survey. Initial data analysis shows that Relational Masculine Norm Violations performed by men are rated as significantly more inappropriate than Normal Behaviors, or the same behaviors performed by women. We also find initial evidence that East Asians rate Relational Masculine Norm Violations as less inappropriate than White Americans. Our results challenge the notion that East Asians are uniformly stricter in upholding social norms.

[144] Measuring Social Relationships: A Feature-Based Lexical Approach

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Traditional psychological theories often emphasize explanatory power through simplified, low-dimensional frameworks. While such models provide conceptual clarity and stability, their practical applicability has become increasingly limited. In response, recent research has sought to refine these models by developing more nuanced, feature-rich structural systems. As a central topic in social cognition, the study of social relationships has garnered substantial interdisciplinary attention. Although the FAVEE model—a five-dimensional framework—has demonstrated cross-cultural and historical universality (Cheng et al., 2025), there remains a lack of a concise, generalizable tool for quantitatively assessing social knowledge. To address this gap, the present research adopts a psycholexical approach, inspired by personality psychology paradigms. In Study 1, we compiled a comprehensive pool of 4,773 trait terms by integrating top-down expert knowledge, bottom-up layperson inputs, and supplementary data generated by artificial intelligence (GPT-4). Study 2 involved collecting ratings for these terms from 1,400 participants across various provinces in China via an online platform. Exploratory factor analysis revealed a hierarchical conceptual structure comprising 12 specific facets nested under three higher-order dimensions. This structure enhances the theoretical granularity of the FAVEE model. In Study 3, confirmatory factor analysis using cross-cultural samples from China (n = 799) and the United States (n = 794) demonstrated strong reliability, validity, and cross-cultural generalizability of the identified structure. Study 4 further validated the structural stability in independent Chinese (n = 518) and British (n = 529) samples, while also examining its associations with key psychological constructs, including motivation, emotion, behavior, and situational context. Collectively, this research establishes a robust, multidimensional framework for measuring social relationships, with broad implications for both theoretical refinement and practical assessment across cultures.

[145] Mending Bridges: Intergroup Apologies and Implicit Attitudes of Personality

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

In the real world, transgressions from one group against others are bound to happen, and often they are acknowledged and apologized for. Previous studies have shown that apologies which are victim-focused are more likely to be forgiven than those which are perpetrator-focused. Implicit theories of personality play a role in how people view the world and others around them, and how people forgive and perceive those who have wronged them. Social psychologists studying this think there are two different ways that people perceive others' personalities. The first is called entity theory. It states that people are fundamentally unchanging and ultimately stay the same at their core. The second is called incremental theory. It states that people are able to change through time and experience.

Past research suggests that someone with a more incremental theory will be more likely to forgive a transgressor in an interpersonal context, however there has been little research done in this area with intergroup apologies. In this study, we are trying to extend this line of research by seeing if different implicit theories of personality will affect forgiveness in an intergroup context.

[146] Mental Representations of Dogs and Cats using Generative AI

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Appearance strongly influences dog adoption decisions, often outweighing health considerations (Weiss et al., 2012; Bir et al., 2017). However, findings on the aspects of appearance that matter are mixed. Some studies find no effect of coat color on adoption outcomes (Brown et al., 2013; Svoboda & Hoffman, 2015), while others find that black dogs have lower adoption rates and higher euthanasia rates compared to lighter-coated dogs (DeLeeuw, 2010; Leonard, 2002; Lepper et al., 2002; Sinski et al., 2016). To clarify these inconsistencies, we investigate appearance-related biases in human decision-making using generative artificial intelligence (Albohn et al., 2024). Participants were assigned to view synthetic images of dogs or cats and asked to categorize them on one of six judgments (e.g., adoptability, attractiveness, dominance, intelligence, friendliness, aggression). Idiosyncratic mental prototypes were constructed by first fitting a model to each individual participant's responses. The computed values for each participant were then visualized using the generative AI model, resulting in a photorealistic representation that varied along the judgment of interest. In the next steps, we aim to validate the model on a new group of participants. We discuss implications for social cognition, animal welfare, and practical applications such as improving adoption outcomes.

[147] Mentoring Across Race: How Linguistic Colorblindness Impacts Black College Students

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Psychological theories of dehumanization have long emphasized the denial of traits viewed as central to humanness. Yet in many of its most pernicious real-world forms, dehumanization takes on a paradoxical quality: targets are likened to animals, yet attributed distinctly human traits such as cunning, deceit, and moral corruption. We argue this contradiction reflects a coherent psychological logic—that the most dehumanizing animals are not seen as mindless, but as embodying a corrupt essence capable of intelligent malevolence. Across four studies (N = 1,255), we examine the trait profiles of animals perceived as most dehumanizing. Studies 1-2 found that animals considered more dehumanizing were attributed more negative, uniquely human traits. Study 3 replicates this with fictional animals and an expanded trait set. Study 4 manipulates the perceived intelligence of rats and finds that greater intelligence amplifies their dehumanizing essence. Together, these findings challenge trait-based models of dehumanization that emphasize omission. Capturing this process may therefore require moving beyond trait denial models toward more holistic measures of perceived essence.

[148] Merely introducing AI as a work partner creates an illusion of understanding in people

6:00 PM – 7:00 PM

CULTURE

Individuals' behavior varies with respect to dispositional categories, yet self-reports commonly do not give people the option of reporting such variability. The present study is an initial effort to give test-takers that option. The primary question addressed here is a descriptive one: How frequently do participants select "it depends" responses if given that option? Participants (university students, n = 87) completed 12 items with a mixed-methods structure. Items described a behavioral act. Participant 1) indicated whether the action is a) "like me," b) "not like me" or c) "it depends"; and 3) completed an open-ended question that varied as a function of a/b/c choices. For "a" and "b", participants listed reasons for action. For "c" they indicated "what it depends on." Of the 12 items, three measured each of two personality traits (extraversion and conscientiousness) and three measured each of character strengths (bravery and kindness). Results: Participants chose "it depends" frequently: 47.7% of the time on average. The majority of participants, 59%, chose "it depends" in response to the majority of items, a result that significantly exceeded the chance probability of 33% ($t(86) = 8.86, p < .001$, Cohen's $d = .94$). Traditional assessment sacrifice contextually-dependent information that participants readily can report.

[149] My Personality?: I Say, It Depends, for These Reasons

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

The relevance of grandiose narcissism to attitudes about writing and writing behavior has not drawn much attention, but we reasoned that narcissists' attention-seeking, self-assurance, and willingness to overclaim and cut corners could be reflected in their writing perspectives and habits. Our survey asked college students (most with undeclared majors) to complete the Narcissistic Admiration and Rivalry Questionnaire and respond to items probing writing-related attitudes, values, and tendencies. Narcissistic students were comparatively more comfortable making controversial and provocative arguments and were more likely to prioritize writing impact and effectiveness over maintaining honesty and integrity. Narcissistic students claimed more confidence in having ideas worth writing about and they reported less inclination to consult the perspectives of others during the writing process. Narcissism predicted placing higher value on oral presentation skills than writing skills, and narcissistic students were more enthusiastic about outsourcing their writing assignments to AI. Demonstrating writing excellence generally did not seem highly relevant to narcissistic students' desired self-image or self-presentational goals.

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

The relevance of grandiose narcissism to attitudes about writing and writing behavior has not drawn much attention, but we reasoned that narcissists' attention-seeking, self-assurance, and willingness to overclaim and cut corners could be reflected in their writing perspectives and habits. Our survey asked college students (most with undeclared majors) to complete the Narcissistic Admiration and Rivalry Questionnaire and respond to items probing writing-related attitudes, values, and tendencies. Narcissistic students were comparatively more comfortable making controversial and provocative arguments and were more likely to prioritize writing impact and effectiveness over maintaining honesty and integrity. Narcissistic students claimed more confidence in having ideas worth writing about and they reported less inclination to consult the perspectives of others during the writing process. Narcissism predicted placing higher value on oral presentation skills than writing skills, and narcissistic students were more enthusiastic about outsourcing their writing assignments to AI. Demonstrating writing excellence generally did not seem highly relevant to narcissistic students' desired self-image or self-presentational goals.

[151] Narrowing Dreams: How an Unequal Society Narrows Career Aspirations

6:00 PM – 7:00 PM

CULTURE

Why do young people dream of the same crowded career paths? We investigated whether income inequality leads children and adolescents to follow popular career aspirations—a phenomenon we term occupational herding. Study 1 (N = 92 countries/economies) analyzed about 2.7 million adolescents' reports of their expected jobs at age 30 and found more convergent aspirations in unequal societies. This 'herding' effect was corroborated by findings that adolescents in more unequal contexts reported stronger peer influence on their career choices. Study 2 (N = 1,072 state-year) examined college degree conferrals and showed greater herding in states with higher income inequality. Study 3 (N = 110 years) revealed that increases in inequality consistently preceded stronger herding in college majors, even after accounting for economic trends. Study 4 (N = 479) manipulated anticipated future inequality and found that parents in the high-inequality condition were more likely to recommend popular careers for their children. Together, these studies show that inequality narrows career pathways, channeling a society's aspirations into a limited set of well-trodden paths.

[152] Oh Hair No!: How Hair Texture Shapes Conversational Generosity in Video-Mediated Chatrooms

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

While previous research has highlighted the importance of feature-based differences among Black individuals at the intragroup level, few have examined hair texture as an underexplored racialized feature with unique consequences for Black women. Across five studies (N = 1,100), we tested whether a "conversational generosity bias" would manifest in the frequency and types of spontaneous compliments white males directed toward the same Black female as a function of her hair texture (straight vs. natural) during zero-history video chat pairings. We suggest that synchronous chat provides a context for intragroup bias to travel through compliments. Using thematic analysis, we identified five distinct compliment types with high interrater reliability ($\kappa = .92$). Results indicated that Black women were more likely to receive feature-specific (e.g., "You have juicy lips, baby") versus global compliments (e.g., "You are beautiful") as a function of hair texture (natural vs. straight). Findings provide a basis for deeper examinations into the consequences of interpersonal perception for Black women at the intersection of technology and the human experience.

[154] Parental Acceptance, Bullying, and Distress in LGBTQ+ Youth of Color

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

There is growing philosophical and scientific rejection of the notion of free will, but the psychological implications of this shift remain underexplored. While prior work has emphasized potential negative outcomes of weakening free will belief, the present studies examine possible benefits. In two experiments, we tested whether exposing participants to deterministic arguments would increase forgiveness. In Study 1 (N = 260), participants who recalled a personal transgression and read pro-determinism texts reported greater self-forgiveness. In Study 2 (N = 262), participants who recalled being wronged by someone else showed greater forgiveness and less hatred toward their transgressor after the same manipulation. Extending these findings cross-culturally, we surveyed 8,917 participants across 44 countries and found that individuals with stronger belief in free will were more punitive in response to everyday moral transgressions. At the country level, stronger free will belief predicted support for the death penalty and higher incarceration rates. These results suggest that undermining belief in free will may foster forgiveness and reduce punitive attitudes.

[155] Parental Cultural Socialization and Bicultural Identity Development in Mexican-American Young Adults

6:00 PM – 7:00 PM

CULTURE

Parental cultural socialization shapes ethnic identities during adolescence and into young adulthood. However, limited research has explored the specific practices (e.g., music, food, language) and parental figures that shape ethnic identity for bicultural young adults. This research uses quantitative and qualitative data from two studies to address: RQ1) How is parental cultural socialization related to Mexican and American ethnic pride and identities?; and RQ2) Do individuals from multicultural backgrounds gravitate towards one cultural identity more than the other? And if so, what factors shape individuals' identification with their Mexican and American identities? Study 1 uses data (N=674 Mexican-origin youth) from the California Families Project to evaluate the relationship between Mexican and American ethnic socialization, cultural identities, and ethnic pride. Study 2 aims to replicate and extend Study 1 by analyzing responses from 57 undergraduates of Mexican-origin, combining survey data with qualitative prompts about bicultural identity development. Together, these studies deepen understanding of how early cultural socialization impacts multicultural identity development.

[156] Pathological Personality Traits and Interpersonal Behavior in Romantic Relationships

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Contemporary Integrative Interpersonal Theory asserts that important expressions of psychopathology arise in interpersonal situations (Hopwood et al., 2021). We use data from a cross-sectional dyadic study of romantic relationships (n = 80 different-gendered couples) to investigate intrapersonal and interpersonal effects of pathological personality traits on interpersonal behavior during a conflict resolution task. Trained coders assessed dominance and warmth for both dyad members using the Continuous Assessment of Interpersonal Dynamics (Halberstadt, 2025). Actor-Partner Interdependence Models that regressed dominance and warmth on both dyad members' pathological traits showed that participants with greater disinhibition expressed less dominance (b = -.17.33, p < .01). Moreover, women expressed less dominance when they had greater psychoticism (b = -.27.10, p < .01) and lower antagonism (b = 33.20, p < .01), and men expressed less dominance when they had higher detachment (b = -.23.66, p = .04). No significant effects emerged for warmth. The null effects for warmth and lack of partner effects will be addressed in the context of interpersonal theory and behavioral measurement.

[157] People Are More Reluctant to Adopt Value-Based Culture Than Instrumental Culture During Group Mergers

6:00 PM – 7:00 PM

CULTURE

Across six preregistered studies (N=3803, 1000 collected prior to the Trump inauguration), we find that people are averse to including measurable diversity goals in public-facing communications (e.g., "We aim to hire 50% women in the coming year"). In Studies 1A/B we demonstrate that even those who privately endorse setting such goals are unwilling to include them in job ads, instead preferring to communicate vague, values-focused commitments to diversity. Study 2 replicates this implementation-communication gap with a sample of working adults from a local pop-up lab. In Study 3, we found a reversal in which a majority of participants were willing to communicate measurable goals for pay equity (e.g., "for women to earn \$1 for every \$1 that men make in the coming year"). We also found that this effect is not due to an aversion to counting people as a majority of participants were willing to communicate such goals for less controversial identities like veterans. Finally, Study 5 found that concerns about backlash against the organization and feeling that communicating such goals is morally "wrong" both fully explained people's preference to avoid sharing measurable goals.

[158] Perceived Authenticity of Prejudice Confrontations by Native Americans Based on Blood Quantum

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

The perceived effectiveness of a prejudice confrontation depends on the perceived racial authenticity of a confronter's group status. Specifically, bias confrontations from majority group members (i.e., White individuals) are often perceived as more genuine, while confrontations from minority group members (e.g., Black individuals) are often perceived as complaining. This research has been limited in scope, predominantly focused on White compared to Black confrontations of racial prejudice. In the current study, we will focus on Native American confrontations and examine how blood quantum shapes the perception of Native American bias confrontations. We will vary the Native American quantum of a confronter (0%, 10%, 25%, 50%, 100%) challenging a White perpetrator's biased remark. We predict (anticipated n = 300) that higher Native American quantum will yield greater perceived authenticity, but poorer impact and outcomes; and lower Native American quantum will yield less authenticity, but greater impact and outcomes. These findings will highlight how perceived authenticity influences perceptions of Native Americans who challenge prejudice.

[159] Perceived Ingroup and Outgroup Status Shifts in Intergroup Hierarchical Structures and Their Effect on Support for International Intervention Strategies

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Depression and anxiety rates are nearly twice as high in women than men. One contributor to this gender difference may be structural sexism—a systemic factor that manifests both at the macro (e.g., policies) and micro (e.g., individual beliefs) levels. Drawing on structural sexism and health theory, we tested whether state gender equality and hostile sexism were associated with depressive and anxiety symptoms. U.S. adults (N = 603; 48 states) were recruited via Prolific. We computed multilevel models with fixed effects for gender, state equality, sexism, and a state equality*sexism interaction. Depression was associated with lower state equality (b = -5.99, p = .01) but not significantly associated with sexism. Anxiety was not directly associated with either predictor. Interaction effects were significant, indicating that higher sexism was associated with higher depression (b = -3.83, p = .01) and anxiety (b = -3.21, p = .02) in low-equality states. Women reported higher anxiety and depression than men, but gender did not moderate effects. Findings reveal novel evidence of the buffering role of structural equality, its cross-gender relevance, and its unique links to mental health.

[160] Perceiving Preference: Ingroup and Outgroup Dynamics in Racialized Desire

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

This research examines how Black and White women perceive racial preferences of Black and White men in the context of dating, highlighting the role of ingroup–outgroup dynamics in racialized attraction. Across two planned studies using experimentally manipulated dating profiles, findings from Study 1 (N = 391) suggest that Black women evaluate racial preference disclosures from Black men more positively than equivalent disclosures from White men across several domains (e.g., fetishization, depersonalization, and affect). Study 2, currently in progress, explores whether these patterns extend to White women participants. Collectively, these studies illuminate how racial group membership and social hierarchies influence perceptions of romantic interest, echoing findings that interracial attraction is shaped by forces beyond idiosyncratic preferences (Auelua-Toomey & Roberts, 2023; Stacey & Forbes, 2022; Thai et al., 2019). This work firmly underscores the necessity of intersectional approaches in understanding intergroup processes within intimate relationships and attraction, making apparent the subtle ways race informs everyday social judgments, even in the most intimate contexts.

[161] Perception on the Podium: The Effect of Witness, Evidence, and Jury Instruction Type on Trial Outcomes

6:00 PM – 7:00 PM

LAW

This study assesses the effects of witness type (informant/police officer), jury instructions (no mention/mention witness' ulterior motives), and evidence type (drugs/cash) on mock jurors' verdicts and witness/defendant credibility ratings in a possession with intent to distribute case. In trial, jurors are told to consider a witness' potential vested interest in the trial outcome. This instruction is omitted when police testify (Johnson, 2017). This study assesses whether including the same instruction for police officers would influence trial outcomes.

Mock jurors (N = 355) read a trial transcript, provided verdicts, and completed defendant/witness credibility scales. With the police (vs. informant) witness, mock jurors had more confidence in the defendant's guilt and found the defendant to be more credible—specifically when there were drugs in the defendant's system (vs. hidden cash). When jury instructions did not mention motive, witness credibility was higher in the cash (vs. drug) evidence conditions. Finally, the officer (vs. informant) was more credible when: (a) ulterior motive jury instructions were provided and (b) when presented with cash (vs. drug) evidence.

[162] Perceptions of Advice Rejectors: Comparing Asked-for vs. Unsolicited Advice

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Prior research has explored how advice-seekers are perceived, particularly in terms of competence (e.g., Brooks et al.). However, little is known about how advice-seekers are judged when they reject advice. In everyday contexts, people who ask for advice but do not follow it are often met with disapproval, yet systematic research on this phenomenon is scarce. The present studies examine whether perceptions of advice rejecters differ depending on whether the advice was solicited or unsolicited. Using a vignette design, participants read a scenario in which a colleague prepared for a work presentation and either asked for advice or received unsolicited input. In both conditions, the colleague ultimately rejected the advice. Participants then rated the advice-seeker on 14 Likert-scale items assessing traits such as competence, confidence, and generosity. We also tested gender effects, exploring whether male and female participants evaluated male vs. female rejecters differently. Findings contribute to the literature on advice-giving and impression formation by highlighting the role of advice solicitation in shaping social judgments.

[163] Perceptions of Safety and Threat in University Websites

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

The current study examined perceptions of safety and threat in a virtual context using the new Safety and Threat in the Environment Perceptions (STEP) scale. Specifically, we examined how seeing a colorblind (vs. multicultural) diversity statement on a university website shaped students' intended engagement, interest, anticipated performance, and intentions to recruit others to the school. We further examined whether group membership affected these perceptions. Black and White students (N=293) saw a university website with a colorblind or multicultural statement, reported their perceptions of safety and threat, and completed the outcome measures. Participants did not differ in perceived safety and threat when seeing the multicultural statement. However, White participants perceived less safety and greater threat than Black participants when seeing the colorblind (vs. multicultural) statement. Moderated mediation results showed that perceived professor support and overall liking of the environment explained associations between the variables. This research suggests that a more nuanced view of diversity statements is needed in the literature and in real-world implementation.

[164] Performing positivity predicts poorer well-being for Americans but not Japanese

6:00 PM – 7:00 PM

CULTURE

North Americans tend to value positive emotional experience and open emotional expression more than East Asians (Matsumoto et al., 2008; Tsai, 2017). Do these cultural differences influence how often people perform emotion, and how performing emotion impacts well-being? We predicted that, compared to East Asians, European Americans would report they typically "perform affect" less frequently but that when they do, they perform positive affect more intensely. We also predicted that performing affect would impact European Americans' well-being more negatively. In Study 1 (N = 189), European Americans reported performing affect less frequently overall than did Japanese ($b = 0.52, p < .01$). In Study 2 (N = 396), in hypothetical scenarios, European Americans reported they would specifically perform more positivity than Japanese ($b = -0.17, p < .001$). Moreover, performing positivity was associated with lower life satisfaction for European Americans ($b = -1.14, p < .001$) but not Japanese ($b = 0.26, p = .48$). These findings suggest performing affect is generally more normative for Japanese, while specifically performing positivity is especially prevalent and harmful for European Americans.

[165] Person Perception in Dictator Games

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Dictator games, in which an individual has full power to share windfall resources with another, have long been used to study human decision-making. While most research examines participants' decisions as a dictator, little is known about how dictators' decisions shape how they are perceived. We address this question by presenting adult participants with vignettes in which dictators decided to keep all, keep half, or give all of \$10 to a stranger. In each case, participants rated how warm, nice, powerful, smart, good, and fair the dictators were. We found that participants (college students in the US, $n = 109$) rated keep-all dictators negatively overall compared to keep-half and give-all dictators in the social context (all dimensions $ps < .05$). In addition, participants rated the give-all dictator as fairer than the keep-all dictator, although the inequality was numerically identical, suggesting that people considered self-interest when making fairness judgments. The results indicate that although sharing any resources may be regarded as irrational from the traditional economic perspective, it has social and reputational benefits.

[166] Personality and Mental Health Outcomes in Adults with Cancer

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Personality plays a crucial role in mental health outcomes among individuals with cancer. This study examined the relationship between the Five Factor personality model and depression, anxiety, COVID anxiety, and positive affect in adults with cancer.

A total of 372 participants with a current diagnosis or history of cancer completed measures of sociodemographic and health characteristics, the IPIP personality measure, PROMIS anxiety short form, PROMIS depression short form, Coronavirus Anxiety Scale, and PANAS positive affect subscale.

Regression analyses revealed that more neurotic patients had greater depression, ($B = .541, p < .001$) anxiety, ($B = .535, p < .001$) and COVID anxiety ($B = .296, p < .001$), and less positive affect ($B = -.272, p < .001$). More conscientious patients had less depression ($B = -.159, p < .001$) and anxiety ($B = -.144, p < .001$) and greater positive affect ($B = .239, p < .001$). More extroverted patients had less depression ($B = -.109, p = .009$). Personality explained 15.9% of the variation in depression ($\Delta R^2 = .159$), 13.4% in anxiety ($\Delta R^2 = .134$), 9.2% in COVID anxiety ($\Delta R^2 = .092$), and 21.4% in positive affect ($\Delta R^2 = .214$) (all $ps < .001$).

Neuroticism, conscientiousness, and extraversion were significantly associated with mental health in patients with cancer. Further research should examine the implications of these findings for improving quality of life in patients with cancer.

[167] Personality Predictors of Longitudinal Adaptation Following the COVID-19 Pandemic

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

The COVID-19 pandemic and its mitigation efforts changed people's lives. Long-term adaptation years after the pandemic's onset—and the predictors of this adaptation—have rarely been examined. In a sample of 248 emerging adults followed from 2020/2021 to 2025, in-person contact increased, and technology-mediated contact decreased over time. Online learning was remembered more positively five years after the transition to online learning. Life satisfaction rose and loneliness fell, suggesting an adaptation following stressful pandemic times. Conscientiousness predicted less negative online-learning evaluations and lower reliance on technology-mediated contact. Extraversion and agreeableness were linked to preferring in-person jobs; extraversion and conscientiousness predicted lower remote preference. Extraversion predicted higher life satisfaction and lower loneliness, and negative emotionality predicted higher loneliness. Indicators across domains largely rebounded five years after the pandemic onset, personality traits still mattered. These findings suggest individual differences in how people respond to and adapt to particular contexts, like a pandemic.

[168] Personality processes in situational contexts: An analysis of sleep narratives

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Generational Historical Reflexivity (GHR) is the recognition of oneself as historically situated within a generational lineage, shaped by inherited social conditions and positioned to transform future realities. Across three studies, we examine its theoretical, empirical, and practical significance. First, a psychometric study ($N=1000$) supports a two-factor structure: historical causality and generational responsibility with strong reliability and validity. Second, an experiment ($N=500$) tests GHR's role in predicting problem-based views of inequality, expansive political vision, and attitudes toward diverse social actions. Third, a collaboration with a racial justice group explores how shifts in GHR relate to political engagement. Together, these studies suggest GHR is a powerful tool for understanding and fostering critical consciousness, political imagination, and intergenerational solidarity in both research and practice

[169] Personality Traits and ICT Service Use on Financial Anxiety

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITs

This study examined how personality traits and smartphone-based financial ICT services relate to financial anxiety about the future. A cross-sectional web-based survey of Japanese adults aged 25-44 assessed financial anxiety, Big Five traits, and use of smartphone financial apps and online services. Financial anxiety was measured on a four-point scale ("very anxious" to "not anxious at all"), and ordered logistic regression estimated associations. Neuroticism showed the strongest positive association with financial anxiety. For smartphone-mediated services, online shopping and flea market apps were positively associated, whereas securities investment services were negatively associated. Point reward use showed a positive main effect, yet its interaction with neuroticism was negatively associated, suggesting a buffering pattern at higher neuroticism. Findings indicate that personality-particularly neuroticism-moderates links between smartphone-based financial behaviors and financial anxiety, underscoring the need for interventions integrating psychological dispositions with everyday mobile financial practices.

[170] Policy Evaluations Differ by Target, Not Structural vs. Individual Nature

6:00 PM – 7:00 PM

LAW

Both individual (person-to-person) and institutional (biased policies leading to disparate outcomes) racism is deeply embedded in U.S. social structures. Despite its pervasiveness, many Americans believe anti-Black bias has declined while anti-White bias has risen, even surpassing anti-Black bias (Rasmussen et al., 2022). Across 3 experiments (2024-2025; N=839, 68% White), we examined how U.S. adults' evaluate racial discrimination as a function of discrimination type (structural vs. individual), policy target (White vs. People of Color), and political ideology. Participants rated policies as more racist when they targeted POC rather than White people ($p < .001$), and these effects were larger among liberals and smaller among conservatives ($p < .001$). Participants' evaluations of institutional (e.g., corporation) and individual (e.g., hiring manager) discrimination, however, did not differ, suggesting U.S. adults do not distinguish between them. Thus, although individuals may oppose structural racism in the abstract, policy support relies more on ideology and target, leaving the concept vulnerable to political rhetoric that exploits misunderstanding and fuels polarization.

[171] Positive Egalitarian Feedback: A Green Light for White American's Language Shifts Towards Black Americans

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

As structural support for Diversity, Equity, and Inclusion in organizations diminishes, leaders' individual behavior has all the more impact. We investigate how, for White people, receiving feedback on their egalitarianism impacts their interracial goals and behaviors. Specifically, we examine the impact of receiving positive (versus negative) feedback from a) an implicit association test or b) a colleague on how they speak to a presumed-real Black interaction partner. Across two separate studies, we find that White liberals, but not conservatives, (total N = 1587) use less competent language when speaking to a Black partner after receiving positive (versus negative) feedback on their racial egalitarianism. There was no such effect for same-race interactions, and White liberals' self-reported goals were unchanged. Study 3 aims to further determine the motivational processes that give rise to this behavioral response. Findings suggest that dynamic interpersonal processes, such as receiving feedback, can impact White Americans' interracial behaviors in ways that can help or harm interracial coalition.

[172] Power of culture: Enculturation protects Native wellbeing against omissions and misrepresentations

6:00 PM – 7:00 PM

CULTURE

Representations of Native Americans are routinely omitted from U.S. society. When not omitted, these representations are stereotypical and limiting. Omission and misrepresentations negatively impact Native Americans' wellbeing. The current work investigates whether higher levels of cultural engagement (i.e., enculturation) protect against these negative consequences for Native Americans. Study 1 (N=4965) revealed that higher sensitivity to Native omissions and misrepresentations was related to greater depression/anxiety and lower wellbeing/life satisfaction. However, these negative associations were weaker when enculturation was high (vs. low), suggesting a buffering effect. Study 2 (N=707) largely replicated the results of Study 1. Higher sensitivity to omissions and misrepresentations were associated with greater anxiety/depression and lower wellbeing/life satisfaction. Yet, once again, when enculturation was high (vs. low), many of these associations were weaker or nonsignificant. Taken together, this research demonstrates the harms of Native omission and misrepresentations for Native Americans and supports the protective power of engaging with one's Native culture(s).

[174] Processing Multiple Cues: How Physical and Social Cues Shape Safety and Threat Perceptions in a Classroom

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

The environments people encounter in everyday life are filled with physical cues (e.g., lighting, color) and social cues (e.g., presence of other people, facial expressions). The current research examined how physical and social cues in a classroom shape gut-level perceptions of safety and threat in the environment, and how these perceptions shaped parents' interest in having their child in the classroom. Participants (N=535) were randomly assigned to view an image of a welcoming or unwelcoming classroom with either a smiling or frowning teacher. Results showed significant main effects of both types of cues, with social cues being stronger. Specifically, participants perceived greater safety and less threat in the environment when they saw the smiling teacher in an unwelcoming classroom versus the frowning teacher in a welcoming classroom. There was also a significant interaction, such that participants perceived greater safety in the classroom with positive (vs. negative) physical cues, and this pattern was amplified by positive social cues. Greater perceived safety, shaped by the interplay of physical and social cues, was related to greater interest in having a child in the classroom.

[175] Promoting sustainable consumption through social norms messaging: An experimental test

6:00 PM – 7:00 PM

OTHER

According to social norms theory, individuals match their behavior to groups they identify with. Optimal distinctiveness theory suggests, however, that individuals will deviate from their group when their sense of uniqueness is threatened. The present study investigates whether insights from social norms theory and optimal distinctiveness theory can be used to encourage people to limit their clothing consumption and thus reduce their carbon footprint. Participants completed a task in which they were told that they are either similar to (high need for distinctiveness) or different from (low need for distinctiveness) their peers. In addition, we then presented participants with a fictitious new article indicating that either a small percentage (weak social norm) or a large percentage (strong social norm) of their peers are currently limiting their clothing consumption. We measured a variety of outcomes related to participants' clothing consumption, both immediately afterwards and one month later. The study tests if the effectiveness of social norms messages can be increased by aligning the messages with individuals' level of need for distinctiveness.

[176] Prosociality Uniquely Contributes to Culture-Specific Well-being Through Distinct Psychological Pathways Across Cultures

6:00 PM – 7:00 PM

CULTURE

Accumulating evidence shows that prosocial behavior enhances well-being. Self-determination theory suggests that this relationship is mediated by basic psychological need satisfaction (e.g, autonomy, relatedness, and competence). However, previous studies fail to consider the culturally specific conceptualization of well-being. This study compared American and Japanese adults to examine how the prosocial tendencies uniquely contribute to culturally specific forms of well-being, subjective well-being and interdependent happiness, through need satisfaction. Multigroup path analyses revealed that prosociality was positively associated with subjective well-being via all three need satisfactions in both groups. Cultural differences emerged in interpersonal happiness. In the Japanese sample, all need satisfaction mediated the link between prosociality and interdependent happiness, whereas only autonomy satisfaction mediated the link in the American sample. These results indicate both universal and culture-specific pathways through which prosociality fosters well-being and highlight the importance of cultural contexts in understanding the psychological benefits of prosocial behaviors.

[177] Psychological Markers of Stress in the Context of Disease-Prone Behavior Patterns Among Cebuano Working Adults: A Structural Equation Modelling Approach

6:00 PM – 7:00 PM

CULTURE

This study investigated the structural relationship between disease-prone behavior patterns (DPBP) and psychological stress markers, specifically anxiety, depression, and somatic symptom burden, among Cebuano working adults. Guided by Gabor Maté’s concept of stress-related behavioral traits and informed by Filipino indigenous psychology (Sikolohiyang Pilipino), the model examined four latent behavioral constructs: compulsive concern for others’ emotional needs, over-identification with responsibilities, suppression of healthy anger, and a perceived duty to regulate others’ emotions. A total of 1,134 working adults participated in the study, completing validated self-report measures including the GAD-7, PHQ-2, and SSS-8. Structural Equation Modeling (SEM) using the DWLS estimator showed a well-fitting model ($\chi^2 = 745.478$, $df = 147$, $p < .001$; CFI = .984; TLI = .981; RMSEA = .060; SRMR = .055). All four behavioral constructs loaded significantly onto the higher-order DPBP factor, which in turn significantly predicted psychological stress ($\beta = .455$, $p < .001$). These findings suggest that culturally ingrained behaviors, often perceived as virtues such as self-sacrifice, conformity, and emotional suppression, may be risk factors for internalizing psychological distress. The study underscores the importance of context-sensitive psychological models, especially in collectivist cultures like the Philippines, where interpersonal harmony may mask maladaptive stress responses.

[178] Psychopathy and First Impressions of Warmth, Dominance, and Trust

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Prior research demonstrates that individuals with psychopathic traits are perceived by others to be less warm, more dominant, and less trustworthy. However, it is unclear how individuals with psychopathic traits view others and whether such effects depend on the facet. The current study uses cross-sectional dyadic data from a zero-acquaintance paradigm to evaluate how two facets of psychopathy, Fearless Dominance (FD) and Impulsive Antisociality (IA), relate to first impressions of warmth, dominance, and trust. Participants included 148 same-sex pairs of undergraduate students who rated their interaction partner on warmth, dominance, and trustworthiness based solely on their photograph. Using multilevel modeling, a series of Actor-Partner Interdependence Model analyses found that participants with higher FD were perceived by their interaction partners as more warm ($b = 0.20$, $p = .029$), dominant ($b = 0.26$, $p = .006$), and trustworthy ($b = 0.36$, $p = .027$). Moreover, participants with higher IA perceived their interaction partners to be less warm ($b = -0.44$, $p < .001$) and trustworthy ($b = -0.60$, $p < .001$). These findings suggest that positive judgments of psychopathy stem from the FD facet. In addition, IA appears to negatively shape initial interpersonal impressions.

[179] Pupil dilation and moral expectancies: Physiological evidence that Chinese participants regard both uncivilized and harmful behaviors as non-normative

6:00 PM – 7:00 PM

CULTURE

Unlike Western moral views that focus on harm, Chinese also consider uncivilized and unfilial behaviors immoral (budaode; Buchtel et al., 2015). To add physiological evidence that both Budaode and harmful behaviors evoke strong norm expectations among Chinese, we conducted an eye-tracking experiment with N = 60 mainland Chinese participants. Ninety statements were selected from a pilot study: 30 budaode (more wrong in China than UK), 30 harmful (wrong in both cultures), and 30 aesthetic judgements (control). In each trial, participants rated the behavior, then pupil dilation was measured in reaction to a previous participant's response ("OK" or "NOT OK"). Multilevel models showed that both budaode and harmful behaviors elicited larger pupil changes in the OK condition, but not aesthetic judgements. Consistent with previous research (Proulx et al., 2017) that expectancy violation occurs early (500–1500ms), while emotion plays a greater role later (1500–4000ms), we also found temporal differences: Attitude moderated pupil responses only in the late stage for harmful and aesthetic behaviors, with a similar trend for budaode behaviors. Further UK data will explore cultural differences.

[180] Racial Differences in Trust in Juries

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Race is a major component in whether people perceive legal institutions, such as police and courts, as legitimate and trustworthy. Generally, Black and Hispanic people have lower trust in legal institutions than White people. We surveyed 1,200 adults (400 White, Black, Hispanic) to examine whether such racial disparities extend to trust in juries, who may be perceived differently from police and courts as representatives of the public. Participants rated their trust in juries (1 = low trust; 7 = high trust) and how well the average jury represented their own race (1 = low representation; 7 = high representation). Path analyses showed a significant indirect effect from race to trust in juries through perceived representativeness, with Black and Hispanic participants perceiving juries as less representative which, in turn, was associated with lower trust in juries. However, after accounting for this indirect effect, Black participants had significantly more trust in juries (M = 5.06) than White (M = 4.92) and Hispanic (M = 4.62) participants. These findings reveal a complex relationship between race and trust in juries and distinguish it from trust in other legal institutions.

[182] Real Hate in Unreal Relationships: Measuring Non-Amicable Parasocial Relationships and Changes over Time

6:00 PM – 7:00 PM

OTHER

Non-amicable parasocial relationships (NPSRs)—one-sided connections with disliked media figures—represent a neglected area of social and media psychology. Three studies are being conducted to better understand predictors and characteristics of these hate-relationships. Study 1 developed the PICL-NPSR Scale (33 items) to measure four types: Pervasive, Ironic/Ludic, Competitive, and Loyal. Undergraduate participants (N = 695) completed the PICL-NPSR, listing media figures they dislike. Very simple structure (Revelle & Rocklin, 1979) and exploratory factor analyses revealed a five-factor solution (VSS = .59; RMSEA = .073, 90% CI [.068, .079]; MAP = .013); 23 items loaded above .40. Study 2 features confirmatory factor analyses and data collection is ongoing (N ≈ 700). Finally, Study 3 is a longitudinal media-exposure experiment (spanning over two months) that analyzes changes over time in people's NPSRs with popularly hated U.S. music artists; recruitment is ongoing (N ≈ 100). Preliminary findings suggest that NPSRs with disliked media figures do occur; individual differences in personality, loneliness, need to belong, aggression, and valenced media consumption may predict NPSRs.

[183] Reconstructing the past to perceive greater racial progress in prejudice norms

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Despite abundant systemic racism and inequality in the US, Americans tend to overestimate racial progress. Research documenting the misperception of racial progress, which often compares "perceived" to "actual" changes in economic disparities between ethnic-racial minority and White Americans, ignores psychological theories of time. We investigated the misperception of societal-level prejudice toward Black Americans over time in two ways. In a sample of 240 undergraduates, we compared perceived prejudice over time to "actual" prejudice using undergraduate archival data over the past 10 years. In a sample of 610 Prolific participants, we compared perceived prejudice to "actual" prejudice using data from the American National Election Survey over the past 60 years. Participants overestimated progress by perceiving more reductions in prejudice than had occurred in reality. However, unlike research on economic disparities over time, participants overestimated prejudice in the past, while perceptions in the present were relatively accurate. Results are consistent with temporal appraisal theory, suggesting that mental representations of progress can take the form of past derogations; people may reconstruct the past in ways that enhance the perceived steepness of progress up to the present to meet psychological goals in the present.

[184] Reducing Attractiveness Bias with Mindfulness-Based Meditation

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Attractiveness biases lead people to believe that high attractive people have more positive traits compared to low attractive people. Despite its prevalence, this bias generally receives less empirical attention than other social biases. Moreover, few studies have examined the effectiveness of bias-reducing interventions (e.g., mindfulness-based approaches) in decreasing attractiveness bias. This study tests whether a mindfulness-based meditation manipulation can reduce displays of attractiveness bias. Adults (N = 130) will be recruited for a two-part online study. We will measure participants' state and trait mindfulness, after which they will complete a facial attribution task. A week later, participants will listen to either a meditation audio or a neutral audio. After listening, participants will complete the facial attribution task again. After data collection, we will run t-tests to compare bias between the meditation and control groups. Additionally, we will conduct correlations to explore whether attractiveness bias differs across emerging adulthood. The results of this study could lay the groundwork for future longitudinal studies and inform bias interventions.

[185] Relational Mobility and Reputation Exchange: Experience Sampling Study Across Societies

6:00 PM – 7:00 PM

CULTURE

The sharing of reputational information plays a central role in sustaining human cooperation and enabling large-scale societies. However, little is known about how patterns of reputational exchange vary across socio-ecological contexts. In this study, we focus on the roles of relational mobility—a socio-ecological factor reflecting the freedom to choose and change relationships—in shaping cultural differences in reputational communication. We are currently conducting a cross-national experience-sampling study in Japan (N = 155; completed) and the United States (target N = 150; ongoing), in which participants are asked to report their daily exchanges of positive and negative reputational information about other individuals in natural social interactions. We present findings on how relational mobility is associated with both the frequency and content of reputational information sharing. In addition, we exploratorily examine the domains of information communicated (e.g., morality vs. competence) and their psychological and behavioral consequences. Together, this work provides new insights into how socio-ecological variation shapes the micro-level social dynamics of reputation exchange, and thereby influences the foundations of cooperation across cultures.

[186] Relational Well-Being, Not Affective Well-Being, Shapes First Impressions

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Classic research suggests that happy people see others more positively. Yet, recent perspectives argue that the well-being–perception link depends on which type of well-being is considered. We examined whether affective (=hedonic) versus relational (=eudaimonic) dimensions of well-being differentially predict impressions of unfamiliar individuals. In Study 1 (N = 200), we derived two reliable components from multiple well-being scales: Affective Well-Being (AWB; vitality, positive affect) and Relational Well-Being (RWB; community, belonging, calmness). RWB, but not AWB, predicted positive impressions of facial attractiveness, trustworthiness, and competence. Study 2 (pilot + combined sample, N = 246) replicated this pattern using newly developed scales (probing AWB and RWB separately) and confirmatory projections of Study 1 loadings. Across analytic approaches, the RWB factor consistently predicted positive person evaluations, whereas AWB showed weak or null effects. Together, these findings suggest that stable, relationally grounded aspects of well-being—not affective positivity—serve as lenses that shape how people perceive others.

[187] Religion and Political Divides: Examining Religiosity and Affective Polarization in the U.S.

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Political divisions in the U.S. are increasingly marked by affective polarization, or hostility toward out-partisans (Iyengar et al., 2012). Religion, in contrast, is often linked to prosociality and reduced hostility (Kelly et al., 2024). However, it remains unclear whether religiosity can mitigate polarization among different political parties, whose political identity may outweigh religious ideas. The present study examined whether the importance of religion predicts affective polarization, and whether this relationship is moderated by political party. Christian American Participants (N = 206; 57 Democrats, 114 Republicans, 35 Independents who leaned towards a party) completed several measures of religiosity, affective polarization, and political affiliation. Results indicated that participants who rated religion as more important in their lives reported lower social distance from out-partisans. This effect was moderated by partisanship, as the trend was only found for independents, not Republicans or Democrats. Findings suggest that religion might be most impactful in bridging divides for those who are less partisan.

[188] Replicating the Avoidance Attachment-Collectivism Cultural-Fit Hypothesis

6:00 PM – 7:00 PM

CULTURE

In collectivistic cultures, evidence has suggested a steeper negative relationship between avoidance attachment and measures of romantic relationship dissatisfaction compared to individualistic cultures (Friedman et al., 2010). This difference was believed to be due to collectivistic cultures placing a stronger value on closeness in relationships, and behaviors associated with avoidance attachment are incongruent with this value. The purpose of this study is to replicate these findings using data from the International Sexuality Description Project. In this ongoing analysis, we are using two sets of multilevel models to assess the relationship between avoidance attachment and a country's collectivism score on three measures related to relationship satisfaction. To replicate Friedman et al.'s study, the first set of models will only include samples from two of the cultures included in Friedman et al.'s research. The second set of models will include up to 56 nations from the ISDP dataset, which will allow us to determine if the "culture-fit" finding is due to differences in collectivism or if there was some other variable specific to the three cultures Friedman et al. utilized.

[189] Residential Mobility and the Evolution of Human Values Across Cultures and Time

6:00 PM – 7:00 PM

CULTURE

Residential mobility—the frequency of changing residence—has shifted dramatically in recent decades and reshaped how people connect, behave, and think. While previous research focused on the social consequences of mobility, the current research investigates its cultural psychological impact: how residential mobility affects human value orientations. Across eight studies—using global surveys, historical time series, cross-cultural comparisons, and experiments—we show that societal-level residential mobility promotes Openness-to-Change and undermines Conservation values, partly through the reduction of social monitoring. Self-Enhancement and Self-Transcendence values showed inconsistent or culturally contingent effects. Time series and experimental studies provided causal evidence, and mediation analyses identified social monitoring as a potential mechanism. These findings suggest that residential mobility not only transforms the structure of social life but also reconfigures what people prioritize, revealing a socioecological pathway by which mobility shapes value systems across cultures and over time.

[190] Revisiting Cultural Mismatch Theory on the Experience of Misfit Among First-Generation College Students in the United States

6:00 PM – 7:00 PM

CULTURE

First-generation (FG) students often struggle with sense of belonging and academic adjustment. Cultural Mismatch Theory proposes a misfit between their interdependent orientations and the independent culture of U.S. universities as underlying these challenges. However, previous studies have methodological limitations, predominantly relying on samples from top-tier universities and psychometrically inadequate measures. This research addressed these issues with more rigorous methods. Study 1 generated an objective cultural index through text-analyzing 1,718 U.S. college mission statements. FG students (n = 259) also reported their perceptions of institutional culture and sense of fit. Neither objective nor subjective cultural measures predicted their perceived fit. Study 2 had FG and continuing-generation (CG) students (n = 262) evaluate hypothetical universities emphasizing either independence or interdependence. Cultural manipulation did not affect FG students' fit. Results across both studies did not support Cultural Mismatch Theory, suggesting potential methodological limitations in prior findings and that recent diversity efforts in universities may have benefited FG students.

[191] Role of perceptual dehumanization in political outgroup harm

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

With the dramatic rise of political violence in the U.S., it is crucial to understand the mechanisms that facilitate outgroup harm. Our behavioral studies revealed that participants discounted the pain of political outgroup members relative to ingroup members, leading to greater willingness to harm them. Using fMRI, we next investigated neural regions associated with early visual processing of faces (i.e., FFA) to examine the role of perceptual dehumanization and regions associated with social cognition (e.g., mPFC, dmPFC, ACC) to examine the role of mentalization. We found that reduced encoding of outgroup (vs. ingroup) members' faces was associated with a greater willingness to harm the outgroup, suggesting the role of perceptual dehumanization in decisions to harm. By studying the psychological and social cognitive processes involved in politically motivated intergroup harm, we hope to better understand how violence is increasingly perpetrated against political rivals.

[192] Seeing What We Want to See: Goals in Forming and Updating Impressions

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Impression formation often depends not only on the information available about a target but also on the perceiver's goal during evaluation. The present study examines how perceivers' goals during evaluation (e.g., looking for a roommate vs. tutor) impact both impressions and subsequent updating when new information is encountered. Participants will learn about multiple targets under either a warmth-related or competence-related goal condition. Next, they will receive new counter attitudinal (goal-relevant or irrelevant) information about half of the targets. We will measure implicit impressions after each learning session and explicit impressions at the end. We expect that people's impressions will be stronger when information aligns with their goals, and will be updated more when the new information is present (vs. absent) and goal-relevant (vs. irrelevant). These findings will demonstrate the dynamic nature of social evaluation, revealing how motivational factors interact with available information to determine impression formation and updating. Thus, our findings could inform interventions to potential biases driven by perceivers' idiosyncratic goals when evaluating others.

[193] Self-Affirmation, Prejudice against Muslim Immigrants and French Secularism: A Dual Motivation Perspective

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

In France, "new secularism" laws established restrictive norms, such as prohibiting religious practices in public institutions. This approach contrasts with "historical secularism", a more inclusive framework that upholds freedom of religious expression. We conducted a pilot study (N = 678) and a main experiment (N = 776) to examine how the norms of new vs. historical secularism interact with self-affirmation in influencing prejudice and perceived threat toward Muslim immigrants. In the pilot study, participants exposed to new secularism norms exhibited higher prejudice after completing a self-affirmation task. In the preregistered main experiment, we additionally measured participants' concerns about appearing prejudiced against Muslims and their motivations to avoid bias (internal vs. external). Results showed that higher external motivation was associated with greater concerns about appearing prejudiced and higher levels of perceived threat toward Muslims, the latter particularly in the new secularism condition. In contrast, higher internal motivation was linked to lower levels of perceived threat and prejudice, irrespective of the normative context. The self-affirmation procedure reduced concerns about appearing prejudiced among participants with external motivation and lowered prejudice among participants with higher internal motivation to avoid intergroup bias. The discussion emphasizes the potential for new secularism norms to have disparate effects on attitudes towards religious groups. In ambiguous contexts of religious neutrality, self-affirmation can mitigate intergroup bias among individuals motivated by internal factors.

[194] Self-Presentation and Dark Personality on Perceived Authenticity

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

We investigated if the relationship between self-presentation and authenticity depends on dark personality. In Study 1 (N= 483) participants imagined both self-monitoring by repressing negative emotions, and expressing genuine negative socially undesirable emotions. Self-monitoring was perceived as more authentic compared to expressing genuine non-socially desirable emotions, but the difference in authenticity between the two conditions was smaller for individuals high in dark personality compared to low. In Studies 2 (N=634) and 3 (N=499), we examined whether emotional valence moderated this relationship. Participants rated authenticity after imagining scenarios involving self-monitoring by suppressing positive emotions, and expressing genuine socially undesirable positive emotions, alongside Study 1's scenarios. In both studies, the pattern of Study 1's results replicated across the emotionally valenced scenarios. This seems to suggest what people find authentic differs based on their level of dark personality, with high dark personality persons seeing self-monitoring and expressing socially undesirable emotions as more similarly authentic than those low in dark personality.

[195] Self-Promotive Interdependence and Moral Attribution in Sub-Saharan Africa

6:00 PM – 7:00 PM

CULTURE

Prior research showed that Westerners tend to attribute others' behavior to internal traits, whereas East Asians tend to consider situational factors. Building on this work, we hypothesized that many African contexts are shaped by a shared cultural understanding in which individuals pursue self-interest in ways that ultimately benefit their ingroup. Across five studies, we investigated social inference patterns in Sub-Saharan Africa (SSA), moving beyond the East-West framework. Participants from multiple SSA regions (Ghana, Kenya, and South Africa) exhibited weaker dispositional bias than American and Japanese participants, particularly when interpreting behaviors that could plausibly serve group interests. When the group-benefiting aspect was absent, these cultural differences in attribution diminished. Notably, SSA participants often viewed dispositional and situational factors as mutually reinforcing rather than competing. Together, these findings suggest that causal attribution in SSA may reflect a broader ethos of self-promotive interdependence, in which self-directed actions are morally justifiable when they serve the interests of one's group.

PERSONALITY PROCESSES/TRAITS

A lot of studies have been made on the possibilities to develop cognitive skills and abilities through language acquisition. However, there are seldom any written methodologies that can be incorporated or used to help the language learners or educators, language specialists, and learning support assistants working with learners under inclusion. Once the research is successful, it would benefit language learners of any age group, especially learners with dyslexia and other Special Educational Needs. Since it aims at language and soft skills acquisition, and cognitive skills development at the same time, it's going to be a novel contribution to the sector of education.

English Language acquisition is considered to be a brain training process, as it can stimulate different parts of the brain responsible for cognitive skills and functions. This research discusses the scope of language acquisition in developing the cognitive skills of learners, and methodologies to implement the same in schools, universities, and even at home. The main objectives of this research includes, identifying the key underlying principles of cognitive skills development during the process and training of language acquisition through literature reviews by collecting data and tabulating them for the comprehensive study, develop language acquisition modules that targets to improve the cognitive skills and abilities of the learner by preparing content and to apply ABA strategies.

[198] Shades of Belonging: Latino Skin Tone Shapes Ingroup Perception

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

This study examines how skin tone influences intragroup perceptions of ethnic identity and cultural belonging among Latinos. Guided by racial phenotypicity bias—which posits that individuals who appear most prototypical of their racial group are also perceived as most stereotypical (Maddox et al., 2004, 2022; Wilkins et al., 2010)—we tested if darker skin tones shape impressions of Latino identity in the absence of behavioral cues. In a within-subject design, participants rated four photos (two males, two females; one light- and one dark-complexioned per gender) on ethnic centrality, cultural and phenotypic prototypicality, and foreignness. Although we predicted darker-complexioned Latinos to be perceived as more phenotypically prototypical, $F(1, 81) = 84.72$, $p < .001$, $\eta^2 = .27$, and more foreign, $F(1, 81) = 67.52$, $p < .001$, $\eta^2 = .15$, we expected mixed results for ethnic centrality and cultural prototypicality, due to a lack of explicit cues (e.g., behavior, language) and their proximity to darkness (Rakić, et al., 2020; Cleland & Gutierrez, 2025). Findings suggest that skin tone shapes impressions of both appearance and identity salience within Latino communities.

[199] Shifting Ground: How Asian Americans’ Perceived Position Influences Intergroup Relations

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Beliefs about the role of luck in life outcomes have long been discussed in philosophy and political theory, yet psychological research has largely focused on personal experiences of luck rather than generalized beliefs about its societal influence. In this paper, we introduce the construct of luck pervasiveness—the belief that luck plays a broad and influential role in shaping people’s outcomes and life circumstances. We distinguish luck pervasiveness theoretically from related constructs including locus of control, belief in personal luckiness, belief in good luck, belief in a just world, sense of control, and free will belief. Across three correlational studies, we demonstrate that luck pervasiveness is empirically distinct from these constructs and uniquely predicts attitudes toward meritocracy and well-being. In two experimental studies, we manipulate luck pervasiveness and show that increasing it reduces meritocratic beliefs and enhances life satisfaction, without increasing fatalism. These findings contribute to the psychological literature on luck, and offer a novel framework for addressing the negative social and psychological consequences of meritocratic myths.

[200] Signals of Peace, Echoes of Violence: A Time-Series Analysis of Public Opinion and Political Violence

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

This study examined the relationship between public opinion and political violence in the Israeli-Palestinian conflict. Public attitudes were analyzed across 41 cross-sectional surveys of Jewish Israelis (N=41,410; 2000-2025) and 40 surveys of Palestinians in the West Bank (N=50,800; 2014-2024), and linked with longitudinal records of terror attacks in the West Bank (14,800) and casualties (3,845). Granger causality tests and impulse response analyses assessed whether violence predicted changes in support for armed resistance or peaceful resolution, and whether such support anticipated subsequent violence. Results indicate that greater Palestinian support for violent actions significantly predicted increases in terror attacks against Israelis, while endorsement of a peaceful resolution forecasted a decrease in terror attacks. Among Jewish Israelis, support for the two-state solution predicted an increase in Israeli casualty levels, implying that expressions of compromise may provoke backlash from extremist actors seeking to derail peaceful resolution. These findings underscore the role of public attitudes as early indicators of both conflict escalation and openings for peace.

CULTURE

Does ecological stress impact individual thought complexity? Previous studies have suggested the surrounding socio-ecological context can influence individual psychology, but little research to date has directly evaluated the influence of perceived ecological stress on individual thought complexity. To fill in this gap, in the present study, 4767 participants were recruited from all regions of the United States. They completed questions related to perceived socio-ecological stress in their surrounding environment (e.g., perceived pathogen prevalence). Participants were further asked to respond to open-ended prompts about politics and health, and their responses were scored for integrative complexity using the well-validated AutoIC system. As predicted, when controlling for political ideology, cumulative perceived ecological stress significantly predicted lower integrative complexity ($p < .01$). These results suggest that, in spite of the vast phenomenological gap between socio-ecological stressors and individual thought complexity, the socio-ecological conditions that persons inhabit is importantly related to the individual thoughts persons exhibit.

Double-blind lineup administration is a safeguard designed to prevent police officers from inadvertently steering witnesses toward a suspect in a lineup (Wells et al., 2020). Although blind procedures prevent suspect-specific cues, administrators may still hope for identifications and subtly encourage witnesses to identify someone. To date, no research has examined whether suspect-blind administrators still engage in social-influence behaviors that encourage witnesses to make identifications. In the present study, we trained participants (n = 223) as lineup administrators and offered half of them a \$20 incentive to obtain an ID from a mock-witness. Lineups procedures were surreptitiously video-recorded and subsequently coded for the presence of ID-encouraging behaviors. We found that incentivized administrators engaged in significantly more ID-encouraging behaviors than those who were not incentivized, despite being blind to the suspect's identity. These findings suggest that administrator motivation, not just knowledge of the suspect, can bias identification procedures.

LAW

Despite the high rates of sexual violence experienced by Native women, research reveals that victim and community blaming produce negative responses (i.e., greater apathy) towards Native victims. One reason for this finding may be the focus on individual culpability. The current research investigates how the role of society blaming (i.e., centering the failings of society and/or institutions as a cause of the sexual violence crisis) may foster supportive attitudes and actions (i.e., empathy, intent to support victims, and less apathy) towards Native women victims of sexual violence. A survey of non-Native men and women (N=337) revealed that greater society blaming was associated with greater empathy and intent to support. Greater society blaming was also associated with less apathy towards victims, but only among women participants, and empathy was higher amongst women than men. Results suggest society blaming may increase supportive attitudes and action for Native women victims among both non-Native men and women, but further research is needed to unpack why men do not report the same empathy or reduced apathy.

[205] Socio-ecological Factors and Within-country Variation in Ideal Affect: Evidence from Candidates' Smiles in Electoral Posters

6:00 PM – 7:00 PM

CULTURE

A series of studies have demonstrated that ideal affect differs across cultures: high-arousal positive (HAP) states (e.g., excited) are regarded as more desirable in Western cultures, whereas low-arousal positive (LAP) states (e.g., calm) are more desirable in East Asian cultures. If such differences reflect adaptation to different types of social relationships (i.e., Gesellschaft vs. Gemeinschaft), as previous research suggests, then ideal affect should vary not only between countries but also within a single country. To examine this possibility, we collected electoral posters from the 2024 election for the Japanese House of Representatives and analyzed how ideal affect, as reflected in candidates' smiles (i.e., excited "HAP" vs. calm "LAP" smiles), varied according to the socio-ecological characteristics of their electoral districts. The results revealed that candidates in more urbanized, wealthier, or less rice-farming districts were more likely to display excited smiles, whereas none of these socio-ecological factors predicted the presence of calm smiles. We discuss the adaptive functions of ideal affect and the potential value of no smile as a signal of low-arousal states.

[206] Some don't like it hot: An experiment examining personality as a predictor of worsening affect when undergoing heat stress

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Citizen science faces persistent challenges in sustaining engagement, and understanding drivers of volunteer participation, particularly in digital initiatives addressing environmental and public health concerns. The study offers a novel application of Regulatory Focus Theory to examine the impact of dispositional goal orientations among participants of Mosquito Alert, a transnational initiative tracking invasive disease-carrying mosquitoes. Using mixed-method analysis of survey data and in-platform behavioral metrics, a significant skew towards prevention-focused participants was found. A further discrepancy emerged between self-reported motivations and actual behavior. Notably, heightened dispositional regulatory focus correlated with shorter participation spans. The findings revealed critical gaps between perceived motivations and behavioral outcomes, underscored importance of further integrating psychological constructs into platform design to enable and maintain long-term volunteer participation. The study advances theoretical understanding of volunteer psychology in sustainability contexts offering actionable strategies for improving the efficacy of initiatives.

[207] Gay Community-Related Social Media Use and Body Dissatisfaction

6:00 PM – 7:00 PM

SEXUALITY

Previous research has linked social media use to body dissatisfaction in heterosexual populations. However, there is a lack of literature explicitly examining the effects of social media use on body dissatisfaction in sexual minority men, despite this population experiencing appearance-related stressors at higher rates than their straight counterparts. In line with intra-minority stress theory and social comparison theory, this study aims to investigate the role of gay community-related social media use on body dissatisfaction in sexual minority men. Through the use of a correlational research design (N = 150), we test whether increased online interactions with mainstream gay community-related media is associated with higher muscularity and body fat dissatisfaction. We hypothesize that increased interactions with mainstream gay community-related media will be associated with higher levels of body dissatisfaction and that intra-minority stress will mediate this relationship. We anticipate that dating app usage will moderate the relationship between gay community-related social media usage and body dissatisfaction and will be positively associated with gay community stress.

[208] Spontaneous Evaluations of Nontraditional Couples and Family Systems

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Throughout modern history, public perceptions of traditional and nontraditional families have changed rapidly. While prior research has looked at explicit attitudes about families from different gender identities (Manning & Gustafson, 2025), there is limited research about implicit impressions of nontraditional families. The current study investigates whether attitudes around such unconventional families, such as perceived normality, shapes the evaluations spontaneously formed about their parental abilities. We will examine implicit and explicit evaluations of parenting behaviors performed by couples of different demographics. We will recruit 200 participants from Prolific Academic to complete the iGASSP task to assess spontaneous evaluative inferences (SEIs) of everyday parenting behaviors across different families. We will also explore deliberative evaluations of these families using the Modern Homonegativity Scale. Our work will provide a clearer understanding of the ways traditional and nontraditional family units are perceived as they navigate their daily lives.

[209] Spontaneous Trait Inferences in the Face of Ambiguity

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Impression formation is likely impacted by perceivers' beliefs about targets' demographics (Hamilton et al., 2015). Yet, little research has considered the relationship that these beliefs may have on spontaneous trait inferences (STIs) from different racial groups' everyday behaviors. The current work contributes to this gap by assessing the impact that stereotype-based beliefs of Black men have on STI formation, using a stimulus set of pre-tested ambiguous behaviors and a robust false recognition paradigm. Across three studies, we show that White perceivers tend to make more positively valenced than negatively valenced STIs about Black targets' ambiguous behaviors in the opposite direction of stereotypical beliefs (study 1-2), unless under cognitive load (study 3). Study 4 replicates those findings with different stimuli. Finally, Study 5 shows that perceivers' awareness of societal negativity toward Black men predicts a stronger tendency to avoid negative STIs from Black men's behaviors. Our findings offer implications for processes, such as stereotype regulation, that may influence impressions of different racial groups.

[210] Stereotypes Reshape Internal Models of Person Perception

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Aid organizations and media often depict Africa as poor and unstable to encourage donations, but this may have fostered negative perceptions that hinder Africa's progress. In two preregistered experiments, convenience (N =298) and representative (N=1127) US and UK samples listed three thoughts on either Africa (A) or Europe (E), then rated their own thoughts' valence and their interest in African or European culture and products. Images of Africa vs. Europe were more negative, and coding (developed in Study 1, preregistered in Study 2) revealed that they were dominated by (1) animals and nature (58% of thoughts on A vs. 17% on E), (2) societal problems (23% A vs. 4% E), and (3) lack of culture (10% A vs. 58% E). Valence ratings and the three themes jointly explained participants' preference for European over African products and culture. Three additional preregistered experiments (N=2026) showed that framing the same facts about Africa as new positive information was more effective than stereotype negations in changing evaluations, purchase intentions and cultural interest. These findings demonstrate the powerful role of stereotypes in explaining global imbalances and inequality.

[211] Thinking Beyond Individual Values: The Relationship Between Internal Value Conflict and Subjective Well-being

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Internal value conflict, the contradiction from endorsing incompatible personal values, is hypothesized to reduce subjective well-being (SWB). This research examines the relationship between internal value conflict and SWB using data from two large-scale, cross-national surveys: the World Values Survey and the European Social Survey. Using Unfolding, we quantified internal value conflict as the misfit between an individual's value structure and Schwartz's theoretical circular value structure. Multilevel modeling indicated that, on average, internal value conflict was not significantly associated with SWB. However, exploratory analyses revealed that this relationship was moderated by income and age: higher income and older age alleviated the negative impact of internal value conflict on SWB. Response surface analysis further showed that pursuing opposing values (e.g., Openness-to-Change vs. Conservation, Self-Transcendence vs. Self-Enhancement) was associated with better SWB among individuals with greater financial and cognitive resources, but lower SWB among those with fewer resources. Thinking beyond individual values, this study offers novel insights into internal value conflicts by examining the compatibility of multiple values. Importantly, we identified the vulnerable populations for whom pursuing multiple, incompatible values may harm well-being; instead, prioritizing a single, healthy value may benefit their well-being. These findings highlight the individual differences in pursuing multiple values, demonstrating that its impact on SWB is dependent on an individual's resources to manage the internal conflict.

[212] Stories Beyond Borders: How Fiction Fosters Empathy Across Divides

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Israeli and Palestinian conflict is a struggle that is marked by deep prejudice and escalating violence that extend beyond borders, affecting not only Jewish and Muslim communities but the world at large. Despite numerous peace efforts and treaties, tensions persist. This study investigates whether outgroup narratives can increase empathy and improve attitudes toward the outgroup, focusing on Jewish-Muslim relations. Muslim and Jewish participants received a passage written from the perspective of a Palestinian/Israeli father and were instructed to either engage in empathy or count the number of times the word “the” appears. Among our Jewish sample, outgroup narratives led to greater outgroup empathy and more positive outgroup attitudes. In the Muslim sample, perceptions of outgroup realistic and symbolic threat influenced the effects of outgroup narratives indicating that more study is needed to inform interventions aimed at reducing prejudice and promoting intergroup understanding.

[213] Stress in the System: A Multi-Level Meta-Analysis of Police-Initiated Contact and Adolescent's Mental Health

6:00 PM – 7:00 PM

META-ANALYSIS

Adolescence is a sensitive developmental period when environmental exposures shape long-term trajectories of well-being. Police-initiated contact, often involuntary and coercive, has emerged as a salient stressor, particularly for marginalized youth. To quantify the association, we conducted a preregistered (PROSPERO) multi-level meta-analysis following PRISMA guidelines. Across six databases, 7,920 records were screened, yielding 19 studies and 64 effect sizes. Eligible studies focused on adolescents (<18), with exposures defined as any form of police contact and outcomes as psychopathology. Results indicated a significant association between police contact and poorer mental health ($z = .23$, 95% CI [.16, .29], $p < .001$). Funnel plot asymmetry was observed and tested. Subgroup analyses tested variability by psychopathology type, study design, population, and exposure timing; moderators included sex and racial composition. Although moderators were nonsignificant, effects were stronger in community samples. Findings highlight police contact as consequential psychological events that heighten adolescent vulnerability, highlighting the need to reframe public safety practices

[214] Stress, Support, and Separation: Dispositional Pathways to Estrangement During Societal Disruption.

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Periods of societal stress can disrupt close relationships and contribute to interpersonal estrangement. Personality is also an important factor in these processes. Prior research has identified social support as a psychosocial resource through which personality is linked to well-being. Extending this work, we tested whether the Big Five personality traits predicted estrangement during the COVID-19 pandemic and whether this link was mediated by social support. Using longitudinal data from a community sample of North American adults ($n = 1,364$), we measured Big Five personality traits and social support early in the pandemic and assessed estrangement in a follow-up survey in May 2022. Our findings revealed that Openness, Extraversion, and Neuroticism were directly linked to greater estrangement. Mediation analyses indicated the association between Neuroticism and estrangement to be partially explained by diminished social support, whereas Agreeableness and Extraversion were indirectly linked to lower estrangement through greater social support. Our findings highlight the critical role of personality traits and social support in shaping interpersonal responses to societal stress.

[215] Supportive Culture Reduce Workplace Sexual Harassment

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Existing literature suggests diversity initiatives are largely ineffective in reducing workplace harassment. According to the U.S. government's report, following #MeToo the number of sexual harassment litigation cases has grown substantially. However, across two studies we demonstrated that a supportive work environment does reduce the sexual harassment rate contrary to popular belief.

Study 1: Using EEOC sexual harassment and workforce gender composition data from 2010 to 2022 EEO-1 reports (N=709,634,122), we found that post-#MeToo, workplace sexual harassment rate have significantly declined.

Study 2: In a workplace simulation 605 cis-gender heterosexual male participants completed an onboarding scenario about a fictional company, then rated their likelihood of their behavior in various workplace scenarios, including a harassment intention scenario. Participants were assigned to a gender-supportive or gender-blind company culture. Participants in the supportive condition showed significantly lower harassment intentions, indicating that even brief exposure to inclusion-oriented messaging can meaningfully shift behavior.

Together, our findings show that institutional structures and cultural norms promoting gender equity can play a crucial role in reducing workplace sexual harassment despite the previous consensus.

[216] Temporal Narratives of Systems of Oppression Among Queer Puerto Ricans

6:00 PM – 7:00 PM

CULTURE

Colonialism often enforces rigid binary systems and perpetuates exclusion through the colonial/modern system of gender (Lugones, 2007). In Puerto Rico, individuals inhabit a complex colonial landscape given the influences of both Spanish and U.S. colonialism (Meléndez-Badillo, 2024). This layered history has produced a dual-cultural reality in which Queer Puerto Ricans must navigate the enduring legacies of both Spanish and U.S. domination. How groups interpret the past shapes how they understand the present (Liu & Hilton, 2005). While these periods can be framed as past (Spanish) and present (U.S.), Construal Level Theory (Trope & Liberman, 2010) further suggests that temporal distance shapes perception, with Spanish colonialism often construed abstractly and U.S. colonialism concretely. Therefore, these legacies develop complex asymmetries in Queer Puerto Ricans' beliefs about systems of oppression and their identity content. Thematic analysis of 25 semi-structured interviews revealed themes indicating temporal differences in perceptions of colonial oppression, tangible and abstract effects of the colonial context, and the colonial legacies of gender and sexuality.

[217] Testing the Reality of Bias Intervention in a Politically Balanced Sample

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

White people often dismiss Black people's concerns about racial bias. The Reality of Bias Intervention, which highlights the cumulative burden of bias and White people's limited perspective on bias frequency, has been shown to increase receptivity to bias concerns. However, prior work has tested the intervention only with an undergraduate sample. We tested it longitudinally with a politically-balanced national sample aged 18-65 (N = 378). We randomly assigned participants (Pps) to read the intervention article or a control. A week later, Pps viewed a problematic Reddit post arguing that Black people overreact to bias. Pps could engage with the post by rating its quality, upvoting or downvoting it, and posting a comment. The odds of downvoting (rather than upvoting) the post were significantly higher in the intervention (vs. control) condition. Moreover, compared to control Pps, intervention Pps evaluated the post more negatively and reported greater concern about racial discrimination in society. Coding of comments is ongoing. Our findings suggest that this brief intervention is effective in a politically-balanced sample, revealing its potential for broader application.

[218] The Culture of Honor and Help-Seeking Behavior in Older Adults

6:00 PM – 7:00 PM

CULTURE

Aging generates higher risks for health problems but older adults may not seek out help from medical professionals or their family when they need it. Past research has suggested explanations for this issue including older adult's feeling stigma for seeking help, desires to remain self-reliant, and lower evaluations of their need for help; however, poorer help-seeking among older adults persists and these factors have not been applied to cultural models nor has general help-seeking for issues outside of a medical context been studied. The Culture of Honor may contribute to this issue as honor endorses emphasize toughness and a defense of one's reputation for being self-reliant and brave. Furthermore, this culture has been shown to negatively impact mental health and help-seeking behaviors through stigma and reputation concerns. In this study, we examine the role of honor as an explanation for why some older adults are less likely to seek help for their health and for everyday issues. We also examine if honor endorses are more likely to express self-reliant attitudes, be avoidant of dependency, and hold self-stigmatizing views towards mental health help-seeking.

[219] The Dark Triad and Digital Politics: Personality, Behavior, and Parasocial Bonds in the U.S 2024 Election

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

In a time when online interactions are so ubiquitous and frequent, understanding the dynamics between individuals engaging in online discourse, through their personality traits and parasocial relationships, has become increasingly important. While research has been conducted on these constructs separately, little is known about how they interact. This study aimed to determine the effects of Dark Triad personality traits (psychopathy, narcissism, and Machiavellianism) on online behaviors and parasocial relationships with U.S presidential candidates in the 2024 election. With a total of 67 participants (collection is ongoing), the sample was recruited from the undergraduate participant pool at Eastern Kentucky University. All participants completed questionnaires about perceived victim blaming, political parasocial relationships, Dark Triad traits, self-control, and political extremism. It was hypothesized that individuals scoring high in Dark Triad traits, who regularly engage in politics, will demonstrate more political extremism and resulting parasocial relationships. It is also predicted that psychopathy and machiavellianism will be more predictive of engaging in negative online behaviors, and that self-control will moderate the associations between Dark Triad traits and negative online behaviors.

[221] The Effect of User Race and Gender on Hiring Outcomes via Differential Perceptions of Self-Promotion Behavior

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Self-promotion creates challenges for women, who must use dominant language to signal competence yet face backlash for violating gender stereotypes. While prior research shows that self-promotion can backfire for women, less is known about how these patterns manifest on sites like LinkedIn, where self-promotion is increasingly normative, and how they vary across intersectional identities. This study tested how responses to self-promotion vary based on user race and gender. In a survey experiment, participants (N = 166) evaluated the warmth, competence, and hireability of a simulated LinkedIn profile in a 2 × 2 design (Black/White × Male/Female). It was hypothesized that White men would receive the highest hireability ratings; Black women would receive higher ratings than White women and Black men; and warmth would mediate hireability. Contrary to predictions, White men received the lowest hireability ratings, while Black women were rated most hireable, with warmth mediating these effects. Findings suggest that identical self-promotion behaviors can be subject to differential perception and reward depending on stereotypes at the intersections of race and gender. This research contributes to the understanding of intersectional stereotyping processes and interracial impression formation, and highlights implications for reducing hiring bias in professional networking contexts increasingly shaped by the self-presentational logics of digital capitalism.

[222] The Effects of Racialized Religious Imagery on Feelings of Belongingness in Black and White Americans

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Psychologists, religious scholars, and church congregations alike share concerns about variables that affect feelings of belongingness in religious settings. To address this, we ask three related questions: What effect does racialized religious imagery and signage in churches have on the people who see it? Does it affect a person's sense of belonging and emotional experiences? And does this effect vary by the viewer's race? In a preregistered experiment on CloudResearch, we investigated 450 Black and 450 White American participants' reactions to racialized signage and religious imagery, such as a mural of a Black Jesus compared to a White Jesus and a stained glass window depicting Black saints compared to White saints. The results from a series of two-way ANOVA yielded significant effects for both within and between races. Further, Black participants showed more positive responses than White participants when they were both exposed to Black-friendly images. Black participants' sense of belonging was also significantly higher when the images aligned with their race, whereas their self-transcendent emotions did not differ based on the racialized imagery in religious settings.

[223] The Effects of Target's Gender and Superiority on Dehumanization

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Dehumanization refers to denying or diminishing others' humanity and takes two forms: animalistic dehumanization (AD) and mechanistic dehumanization (MD). Two pre-registered studies examined whether the domain of superiority and target gender shape dehumanization patterns. Japanese young adults (N = 355) read descriptions of targets portrayed as superior in appearance or intelligence and rated them on AD and MD scales. Results from both studies showed a significant two-way interaction: appearance-superior targets were more animalistically dehumanized, whereas intelligence-superior targets were more mechanistically dehumanized. However, the effect related to target gender differed across studies. Among female participants (Study 1), the interaction effect was stronger for male targets, whereas male participants (Study 2) showed no robust target gender effect. Exploratory analyses indicated that appearance-superior male targets were perceived by women as less warm but by men as warm. These findings suggest that perceptions of superior others vary across their domains and genders.

[224] The Face We Trust: How Digital Photo Enhancement Shapes First Impressions

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Within milliseconds of meeting each other, humans form unconscious judgments of personality and trustworthiness shaped by evolutionary mechanisms, cultural norms, and visual cues. Facial features such as structure, symmetry, and affect contribute significantly to these judgments. With a growing number of connections being initiated online, these evaluations are increasingly influenced by AI-generated photo editing. While such enhancements may increase perceived attractiveness, they can distort authenticity and bias decisions. This shift in the way humans present themselves raises critical questions about the impact of AI-edited images on trait judgments; particularly in contexts where first impressions play a decisive role in whether to interact at all, such as employment-seeking and online dating. Participants rated trustworthiness of validated facial images, presented both edited and unedited. By comparing ratings across conditions, this study investigates how such enhancements influence perceived trustworthiness. Findings offer insight into the psychological consequences of AI-manipulated self-presentation and its implications for social decision making in digital environments.

[225] The Hateful Eight: An Efficient Multifaceted Short Dark Tetrad Measure

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Using the 28 items of the Short Dark Tetrad (SD4; Paulhus et al., 2021), we developed a 16-item version with two items for each of eight facets called the Hateful Eight (H8). Across four studies of university and online samples (total N = 2,391), we used item response theory models and confirmatory factor analyses (CFAs) to select the best SD4 items. CFAs supported both an eight-facet solution and hierarchical models in which the eight facets loaded onto their four respective Dark Tetrad traits, which in turn loaded onto a global Dark Tetrad factor. We labeled the eight facets as: deviousness, scheming (both assigned to Machiavellianism); leadership, exceptionalism (both assigned to narcissism); defiance, recklessness (both assigned to psychopathy); and violent voyeurism, verbal abuse (both assigned to sadism). We tested the H8's convergent and discriminant validity with number of sexual partners, self-esteem, Big Five personality, adult attachment, and established measures of the Dark Triad traits. The generalizability of our findings is constrained to North American, English-speaking adults.

[226] The Hidden Cost of the Concerns about Losing Face in Asian Americans: Exploring the Mediating Pathways to Social Anxiety

6:00 PM – 7:00 PM

CULTURE

Social anxiety is a common mental health issue that is not only more prevalent but also more severe among Asian Americans (AA) compared to other ethnic-racial groups. The concern about losing face (CLF), an essential aspect of Asian culture, is a significant antecedent of social anxiety among AA. Yet, little is known about the factors that could explain the link between CLF and social anxiety among AA. This study investigates the mediating roles of fear of negative evaluation and self-silencing. Since AA with CLF place care about others' perceptions and strive to maintain a positive self-image in social settings, they would be fearful of negative evaluations from others, and engage in self-silencing behaviors, such as suppressing emotions, to avoid negative evaluation, which in turn becomes socially anxious. In a sample of 304 participants, CLF was shown to predict social anxiety in a parallel mediation model. This link was explained by fear of negative evaluations and self-silencing. This model explained approximately 35% of the variance in social anxiety in AA, controlling for direct and indirect coping.

[227] The Hidden Forces Shaping Self-Enhancement Across East and West

6:00 PM – 7:00 PM

CULTURE

BDSM can produce pleasurable altered states of consciousness (Ambler et al., 2017), but these altered states might impact practitioners' ability to negotiate a subsequent scene. BDSM practitioners (N = 81) completed surveys before and after a BDSM scene. The surveys measured positive and negative affect, stress, sexual arousal, interest in BDSM activities, and hard and soft limits (activities that the participant would prohibit or be disinclined to allow, respectively). Consistent with prior research, positive affect and sexual arousal increased during the scene, and negative affect and stress decreased. New to this study, interest in BDSM activities increased significantly for tops (participants taking on the dominant role) but was unchanged for bottoms, interaction $t(37) = 2.10$, $p = .04$. From before to after their scenes, participants showed a marginally significant increase in hard limits, $p = .08$, and a marginally significant decrease in soft limits, $p = .06$. However, over 25% of participants reported at least one hard limit at baseline that was no longer a hard limit after their scene. Results suggest that a prior scene might impact subsequent scene negotiations.

[228] The Impact of Anti-DEI Legislation on Norms, Attitudes, and Confrontation

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

The United States has witnessed a mounting movement to ban diversity, equity, and inclusion (DEI) initiatives in higher education and public school settings. The current research examined how the implementation of anti-DEI legislation on college campuses affects White undergraduates' perceived norms, attitudes, and willingness to stand up against discrimination. Compared to participants who learned about continuing DEI efforts on the college campus (N = 128), participants who learned about restricting DEI (N = 136) perceived less support for continuing DEI among students and faculty both currently and in the future, and reported less personal support for continuing DEI. However, the two conditions did not significantly differ in intentions to confront bias in a series of vignettes. Findings extend prior work by demonstrating that legislative decisions can not only impact perceptions of others' policy support, but may also significantly shape personal attitudes. Future research should examine how members of marginalized groups respond to such legislation and explore interventions to improve the rates of confrontation as opposition to DEI persists.

[229] The Impact of Blood Quantum Enrollment Requirements on Perceived Tribal Belonging

6:00 PM – 7:00 PM

CULTURE

Blood quantum laws, which define Native American identity by an individual's "degree of Indian blood," are widespread in Native American tribes, yet little is known of their psychological effects. This project investigates the psychological and community impacts of Indian blood quantum enrollment requirements on Native Peoples' perceived tribal belonging, identity, and well-being. When defining tribal membership, blood quantum can determine access to land, cultural knowledge, education, and employment opportunities. Blood quantum requirements can also shape how people understand themselves and their tribal community. Despite its significance, research on the psychological effects of blood quantum enrollment requirements remains scarce; no work on blood quantum has been featured in major social psychology journals. In this study, we are testing the hypotheses that (1) blood quantum enrollment criteria predicts feelings of tribal belonging and (2) enculturation, the extent to which one participates in Native culture, can moderate that relationship by producing feelings of belonging through community engagement. To test this hypothesis, we conducted a survey containing qualitative and quantitative questions relating to enculturation, tribal enrollment status/blood quantum, and feelings of belonging. We recruited 444 Native American participants through the online platform Prolific and by advertising the study through listservs and recruitment flyers. Most participants were enrolled members of their tribe (n = 246), which made analyses difficult due to the unequal group sizes. However, we found significant effects of tribal enrollment on feelings of tribal belonging moderated by enculturation. The qualitative data we collected will begin to help us understand how Native people feel about blood quantum. Future studies will explore this further in focus groups and interviews.

[230] The Impact of Election Stress on Young Adults' Wellbeing and Social Networks

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Young adults in the U.S. report rising political anxiety and declining wellbeing, yet little is known about how they navigate everyday social life under major collective stressors. To investigate, we surveyed ~3,000 undergraduates from the same community in a three-week ecological momentary assessment (EMA) study spanning the 2024 U.S. national election, along with pre- and post-election trait surveys six months apart. Participants completed daily EMAs on wellbeing (happiness, sadness, stress, anger) and social interactions (partner, closeness, content, quality). We use multilevel models to test two hypotheses: Selection—whether reactivity to election stress (anticipatory and recovery) predicted shifts in interactions (e.g., avoiding extremity or high-disagreement, seeking homophilous or norm-consistent ties); and Buffering—whether interactions moderate stress-affect links. Preliminary findings suggest that while having an interaction generally buffers stress, interactions between certain groups, such as low-income, high-stress students, can predict higher stress and lower wellbeing. Our results reveal how collective stressors ripple through young adult social networks.

[231] The Impact of Facial Expressions on Perceived Trustworthiness

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Smiles are thought to be signals of prosocial intentions. Past research supports the conclusion that individuals displaying a smile would be deemed as more trustworthy than those with a neutral facial expression. Here, we were interested in understanding how people respond to a person who displays a smile and subsequently exhibits untrustworthy behavior. We sought to test whether interacting with an untrustworthy partner causes people to become angrier and more punitive toward partners who display smiles than partners who display neutral expressions. We recruited 500 participants in an online study to test 1) whether people's transfers in a Trust Game differed between people whose partners displayed a smiling or neutral face, and 2) when participants received nothing in return from the Trust Game, whether they were more inclined to incur a cost to remove some of their partner's gains. While we found that people's losses in the Trust Game directly impacted their motivations to punish, we found little support for the notion that smiles affect Trust Game transfers and subsequent punishment.

[232] The Impact of Racial Entitlement on White Nationalist Ideology and Intergroup Violence

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

If money is good, then shouldn't more money always be better? Perhaps not. Traditional economic theories suggest that money is an ever-increasing incentivizer. If someone will accept a job for US\$20/hr, they should be more likely to accept the same job for US\$30/hr and especially for US\$250/hr. However, 10 preregistered, high-powered studies (N = 4,205, in the United States and Iran) reveal how increasing incentives can backfire. Overly generous offers lead people to infer "phantom costs" that make them less likely to accept high job wages, cheap plane fares, and free money. We present a theory for understanding when and why people imagine these hidden drawbacks and show how phantom costs drive judgments, impact behavior, and intersect with individual differences. Phantom costs change how we should think about "economic rationality." Economic exchanges are not merely about money, but instead are social interactions between people trying to perceive (and deceive) each others' minds.

[233] The Influence of Intercultural Communication and Acculturation on Context Dependence

6:00 PM – 7:00 PM

CULTURE

Hall's (1976) high/low context theory suggests that reliance on context varies across cultures. In intercultural settings, limited shared knowledge typically reduces context dependence (Gudykunst, 1991). However, Wu (2025) reported that greater intercultural experience is associated with higher context dependence. To explain the gap, in this study, intercultural interaction experience was used as the predictor variable, intercultural adaptation as the mediating variable, and context dependence as the criterion variable. Data were collected through an online survey. Participants included 174 individuals in the high intercultural interaction experience group and 182 in the low intercultural interaction experience group. The high-experience group comprised Chinese individuals residing abroad or working in foreign-affiliated companies, whereas the low-experience group comprised ordinary Chinese individuals living in China. The results showed that the high-experience group had significantly lower context dependence ($M = 3.10$, $SD = .66$) than the low-experience group ($M = 3.39$, $SD = .60$), $t(354) = 4.38$, $p < .001$, and intercultural adaptation served as a full mediator in this relationship. Specifically, in the high intercultural experience group, intercultural interaction reduced adherence to home-culture values, which in turn lowered context dependence ($\beta = -.107$, 95% CI $[-.150, -.030]$, $p < .01$). The model fit indices were good: CFI = .915, TLI = .905, RMSEA = .059, and SRMR = .061 (bootstrap samples = 5000), indicating that intercultural adaptation promoted low-context communication less reliant on home-culture values. In contrast, in the low-experience group, intercultural interaction increased orientation toward the foreign culture, which led to higher context dependence ($\beta = .115$, 95% CI $[.011, .077]$, $p < .05$). The model fit indices were good: CFI = .922, TLI = .915, RMSEA = .056, and SRMR = .063 (bootstrap samples = 5000). The low-experience group was found to live in environments where intercultural adaptation was not necessary, resulting in no deep intercultural adaptation. They maintained high-context cultural communication that relied on familiar values and shared background knowledge. This study highlights that in intercultural communication, context dependence decreases through the necessity and motivation for intercultural adaptation, extending existing theory and clarifying the gap between Gudykunst's (1991) and Wu's (2025) studies.

[234] Contextual and Developmental Origins of Comfort Eating Behavior: Mixed-Method Insights from the Eating in America Study

6:00 PM – 7:00 PM

EMOTION

Objective: Characterize the etiology of comfort eating from a life course perspective using a mixed-methods approach.

Method: A national census-matched sample of U.S. adults 18 and older (N = 2,022) was recruited for a survey using a Qualtrics panel from December 2019 to January 2020. We characterized the origins of comfort eating by analyzing both structured and open-ended survey data.

Results: Comfort eaters (77% of the sample) most often initiated comfort eating between the ages of 11-17 (26%) or 18-25 (27%). More than twice as many comfort eaters versus non-comfort eaters (72% vs. 32%) reported that a family member gave them food when they were upset when they were growing up. Rich open-ended data (1,568 individual responses) reveal the diverse and most prevalent reasons why comfort eaters believe they first took up the behavior (e.g., emotions, social contexts, adverse events, coping attempts, and food qualities).

Conclusion: These findings regarding the life-stage, social, familial, and adverse contexts related to the development of comfort eating provide novel insights to inform future comfort eating intervention and prevention efforts.

[235] The Internal Struggle: Honor Culture and Mental Health Stigma Among Military Personnel

6:00 PM – 7:00 PM

CULTURE

Mental health struggles among current and former military personnel are a major public health concern. Importantly, help-seeking stigma contributes to military personnel's suicide risk. Heightened help-seeking stigma is also prevalent within cultures of honor, where social reputation is tied to self-worth. Recent research found strong connections between honor culture and both military involvement and veteran suicide rates. Considering the importance of honor to military personnel's identity, honor endorsement might exacerbate their help-seeking stigma, as well. The present study (N=711) examined differential associations among honor endorsement, perceived cultural norms, and help-seeking stigma between military personnel (n=475) and civilians (n=236). Controlling for relevant factors, we found honor endorsing military personnel more strongly stigmatized help-seeking for both personal and social reasons; however, there was no effect on perceived barriers to mental healthcare. The perceived cultural norms of military personnel did not affect help-seeking stigma. Findings suggest the need for culturally tailored interventions to facilitate military personnel's help-seeking behaviors.

[236] The links between direct gaze and social cognition – Implications for impression accuracy and joint attention

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Eyes are said to be a window to others' souls, yet this intuition remains scientifically underexplored. This experimental study investigated how direct gaze (looking someone in the eyes) during live interactions contributes to impression formation and subsequent social cognition. Participants interacted with four confederates acting as impression targets (one at a time), while we manipulated whether the targets' eyes were visible or not; then, they rated each target's personality and completed a joint attention socio-cognitive test. Results from the Social Accuracy Model show overall impression accuracy and a modulation based on dyads' gender, such that eye visibility improved distinctive accuracy for gender-mismatched pairs but had no impact on gender-matched pairs. Diverging results from hierarchical modeling of joint attention, revealing more direct contributions of direct gaze, will be discussed in light of evolutionary models of person perception. Integrating theories and methods from various psychological domains, this research is an important step toward answering fundamental questions about the concrete importance of the social information conveyed by eyes in everyday life.

[237] The Message and the Motive: How People Share, Interpret, and Evaluate Information in Relationships

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

This project investigates how people share and interpret information, focusing on the gap between communicators' intentions and recipients' perceptions when personal relevance varies for communicators and recipients. In Study 1, participants decide what information to share. In Study 2, participants view responses from Study 1, infer motive for information choice, and report message and source evaluations. We hypothesize that information selectors will be motivated to share their own beliefs when the topic has high personal relevance, but will defer to the recipient's beliefs under low personal relevance. Furthermore, recipients will infer intentions that differ from the selectors' self-reported intentions. Comparing across studies reveals where misalignments occur between intended motives and inferred ones, and how gaps affect message receptivity and willingness to engage.

[238] The Moral Inversion of Rule-Breaking: Experimental Evidence for Transvaluation in Groups

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

People sometimes admire actions they also judge as wrong, especially when such actions benefit their own group. This process, described in moral philosophy as transvaluation, has received little direct empirical attention in psychology. We test whether violations of fairness, privacy, and autonomy rules can be morally "revalued" when they increase group resources. Participants were randomly assigned to contrived groups and told their group had distinct values (i.e., democratic, non-democratic). They evaluated vignettes in which one group member followed rules but failed, and another broke rules but secured benefits for the group. Across two studies, we examined three domains of rule-breaking in (1) the acquisition, (2) protection and (3) distribution of common resources, and tested whether group identity strength and moral foundation endorsements moderated the likelihood of "value-flips." We predict that admiration of rule-breakers despite moral condemnation will be strongest in group-benefiting contexts, consistent with theories of moral foundations (Graham et al., 2011) and group-based moralization (Leach et al., 2008). This research provides a novel test of transvaluation as a psychological process, clarifying when groups transform moral violations into virtues.

[239] The Pressure to be Fair and Lovely: Associations Among Colorism Pressures and Body Image Among Indian American Women

6:00 PM – 7:00 PM

CULTURE

"You're too dark! Stay out of the sun." "No one likes a chubby girl. You should eat less." These are common remarks in many Indian immigrant households, where beauty expectations are deeply intertwined with cultural values. Berry's acculturation model emphasizes that South Asian American immigrant women face dual societal pressures: those from the mainstream culture and also pressures from their culture of origin. Very little quantitative research, however, has examined these concerns among Indian Americans because of the difficulty in recruiting a sizable sample. This study examined the relationship between growing up in an Indian American immigrant household, skin color satisfaction and body dissatisfaction among 76 Indian American women recruited from online panels (data collection is ongoing Indian women who reported more pressure from peers, media, and family to have lighter skin tones were more likely to internalize the light skin norms and reported less satisfaction with their skin tone. They also reported greater internalized racism. These results emphasize the need to address bicultural appearance pressures in South Asian populations.

[240] The Puzzle of Persistence: Behavioral and Self-Reported Evidence from a Tangram Task

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Persistence is a central construct in social psychology, yet its definition and measurement vary widely. Traits such as grit, motivation, and determination are often treated as interchangeable, and persistence is assessed both through self-report questionnaires and through behavioral tasks. Prior studies highlight this inconsistency: in an impossible problem-solving task, higher self-reported persistence was associated with less time spent on the task, suggesting a disconnect between subjective and behavioral measures.

The present pilot study extends this work by examining persistence through a tangram task as a behavioral measure, alongside both a single-item and a multi-item self-report of persistence. Participants also completed measures of existential isolation, which is believed to play a role in motivation and persistence levels. This exploratory design evaluates the degree of convergence between behavioral and self-reported measures of persistence, as well as the alignment between different forms of self-report. Findings will inform the feasibility of tangrams as a behavioral index and contribute to clarifying how persistence is best conceptualized and measured.

[241] The relationship between student low motivation, anxiety disorders, and personality?

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

This study examines the relationship between low student motivation, anxiety disorders, and students' personality in predicting academic performance. Emotional well-being is intimately linked with cognitive functioning, meaning that understanding the intricate relationship between low student motivation, anxiety disorders, and student personality is essential for fostering an effective educational environment. A quantitative, cross-sectional correlational design utilised three commonly used and validated questionnaires: the Student Motivation Scale (SMS), the ten-item personality inventory (TIPI), and the Brief Fear of Negative Evaluation Scale (BFNE). These were distributed online to master's students from various ethnic groups. One hundred & fourteen participants took part, and data were collected directly by Qualtrics. The bootstrapped mediation analysis found a significant indirect effect of neuroticism on academic performance via conscientiousness. Specifically, neuroticism was found to impact conscientiousness, affecting academic performance negatively. The indirect effect was statistically significant ($B = -0.017$) with a 95% confidence interval that did not cross zero $[-0.241, -0.011]$. This implies that conscientiousness partially mediates the relationship between neuroticism and academic performance. The theoretical implications include supporting integrative models that view personality traits as interrelated rather than isolated predictors of academic outcomes. The mediation effect demonstrates how one trait (neuroticism) can exert influence through another (conscientiousness), reinforcing the dynamic interaction of personality dimensions in shaping human behavior. The study highlights the importance of targeting emotional regulation and conscientious behaviors in educational interventions. Students with high neurotic tendencies may benefit from structured support systems that promote organization, time management, and emotional resilience.

[242] The Social Lives of Social Media Users: Detecting Relationship Quality

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Social media users often present idealized versions of their social lives on their profiles, raising the question of whether offline social relationship quality can be detected based on online social media profiles. The present study investigated the accuracy and bias of perceivers' ($N = 316$) judgments of targets' ($N = 155$) social relationship quality based on viewing targets' Instagram profiles. Using the Truth & Bias Model (West & Kenny, 2011), perceivers demonstrated significant accuracy in relationship quality judgments, agreeing with targets' own self-reports. This held controlling for the related and highly detectable trait of extraversion. Perceivers did not demonstrate significant assumed similarity nor positive directional bias. Thus, offline close relationship quality is detectable on social media. Additional analyses will explore which cues enable accurate judgments, and the implications of accurate relationship quality detection for social outcomes, such as liking. Overall, this work sheds light on how relationship quality is expressed and perceived, enhancing our understanding of how to identify and support people struggling with social connection.

[243] The threat of Asians in STEM among hierarchy-favoring Whites

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

We hypothesize that White Americans with a stronger preference for hierarchy, known as social dominance orientation (SDO) may feel more threatened by Asian Americans in high status fields such as STEM. We also suspect that SDO and perceived threat have an impact on affirmative action support. We conducted two studies to investigate our hypotheses. In Study 1, we found that White Americans who reported higher levels of SDO were more likely to report that Asian immigrants were a threat to White jobs (i.e., realistic threat) and culture (i.e., symbolic threat) after answering questions about Asian Americans in STEM. In study 2, after participants watched a video on Asian underrepresentation in STEM, high SDO White Americans initially reported less affirmative action support than low SDO participants. However, when participants reported more realistic and symbolic threats toward Asian Immigrants, affirmative action support decreased only for low SDO participants. Our findings help illustrate the damaging consequences threat misperception has on both ideology and equitable legislation such as affirmative action.

[244] The Triarchic Model of Psychopathy: Is Boldness a Protective Factor in the Relationship Between Alexithymia and Well-Being?

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Resembling ideas about successful psychopathy, previous research on the triarchic model has shown that the boldness factor can be protective against traits that predict poor subjective well-being (Lance Du & Templer, 2022). Considering that alexithymia is a consistent feature of psychopathy and predicts poor well-being, this study aimed to understand whether boldness could mitigate this relationship (Burghart & Mier, 2022; Hemming et al., 2019). With this goal, this study measured psychopathic traits, subjective well-being, and alexithymia in 655 undergraduate students. The results indicated that while boldness does reduce the effect of alexithymia on well-being, it did interact with it as a theorized protective factor should. Moreover, exploratory analyses did not replicate previous findings for boldness serving as a protective factor against the other triarchic traits (i.e., meanness and disinhibition).

[245] The Violent Brain

6:00 PM – 7:00 PM

PSYCHOPHYSIOLOGY/GENETICS

The effects of violent media consumption on children and adolescents is one of the most studied areas in psychological and pediatrics research with results consistently finding a link between increases in aggressive behavior, aggressive affect, and aggressive cognition in those who consume, or are exposed to, violent media (e.g., Bushman & Anderson, 2023). While research in this area spans decades, only with advancements in neurobiological measurements and technology, have scientists been able to assess the direct neurological outcomes of violent media exposure. In this literature review, we examine the current state of neurological research on violent media consumption among aggressive adolescents across cross-sectional, experimental, and longitudinal designs. The examined research consistently demonstrates a strong causal correlation between the neural correlates of aggression and exposure to violent media. Findings repeatedly noted the association of delayed maturation of the prefrontal cortex and various limbic regions, often related to an individual's ability to control impulsive and aggressive behaviors. However, it is understood that further research is needed, as neurological research presents one of the best possible paths to assess the cause and effect of violent media and aggressive behaviors.

[247] CANCELLED:

6:00 PM – 7:00 PM

PSYCHOPHYSIOLOGY/GENETICS

Prior research suggests that wealthy individuals are judged more harshly than poor individuals for the same moral infractions. However, it remains unclear whether this effect emerges because of wealth status itself or because of targets' histories of monetary privilege or stress. Across five studies (Ns = 257, 243, 376, 252, 290), participants evaluated bad-behaving targets who varied in childhood (low/high) and current (low/high) socioeconomic status (SES). Overall, low SES targets were judged less harshly and current SES contributed more than prior SES for judgments of moral character and reasons for acting. The age at which targets became low or high SES (5 or 17) interacted with whether current and past wealth impacted judgments. In addition, providing participants negative (vs. no) character information lessened the importance of current and prior SES on character evaluations. Results replicated over different infractions (e.g., theft, deception, and physical aggression). Overall, participants use target SES, particularly current SES, as an indicator of moral character after an infraction, such that actors with high SES are assumed to be more immoral than those with low SES.

[248] Tolerance Isn't Always Kind: The Paradox of Conditional Inclusion

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Intergroup tolerance—putting up with a disapproved conduct of an outgroup—is often regarded as a civic virtue essential for coexistence in multicultural societies. However, its inherently power-asymmetrical and conditional nature can produce paradoxical effects on social change. This research examines these outcomes from the perspective of tolerance recipients through two experimental studies: Study 1 with LGBTQIA+ individuals (N = 180) and Study 2 with Muslims (N = 167). Participants were exposed to scenarios evoking feelings of discrimination, tolerance, or acceptance via fabricated news. Across both studies, discrimination and tolerance (compared to acceptance) elicited negative emotions—such as feeling patronized, discouraged, or ambivalent—whereas acceptance (compared to tolerance) evoked positive emotions, including appreciation, happiness, and understanding. In Study 1, the experience of tolerance, compared to acceptance, was associated with higher collective action intentions, and high system justifiers also reported greater identity concealment when tolerated (compared to discriminated), motivated by fear of backlash. These findings highlight tolerance as a paradoxical form of inclusion that can simultaneously mobilize and suppress social change.

[249] Too much or not enough? Tightness of norms and the implications for well-being.

6:00 PM – 7:00 PM

CULTURE

Do people fare better in more or less restrictive social settings? Societies with tighter social norms tend to be more ordered and have lower rates of crime, but at the same time show lower creativity and are less tolerant of different ways of living (Gelfand et al., 2011). While there is empirical support to argue that people fare better in either looser or tighter social context, or that they are best adapted to whatever you grew up in, we hypothesized a non-linear relationship between perceived tightness of norms and wellbeing. People who perceive the norms in their communities to be especially loose or tight might feel overly free or restricted respectively, with an overall preference for a more balanced society that offers both limitations and leeway. We tested this theory with 8359 participants across all 50 US-states. We found an inverted u-shaped link between tightness of norms and wellbeing – both high and low tightness were associated with lower subjective well-being. This effect was moderated by higher-level norms. Our findings highlight that solely testing linear relationships may result in overlooking more complex links between psychological constructs.

[251] Trait Inferences for White and Asian Targets: Warmth vs. Competence

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

We infer traits from others' behaviors via spontaneous trait inferences (STIs). But how do stereotypes about a social group shape STIs? Do STIs impact follow-up actions? Participants (N = 117) learned either White or Asian faces, each paired with a positive or negative behavior tied to warmth (e.g., warm, cold) or competence (e.g., smart, stupid). We found that participants formed STIs for both groups, but with different patterns. Participants formed positive and negative warmth STIs for White targets, whereas they formed positive warmth and negative competence STIs for Asian targets. These findings align with the primacy of the warmth effect for White targets. Given that most participants were White (62%), they may have focused on warmth for their racial in-group while inferring counter-stereotypic traits for Asians, consistent with the "model minority" view (competent but cold). Additional data on participants' willingness to approach (warmth-related) and recruit (competence-related) targets will be analyzed by SPSP 2026. These findings provide insights into race-based spontaneous impressions, particularly when involving stereotypes, as well as subsequent behavior toward others.

[252] Traits of the Tamer and the Tamed: HEXACO and General Causality Orientation Predictors of Sexual Domination and Submission Behavior and Preferences

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Bondage, Dominance, Submission/Sadomasochism, and Masochism (BDSM) is a common framing for communities who partake in sexual, physical, psychological, and other power exchanges between consenting participants. Previous predictors of BDSM preferences for sexual domination (i.e., taking control of others) and submission (i.e., giving control to others) have been identified (e.g., each has been linked to basic personality traits). However, inconsistencies in the literature exist. For example, trait agreeableness is evidenced as a negative predictor of sexually dominant identities but positive predictor of sexually submissive identities (Mallaioli et al., 2025). Hébert and Weaver (2014), in contrast, found no differences in agreeableness between the two groups. Perhaps the pathway from basic personality to sexually dominant, submissive, and "switch" preferences may be better explained by accounting for individual differences in motivation orientations to better explain these mixed relationships. To evaluate this possibility, we examined the mediating role of general causality orientations (i.e., tendencies in attuning to one's environment and explaining one's behavior as autonomous, controlled, or beyond one's control) to further understand and explain these relationships.

[253] Trajectories of Sense of Purpose in Later Life: The Role of Sociodemographic Variables Across Six Longitudinal Studies

6:00 PM – 7:00 PM

META-ANALYSIS

Sense of purpose is defined as the extent to which individuals perceive their lives as having direction, goals, and meaning. Higher sense of purpose is consistently linked to slower cognitive decline, reduced mortality risk, and less allostatic load. Yet, little is known about how purpose trajectories differ by social and health factors. In this pre-registered work, we examined sociodemographic predictors of age-related trajectories of purpose across six longitudinal studies with at least three waves of purpose: HRS (N=14,000), MIDUS (N=4,000), Rush MAP (N=2,300), Rush MARS (N=950), Rush LATC (N=250), and WLS (N=10,300). Using a coordinated analysis approach, this study used multilevel linear and quadratic growth models to characterize how sense of purpose trajectories differed based on race, gender, SES, relationship status, and health conditions (e.g., stroke, high blood pressure). We anticipate that sense of purpose may decline later in the lifespan, and that these trajectories will differ based on individuals' social and health contexts. Findings highlight the importance of grounding interventions aiming to promote purpose in individuals' social and health contexts.

[254] Uncertainty Avoidance Relates to Differentiated Facial Impressions

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

The structure of social trait perception substantially varies across individuals and cultures, but the sources of this variability remain poorly understood. One potential source lies in how people handle the inherent uncertainty of face-based first impressions, which require rapid personality judgments based on limited information. Based on this premise, we hypothesize that individuals with higher uncertainty avoidance engage in more fine-grained processing of facial impressions, using a cognitive strategy that reduces ambiguity. Across two studies, we found that both individuals (Study 1: N = 105) and cultures (Study 2: N = 10,552, 40 regions) with higher uncertainty avoidance formed more distinctly differentiated personality trait impressions from faces. The relationship between uncertainty avoidance and impression differentiation was mediated by the strength of trait concept dissociations that individuals held (Study 1). Our findings demonstrate that basic cognitive tendencies shape social perception, offering a novel explanation for individual and cultural variability in impression structure.

[255] Unsettling Ignorance: Native Visibility Lowers White Collective Esteem but Increases Engagement with Native Issues

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Positive regard for White identity relies on cultural narratives that omit marginalized groups’ experiences with injustice. Facing the realities of Native oppression may induce White identity threat, reducing engagement with critical Native issues. We tested how Native representation (vs. omission) in climate justice documentaries influenced White Americans’ collective self-esteem, intentions to learn more, and actual engagement with seeking information about contemporary Native environmental justice efforts. We analyzed pooled data from two experiments with White participants from the Pacific Northwest (N=507). As expected, exposure to Native representation lowered Whites’ collective self-esteem; however, this process resulted in more interest and behavioral engagement, rather than less. Findings suggest that including Native voices in local environmental narratives may actually promote engagement with learning about critical Native issues through an identity threat process.

[256] Validating Complex Flexibility: A Novel Cognitive Construct in Korean Culture

6:00 PM – 7:00 PM

CULTURE

This study proposes complex flexibility (CF) as a cognitive trait reflecting Korean cultural characteristics and validates its measurement tool. CF is defined as a cognitive tendency to process contradictory information in a flexible yet paradoxical manner, distinct from constructs such as cognitive flexibility or naïve dialecticism. The construct comprises four subfactors: oppositional inclusiveness, integrative duality, logic rejection, and ideal solution expectation. To validate the construct, about 600 Korean adults were recruited across two studies, with 530 valid responses (EFA n=286, CFA n=242). EFA of 40 preliminary items yielded a 12-item, four-factor scale, and CFA confirmed this structure with CF as a higher-order factor (good fit indices). Correlational analyses suggested validity: CF was positively related to Korean decision-making tendencies and moderately to cognitive flexibility and holistic thinking, while unrelated to risk aversion, loss aversion, or indecisiveness. The validated CF scale introduces a novel tool to explain unique decision-making processes in Korean society and offers applications for organizational contexts and cultural decision-making research.

[257] Verbal Assertiveness May Be Linked to Interdependence in South Asia: Initial Evidence from India

6:00 PM – 7:00 PM

CULTURE

coauthors: Irene Melani, Yaxin Xiao, Georgios I. Christopoulos, Honghong Tang, Krishna Savani, Mohammad Ghazi Shahnawaz, and Shinobu Kitayama

Research suggests that South Asian Americans (SAAs) are particularly successful in leadership attainment due to verbal assertiveness (VA). However, this pattern appears paradoxical within South Asia’s culture of corporeal interdependence. VA promotes expressive freedom—a marker of independence in many Western societies—which contrasts with most Asian contexts’ emphasis on expressive suppression. Thus, it is unclear whether SAAs’ VA reflects assimilation to US independent culture or represents South Asia’s form of interdependence distinct from East Asia’s effacing type. To address this, we compared correlates of VA among Indians (N = 233), European Americans (EA; N = 228) and Chinese (N = 224). Our results showed that Indians reported the highest level of VA, predicted by both independent and interdependent self-construals—whereas only independence predicted VA for EA and Chinese. Ongoing investigations further revealed that VA is associated with expressing socially engaging emotions in India, but socially disengaging emotions in the US. Our findings provide initial indication that, in India, VA may serve affiliative rather than antagonistic functions aligned with interdependence.

[258] Wanting to maximize positivity influences how we prefer partner support.

6:00 PM – 7:00 PM

CULTURE

European Americans want to maximize positivity more than East Asians do, and this shapes their affective experiences (Sims et al., 2015). But do these cultural differences influence what types of social support people want from close others during tough times? To answer this question, we recruited and examined 119 romantic couples (60 European American, 59 Japanese) who took turns discussing a personal concern (e.g., about their health) with their partners and rated their partners' responses. As we predicted, the more sharers valued maximizing positivity, the less positive resonance (i.e., a sense of mutual warmth and being "in sync") they felt with listeners who pointed out problems during the discussion ($\gamma_{1,1} = -18.99$, $p = .003$). Consistent with cultural differences in wanting to maximize positivity, US sharers ($p < .001$) felt less positive resonance when their partners pointed out problems ($\gamma_{1,1} = 7.23$, $p = .043$), but this was not true for Japanese sharers ($p = .79$). These findings suggest that cultural differences in how people want to feel shapes what types of social support they want during tough times.

[259] We Are What We Watch: Genre Preferences and Personality

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Psychological science has long been critiqued for relying on samples drawn primarily from Western, Educated, Industrialized, Rich, and Democratic (WEIRD) societies. After two decades of calls to broaden the field's empirical base, the present study offers a contemporary update. We analyzed all human-subjects research published in 2024 in six leading psychology journals ($k = 1209$) and compared our findings to previous landmark reviews. Our data show that while the proportion of U.S.-based samples initially declined (from 68% in 2003–07 to 62%) from 2014 to 2018 it has remained largely stagnant since then (60% in 2024). U.S. participants remain vastly overrepresented—an individual in the United States is 50 times more likely to be a research participant than someone elsewhere in the world. Demographic reporting has improved somewhat, but participants' race/ethnicity, socioeconomic status, and education are still frequently omitted. Overall, our findings indicate that psychology not only remains heavily dependent on WEIRD and undergraduate samples, but is still reluctant to meaningfully consider the inevitable constraints on generalizability.

[260] What Makes Us Human? Sociality as a Key Dimension of Mind Perception

6:00 PM – 7:00 PM

CULTURE

Traditional models of mind perception emphasize agency and experience. However, these models were developed primarily in Western, individualistic contexts. We propose that sociality—the capacity to form and sustain meaningful relationships—represents an additional dimension of mind perception more strongly emphasized in collectivist cultures. To test this, we employed the "Potion of the Mind Test," in which participants allocate 100 mg of "mind potion" across 40 capacities to construct an ideal human. Across two studies ($N = 661$) conducted in China, Mexico, and the United States, sociality consistently emerged as central to conceptions of the ideal human. Importantly, differences also appeared: U.S. participants prioritized social relation capacities tied to personal relationships (e.g., sibling, friend), whereas Chinese participants emphasized social norm capacities tied to traditions and broader societal roles. These findings extend existing models by providing evidence that sociality is a distinct dimension of mind perception and highlight how it contributes to cultural variation in conceptions of humanness.

[261] When AI Becomes 'Other': The Role of Racial Representation and the Uncanny Valley in Human-AI Relationships

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Conspiracy theories are increasingly prominent in politics and media. Schizotypal personality traits are the best predictors of conspiracy belief because they reflect cognitive styles that deviate from conventional logic. Cognitive deficits also make individuals more susceptible to celebrity worship. As celebrities increasingly influence political spheres, it is critical to examine whether attitudes toward celebrities relate to political cognition. 318 participants completed the Conspiracy Mentality Questionnaire, the Brief-Schizotypal Personality Questionnaire, and the Celebrity Attitudes Scale. Conspiracy mentality was correlated with schizotypal personality ($r = 0.23$, $p < .05$), and with celebrity worship ($r = 0.18$, $p < .05$). In individual linear regression models, schizotypal traits ($t(269) = 3.85$, $p < 0.001$, $R^2 = 0.05$), and celebrity worship ($t(265) = 2.98$, $p < 0.001$, $R^2 = 0.04$) were significant predictors of conspiracy mentality. When included together, both schizotypal traits ($t(257) = 3.40$, $p < .001$) and celebrity worship ($t(257) = 2.24$, $p = 0.03$) were significant ($R^2 = 0.08$), but did not have a significant interaction ($t(256) = 0.58$, $p = 0.56$). This suggests that celebrity worship is related to conspiracy belief. Understanding this link may help explain why some people are more prone to conspiratorial thinking.

[262] When Do People Prefer Multiracial Partners? The Role of Context and Culture

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Racial diversity is known to influence expectations about team dynamics, but less is understood about how multiracial individuals are evaluated as potential collaborators. We investigated how racial group composition influences collaboration expectations across two studies ($N = 600$) with monoracial participants from the U.S. mainland and Hawaii. In Study 1, participants selected a single partner from individual photographs for either a social or work task. In Study 2, participants selected one photo depicting two partners from group images for the same tasks. Participants then reported expectations of work efficiency and attitudes toward selected teammates. In Study 1, multiracial partners were expected to be more efficient and evaluated more positively in social tasks, with effects consistent across regions. In Study 2, significant interactions between group composition and task type emerged only among Hawaiian participants, who evaluated multiracial and racially mixed groups more favorably in social contexts. These findings suggest that the perceived value of multiracial partners is context-dependent, shaped by task framing, interaction format, and regional norms.

[263] When do people welcome accountability, and how does it feel?

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Accountability plays an important role in societies, yet individuals are often averse to embracing their own accountability. This raises questions about when people are more or less inclined to welcome accountability and what it feels like when they do. This study ($N = 32,485$ observations from $N = 977$ US adults) used the day reconstruction method to examine situational predictors of welcoming accountability and links between welcoming accountability and well-being. Although the results revealed various situational predictors, the strongest was the presence of other people. People who characteristically welcomed accountability tended to experience more pleasant emotion and meaningfulness and less unpleasant emotion. Similarly, when people welcomed accountability more than was typical for them, they tended to experience more pleasant emotion and meaningfulness, but also more unpleasant emotion. These findings offer important insights into how welcoming accountability manifests across situations and establishes its relationships with different aspects of well-being.

[52] Cultural Differences in Estimating Negative Evaluations of Altruistic Behavior

6:00 PM – 7:00 PM

CULTURE

Altruistic behavior, generally considered prosocial and desirable, is not invariably evaluated positively. In Japan, people tend to evaluate altruistic behavior more negatively than in the US (Kawamura & Kusumi, 2020), yet underlying mechanisms of this cultural difference remain unclear. One possibility is that Japanese people consider potential negative consequences when help is unsolicited. We therefore predicted that Japanese would anticipate more negative evaluations of unsolicited helping than Americans, reflecting their cultural emphasis on recipient-centered considerations and the risk of causing embarrassment. Participants (100 Japanese and 159 Americans) read a scenario of helping a stranger and, under conditions that varied the number of evaluators (ranging from 1 to 500), estimated how many would evaluate the altruistic behavior positively or negatively. Contrary to our prediction, Americans estimated higher proportions of negative evaluators than Japanese. This unexpected pattern highlights the need to refine existing cultural theories of helping by distinguishing between direct evaluation of behavior and meta-evaluation of how others might judge that behavior.

[264] When Does Perceived Inequality Breed Envy? Evidence from 34 Countries on the Cultural Moderation of Individualism

6:00 PM – 7:00 PM

CULTURE

Although previous studies have shown that income inequality undermines social cohesion, the emotional processes linking inequality to interpersonal life remain underexplored. Envy is a particularly relevant emotion, as it is driven by upward social comparison in unequal contexts and shapes both interpersonal relationship and subjective well-being. In the present study, we examine how perceived income inequality influences two kinds of envy: benign envy, which motivates self-improvement, and malicious envy, which involves resentment and hostility toward others. Using survey data from 23,202 participants across 34 societies, we find that higher perceived income inequality is associated with greater levels of both benign and malicious envy. However, the cultural patterns diverge. Specifically, the association between perceived income inequality and benign envy emerges only in collectivistic cultures, but not in individualistic cultures. By contrast, the association between perceived income inequality and malicious envy appears consistently across societies with diverse economic and cultural orientations, highlighting a robust, pan-cultural relationship through which inequality fosters antagonistic emotions. Taken together, these findings identify envy as a key psychological consequence of perceived income inequality.

[265] When Perception Meets Reality: How Moral Metaperceptions Shape Intergroup Relations in Political Divides

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

This research investigates moral metaperceptions across political divides and their impact on intergroup relations. Through a multi-method approach combining computational analysis of 10 million tweets and three experimental studies, we examine how individuals believe they are morally evaluated by political outgroups. Our findings reveal systematic discrepancies between how outgroups actually perceive a group's morality and how that group believes they are perceived. For instance, pro-life individuals believe pro-choice people rate them significantly lower on care and equality than pro-choice individuals actually do. Similar metaperceptual inaccuracies emerge in gun control debates. Critically, these inaccuracies predict intergroup trust and threat perceptions. Individuals who believe outgroups view them less moral than they actually do report higher threat and lower trust. Our intervention study demonstrates that correcting these misperceptions by providing accurate feedback about how outgroups actually evaluate one's moral positions significantly increases trust and reduces perceived threat. These findings suggest that addressing metaperceptual inaccuracies offers a promising pathway for reducing political polarization and improving intergroup dialogue in contentious moral debates.

[266] When Race Talk Goes Public: How Beliefs, Framing, and Responses Shape Observer Reactions to Discrimination Disclosures Online

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Sexual objectification behaviors (e.g., groping, inappropriate sexual comments) are usually conceptualized as coming from a stranger and negatively impact wellbeing. But what does sexual objectification look like when it comes from a romantic relationship partner, and does it have the same negative impacts? In the current research, we addressed these questions across three studies aimed at developing and validating a new Behavioral Objectification from a Partner (BOP) Scale, which assesses sexual objectification that is specific to relationship contexts. In Study 1, 104 women and gender minorities completed and provided feedback on the BOP Scale. In Study 2 (a and b), women partnered with men completed the BOP Scale and additional measures at Time 1 and Time 2 (four months later). Study 2a (N = 260) used exploratory factor analysis to build the factor structure, and Study 2b (N = 297) confirmed the factor structure. Finally, Study 2 also demonstrated that the BOP Scale showed meaningful cross-sectional and longitudinal associations with increased experiences of appearance surveillance from a partner, self-objectification, and sexual coercion, and decreased sexual desire.

[267] Where We Belong: Environmental Socialization as Resistance to Settler Violence

6:00 PM – 7:00 PM

CULTURE

Colonial violence continuously undermines Indigenous Peoples' connections to ancestral homelands. This connection is critical for supporting positive identity processes that foster belonging. Receiving cultural teachings about land (i.e., environmental socialization) may provide a connection to land, despite displacement status. A correlational study (N = 398) assessed whether environmental socialization was associated with belonging for Indigenous individuals who are or are not displaced. Although displaced individuals reported lower levels of belonging than nondisplaced individuals, there was a positive relationship between environmental socialization and belonging regardless of displacement status. These findings support the assertion that physical displacement is harmful to Indigenous Peoples, but environmental socialization may buffer against these adverse effects and instead foster cultural connection.

[268] White Individuals' Intentions to Engage in Racial Justice Action: Utilizing the Theory of Planned Behavior

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Throughout history, social movements occur and people take part in different actions to combat racial injustice, such as the protests for police reform in 2020. Research suggests that White Americans are less involved in these actions compared to people of color, potentially due to varying individual and external factors. The current study aims to utilize the Theory of Planned Behavior (TPB) to examine how attitudes, norms, and perceived behavioral control (PBC) relate to White Americans' intentions to engage in racial justice actions. A pilot study determined six racial justice-related behaviors of varying risk levels (low, moderate, high) to be used in the main study. The main study will test how TPB constructs predict intentions to engage in these behaviors and explore political ideology as a moderator. We hypothesize that attitudes and PBC will positively predict intentions across all risk levels. In contrast, norms are expected to negatively predict moderate- and high-risk behaviors, but show no effect on low-risk behaviors. We anticipate this study providing more insight into the factors that motivate White individuals to engage in actions that support racial justice.

[269] Who Becomes a Leader? A Theoretical Model for Early Career Leadership Identity & Success

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

Previous studies have explored the prominent connection between leadership emergence and broad personality traits. However, these studies have frequently overlooked the role of other individual differences that may also play a significant role in shaping leadership potential and behavior. Profiling a leader through these additional dimensions offers a deeper understanding of what makes someone effective, influential, and motivated to lead. This is especially important for recent college graduates, who are entering the workforce during a period of personal and professional transition.

The current project adopts a recently developed theoretical model to explain the underlying mechanisms (i.e., personality traits, interests, values, and skills) that drive leadership identity development and subsequent leadership success through the year following graduation. This study utilizes data from the Houston Occupational and Personality Study, which followed 613 graduates from three U.S. universities across five timepoints, starting before graduation through a year post graduation (22.78, SD = 2.97). Participants indicated whether they held an official leadership position ("Yes" or "No"), allowing for comparisons between leaders and non-leaders. Preliminary research included correlations between Leaders and Big Five Personality Traits (including their facets), career interests, and values; and a longitudinal analysis of relevant Leaders' traits. Leaders were more extraverted ($t = 2.20$, $p = .29$) than non-leaders, with assertiveness identified as the only significant facet-level predictor ($t = 2.80$, $p = .006$). Preliminary longitudinal analyses revealed that leaders' assertiveness level remained consistently higher and slightly increased, while non-leaders experienced a decline in assertiveness. Ongoing analyses will expand these findings to other individual differences and situate these relationships within a broader model of leadership identity and success.

[270] Who is the popular online dater?

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Despite online dating exposing people to endless potential partners, people struggle to date. Indeed, 50% of likes sent on Hinge go to 15-25% of users (Goldgeier, 2017), suggesting some people get all the traction, leaving others dateless. Why? Crucially, online dating involves different processes than in-person dating (e.g., browsing of profiles versus interpersonal exchange), serves different functions (e.g., sorting versus exploring chemistry) and involves different cues (static versus dynamic), changing the degree to which people agree on who is desirable. Using two samples of judges ($N=196$ and $N=287$) who rated targets' online dating profiles ($N=180$), we explore how much people agree on who is desirable and who the desirable dater is. We explore traits based on evolutionary theories of attraction (e.g., attractiveness and status), desirable traits in traditional dating (e.g., personality) and those that may matter online (e.g., authenticity, effort). This study will reveal if 1) some people do tend to be popular in online dating and who those people are and 2) the selection process online differs from in person, which may contribute to the dating frustration people report.

[271] Who Learns Best with AI? Individual Differences in Academic Achievement Across AI and Traditional Learning Environments

6:00 PM – 7:00 PM

PERSONALITY PROCESSES/TRAITS

The growing use of artificial intelligence (AI) in education raises questions about how individual differences interact with instructional format to influence learning. This simulation study modeled academic achievement across AI-supported and traditional learning conditions using a dataset of 1,000 simulated learners with distributions reflecting plausible ranges for personality traits, cognitive abilities, academic interest, executive functioning, and AI familiarity. A multiple regression model explained 70.3% of the variance in achievement, $R^2 = .703$, $F(21, 978) = 110.0$, $p < .001$. Higher achievement was associated with greater topic interest ($\beta = 0.211$, $p < .001$), openness ($\beta = 0.149$, $p < .001$), attention ($\beta = 0.102$, $p < .001$), memory ($\beta = 0.091$, $p < .001$), executive functioning ($\beta = 0.085$, $p < .001$), conscientiousness ($\beta = 0.058$, $p < .001$), and AI familiarity ($\beta = 0.082$, $p < .001$), whereas neuroticism was negatively related ($\beta = -0.040$, $p = .004$). Four significant interactions emerged: openness $\times$ condition ($\beta = -0.098$, $p < .001$), interest $\times$ condition ($\beta = -0.081$, $p < .001$), AI familiarity $\times$ condition ($\beta = -0.074$, $p < .001$), and conscientiousness $\times$ condition ($\beta = 0.058$, $p = .007$). Findings highlight the need to tailor AI-based education to diverse learner profiles.

[272] WHO or WHY: The Roles of Ally Race and Perceived Motivations in the Target Disadvantaged Group's Personal Outcomes

6:00 PM – 7:00 PM

INTERGROUP RELATIONS

Past research has demonstrated that the target disadvantaged group's perception of allyship behaviors differed by ally race (i.e. advantaged vs. disadvantaged group) and perceived allyship motivations (i.e. sincere vs. ulterior). One possible reason behind this different perception was the differentiation of suspicion level toward allies. Consequently, this can lead to different perceivers' personal outcomes, such as self-esteem and collective action intention. However, past studies often failed to incorporate these variables into a single framework and establish causal relationships between them. Therefore, the current study aims to manipulate ally races and perceived allyship motivations and directly compare their consequential impacts on the target disadvantaged group. In a two-part survey, Black participants first rated their suspicion level toward White (i.e. advantaged group) and Latino people (i.e. disadvantaged group) in general. Two weeks later, they read a news article about a BLM protest where either White allies or Latino allies attended for sincere, ulterior, or ingroup-focused motivations and then answered some questions about allyship evaluation and their personal outcomes. A significant correlation between ally race and suspicion level was found. Additionally, perceived sincerity was shown to be a significant mediator between perceived allyship motivations and some of participants' personal outcomes. The implications and future directions of this research were discussed.

[273] Willingness or Weakness? How Honor Values Shape Perceived Strength of Those Who Compromise in Negotiation

6:00 PM – 7:00 PM

CULTURE

Reaching agreements to coordinate conflicting needs is essential to group-living. In the cultural logic of honor, however, compromising may be eschewed as it can imply weakness and damage social image. In a pre-registered experiment in the UK (N = 526; ~50% White British, ~50% MENA/South Asian backgrounds), participants read a negotiation scenario where a person proposed allocating desired resources with varying degree of compromise: Contention (they get 100%, the other gets 0%), Weak Compromise (66:33), Strong Compromise (33:66), and Concession (0:100). Participants rated the person's perceived strength (e.g., strong, tough), and completed measures of personal and perceived normative honor values (self-promotion & retaliation, defense of family reputation). Results revealed that higher personal and perceived normative honor values of both facets predicted lower strength ratings of those who conceded more (all p 's < .037). Unexpectedly, participants from honor culture backgrounds perceived those who conceded more as stronger than did White British participants (p < .001). These findings offer insights for culturally-informed approaches to reaching mutual agreements in negotiations.

[274] You are what you eat? The role of cultural foods in interpersonal impression formation

6:00 PM – 7:00 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Eating culturally-relevant food is one of the most frequent ways we engage with our cultural identity. However, it is unclear whether cultural foods influence how we perceive the identities of others. In two online studies (total N=1440; 50% White, 50% Asian), participants were randomly assigned to view the social media profile of a biracial (Asian and White) target person whose profile included pictures of Chinese food, American food, or no food. Given that biracial individuals may frequently experience identity denial or stereotyping depending on how their identity is perceived by others, we tested whether food is seen as a meaningful marker of identity. In Study 1, targets' cultural identity (as Chinese or American) was perceived to be stronger when it was congruent with the food displayed in their profile (Cohen's f 's ranging from 0.08-0.09, p 's < 0.03). The same effect however was not observed for targets' racial identity (p 's > 0.08). In Study 2, we seek to replicate these findings and test whether participants are more likely or less to apply Asian stereotypes to targets based on the food displayed in their profiles.

[275] Sex Differences in Daily Stressor Exposure

6:00 PM – 7:00 PM

EVOLUTION

Men and women evolved to pursue different goals, which exposes them to different types of stressors. However, it might also be the case that they likely evolved to attend to and be more affected by the stressors that they recurrently faced the most throughout evolutionary history. Based on available research, we are unable to tell with certainty if individuals are accurately reporting their stressor exposure or if they are reporting the stressors that they were more attentive to, were more affected by, or remember vividly. The present research addresses this issue through two complementary studies. In Study 1, we analyze large-scale daily diary data from two countries to examine sex differences in exposure to five domains of daily stressors: argument-related, avoidance of argument, work/school-related, network-related, and home-related. In Study 2, using a multi-national sample, we investigate whether the differences observed in Study 1 are attributable to variation in perceived stressfulness, perceived frequency, and recall vividness across these domains.

[276] Virtue Through Victimhood: Moral Perception in Intergroup Contexts

6:00 PM – 7:00 PM

STEREOTYPING/PREJUDICE

Victims of immoral actions are perceived as virtuous based on motives to protect and bring justice to victims despite not knowing their actual moral standing (Jordan & Kouchaki, 2021). According to the theory of dyadic morality (Schein & Gray, 2018), such victims of wrongdoing (moral patients) are afforded sympathetic reactions when their victimhood is the result of harm caused by an intentional perpetrator (moral agents). We extend this approach beyond the individual level of interpersonal transgressions (Person A harms Person B) to intergroup behaviors (Group A harms Group B). To the extent that socially stigmatized groups (e.g., based on race, gender identity, SES, neurodivergence) are perceived as victims of immoral systemic discrimination they may be perceived as more virtuous. Specifically, we examine whether some stigmatized groups are perceived as more victimized (and therefore more virtuous) than others. Furthermore, we test whether beliefs about an abstract moral agent (i.e., systematic/institutional discrimination against stigmatized groups) predict perceptions of harm, which in turn predict virtuous victimhood of the corresponding moral patients.

[277] The interplay of stress and oxytocin on social behavior

6:00 PM – 7:00 PM

SOCIAL NEUROSCIENCE

When confronted with stress, some individuals exhibit the typical fight-or-flight response, whereas others turn to social affiliation, which may manifest in prosocial behaviors such as trust, cooperation, and empathy. Given its well-established role in regulating socio-emotional functioning, oxytocin is considered a prime candidate for facilitating such behaviors. However, most prior studies on oxytocin and social behavior have been conducted in controlled, non-stressful settings. In the present research, we manipulated both stress (via the Trier Social Stress Test) and oxytocin levels (via intranasal administration) to examine their joint effects on prosocial behavior, with a particular focus on generosity. Our findings indicate that the combination of stress and oxytocin administration enhances generosity.

[278] The Racialized Language of Dirt in Black Women's Digital Navigation

6:00 PM – 7:00 PM

STEREOTYPING/PREJUDICE

Dominant societal narratives often construct femininity through a framework of purity, morality, and cleanliness, marginalizing those who fail to conform. Black women, in particular, are frequently positioned outside of traditional femininity, labeled as masculine, hypersexual, or *dirty* in both literal and figurative senses. This study investigates the discursive usage of *dirty* across two Twitter communities: one exclusively for Black women (Eve Gene) and one general women-centered space (Insufferable Women Uncensored; INSWU). A detailed content analysis of 354 tweets from both spaces examines how participants navigate, resist, and redefine what it means to be *dirty* in relation to gendered and racialized norms. Findings revealed that *dirty* appears in multiple contexts—including betrayal, hygiene, and sexuality—but the distribution of meanings differed significantly across groups. A chi-square test showed that the frequency of thematic meanings varied between communities, $\chi^2(9, N = 395) = 37.77, p < .001$. Follow-up chi-square tests indicated that Sexual Hygiene appeared significantly more often in INSWU ($\chi^2(1) = 14.23, p < .001$), while Physical Dirt appeared significantly more often in Eve Gene ($\chi^2(1) = 5.17, p = .023$). Personal Hygiene and Betrayal did not differ significantly between communities. Further qualitative analyses showed that in Eve Gene, *dirty* was used to resist racialized and gendered stereotypes and to reframe stigma through reflexive engagement. In contrast, INSWU employed *dirty* primarily as a tool for moral judgment and intra-group policing surrounding sexuality and interpersonal transgressions. These findings demonstrate how digital platforms function as sites where stigma is both reproduced and contested, and how Black women mobilize language as a form of discursive agency to negotiate exclusionary ideals of womanhood. By centering everyday digital speech, this study extends psychological and feminist scholarship on stigma, performativity, and social roles, illustrating how racialized meanings of dirt circulate, shift, and are strategically repurposed in online communities.

[279] When Stories Feel Harder: Loneliness Shapes Perceived Challenge in Narratives

6:00 PM – 7:00 PM

INDIVIDUAL DIFFERENCES

Prior research suggests that lonely individuals process naturalistic stimuli (i.e., short narrative-based videos) differently than their non-lonely peers. What specific narrative features may drive this effect? In this study, we examined how loneliness shapes individuals' perceptions of emotional and intellectual challenges that they experience while engaging with narrative media content. To do so, participants ($N = 174$) rated video segments on perceived emotional and intellectual challenge. Results suggest that lonely individuals, compared to non-lonely participants, rated segments as more emotionally challenging (e.g., $z(\infty) = 2.98, p = .003$, with an estimated mean difference of 0.70) and more intellectually challenging (e.g., $z(\infty) = 2.28, p = .023$, with an estimated mean difference of 0.60). These findings suggest that loneliness may heighten emotional reactivity and increase the perceived cognitive demands of processing narratives, making engagement with complex social information more effortful.

[280] Measuring Teleological Thinking: Development and Early Validation of a New Assessment Tool

6:00 PM – 7:00 PM

SOCIAL COGNITION

Teleological thinking, the tendency to explain natural, biological, and physical phenomena in terms of purpose or goal-directedness, is a pervasive cognitive bias with implications for scientific reasoning, education, and belief system. Although a few measures assessing teleological thinking currently exist, they typically focus narrowly on specific aspects or contexts, limiting their scope and general usability. To address this gap, we aimed to develop a comprehensive, yet accessible, measure that captures multiple dimensions of teleological reasoning. Our measure encompasses an extensive variety of contexts where teleological thinking can occur, including personal or existential domains as well as natural and social environments. In this presentation, we outline the stages of measure development, including theoretical grounding, item generation, and expert review. We will also share initial data from the pilot study investigating the psychometric properties of the measure, such as reliability, factor structure, and preliminary validity. These initial findings will guide further refinements and highlight the applicability of the new measure in cognitive research, educational settings, and psychological practice.

- *Leave the Lights On: How Joyful Decisions Can Save Our Species* by Elizabeth Dunn (UBC)

In addition to highlighting member-authored books, the display features SPSP journals and promotional materials to inform attendees about publication opportunities and journal offerings. Please note that this is an informational display only; no staff will be present at the table. Complimentary items, including notebooks and pens, are available while supplies last. An informational placard with Sage contact details is provided for any questions about the journals.

Evening Reception at Mindworks (Pre-Registration Required)

7:00 PM – 9:00 PM | Location: 224 S Michigan Ave, Chicago, IL 60604

Join us for an Evening Reception at **Mindworks**, Chicago's only public behavioral science discovery center. Explore interactive exhibits, take part in studies, and enjoy drinks and light snacks while connecting with researchers and fellow SPSP attendees.

[RSVP here.](#)

Address: **224 S Michigan Ave, Chicago, IL 60604**

Capacity is limited, so please reserve early. Mindworks is about 15 minutes from the McCormick Convention Center. A shuttle with Mindworks signage will run continuously from 3 PM to 9 PM, so attendees can arrive or depart at their convenience.

Friday, February 27, 2026

Name Badge Pick-Up and Information Desk

7:00 AM – 6:00 PM | Location: Lobby, Level 3

Quiet Room

7:00 AM – 8:00 PM | Location: E267, Level 2

The quiet room is available to all meeting attendees where talking and other interactions with attendees are not allowed. It's a place for people to work or think in silence. The room will be set with several small tables and chairs.

Interfaith Prayer, Meditation and Reflection Room

7:00 AM – 8:00 PM | Location: E250, Level 2

A space set up for private reflection and to support prayer, meditation, and reflection by attendees of all faith backgrounds. This is a technology-free zone. The room will be set with several small tables and chairs.

Ombuds Room

7:00 AM – 8:00 PM | Location: E251, Level 2

What is an Ombuds?

An Ombuds is a person trained in conflict resolution who maintains a neutral position in their role and is independent of SPSP and has no other role in the Society. A safe, off the record resource for meeting attendees to help resolve conflicts, problematic issues or concerns. While the Ombuds can provide guidance to individuals wishing to understand formal reporting options, they do not accept complaints on behalf of SPSP. Throughout the convention, the Ombuds will identify any trends and patterns arising from consultations and inquiries received. Following the convention, a report will be provided to summarize any trends and patterns to the SPSP Board of Directors in a completely anonymized manner.

How can I contact the Ombuds?

You can contact the ombuds during office hours from February 26-February 28, 2025. You also may contact the ombudsperson by phone or email through February 28, 2025.

To contact our ombuds service during the convention, visit the Ombuds in their office at the McCormick Place Convention Center in Room E251, Level 2, email: ombuds@spsp.org; or call (949) 293-7515. Ombuds office hours during the convention are as follows. A sign at their office will indicate when they will return if they are not present during the posted hours. 9:00 AM -- 12:00 PM CST; 1:30 PM - 3:00 PM CST & 4:00 PM -- 5:30 PM CST

Poster Storage

7:00 AM – 7:30 PM | Location: Exhibit Hall D1, Level 3

Coat Check

7:00 AM – 7:30 PM | Location: Exhibit Hall D1, Level 3

AM Beverage Break

7:30 AM – 9:00 AM | Location: Exhibit Hall D1, Level 3

Join us for complimentary beverages in the exhibit hall.

*NETWORKING

Exhibit Hall Open

7:30 AM – 6:00 PM | Location: Exhibit Hall D1, Level 3

*NETWORKING

Member Authors & SPSP Journals

7:30 AM – 6:00 PM | Location: Exhibit Hall D1, Level 3

Visit the Member Authors & SPSP Journals table to explore and celebrate the impactful scholarship of the SPSP community. This exhibit showcases works by SPSP members, including,

- *Principles of Research in Behavioral Science and Psychology of Prejudice and Discrimination* by Mary Kite (Ball State University)
- *Leave the Lights On: How Joyful Decisions Can Save Our Species* by Elizabeth Dunn (UBC)

In addition to highlighting member-authored books, the display features SPSP journals and promotional materials to inform attendees about publication opportunities and journal offerings. Please note that this is an informational display only; no staff will be present at the table. Complimentary items, including notebooks and pens, are available while supplies last. An informational placard with Sage contact details is provided for any questions about the journals.

First Aid Room

8:00 AM – 6:00 PM | Location: Exhibit Hall D1, Level 3

Let's Talk How Is Social Psychology Practiced Globally? Toward Inclusive and Localized Approaches

8:00 AM – 9:10 AM | Location: E450A, Level 4

This professional development session invites critical reflection on how social psychology is conceptualized, taught, and practiced globally. Although often framed as universal, the discipline remains largely shaped by WEIRD paradigms that can marginalize alternative epistemologies, methodologies, and sociocultural realities. This session brings together scholars working in Majority World and other non-hegemonic contexts to share their experiences conducting and teaching social psychology beyond dominant academic centers.

We will explore both structural barriers and innovative practices in adapting theories and methods to local realities, institutional settings, and linguistic and cultural diversity. Topics may include theory development grounded in local frameworks, methodological adaptations, publication challenges, and structural inequities in knowledge production. At the same time, the session will highlight opportunities for collaboration, conceptual advancement, and contextually meaningful impact.

The round table will feature 3–4 concise presentations (including remote or recorded options), followed by open discussion with attendees.

Global Impact: Communicating Psychology for Policy and Public Good

8:00 AM – 9:10 AM | Location: E451A, Level 4

Bridge the gap between your research and global impact. This session, hosted by the SPSP United Nations Committee, empowers personality and social psychologists to effectively communicate their work to public audiences and policymakers worldwide. Learn strategies to translate academic findings into actionable insights for sustainable development and global policy solutions. Discover how to leverage your expertise to inform critical discussions on the world stage.

Ethical and Reproducible Use of Large Language Models for Data Analysis

8:00 AM – 10:40 AM | Location: E255, Level 2

Large language models (LLMs) offer exciting new opportunities for analyzing text data. However, most LLMs used in psychology research are proprietary commercial products (e.g., OpenAI's GPT models) that pose risks to research ethics and reproducibility. Psychology lags behind other social sciences in addressing these risks, despite recent work suggesting they foreshadow a second reproducibility crisis. This workshop will feature experts from Political Science and Communication Studies who will outline best practices in their fields for LLM-based research. We will examine the ethical and reproducibility risks of commercial LLMs, show how to identify them, and demonstrate how to use open LLMs that pose fewer risks. The first half of the workshop will feature three talks and a Q&A exploring these issues in depth. The second half will include a hands-on coding tutorial that walks attendees through loading, fine-tuning, and deploying an open LLM in an ethical, reproducible way. We will conclude with an "LLM Research Clinic", offering tailored advice for integrating LLMs into attendees' own research.

The Most Dehumanizing Animals Are Attributed Uniquely Human Traits

8:00 AM – 9:10 AM

GROUPS/INTERGROUP PROCESSES

Psychological theories of dehumanization have long emphasized the denial of traits viewed as central to humanness. Yet in many of its most pernicious real-world forms, dehumanization takes on a paradoxical quality: targets are likened to animals, yet attributed distinctly human traits such as cunning, deceit, and moral corruption. We argue this contradiction reflects a coherent psychological logic—that the most dehumanizing animals are not seen as mindless, but as embodying a corrupt essence capable of intelligent malevolence. Across four studies (N = 1,255), we examine the trait profiles of animals perceived as most dehumanizing. Studies 1-2 found that animals considered more dehumanizing were attributed more negative, uniquely human traits. Study 3 replicates this with fictional animals and an expanded trait set. Study 4 manipulates the perceived intelligence of rats and finds that greater intelligence amplifies their dehumanizing essence. Together, these findings challenge trait-based models of dehumanization that emphasize omission. Capturing this process may therefore require moving beyond trait denial models toward more holistic measures of perceived essence.

The Effect of Workplace Gender Diversity on Domestic Role Intentions

8:00 AM – 9:10 AM

DIVERSITY

Although women's workforce participation has increased, they still perform most household and childcare tasks. This research examined whether exposure to gender-equal workplaces can contribute to greater gender equality within households. Across four experiments (N = 1,222), single and married participants were randomly assigned to view an image of an office environment with either gender diversity or a male majority. In Study 1, the intervention increased the desire of single women for housework equally in their future relationships. Study 2, conducted on a larger sample of single men and women, revealed a significant gender-by-condition interaction: men exposed to gender-diverse imagery reported greater willingness to engage in housework, while women reported slightly reduced willingness. In Study 3, married men in the diversity condition expressed more willingness to engage in childcare, but not housework. The intervention had no effect on married women in Study 4. Across studies, women reported more willingness than men to take on domestic tasks. The findings suggest that exposure to normative representations of workplace gender equality can influence domestic labor intentions.

Matching Two-Sided Messages to Individual Differences in Holistic Thinking Consequences for Information Processing, Persuasion, and Attitude Strength

8:00 AM – 9:10 AM

ATTITUDES/PERSUASION

This research develops a recently identified type of personalized matching in persuasion, explains the process underlying that effect, and shows its consequences. Across three studies, individual differences in holistic thinking were matched with message sidedness (one- vs. two-sided). Study 1 provided evidence for this personalized matching effect, and identified the underlying process responsible by manipulating argument quality (strong vs. weak) of the persuasive messages presented and by examining its consequences. Results indicated that the attitudes of participants in the matched conditions were more affected by strong vs. weak arguments compared to those in the mismatched conditions, suggesting that elaboration differences were the mechanism for the effect. Furthermore, this study demonstrated that these differences in elaboration were consequential such that attitudes based on high (vs. low) elaboration were more impactful in guiding subsequent behavior. Study 2 further extended the contribution by showing that merely framing a one-sided message as two-sided, while keeping the objective structure of the message constant, was sufficient to produce the predicted matching effect. As predicted, Study 3 (pre-registered) revealed that individuals with higher scores in holistic thinking were more persuaded by the two- (vs. one-) sided message.

Missed connections: How miscoordinated timing inhibits networking during networking events

8:00 AM – 9:10 AM

SOCIAL COGNITION

People attend networking events to meet strangers, yet research finds people interact primarily with others they already know during these events (Ingram & Morris, 2007). We propose people fail to meet more strangers because of a temporal coordination problem: Different people finish their conversations at different times, making it difficult to coordinate the start of a conversation with a stranger. As a result, people gravitate primarily to friends and acquaintances because doing so seems less risky than approaching strangers who are in the middle of a conversation and could reject them. We find evidence of this coordination problem in two field studies (Studies 1a-b), one recall study (Study 2), and one virtual reality experiment (Study 3). Importantly, a field experiment tests a simple intervention—a coordinating device that prompts people to finish their conversations in a synchronized manner—and finds that this intervention increases the percentage of time people spend interacting with strangers (Study 4). Our research identifies a novel barrier to connecting with strangers, and offers a virtually costless intervention to facilitate such connections during networking events.

Higher individualism predicts lower intensity of experienced love: Data from 91 countries

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

Romantic love is a near-universal human experience. However, its intensity varies significantly across individuals and societies. We hypothesized that this variability is partly individualism—a cultural orientation prioritizing personal goals over group interests. As individualism continues to rise globally, its implications for romantic relationships remain underexplored. Here, we address this by examining the link between individualism and romantic love in two large-scale cross-cultural studies. In Study 1, we collected data from a convenience sample of 61,067 partnered individuals from 81 countries. In Study 2, we selected nationally representative samples from 50 countries, with controlled distributions of gender, age, and residential area (N=6,620). The results were consistent across both studies—as individualism increased, both men and women reported lower levels of love. In Study 2, individualism was additionally linked to a lower expressed desire for love, suggesting that individualism may erode the perceived importance of love. As people become increasingly individualistic, our findings provoke questions about the future of romantic love.

The Role of Social Support in Goal Disengagement

8:00 AM – 9:10 AM

MOTIVATION/GOALS

Despite its prevalence in everyday life, goal disengagement (i.e., withdrawing effort from goal pursuit) remains understudied. Although some work has examined intrapersonal factors, little is known about interpersonal influences on goal disengagement. To address this gap, in three studies we explored the role of social support during action crisis—the critical period when one is deciding whether to continue pursuing a goal. In Study 1, participants gave advice to a fictitious close friend experiencing an action crisis, which revealed common types of support. In Studies 2 and 3, participants imagined experiencing an action crisis and were randomly assigned to receive a piece of advice drawn from themes from Study 1 (e.g., persevere vs. disengage) or no advice (control condition). We consistently found that advice from close others influenced people's disengagement decisions. Study 3 identified mechanisms (e.g., goal-related doubt, openness to alternatives, etc.) through which advice affected future behavioral intentions. This work underscores the role of close others in disengagement and calls for future research to incorporate interpersonal factors when examining this process.

A strengths-based approach to preventing adolescent suicide and self-harm: A longitudinal assessment of early-life protective factors

8:00 AM – 9:10 AM

MENTAL HEALTH/WELL-BEING

Suicide and self-harm are leading causes of death among adolescents. Yet, the strengths-based factors in childhood (e.g., belonging) that may protect adolescents have received far less attention than risk factors. Using nationally representative longitudinal data from Australian adolescents (N=3,127), we examined if various sources of well-being measured across four waves in early-life (6–13 years) reduced adolescents' (14–15 years) thoughts and behaviors/attempts of self-harm and suicide. We modeled a range of predictors that captured 5 key dimensions of a nation-wide participatory child well-being framework: (1) Valued, loved, and safe (e.g., school safety); (2) Material basics (e.g., financial security); (3) Healthy (e.g., mental health); (4) Learning (e.g., school satisfaction); (5) Participating (e.g., community involvement). We found that the utility of protective factors changed across development: in middle childhood (6-9 years), Valued, loved and safe and Material basics mattered most while in pre-adolescence (10–13 years), Healthy and Participating were most important. Results indicate that protective factors play a key but dynamic role in self-harm/suicide prevention.

The Paradox of Breadwinning: Fathers are Less Identified with Work than Mothers

8:00 AM – 9:10 AM

GENDER

This research examines the hypothesis that gender norms emphasizing breadwinning for men – more than women – paradoxically result in a weaker work identity for men, especially fathers, in comparison to women, especially mothers. Across three studies, we find that women – especially mothers – identify more strongly with work than men. We posit that men and women exhibit different priorities in the workplace. While men may prioritize salary, women prioritize personal fulfillment. These differing priorities could be associated with variations in work identity. We examine this hypothesis in three studies. In a nationally representative cross-sectional sample, women (vs. men) have a stronger work identity (Study 1). A survey of employed parents demonstrates that mothers (vs. fathers) have a stronger work identity (Study 2). In a field study of librarians, parenthood was associated with stronger work identity for women, compared with men (Study 3). The findings suggest that men's breadwinner pressure inhibits integrating work into identity, while women may pursue work more freely for intrinsic meaning. These results challenge stereotypes that men, particularly fathers, are more work-identified and highlight how gendered motivations and autonomy shape work identity.

Short and Not So Sweet: When Brief Responses Make You Feel Ignored

8:00 AM – 9:10 AM

BELONGING/REJECTION

Conversation is inherently collaborative, but when one person offers only brief replies, it can disrupt this balance and diminish a person's sense of inclusion. Across three studies (N = 1,625), we found that receiving short responses consistently evoked feelings of being ostracized. In Study 1, short replies—even when warm—threatened basic psychological needs more than longer ones. Study 2 showed that the hurtful impact of short responses did not depend on who delivered them, affecting participants similarly whether from close others or acquaintances. Study 3 revealed that even when the reason for the short response was known (e.g., being busy at work), it can't help and the negative impact on need satisfaction remained. These effects stemmed from recipients feeling relationally devalued and unimportant in the interaction. Together, these findings highlight short replies as a subtle yet potent form of ostracism, showing that minimal engagement can powerfully signal social exclusion.

Person or the Situation? Predicting individual officers' search bias.

8:00 AM – 9:10 AM

LAW

In a pre-registered study, we compare widely used measures of police bias to a novel bias measure that accounts for the unknown contraband rate. We use data from 18,870 officers across 9 U.S. states and 10 municipalities. Surprisingly, in South Carolina, officer race and age are not predictive of racial bias. Instead, county level regional bias (as captured by the IAT) is predictive of police bias. In South Carolina the average race discrepancy between White and Black community members on the IAT predicts an officer's propensity for searching more innocent Black drivers than innocent White drivers in that county. This effect holds when controlling for an individual officer's department, age, and race. Importantly, the weapons version of the IAT predicts the discrepancy between recovery rates of contraband (including weapons) for drivers of different races. Neither IAT predicts a police officer searching one race of drivers over another. These findings suggest that measures of police bias capture different psychological processes.

The Lasting Psychological Impacts of COVID-19

8:00 AM – 9:10 AM

LANGUAGE

How did the COVID-19 pandemic shape people's psychological states in the long term? To examine the long-term psychological impacts of the pandemic, we analyzed the natural language of over 3 million Reddit users (63.8 million comments) across 50 U.S. cities in the four years before and after the pandemic. Using an array of text analysis methods, we found enduring shifts in emotions and identity. Specifically, we observed a sustained decline in positive emotion and an increase in negative emotion that lasted at least 48 months since the onset of the pandemic. The pandemic also produced a lasting impact on the salience of collective identity, evidenced by increased use of affiliation-related language and collective pronouns (e.g., "we," "they"). We used topic modeling analyses to further probe the nature of these lasting psychological shifts. These shifts emerged abruptly around the time the pandemic was declared, showed slight recovery as the pandemic waned, but did not return to pre-pandemic levels. Mixed-effects models indicated that both city- and national-level daily COVID-19 case growth rates predicted the observed psychological patterns. Taken together, the findings illuminate lasting cultural shifts in psychological states produced by the pandemic.

Identity and Group-based Dynamics Across Organizational Levels

8:00 AM – 9:10 AM | Location: E253AB, Level 2

MORALITY DIVERSITY ORGANIZATIONAL BEHAVIOR INTERGROUP RELATIONS

Organizations are increasingly diverse across demographic and ideological lines, yet the processes by which people interpret identity cues have received scant attention. The present symposium brings together four papers that explore identity differences and group-based dynamics and how they shape outcomes at the individual, team, and organizational levels. Berry et al. investigate how perceptions of a work team's corruptibility are shaped by the demographic composition of its team members. Spelman et al. highlight the role of ideological differences in employees' decisions to leave their organizations. Cho and Petsko explore how people perceive job referrals when the job applicant and referral writer belong to different racial groups (vs. to the same racial group). Finally, Carter and White show how the timing of organizational LGBTQ+ allyship displays influences perceptions of authenticity and downstream consequences on employee behavior. Taken together, these talks offer valuable insights for scholarly understanding of identity, diversity, and group-based dynamics in organizations.

Demographically Diverse Groups Are Perceived as Less Corruptible

8:00 AM – 9:10 AM

DIVERSITY

Demographic diversity is a salient feature of teams, shaping how they are perceived and treated by others. Although diverse teams are frequently seen as having conflicting values and viewpoints that can create challenges for the team, we propose that this perceived conflict is viewed as a strength in the moral domain. Across seven studies and five supplemental studies utilizing different paradigms and stimuli (N = 3,559), we find that people evaluate diverse (vs. homogeneous) teams as less corruptible because they are considered to have higher ethical conflict—disagreements over how to think about and navigate moral issues. We further demonstrate that these perceptions are consequential and impact behavior as they influence how people create teams when given a goal to reduce (vs. increase) the risk of corruption, as well as the betting decisions people make in a prediction market where they can earn a financial bonus for accuracy. Together, these findings suggest that perceived ethical conflict in diverse teams is less a challenge to be managed, and instead a signal of moral strength that influences how people judge, construct, and align with teams in consequential ways.

Political Misalignment in the Workplace: The Psychological and Behavioral Consequences of Co-worker Political Dissimilarity

8:00 AM – 9:10 AM

POLITICS

Despite rising partisan animosity and increasing ideological self-segregation, the American workplace remains one of the last venues for routine cross-partisan contact. Yet little is known about the psychological and behavioral consequences of working in politically misaligned environments. In this research, we integrate organizational behavior with political psychology to examine how political dissimilarity at work shapes interpersonal dynamics and employee retention.

We first leverage a rare, high-powered dataset: a national census of over 6,000 U.S. general surgery residents (82% of the population). Using a novel, issue-based measure of political misalignment we find that political misalignment significantly predicts residents' intentions to leave their programs. This effect is mediated by interpersonal conflict with co-residents—highlighting how ideological difference can strain even high-functioning professional teams in high-stakes settings. A second multi-wave study of full-time U.S. workers (N = 602) replicates these findings in a broader population while testing competing mechanisms. Together, these findings underscore the hidden interpersonal costs of political misalignment in professional environments.

Referral Readers Assume that Sponsors are the Same Race as Job Applicants—But Not Vice Versa: Evidence of an Asymmetrical Racial Spillover Effect

8:00 AM – 9:10 AM

ORGANIZATIONAL BEHAVIOR

Recent work suggests that cross-race sponsorship may be uniquely beneficial for racial minority job applicants such that a referral from a different-race (rather than same-race) sponsor may mitigate negative racial stereotypes (e.g. Randel et al., 2021). Yet, across five experiments (total N = 4,796), we document a cognitive bias that undermines this potential benefit of cross-race sponsorship. Specifically, when we experimentally manipulate sponsor race (White vs. Black) and job applicant race (White vs. Black), we find evidence of an applicant-to-sponsor racial spillover effect where participants are more likely to assume that sponsors share the same racial identity as applicants in cross-race (vs. same-race) referral contexts. Moreover, we find that this effect is asymmetrical in nature such that referral readers do not assume that applicants share the same racial identity as their sponsors in cross-race referral contexts. We show evidence for this effect using pretested race-signaling names (Experiments 1, 3, 4) and photos (Experiments 2 and 5). This work has implications for research on perceptions of race, sponsorship, and racial discrimination in organizations.

When You Say It: How the Timing of LGBTQ+ Allyship Displays Shapes Evaluations of Organizations

8:00 AM – 9:10 AM

SOCIAL JUSTICE

Organizations frequently aim to display their allyship with the LGBTQ+ community—particularly during Pride Month. We integrate theories of attribution and identity safety in order to demonstrate how the timing of these allyship displays shapes the evaluations observers form about an organization’s authenticity. Across field, laboratory, and online samples, six preregistered experiments reveal that both LGBTQ+ observers and LGBTQ+ employees perceive organizational allyship displays as less authentic when displayed during Pride Month as opposed to other times. We further find that the timing of organizational allyship displays shapes perceived authenticity by influencing the extent to which LGBTQ+ evaluators attribute values-driven motives to the organization’s allyship, a process that, in turn, impacts employees’ sense of belonging and organizational commitment. Lastly, we find that this effect is unique to LGBTQ+ individuals: non-target groups evaluate the authenticity of allyship displays similarly, regardless of timing. To be an authentic ally, it is not just what an organization says, but also when an organization says it.

A Million Little Things: Modeling Accumulating Influences on Personality Development

8:00 AM – 9:10 AM | Location: E265, Level 2

PERSONALITY DEVELOPMENT

Personality development is shaped by a vast array of genetic variants and life experiences that accumulate and interact across time. Yet, this complexity is often not reflected in research on personality development, with many studies focusing on single, isolated predictors—including candidate genes and a few, infrequent major life events (“candidate events”). In this symposium, we present new methods and tools designed to capture the poly-experiential and polygenic nature of personality development. Four speakers will present research examining: (1) the combined effects of many life events on trait change using poly-experience indices (PXI) and Experience-Wide Complex Trait Analysis (ECTA); (2) how consistency in common daily experiences fosters personality profile stability across adulthood; (3) whether and how Big Five polygenic indices (PGIs; N = 1.09 million) moderate age-graded and event-related personality development; and (4) the promise and pitfalls of using Mendelian Randomization (MR) to infer causal relations between personality traits and environmental exposures. Links to tutorials, code, and publicly available genomics data will be shared during the symposium.

Moving Beyond the Candidate Event Crisis: Estimating the Combined Effects of Life Events on Personality Development using Poly-Experience Indices (PXI) and Experience-Wide Complex Trait Analysis (ECTA)

8:00 AM – 9:10 AM

PERSONALITY DEVELOPMENT

Research on personality development has traditionally taken a “candidate event” approach, estimating the associations between a few major life events and trait change. In contrast, people’s lives consist of a rich collection of experiences that continually shape who they become. The present research used methods inspired by molecular behavior genetics to model the combined effects of many life events on personality development. First, in a Longitudinal Experience-Wide Association Study of 4,904 adults, we estimated the effects of repeated exposure to 25 life events on Big Five trait change. We then evaluated the out-of-sample predictive performance of poly-experience indices (PXIs)—individuals’ predicted trait change, calculated by aggregating their exposure to each event weighted by its estimated effect size. Second, we conducted an Experience-Wide Complex Trait Analysis (ECTA) to estimate the proportion of variance in personality change explained by life events, treating event effects as random effects in linear mixed models estimated via AIREML. Together, these methods offer a scalable framework for capturing the poly-experiential nature of personality development.

Does a Stable Daily Environment Foster Stable Personality Development? Evidence from Longitudinal Panel Data

8:00 AM – 9:10 AM

PERSONALITY DEVELOPMENT

Personality traits are relatively stable yet also exhibit meaningful change across the lifespan. Although substantial evidence links major life events to personality development, the role of everyday environments and daily experiences remain underexamined. The present study investigates whether longitudinal stability in daily environments contributes to stability in personality development, such that individuals with more consistent daily contexts exhibit greater personality stability over time. Utilizing longitudinal data from the German Socio-Economic Panel (GSOEP), we examined the Big Five traits and indicators of daily environments (e.g., employment, income, housing) of 147,719 individuals across span of 39 waves. We operationalized profile consistency as intra-individual correlations, and evaluated whether environmental stability was associated with personality profile stability. Individuals with higher environmental consistency demonstrated greater stability in personality development across adulthood. Our findings illustrate how the structural regularity of daily environments complements the role of major life events in shaping patterns of personality change.

Genotypic Associations with Age-Graded and Event-Related Personality Development

8:00 AM – 9:10 AM

PERSONALITY DEVELOPMENT

Past research connecting genetic variation to personality development has studied the influence of single candidate genes. However, these single-gene studies are not replicable (Dick et al., 2012). Polygenic Indices (PGIs) for personality offer a more powerful method for examining gene-environment transactions by estimating the aggregate effects of hundreds of thousands of trait-specific genetic variants. The present study examined personality PGIs as a possible mechanism underlying individual differences in personality development. PGIs were derived from a large-scale genome-wide association study of the Big Five traits (N = 1.09 million) and applied to two representative samples of Canadian and American older adults (Ntotal = 52,259). We first tested whether and how Big Five PGIs moderate age-graded personality development. Then, we tested whether these PGIs moderated event-related personality trajectories before, during, and after stressful life events. Our findings demonstrate the potential of PGIs to advance personality development research by appropriately capturing gene-environment correlation and interaction in the context of normative and event-related personality changes.

Mendelian Randomization is NOT Causal Magic for Personality Research

8:00 AM – 9:10 AM

PERSONALITY DEVELOPMENT

In theory, Mendelian Randomization (MR) leverages genomic data to make causal inferences about how traits (like personality) and exposures (like life experiences) affect one another. In practice, MR rests on many assumptions that may not hold for personality traits. In this talk, I introduce MR to social/personality researchers, review its past (mis)application to traits like educational attainment and smoking, and describe initial applications of MR in personality genomics. Our high-powered genetic investigation (personality N ~ 1 million) reveals some potentially-causal influences of life experiences on personality development (and vice versa), as well as some likely false-positives. I conclude by outlining my emerging opinions for best practices in MR research on personality, and I point the way to publicly available genomics data so anyone can (carefully) test MR for themselves.

A Space for Place in Social Psychology

8:00 AM – 9:10 AM | Location: E353C, Level 3

MENTAL HEALTH/WELL-BEING

This symposium explores the role physical environments play in guiding a range of psychological and social processes. Across diverse methodologies and populations, the talks reveal how people's experiences of space are infused with emotion, identity, and meaning. The first presentation examines how happiness affects both personal and outsider perceptions of physical environments, showing that well-being predicts perceived hominess and property valuation. The second talk highlights the role of the home in friendship development, demonstrating that in-home interactions predict greater intimacy beyond frequency alone. The third presentation discusses how group-based stereotypes are intertwined with places, showing the racialization of geographic terms (e.g., rural) beyond actual differences in demographics. The final talk introduces the place resonance hypothesis, providing experimental evidence that alignment between personal and environmental coherence fosters greater meaning, affect, and attachment. Together, these talks underscore the importance of places across a variety of psychological processes, advancing our understanding of space as a dynamic and integral part of social life.

Happy Homes: How Well-Being Shapes the Feeling and Value of Space

8:00 AM – 9:10 AM

MENTAL HEALTH/WELL-BEING

Can happiness make a house a home? Across seven studies, we examined whether happiness influences how people perceive the spaces they inhabit. A qualitative study (N = 277) explored definitions of hominess, identifying themes such as psychological comfort, personality expression, identity, and social connection. Studies 2 and 3 found that hominess, whether self-rated (N = 797) or coded from narrative descriptions (N = 815), was predicted by subjective well-being, even after accounting for demographics, personality traits, and objective photo-based ratings. Study 4 (N = 277) extended these findings to people's workspaces. In three experiments, the ostensible happiness of a resident increased outsiders' perceptions of hominess (Study 5, N = 1209) and the amount they were willing to pay for the home (Studies 6–7, N = 604, 601), with perceived hominess mediating these effects. These results suggest that happiness not only shapes how people experience their environments, but it also changes how those environments are seen and valued by others.

Bringing friendship home: The relationship between hosting and interpersonal closeness

8:00 AM – 9:10 AM

MENTAL HEALTH/WELL-BEING

Interactions with friends are, like all social processes, situated within particular physical places that can either constrain or facilitate certain types of social behavior. In this talk, I argue that the home represents a uniquely important setting capable of facilitating social penetration amongst friends. Across a set of three empirical studies, I test whether interacting with a friend as either a host or visitor is associated with greater relationship intimacy. First, a pair of cross-sectional studies among both U.S. adults (Study 1) and undergraduate students (Study 2) offer convergent evidence that the frequency of interacting in one's residence is predictive of greater closeness and knowledge, even when controlling for interaction frequency in other places and mediums (e.g., virtually). Furthermore, a longitudinal analysis of undergraduates (Study 3) finds that an increase (relative to the previous week) of interacting in either one's own room or a friend's room was associated with greater levels of intimacy. These studies provide evidence for viewing the home as a potentially valuable social resource for promoting friendship development and maintenance.

Perceived Racial Demographics of More and Less Rural Locations

8:00 AM – 9:10 AM

MENTAL HEALTH/WELL-BEING

Whereas an abundance of social cognition research examines racial stereotypes of people, the present work adds to a smaller literature on racial stereotypes of places. Specifically, we asked respondents to estimate the racial composition of specific cities, states, and regions in the U.S., comparing relatively rural places to relatively urban ones. We expected that observers would see more rural places as having smaller Black populations, and larger White populations, compared to less rural places, but these perceived differences would exist independent of actual variation in racial makeup. Relying on data from two White samples and one Black sample, we found that, indeed, locations that were more rural were seen as less Black and more White than less rural locations, and this result held, controlling for actual racial variation as estimated by the U.S. Census. We interpret these results as reflective of multiple mechanisms: (1) sensitivity to actual variation among locations, (2) application of place-based stereotypes that are not entirely accurate, and (3) uncertainty-based rescaling that manifests in an aversion to extreme ratings.

Testing Place Resonance: Coherence Predicts Positive Psychological Outcomes

8:00 AM – 9:10 AM

MENTAL HEALTH/WELL-BEING

People strive to maintain a stable sense of self and consistency, driven by a need for accuracy in understanding the world. Contemporary psychological theories build on this idea by examining underlying mechanisms behind this drive for certainty. Two key constructs—place coherence (perceiving a place as orderly or schema-consistent) and personal coherence (experiencing life as meaningful and comprehensible)—highlight the reciprocal relationship between environments and identity. The place resonance hypothesis suggests that alignment between place and personal coherence enhances psychological well-being (Krause et al., 2024). In a 2 (place coherence: high vs. low) × 2 (personal coherence: high vs. low) experiment, participants reported higher positive psychological outcomes (including meaning in life, positive affect, and place attachment) when both forms of coherence were high, compared to mismatched or low conditions. This research offers empirical insight into environmental fit and well-being, with implications for psychological theory and application.

Attachment and Regulation Across Domains: Thought, Emotion, Memory, and Behavior

8:00 AM – 9:10 AM | Location: E258, Level 2

CLOSE RELATIONSHIPS

This symposium brings together four presentations that explore how attachment shapes regulation across cognitive, emotional, and interpersonal domains. In the first presentation, two longitudinal studies reveal how temporary shifts in attachment style are associated with corresponding changes in autobiographical memory valence, illustrating how memory can be a dynamic regulatory target. Next, a daily diary study reveals how fluctuations in state attachment and stress interact to predict intrusive thoughts and thought suppression, illuminating how attachment dynamics modulate cognitive control in everyday life. In the third presentation, two studies reveal how attachment anxiety and avoidance uniquely predict maladaptive responses to imagined positive, negative and neutral relationship events, highlighting the valence-specific nature of dysregulation. Finally, observational data from two studies investigating couple interactions shows that attachment avoidance (and to some extent attachment anxiety) predicts reduced expression of positivity during support-seeking conversations, potentially undermining partner responsiveness and co-regulation. Together, these studies underscore the broad influence of attachment on self-regulation across time, context, and domain.

Associations Between Variability in Attachment, Relationship Processes, and Childhood Memories

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

Working models of attachment are thought to encompass many aspects of our lives with respect to close relationships, including schemas and past experiences. But people are not always reliable narrators about their past—experiences can be seen through rose-colored glasses or warped to portray others in a less charitable way. I examined changes in autobiographical childhood caregiving memories among a sample of 2,692 middle-aged and older adults from a nationally representative study followed over four years (Study 1) and 938 emerging adults followed three times over 8 weeks (Study 2). I found considerable variation in the valence and nature of childhood experiences recalled by participants. This variation in childhood memories was tied to a person's current circumstances—both their relationship transitions, mental health, and attachment orientations. Study 2 shows that improvements in security during emerging adulthood are associated with more contemporaneously positive relationships and, in turn, more positive childhood memories. The presentation will feature a discussion about the lens through which we regulate, experience, and remember our relationships with close others.

Attachment, Intrusive Thoughts, and Their Suppression: A Daily Diary Study

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

Intrusive thoughts—unwanted, repetitive cognitions that are difficult to control—disrupt daily functioning and are often managed through strategies like thought suppression. Prior research linked attachment styles to how people experience and manage such thoughts, but most existing studies have relied on lab-based experiments, offering limited insight into daily processes. To address this gap, we conducted a two-week daily diary study and investigated how state attachment (secure, anxiety, avoidance) interacts with stress to affect intrusive thoughts and thought suppression. Using Bayesian multilevel modeling, we found significant between- and within-person effects of state attachment and stress on intrusive thoughts and suppression. Notably, several interaction effects emerged. On days when individuals felt more stressed than usual, lower-than-usual state security predicted more intrusive thoughts. Moreover, individuals reported more success on thought suppression on low-stress days when they felt more secure, and on high-stress days when they felt less anxious. These findings highlight the dynamics between daily state attachment and stress in shaping cognitive control.

Differential Patterns of Dysregulation: Attachment Anxiety, Avoidance, and the Valence of Romantic Events

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

Regulation of one's responses to romantic relationship events is associated with individual and relationship wellbeing. Working models of attachment play an important role in shaping how individuals construe and respond to relationship events. Most work has focused on the association between attachment styles and regulatory responses to negative events. In this presentation I will discuss findings from two studies investigating the regulatory repertoire of those high in attachment anxiety and those high in attachment avoidance, in response to hypothetical positive, negative and neutral romantic relationship events. Findings revealed unique patterns of dysregulation displayed by those with high attachment anxiety versus those with high attachment avoidance. Those high in attachment anxiety were more likely to respond maladaptively (increased negative emotion, rumination, and hostility) to negative partner behaviors. Those high in attachment avoidance were more likely to respond maladaptively to positive partner behaviors. There were few maladaptive responses to neutral events. Implications of these patterns of dysregulation will be discussed.

Attachment and Positive Expressivity in Support-Seeking Contexts

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

In times of distress, people often turn to close others for support. Notably, expressing positivity (e.g., gratitude, optimism) when discussing stressors can encourage partners to offer high quality support. But support-seekers may vary in their tendency to express such positivity. In two behavioral observation studies, we examined whether support-seekers' attachment predicted their positive expressivity as they disclosed to their romantic partner about their greatest fear (Study 1) or a recent personal stressor (Study 2). Across studies, support-seekers higher (vs. lower) in attachment avoidance expressed less positivity, as rated by coders—especially partner-focused positivity (e.g., gratitude, love/affection). Some evidence also linked higher avoidance or anxiety to less happiness expression and humor use, and to greater negative expressivity of particular types. These findings have implications for emotion regulation and support provision in dyadic contexts. They suggest that people high in attachment insecurity (and especially avoidance) may express themselves in ways that reduce their chances of obtaining responsive support from their partners.

Beyond Warmth and Competence: High-Dimensional Models of Social Cognition and Perception

8:00 AM – 9:10 AM | Location: E450B, Level 4

SOCIAL COGNITION

This symposium spotlights high-dimensional models of social cognition and perception, showcasing work that moves beyond lower-dimensional frameworks (i.e., warmth/competence) to better understand how people flexibly learn about and represent others. These talks use a combination of representational similarity analysis (RSA), network analysis, and behavioral experiments to explore how motivation, identity, and context shape the mental maps guiding social perception. Talk 1 illustrates how RSA is used to model the structure of social perception, drawing on examples from self-perception, face processing, and group stereotypes. Talk 2 demonstrates that people use conceptual maps of trait space to flexibly and spontaneously generalize social impressions to novel domains. Talk 3 shows that while people use internal models to guide impressions, stereotypes override them when they conflict with semantic beliefs, leading to incoherent impressions. Talk 4 reconciles dimensional and network views, demonstrating that our representations shift based on target familiarity, culture, and time. Together, these talks offer a versatile, context-sensitive account of social cognition and perception.

Beyond X-Dimensional Models: Using Representational Similarity Analysis to Map the Complexities of Social Perception Across Cultures, Social Identities, and Daily Contexts

8:00 AM – 9:10 AM

SOCIAL COGNITION

How do we model the rich, context-dependent process of social perception? Traditional approaches reduce social perception to 2–3 “universal” dimensions (e.g., warmth, competence), but may oversimplify real-world variability across cultures, social identities (e.g., race, gender) and everyday contexts. This talk showcases representational similarity analysis (RSA) as a flexible framework for modeling high-dimensional social representations without data reduction. Specifically, RSA can capture variability in the structure of social perceptions across cultures, group identities (e.g., race, gender), and self-perceptions over time. I present three empirical cases: a three-week longitudinal study of gendered self-perceptions (N=309), a North American dataset of facial first impressions and societal stereotypes (N = 4,247), and a cross-cultural analysis of countries' gender stereotypes in language predicting gender disparities in facial first impressions (N~11,000). Across these cases, RSA reveals systematic variability overlooked by traditional models. This talk shows how high-dimensional approaches can more accurately reflect social perception as dynamic and socially contextualized.

Conceptual Maps of Social Knowledge Support Trait Generalization

8:00 AM – 9:10 AM

SOCIAL COGNITION

People infer traits from the social behavior of others, supporting predictions about their future behavior. We propose people use maps of social knowledge to generalize impressions and predict behavior in new contexts. In Experiments 1-2, participants learned initial information about potential partners (e.g., their sociability) and later chose who to engage with in tasks where other traits were valuable (e.g., an economic game requiring generosity). Trait similarity (i.e., between original and novel domains) shaped partner choice, but critically, this relationship was socially specific—emerging when participants were learning about other humans, but not nonsocial targets—and was not explained by mere valence. Experiments 3-4 demonstrated that trait generalization can occur spontaneously: in a false recognition task, participants were more likely to misremember conceptually-similar traits as having described a person’s behavior. Moreover, similarity-based generalization persisted under cognitive load, suggesting it operates efficiently. In sum, these findings illuminate how people flexibly navigate social contexts by drawing on structured representations of social knowledge.

Stereotypes Reshape Internal Models of Person Perception

8:00 AM – 9:10 AM

SOCIAL COGNITION

People form impressions of others from limited information, often by drawing on high-dimensional internal models of person perception. These models reflect beliefs about how traits relate to one another. For example, learning someone is “analytical” may lead to inferences that they are also “logical”. But what happens when these semantic beliefs conflict with stereotypes? To test this, we created a semantic network of 150 traits capturing normative beliefs about trait interdependencies. Participants then read behavioral descriptions of individuals who were either race-neutral, Black, or Asian, with each description implying a specific trait. When the implied trait aligned with stereotypes—or when targets were race-neutral—participants drew on the semantic network to infer additional traits and form semantically consistent impressions. In such cases, trait-based reasoning and stereotype beliefs worked in tandem. But when the implied trait violated stereotypes, participants abandoned the network and defaulted to stereotype-based inferences. These findings reveal how stereotypes can override internal models of person perception, disrupting internally consistent impressions.

Flexible Mental Representation of Person Perception

8:00 AM – 9:10 AM

SOCIAL COGNITION

Decades of research have argued that social inferences are underlain by only a few latent dimensions. Others suggest that social inferences are better captured by networks without underlying dimensions. However, evidence supporting the latter has yet to emerge. In this talk I will present new findings from my lab that show the mind flexibly switching between these two types of representations depending on the context. U.S. representative participants watched naturalistic videos and freely described inferences about target people. In one set of pre-registered studies, the target people are strangers; in another set, the target people are famous individuals. We found that for strangers, optimally identified 25 factors only explained 15% of the variance while networks better reproduced the observed covariances; for famous people, latent factors achieved sufficient explained variance. We also found variation in mental representations across different timepoints of the videos and across perceivers from different cultures. Taken together, these studies reconcile competing theories and advance a naturalistic understanding of the context-dependency of mental representation.

Caste: Towards a Globally Relevant Psychology of Inequality

8:00 AM – 9:10 AM | Location: E271, Level 2

GROUPS/INTERGROUP PROCESSES

Caste is a pervasive system of social inequality that affects over two billion people globally. For decades, anti-caste activists have attempted to articulate psychological dynamics that contribute to the pervasiveness of caste. However, it has received sparse attention within social psychology. We address this gap by empirically illuminating the role of group-based processes perpetuating caste in South Asia using a variety of methods. The first talk presents results from field experiments to show how contextual salience of Hindu Nationalism enables support for violent sanctions for violations of caste norms. The second talk presents result from a representative survey and an experiment to show how people use subtle and non-subtle purity signals to communicate caste. The third talk presents evidence from multi-site experiments to show how concerns for reputation management perpetuate caste-based hierarchies. Across these three talks we shed light on psychological mechanisms through which caste is maintained, experienced, and communicated in South Asia. This symposium advances the field’s understanding of one of the most enduring and consequential social hierarchies in the world.

Can Narratives of Belonging Portend Violence? The Impact of Hindu Nationalist Primes on Support for Violence Against Dalit People

8:00 AM – 9:10 AM

GROUPS/INTERGROUP PROCESSES

Indians and Americans are currently navigating deeply polarized societies, where multiple groups are competing to define a common national identity. Rhetorics like "Make America Great Again" and "Hindu Unity" are tools that enable this. In India, the Hindu nationalist project offers belonging to Hindus across caste divisions. Across two field experiments in Uttar Pradesh, India, we tested the consequences of priming narratives associated with Hindu nationalism (e.g., "India should be a Hindu nation") on the enforcement of traditional caste norms. Following the architect of the Indian Constitution, Ambedkar (1936), we hypothesized that the salience of Hindu nationalism may reinforce, rather than undermine, caste-based normative expectations. Participants ($n = 912$), randomly assigned to a Hindu nationalism or a control prime, were asked to read four vignettes and indicate their support for violent sanctions against those who violated caste-based norms (e.g., a Dalit boy taking water from a public well). We find that when primed with Hindu nationalism, participants are more likely to support caste violence, suggesting that Hindu nationalism can potentially reify caste hierarchies.

Cow Vigilantism: Caste, Nationalism, and Vegetarianism Preference in India

8:00 AM – 9:10 AM

GROUPS/INTERGROUP PROCESSES

Work on the psychological processes underlying the indirect signaling of social identities has found that individuals often communicate their group affiliations using subtle cues and coded language. We assess this in the context of ethnonationalism, caste, and vegetarianism in India. Specifically, we assess how people use food to signal caste, caste to signal food preferences, and both to signal support for ethnonationalism. In the first study ($N=680$), we find that participants who hold their caste identity as more salient are also more likely to hold vegetarianism as salient, express a reluctance to affiliate with non-vegetarians, and ideologically lean right. In the second experimental study ($N=1369$), participants inferred food preferences based on caste, caste based on food preferences, and partisanship based on both food preferences and caste. These studies help us understand how people indirectly signal social identities when it might be considered unacceptable to do so. They also contribute to our understanding of dog whistles. Implications will be discussed in the light of ethnonationalism and increasing vigilantism in the name of cow protection in India.

Caste and Judgment: Shifts in Reputation Evaluations After Economic Games

8:00 AM – 9:10 AM

GROUPS/INTERGROUP PROCESSES

This study examines how reputational evaluations shift after people learn about others' monetary allocations towards them, and how such shifts are shaped by caste hierarchies. Using a Dictator Game, participants in four South Asian field sites (two in Madurai, one in Kanpur, and one in Nepal) make multiple decisions where they allocate a monetary endowment between themselves and local community members. Importantly, evaluations of select donors are elicited at two points: once before participants know what they received, and after the results are revealed. This design allows us to observe changes in reputational evaluations as a function of dictator game giving. Our central focus is on how these reputational shifts vary by caste. Are Dalit donors judged more harshly when they give little, or less positively when they give more? This study moves beyond aggregate giving behaviour to examine the interpersonal consequences of generosity and the differential effects that caste can have on how one is judged. By combining experimental games with real-time reputational tracking, we uncover how caste mediates reputational dynamics in contemporary South Asian settings.

Conceal or reveal? Self-disclosure and why it matters

8:00 AM – 9:10 AM | Location: E352, Level 3

JUDGMENT/DECISION-MAKING

In everyday life, people can choose to conceal or reveal information about themselves to others. Whether it be their deeply held secrets, hobbies outside of work, obstacles faced in life, or positive and negative events, people's decision to disclose or not has important implications. This symposium presents new findings and approaches to understanding when and why people self-disclose and the consequences of doing so. Elinora Pentcheva discusses barriers to self-disclosure, noting that individuals are prone to omission bias—discounting possible consequences of concealing versus disclosing—which vary based on people's beliefs about disclosure and personality traits. Next, Rebecca Walsh presents evidence showing how expressions of positivity and negativity during self-disclosures shape partners' supportiveness in close relationships. Extending to the academic context, Lora Park shows that while instructors are reluctant to self-disclose in class, sharing hobbies and obstacles in life improves students' outcomes. Finally, Michael Slepian offers a new approach to studying common secrets people may conceal or disclose using the Multiple Exemplar Method, with consequences for wellbeing.

Should I stay or should I disclose? How omission bias guides our disclosure decisions

8:00 AM – 9:10 AM

JUDGMENT/DECISION-MAKING

A substantial body of research has concerned itself with the benefits of self-disclosure, both interpersonally and for individual well-being. We know comparatively less about the contextual and psychological barriers to self-disclosure, especially in non-clinical contexts. The present work proposes that when evaluating whether to reveal, we are prone to omission bias—discounting the possible consequences of concealment relative to those of self-disclosure. Across six studies, including three nationally representative samples, we find that participants weigh the risks and benefits of revealing significantly more than the risks and benefits of concealing. These findings replicate across a series of disclosure dilemmas in both personal and professional contexts, with the risk of revealing reliably found to be the most salient dimension of a disclosure decision. We further show that this bias is partly explained by individuals' beliefs about disclosure (their "disclosure philosophy") and demonstrate that these beliefs vary with the Big Five personality traits and other factors, highlighting meaningful variability in how disclosure tradeoffs are evaluated.

Interpersonal effects of expressing negativity and positivity when disclosing about negative events

8:00 AM – 9:10 AM

JUDGMENT/DECISION-MAKING

When disclosing negative experiences, people may express both negativity (e.g., anxiety, sadness) and positivity (e.g., gratitude, optimism). How might expressions of negativity and positivity shape the supportiveness of a close partner's response? Behavioral observation studies showed that when disclosers expressed more (vs. less) negativity and/or more (vs. less) positivity while talking about an upsetting event (Study 1) or their greatest fear (Study 2), their romantic partner behaved more supportively. Negativity and positivity did not interact to predict support. Next, in two experiments, participants imagined receiving a negative disclosure from their partner that varied in the extent of negativity (Study 3) or positivity (Study 4) expressed. Both negativity and positivity increased the supportiveness of participants' responses. Across studies, we also identified potential mechanisms linking negativity and positivity to support. Overall, this work suggests that expressions of negativity and positivity independently promote high quality support in negative disclosure contexts, highlighting ways in which disclosers can shape their support outcomes.

Instructors' disclosures of personal information boost students' motivation and Interest

8:00 AM – 9:10 AM

JUDGMENT/DECISION-MAKING

In academia, instructors may be reluctant to disclose information about themselves because they overestimate the negative consequences and underestimate the positive impacts of doing so. We suggest, however, that instructor disclosures may benefit students by increasing relatability with the instructor, belonging, and perceptions of safety in the classroom. In Study 1, college students reported that instructors may not want to disclose obstacles they faced in life because it would take too much time and effort or they would feel uncomfortable and awkward. However, students felt greater relatability with instructors when they disclosed their obstacles, identities, or hobbies, which predicted greater academic engagement, interest in taking a future course with the instructor, and desire to recruit others to take the course. In Study 2, students who imagined an instructor disclosing obstacles they had faced in life or their hobbies (vs. no disclosure) felt greater relatability with the instructor, belonging, and safety in the classroom, which increased their intended engagement, interest in taking a future course with the instructor, desire to recruit others, and anticipated grades.

Comparing exemplars to each other: A new approach to secrecy, and for psychology more broadly

8:00 AM – 9:10 AM

JUDGMENT/DECISION-MAKING

For decades, the study of secrecy has been confined to experiments involving situations involving concealment versus disclosure of secrets. This approach—while providing an opportunity to study in-the-moment actions toward concealing secrets—presents a narrow window into disclosures. In contrast, the Multiple Exemplar Method (MEM) offers a new approach to studying people's secrets and their everyday experiences with them. This talk presents recent insights obtained using this approach, in moving away from an individual-based lens toward an exemplar-based lens of everyday concealment versus disclosure experiences. First, the MEM documents a set of common exemplars of secrets and then examines these exemplars in relation to each other—both within and across persons—allowing researchers to compare real-world exemplars to each other on any dimension of interest. Comparing real-world secrets to each other offers insights into the mechanisms by which withholding disclosures predicts harm to well-being. More broadly, this talk discusses how an exemplar-based approach to studying concealment versus disclosure of personal information is a useful tool for examining the psychology of secrets.

Dynamic Identity Across Multiple Timescales

8:00 AM – 9:10 AM | Location: E270, Level 2

SELF/IDENTITY

Identity is dynamic - it shifts as we taste a family meal, speak our home language, notice who surrounds us, and reflect on who we are becoming. These moments and how they are experienced over time - for example, consistently being the only minority in the room, accumulate to produce longer-term shifts in cognitive self-representations during adolescence, midlife, and across the life span. This symposium asks: How does identity evolve over time, and what do these changes reveal about the self? The first paper examines how salience, importance, and valence of individuals' racial and gender identities fluctuate as they move through daily life. The second explores how patterns of day-to-day change in salience across multiple identities relate to mental health. The third tests how a racial identity intervention fosters coherence in global self-concept. The fourth introduces a dynamic systems model, illustrating how identity, motivation, and action co-develop across multiple timescales. Together, these papers push forward new theory, measurement, and methods to enrich the study of identity as a dynamic, evolving construct across diverse contexts and timescales.

Dynamic identity in everyday life: How salience, importance, and valence for social identity vary with changing situational cues and behaviors

8:00 AM – 9:10 AM

SELF/IDENTITY

The Multidimensional Model of Identity posits that behavioral, cognitive, and emotional experiences tied to social identities evolve over time. This paper extends the model by postulating how identity evolves in real-time in daily life. Using intensive longitudinal data from two studies (N1 = 121, 7 time points; N2 = 48, 25 time points), we examine how three dimensions (salience, importance, and valence) of racial and gender identity fluctuate in relation to situational cues (others' social identities, familiarity, modality) and behaviors (language use, codeswitching). Findings reveal that identity salience fluctuates in relation to the identity of others and what languages are being spoken in the situation; identity importance fluctuates with familiarity and modality; valence of racial identity changes with language use, while valence of gender identity shows no consistent relation to situational cues and behaviors - stronger coherence across contexts. These results highlight the temporal and context-dependent nature of identity and the specific dynamic processes by which individuals actively negotiate meaning and relevance across shifting social situations.

Multiple identity saliences and mental health: The mediating role of meaning in life among college students

8:00 AM – 9:10 AM

SELF/IDENTITY

Few studies have examined the longitudinal mechanisms through which social identities are related to mental health. This study combines daily diaries and surveys from a racially/ethnically diverse sample of United States college students during the fall and spring semesters of two years of college. Over 400 participants (Asian = 24%, Black = 12%, Latiné = 31%; White = 29%, Other = 4%; female = 76%, male = 22%, non-binary = 2%) reported the psychological salience of four identities (i.e., race/ethnicity, gender, friend, student) daily for 14 days. Participants reported meaning in life and mental health in surveys. Using person-mean-levels and person-variability of the four identities, four latent profiles emerged. Profiles with higher mean levels of identity (compared to moderate levels) in the fall semester predicted better mental health one year later, which was explained by higher levels of meaning in life in the intervening spring semester. Higher levels of multiple identities were associated with better mental health one year later, underscoring how identities may increase feelings of meaning as an explanatory factor.

Eight-month trajectory of global identity coherence of adolescents of color after ethnic-racial identity exploration and the moderating effect of perceived discrimination

8:00 AM – 9:10 AM

SELF/IDENTITY

Adolescents' global identity synthesis (GIS) and confusion (GIC) are key processes in forming a coherent sense of self. In racialized contexts, the sense of GIS and GIC among youth of color may change as they explore their ethnic-racial identities (ERI). We examined GIS and GIC among 127 racially diverse youth of color (Mage = 14.11 years) across four waves over eight months, before (W1) and after (W2-4) an eight-session curriculum supporting students' ERI exploration, taught by their U.S. History teachers. Multilevel growth models revealed no average change in GIS, but a small increase in GIC over time. Baseline frequency of perceived ethnic-racial discrimination (ERD) moderated this trend, wherein youth with higher reports of ERD showed less steep increases in GIC. It is possible that, as students were integrating newly explored ERI reflections from the curriculum, they experienced short-term GIC increases. Adolescents who were actively noticing racialized experiences before the curriculum may be better equipped for such integration, reducing the potential for GIC increase. The relevance of time in examining the influence of ERI exploration on global identity will be discussed.

A complex dynamic systems approach to identity and its change: The Dynamic Systems Model of Role Identity

8:00 AM – 9:10 AM

SELF/IDENTITY

We describe a Complex Dynamic Systems (CDS) model of identity, motivation, and action—the Dynamic Systems Model of Role Identity (DSMRI). The DSMRI integrates understandings from psychosocial, social psychological, sociocultural, and situative perspectives on identity and motivation to define identity and motivational phenomena as dynamic, non-linear, and contextualized. The DSMRI views motivated action as emerging from the agent's situated interpretation of who they are when occupying a sociocultural role within a cultural activity system—their role identity (e.g., student in a classroom). This role identity is a CDS framed by sociocultural and dispositional control parameters. We draw from a dataset containing classroom recordings, written teacher reflections, and interviews of teachers (N=46) facilitating classroom discussions to demonstrate how the DSMRI affords investigating the dynamic nature of identity across time scales. Through DSMRI-guided qualitative analysis, we demonstrate how analyzing the data at different timescales (e.g., second-by-second vs. across three years) emphasizes different dynamics in identity and its change.

Human Interaction, Reimagined: How Technology Shapes the Way We Connect

8:00 AM – 9:10 AM | Location: E351, Level 3

APPLIED SOCIAL PSYCHOLOGY

Increasingly, technology doesn't just mediate communication; it transforms human interaction. This symposium presents research that explores how emerging technologies are reshaping the way people connect, communicate, and respond to one another. Shi and Goldenberg demonstrate that people prefer AI companions for sharing emotional experiences because they are not judgmental, yet still turn to human partners for emotional support, suggesting that AI is redefining the role of human interaction. Del Rosario et al. show that people align their moral reactions with others' in real-time digital conversations, highlighting social media's influence on moral discourse. Yeomans and Wood Brooks find that people struggle to detect what others want to talk about, while large language models can detect such cues, revealing technology's potential to improve conversations by guiding topics. Pottmann and Abi-Esber show that Virtual Reality simulation helps people become more comfortable with public speaking, appear more confident and competent, and deliver higher-quality speeches. Together, these findings provide insights into how we can design and leverage technology to foster social interaction.

Choosing who to Share: Psychological Drivers of Sharing Emotional Experiences with Human vs. AI

8:00 AM – 9:10 AM

APPLIED SOCIAL PSYCHOLOGY

As AI technologies become more integrated into daily life, people are increasingly turning to AI companions instead of humans for emotional support. What psychological factors drive people to choose AI over humans? In this research, we explore the mechanisms underlying people's decisions to share emotional experiences with either a human or an AI companion. Participants were asked to recall an emotional experience, choose a sharing partner (human vs. AI), and explain their choice. Results revealed that the most common reason for choosing an AI companion was its perceived non-judgmental nature, whereas those who chose a human emphasized emotional support. Participants perceived human partners as more capable of providing emotional support, but also more judgmental than AI. We also found that perceived judgment played a stronger role than emotional support in predicting partner choice. These findings shed light on how people weigh social-evaluative concerns and emotional support needs in emotional disclosure and offer new insights into the role of AI in shaping interpersonal processes.

Investigating the role of social influence in shaping moral outrage

8:00 AM – 9:10 AM

APPLIED SOCIAL PSYCHOLOGY

Social media has transformed communication, connecting large audiences and enabling widespread conversations. Within these networks, moral content tends to be especially engaging and spreads rapidly, inciting moral outrage with it. But to what extent is this outrage informed by others' reactions and are people aware of it? We tested whether people update their initial reactions to moral content after seeing others' input, becoming more (or less) outraged to align with the group. Across three trials, participants (N = 110) watched videos depicting morally ambiguous actions (e.g., hunting for animal conservation). After each video, they joined a livestream-style chat with five other purported participants who either condemned or condoned the behavior. We find that participants update their responses to match the group's reaction, expressing more outrage when the group condemns the behavior and less outrage when the group condones it. However, participants' estimates of how much others influenced them does not predict actual changes in their responses. This work illustrates how moral discourse can amplify or dampen moral outrage, even when people are unaware of it.

What Should We Talk About? Topic preference detection is an important and difficult conversational skill

8:00 AM – 9:10 AM

APPLIED SOCIAL PSYCHOLOGY

Although most humans engage in conversations constantly throughout their lives, mistakes are commonplace—conversation requires quick, relentless perspective-taking and decision making. During every turn of every conversation, people must decide: Should we stay on this topic or switch to a new one? We introduce topic preference detection—accurately predicting a conversation partner's topic preferences (i.e., what they want to talk about). Across synchronous and asynchronous conversations between people in close relationships and among strangers, we find that people want to incorporate their partner's topic preferences in conversation. However, they often cannot predict those preferences, even after ten minutes of conversation. They readily fail to identify conversational cues to topic preferences that are consistently detectable by large language models. This implies room for technology to improve how we interact with each other, and offers promise for socially aware agent models that use more than just users' queries to guide conversation topics. For humans, our work suggests that topic preference detection is an important and common task that is often performed poorly.

Virtual Reality Intervention Improves Public Speaking Confidence and Competence

8:00 AM – 9:10 AM

APPLIED SOCIAL PSYCHOLOGY

Technology is often blamed for distancing us, but can it help us improve our communication? We show how immersive technology can foster social interaction by helping people overcome a critical barrier to effective communication: the fear of public speaking, which affects at least 1 in 5 people, discouraging them from speaking in meetings, classes and other group settings. Across two pre-registered studies, we show that practicing public speaking in Virtual Reality (VR) makes individuals feel more comfortable speaking in front of others, an effect which lasts for at least one week. Linguistic analyses reveal that VR-trained speakers used 47% fewer verbal disfluencies (e.g., "um," "uh") and exhibited greater analytical word choice. Lastly, the speeches given by VR-trained speakers were rated by third-parties as more confident, competent, and higher-quality. These effects of condition on third-party ratings were mediated by speakers' self-reported speaking comfort and verbal disfluencies. Given our work, VR offers a powerful and scalable solution to help individuals build essential communication skills and approach social interactions more confidently.

Morality in Everyday Life: Opportunities, Tradeoffs, and Disagreements

8:00 AM – 9:10 AM | Location: E253CD, Level 2

MORALITY

Moral psychological research has overwhelmingly relied on hypothetical scenarios and lab experiments. As a result, existing research has little to say about how people experience morality in real-world contexts. Here, we argue for the value of studying everyday morality and showcase studies exploring how people perceive and respond to the moral opportunities and challenges of daily life. The first speaker illustrates the limitations of traditional moral psychology paradigms for understanding naturalistic moral cognition and offers suggestions for overcoming these limitations. In four daily life studies, the second speaker finds that people frequently perceive opportunities to express specific moral virtues, but not "morality". Using the day reconstruction method, the third speaker investigates how often people experience tradeoffs between moral virtues and how they respond to such tradeoffs. The final speaker examines peoples' detailed accounts of their most recent moral disagreement to discover when everyday disagreements typically arise and how they are resolved. These talks highlight the unique and more realistic insights that can be gained by studying morality in everyday life.

Raising Moral Psychology from the DEAD

8:00 AM – 9:10 AM

MORALITY

Moral psychology is dominated by tasks that are DEAD: decontextualized, engineered, anonymous and disembodied. DEAD tasks capture cognitive processes that are not representative of how moral cognition "lives" out in the world, which limits our ability to generalize our findings beyond the lab (much as an overreliance on WEIRD samples limits our ability to generalize across cultures). The dominance of DEAD tasks can be understood as a symptom of rising productivity demands in the academy and the transition to online testing in the wake of the reproducibility crisis. The DEAD paradigm poses serious risks to scientific understanding (by narrowing our view of what constitutes moral cognition) and to society (by sculpting the benchmarks for AI safety testing). This talk will illustrate the limitations of the DEAD paradigm with a series of case studies and offer methodological suggestions for transcending those limitations, with a focus on placing traditional methods in conversation with a broader set of interlocutors, including participants themselves.

Moral Virtues Are Often Relevant in Daily Life, but "Morality" Is Not

8:00 AM – 9:10 AM

MORALITY

Recent work suggests that morality may be surprisingly absent from daily life. We revisit the everyday relevance of morality by examining how often people perceive opportunities to express 12 moral virtues (e.g., honesty, kindness), 12 corresponding vices (e.g., dishonesty, unkindness), and (im)morality. Studies 1 (N = 377) and 4 (N = 267) use the Day Reconstruction Method. Studies 2 (N = 459) and 3 (N = 280) use the Experience Sampling Method. In Studies 1–3, North American participants perceived opportunities to express at least one of the 12 virtues more often than not. However, they rarely perceived opportunities to be "(im)moral" (8%), and rarely perceived virtue opportunities as moral opportunities. Patience, responsibility, and respectfulness were most often relevant, whereas forgiveness, courage, and loyalty were least often relevant. Strikingly, people perceived four times more opportunities to express virtues compared to vices. These findings largely replicated in a Chinese sample (Study 4). We conclude that conceptualizing morality in more concrete terms reveals a plethora of morally relevant situations that have gone unnoticed in previous studies.

Virtue Trade-offs in Everyday Life

8:00 AM – 9:10 AM

MORALITY

Is it usually possible to be virtuous in all ways, or are there inherent tradeoffs among moral virtues? Past work has examined a limited set of virtue pairs (e.g., honesty vs. compassion, fairness vs. loyalty) and focused on contexts where tradeoffs are likely to occur. Across two Day Reconstruction Method studies featuring representative U.S. samples, we describe the frequency and experience of tradeoffs among 12 virtues in everyday life. In Study 1, 377 participants reported virtue conflicts during 12,385 episodes. In Study 2, 608 participants provided detailed information about one tradeoff episode. Virtue tradeoffs occurred between 16-26% of the time, most often involving honesty or courage. Tradeoffs were largely resolved by prioritizing one of the two virtues (54% of decisions), but people were most satisfied when they found a way to integrate both virtues (12% of decisions). Finally, people claimed to highly value honesty in the abstract, but rarely prioritized it during everyday tradeoffs. These findings suggest that virtue expressions tend to be largely compatible in everyday life and highlight the importance of studying moral decision making in ecologically valid contexts

The Context, Content, and Consequences of Everyday Moral Disagreement

8:00 AM – 9:10 AM

MORALITY

Everyday life is full of moral disagreements, yet research rarely examines this in context. Participants (N=82) provided detailed accounts of their most recent disagreement along dimensions of content, context, and consequence. Most disagreements were at least moderate in personal significance (67%) and about the permissibility of actions (63%), although disagreement about the moral traits of individuals (30%) were still notable. The most relevant moral foundations were harm, proportionality, and equality (>45%). Disagreements mostly occurred in groups (66%), with family or friends (35-51%) and in residential settings (50%), but rarely with strangers (4%) or remotely/online (17%). This calls into question the generalizability of research that investigates disagreements with strangers or on online platforms. Most disagreements were resolved by agreeing to disagree without further conflict (57%); however, a fair number of disagreements (28%) resulted in successful moral persuasion. These findings suggest that close relationships and personal settings are the most relevant contexts for studying disagreement and that people may be surprisingly tolerant and open to updating their views.

Relationship Idiosyncrasies

8:00 AM – 9:10 AM | Location: E353A, Level 3

CLOSE RELATIONSHIPS

Decades of research on close relationships has identified how relationships typically form, develop, and function. However, little attention has focused on idiosyncrasies in relationships—what makes a given relationship unique from another, why uniqueness matters. This symposium leverages cutting-edge methodological approaches to shed insight on this topic. The first talk identifies idiosyncratic patterns of variability in relationships and how relationship interventions can shape those patterns. The second talk shifts to idiosyncrasies in the content of a relationship's "microculture"—nicknames, inside jokes, etc.—and how these contribute to daily relationship functioning. The third talk suggests that studying a given participant's many relationships yields insights into what makes partners uniquely desirable and why microcultures promote relationship well-being. The fourth talk investigates the use of idiosyncratic "insider language" between friends and strangers, and how it enhances social connection. Overall, this greater attention to what makes relationships unique from each other can provide new insights into how relationships form and thrive.

Beyond means: Considering variability in relationship dynamics over time

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

Despite decades of research, robust prediction of romantic relationship outcomes continues to elude relationship scientists; one reason for this may be that researchers have historically focused on understanding between-person differences in mean-levels of relationship quality. However, scholars have long recognized that relationship processes are dynamic. Indeed, a small body of work sheds light on the fact that many relationship processes critical to relationship functioning, such as satisfaction, conflict, and love, vary within-person as well as between-person. This research suggests that level of within-person variability in relationships matters. But what about patterns of variability? What can we discover about relationships by considering not just whether and how much people change, but the distinct patterns of that change? In this talk, I will (A) present results from a 28-day experience sampling study (> 5,000 records from 113 Ps) highlighting variability in relationship patterns over time, (B) explore individual differences that shape relationship patterns, and (C) shed light on the ways in which positive relationship interventions can influence relationship patterns.

Relationships as Microcultures

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

We propose that just as (macro)cultures are characterized by their own language, rituals, values, identities, and narratives, close relationship partners similarly construct their own microculture, inventing private words, inside jokes, rituals, and stories with shared, idiosyncratic meaning. We introduce relationship microcultures as a new construct explaining how everyday, seemingly mundane interactions—such as nicknames, inside jokes, or daily rituals—contribute to global relationship outcomes. We conducted a longitudinal study of romantic couples (N = 123 couples) in which we intensively tracked daily microculture use over a 2-week period. Participants felt greater relationship satisfaction and commitment on days when their idiosyncratic microculture was more pervasive than usual. These results suggest that microcultures play an important role in the daily lives of romantic partners and that studying microcultures can provide new insights unaccounted for by existing theories in relationship science.

How Can We Capture what is Unique about a Relationship?

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

A basic theoretical principle in attraction and close relationships research is that people are drawn to—and build relationships with—particular partners for idiosyncratic, unique reasons. However, scholars in these traditions tend to study a single relationship at once, and so the extent to which people desire each other for unique reasons remains largely untested. Two studies attempted to capture these idiosyncratic forces. In Study 1, N = 357 participants reported on two real-life potential romantic partners (e.g., Edward and Jacob). Data revealed that when a trait that made Edward desirable was swapped with a trait that made Jacob desirable, attraction to both partners declined. That is, participants liked the partners for different, unique, non-substitutable reasons. In Study 2, N = 961 participants described important customs, stories, and phrases (i.e., the “microculture”) with both a current romantic partner and a peer. Participants were happier in their romantic relationships if their relationship microculture had come up with their partner over the prior 24 hours, and this association was stronger than if the peer microculture had come up with their partner.

From talk to telepathy: The spontaneous use of insider language in casual conversation

8:00 AM – 9:10 AM

CLOSE RELATIONSHIPS

Close friends seem to communicate almost telepathically. A single word or phrase can be loaded with meaning that would take pages of text to explain to an outsider. This linguistic compression is undeniably efficient. But is efficiency the only reason friends often speak in code? In a series of studies, we show that when people use “insider language” with each other they feel closer. Friends, as expected, use insider language more frequently than strangers, but even strangers are able to incorporate it into their conversations. While the content of insider language varies between friends and strangers, both groups experience heightened connection when it is used. These results suggest that the human ability to say more with less confers a social advantage beyond mere efficiency. These findings also highlight a potential limitation of large language models, which, trained on explicit text, may struggle to grasp how communication shifts with intimacy and may be unable to generate insider language to foster closeness.

Self-Beliefs Across Contexts

8:00 AM – 9:10 AM | Location: Lakeside Ballroom E354B, Level 3

SELF/IDENTITY

Self-beliefs—how individuals understand and evaluate themselves—are shaped by cognitive, social, and cultural processes that, in turn, influence behavior. This symposium highlights cutting edge research examining self-beliefs across these three levels of analysis. The first talk investigates the motivational strategies people believe work best for themselves, showing that the effectiveness of radical (vs. gradual) approaches are often underestimated despite being a better predictor of goal success. The second talk examines how people compare themselves over time, finding more evidence supporting a realistic (vs. self-enhancing) outlook of one’s future. The third talk reveals that even when harmed, people are reluctant to punish close others—suggesting moral judgment is shaped by relational closeness to the self. The final talk introduces a culturally distinct model of selfhood in Sub-Saharan Africa, where competition and achievement are seen as group-serving, not self-serving. In sum, the current symposium will provide an overview of recent work on how self-beliefs about motivation, temporal change, in close relationships, and across cultures can influence perception and behavior.

The Role of Motivational Knowledge in Successful Goal Pursuit

8:00 AM – 9:10 AM

SELF/IDENTITY

Our research examines whether “motivation knowledge”—individuals’ understanding of how to motivate themselves—predicts successful goal pursuit. Across 5 studies ($n = 2,131$), we identify two main strategy groups: radical approaches (e.g., all-or-nothing framing, strict rules, immediate change) and gradual approaches (e.g., flexible framing, intuitive rules, incremental change). Additionally, we address two empirical questions: (1) Do radical (vs. gradual) approaches better predict self-regulatory success and (2) Do people accurately predict this relationship? Our findings suggest that while the endorsement of both approaches predicts successful goal pursuit, the endorsement of radical strategies is a better predictor. We replicate this in the healthy-eating, exercise, and finance domains (Study 1), across a 12-week longitudinal study using New Year’s Resolutions (Study 2), and with both US and Chinese samples (Study 3). However, people tend to underestimate the effectiveness of radical strategies in the health domain while accurately recognizing the effectiveness of radical strategies in the finance domain. These results suggest the potential for motivational knowledge to be learned.

Rethinking Rose-Tinted Glasses: A Cognitive-Ecological Explanation of Prospective Self-Comparisons

8:00 AM – 9:10 AM

SELF/IDENTITY

We examined prospective (i.e., future-oriented) self-comparisons in an ecology with three empirically validated principles of impression formation. First, people can have more negative than positive attributes (diversity). But second, individuals do have more positive than negative attributes (frequency). Third, over time people generally improve by losing negative attributes and gaining positive attributes (growth). In three experiments, people listed and evaluated similarities and differences between their present and future selves. Across all studies, we found that present-future similarities were most positive, present self’s unique attributes were most negative, and future self’s unique attributes were in between. In Study 1, this pattern emerged for both self-comparisons and acquaintance-comparisons. In Study 2, it emerged for both prospective and retrospective (i.e., past-oriented) self-comparisons. In Study 3, the pattern vanished when middle-aged people compared their present self to their old age self. Taken together, these findings largely support a realistic view of one’s own future. The findings also lend some support for a self-enhancing view of what the future holds.

The Loyalty Paradox: Do We Protect or Punish Close Others Who Hurt Us?

8:00 AM – 9:10 AM

SELF/IDENTITY

A growing body of research demonstrates that when close others commit nonviolent crimes against others, we often overlook their actions because protecting close others feels akin to protecting ourselves. But what about when we ourselves are the victim? Across four multi-method studies, our results reveal a striking pattern: even when an individual is the victim of a crime, they are still motivated to protect close others. This may be due to an increased concern that harm might come to them if they report a close other’s crimes. We also identify a “tipping point” that captures when close others indicate that they would report a crime committed against the self: participants reported that a close other would have to steal almost three times as much money than a distant other before they would consider reporting them. Lastly, using 26 years of large-scale real-world crime data, we demonstrate that people’s tendency to protect close others, even when they are the victim, generalizes to all but the most severe property and violent crimes. This work illuminates the complex dynamics of close relationships in moral judgment.

Self-Promotive Interdependence: A Distinct Cultural Model of the Self in Sub-Saharan Africa

8:00 AM – 9:10 AM

SELF/IDENTITY

Self-beliefs vary remarkably across cultures. Although this point has traditionally been illustrated through East–West comparisons—recent research has expanded the scope of inquiry to other cultural regions. In this context, Sub-Saharan Africa (SSA) offers a distinctive case. It is characterized by the belief that (i) within-group competition is essential for strengthening the group’s capacity, and (ii) personal achievement is the most effective way to contribute to the group. This belief system—self-promotive interdependence—has been demonstrated across three domains: (i) emotional expressions marked by equal expression of pride and connection in response to success, whether it is one’s own or an ingroup member’s; (ii) a positive association between perceived ingroup competition and ingroup identification; and (iii) attribution patterns showing a strong tendency to explain illicit behavior benefiting the ingroup in situational terms. These patterns have been observed consistently across multiple SSA countries and are clearly distinct from those found in the Middle East, East Asia, and the West. Implications for the origins of cultural variation in self-beliefs will be discussed.

The impact of subjective social class on support for equality

8:00 AM – 9:10 AM | Location: E451B, Level 4

POLITICS

How does social class shape political attitudes and behavior? This symposium brings together emerging research showing that subjective understandings and experiences of class—rooted in beliefs, identity, or local context—play an important role in shaping solidarity and support for redistribution. Talk 1 shows that class-based zero-sum beliefs (i.e., that the upper class gains at the working class's expense) foster working-class solidarity and support for redistribution. Talk 2 shows that White Americans who feel economically "last place" amid racial inequality express stronger support for Trump and right-wing ideologies. Talk 3 shows that identifying as lower class—driven by lived experiences like financial stress and insecure work—predicts greater support for reducing inequality. Talk 4 shows that neighborhood affluence predicts working-class identification, which in turn shapes support for redistribution. Together, these talks highlight how economic disadvantage is perceived, experienced, and interpreted. They reveal how broader material circumstances shape individuals' subjective understanding of their class positioning, economic inequality, and consequent political behavior.

Class zero-sum beliefs foster working-class solidarity and redistributive policy support

8:00 AM – 9:10 AM

POLITICS

Can zero-sum beliefs foster solidarity rather than sow divisions? We propose that class zero-sum beliefs (CZSB)—the belief that the upper class gains at the expense of the working class—fosters solidarity among the working class, driving support for redistributive economic policy. Across five studies (N = 2,442), we test this model using correlational, experimental, and longitudinal designs. In S1, CZSB predicted solidarity and policy support, controlling for SDO, zero-sum mindset, ideology, and demographics. In S2, a manipulation of CZSB established its causal effect on working-class solidarity. In S3, solidarity emerged only when the upper class gained at the expense of the working class, as opposed to the other way around. In S4, with a sample of white working-class people, racial zero-sum beliefs suppressed cross-race working-class solidarity. In S5, a longitudinal study of swing voters during the 2024 Presidential Election, CZSB explained swings in favor of Harris and away from Trump, mediated by perceived alignment with working-class interests. Together, these findings illuminate how zero-sum beliefs, when oriented toward class, can be mobilized to unify rather than divide.

White Americans' Feelings of Being "Last Place" Predict Trump Support

8:00 AM – 9:10 AM

POLITICS

Due to racial wealth inequality in the U.S.—inequality that benefits White Americans on average—many Americans associate White people with wealth. Yet, many White Americans report feeling, personally, like they are "falling behind" (Caluori et al., 2024). We conducted a five-wave longitudinal study with a representative quota sample of non-Hispanic, White Americans (N = 506) during the 2024 U.S. presidential election. We found that White Americans who feel they are in "last place" (i.e., behind other White, Black, Asian, and Hispanic Americans) reported the highest levels of alt-right ideology, support for DEI bans, and support for Donald Trump, controlling for the influence of objective status. Further, "last place" White Americans expressed the highest rates of voting for Donald Trump in the 2024 election. We conclude that high racial economic inequality shapes White Americans' subjective perceptions of personal status in a way that meaningfully relates to political attitudes and behavior.

The roots of solidarity: Social class identity and the experiences that give rise to it

8:00 AM – 9:10 AM

POLITICS

The collective efforts of individuals with the least resources, status, and power in a society can be a powerful tool for reducing economic inequality. Across four studies, we examine the links between social class identity, support for reducing inequality, and lived experiences. We find that among people with objectively low social class standing, those who subjectively identify as lower (vs. higher) social class are more supportive of reducing inequality (e.g., policy support). We then use machine learning methods to identify which lived experiences are most strongly associated with lower (vs. higher) social class identities. Examining 78 features of lived experiences, we find that lower social class identities are associated with financial stress and insecurity, upward social class connections, and worse working conditions (e.g., low control); higher social class identities are associated with leisure travel, number of home bathrooms, and job benefits. These patterns are confirmed on a new sample, replicating similar predictions. Overall, these results provide novel support for the importance of conceptualization of social class in support of reducing economic inequality.

Disentangling the collective and individual dimensions of social class

8:00 AM – 9:10 AM

POLITICS

Although both subjective rank and social-class identification are used to operationalize "subjective social class," the two measures are theorized to diverge in how reliably they track individuals' broader resource ecologies. Across two studies (N = 9,254), we empirically validate this perspective, finding that ZIP- and tract-level estimates of income and educational attainment positively predict individuals' class identity, such that those from more affluent neighborhoods are more likely to identify with the middle and upper classes. Social rank, on the other hand, is inconsistently correlated with estimates of neighborhood affluence. In light of these neighborhood effects, we suggest that class identification is a better proxy for the structural and collective components of class phenomena, whereas measures of subjective rank may better estimate individual and situational facets. Exploratory structural equation models (SEMs) find that those who live in less affluent neighborhoods express greater support for redistributive policies — an effect explained through a greater likelihood of self-identifying with the working class but not perceived rank.

The Psychological Power of Labels: How Words Shape Social Perception

8:00 AM – 9:10 AM | Location: E353B, Level 3

SOCIAL COGNITION

We use labels in all facets of life, but the labels that define our groups, organizations, and initiatives uniquely shape how others see us and what resources we can access. This symposium explores the psychological power of labels, integrating insights from semantics and social cognition to understand their broader societal impact. The first paper lays a theoretical foundation, while the subsequent two use surveys, experiments, and large language models to show how labels can produce unintended consequences. Specifically, the first paper proposes mechanisms by which labels contribute to polarization in organizations. The second paper examines how ethnic terms like "Hispanic," "Latino," and "Latinx" lead observers to infer political ideology, even when the labeled individual or group did not choose the term. The final paper investigates how "DEI" became politicized and shows that initiatives labeled "DEI" are perceived more negatively — especially by non-liberals — than the same efforts labeled, for example, as "Equity Initiatives." Overall, this symposium demonstrates the powerful effects of labels that are often overlooked and provides novel insight into how to use labels wisely.

The Polarization of Labels: How Categorization and Semantization Drive Division

8:00 AM – 9:10 AM

SOCIAL COGNITION

Leaders routinely adopt labels, like those for employee resource groups, job titles, and units, to promote alignment. Yet, these labels can also divide. This talk introduces a label-driven polarization framework explaining how labels catalyze division via two mechanisms: categorization and semantization. Categorization reinforces boundaries between social groups, while semantization imbues labels with connotations — often political or ideological — that shape perception. These effects are magnified in polarized environments, turning simple labels into flashpoints. We argue that polarization can emerge not only from ideological difference but from the language we use to define groups. Our framework clarifies when and why labels unite or divide and proposes how relabeling and managing semantic associations can mitigate unintended consequences. This session will ground the theory in real examples, offering insights for leaders navigating identity-based tensions and making strategic language choices amid division.

From Hispanic to Latinx: Label Ideology and Donor Behavior

8:00 AM – 9:10 AM

SOCIAL COGNITION

Pan-ethnic labels like “Hispanic,” “Latino,” and “Latinx” are often used to represent Latin American descendants (LADs) in the U.S., but they carry different political baggage. Across three studies, we find consistent ideological associations: “Hispanic” with conservatism, “Latino” with center-left, and “Latinx” with liberalism. These implicit political connotations attached to these labels not only influence perceptions of organizations that use them, but also which organizations donors choose to support and how much they give. For example, in Study 3, a “Hispanic Advocacy Group” is perceived as more conservative than a “Latinx Union,” leading liberal donors to be significantly less likely to contribute, and to give smaller amounts when they do. In 3 studies, we illustrate how subtle semantic cues embedded in naming conventions can influence perceived alignment and drive material resource allocation, highlighting both strategic opportunity and risk in organizational labeling decisions.

Framing DEI: How Organizational Labels Shape Support and Perception

8:00 AM – 9:10 AM

SOCIAL COGNITION

Labels shape how people perceive and respond to organizations. In this talk, we examine how the politically charged term “DEI” influences stakeholder reactions compared to its component terms: diversity, equity, and inclusion. Across studies, we find that labels affect emotional reactions, stakeholder support, and donation behavior. Specifically, we find that DEI as a label is perceived more negatively, supported less, and leads to lower donations than diversity, equity, and inclusion as labels. We find that political ideology moderates this effect: non-liberal participants, compared to liberals, respond with greater negative affect and perceptions of DEI and DEI-labeled initiatives, which negatively influences their behavior directed towards DEI-labeled (compared to the diversity, equity, and inclusion labels). In contrast, liberal participants respond similarly across all labels. These results show how ideologically loaded terms can trigger unintended effects. Building on theories of semantic prosody and lexical precision, our findings are consistent with the claim that terms with more narrow definitions are more prone to polarization than those with broader meanings.

Generative AI Social Science Hackathon

9:00 AM – 6:00 PM | Location: E256, Level 2

Social psychology has developed sophisticated experimental paradigms over decades, but these haven't been systematically applied to AI systems. The Generative AI Social Science Hackathon aims to jumpstart experimental social science research on generative AI topics. This will bring together social psychologists and software developers to design rigorous empirical studies on human-AI interaction. This event will generate proof-of-concept experiments that address fundamental questions about generative AI's psychological effects using rigorous social psychology methodologies.

INVITATION ONLY

CloudResearch Sponsored Session: Detecting AI Agents in Online Research Using New Survey Technology

9:30 AM – 10:40 AM | Location: E350, Level 3

In this presentation, we demonstrate the features of Engage, an AI-powered survey platform from CloudResearch. A paper in the *Proceedings of the National Academy of Sciences* (PNAS) characterized large language models as an “existential threat” to online survey research. The study showed that autonomous AI agents can pass 99.8% of standard attention checks, CAPTCHAs, and open-ended evaluations, maintain coherent demographic personas, and generate responses indistinguishable from humans.

The implications for online research are significant. A single survey can be completed by an AI agent for just five cents, creating strong incentives for fraud at scale and raising urgent concerns about data integrity.

But how serious is this threat in practice, and what can be done? This session separates hype from reality by examining what AI agents can and cannot do. While attention checks fail, AI agents produce behavioral signatures that are unmistakably non-human and 100% detectable. Using real behavioral data, we will show what these signatures look like and why they cannot be faked.

Attendees will gain a clear understanding of today's threat landscape and practical strategies to protect research from synthetic respondents. Attendees will see how Engage records each survey session and flags behaviors that indicate AI-use, inattention, or fraud. Beyond data quality, AI survey tools allow researchers to engage participants in new modes of data collection. We will demonstrate how “conversational surveys”, conducted with AI, can easily add qualitative data to any quantitative study and the benefits of doing so. Attendees will learn about Engage's ability to identify themes and patterns across participants in ways that are driven by theory or exploration. Finally, we will describe how AI-powered surveys may solve some classic methodological problems like where in a survey to measure a moderating variable. By the end of this demonstration, attendees will not only understand some of the changes AI is bringing to survey tools, but how these changes can improve their research.

Advancing Inclusion in Publishing: Community Discussion on Policy and Change

9:30 AM – 10:40 AM | Location: E451A, Level 4

Promoting inclusive excellence in publishing is essential for enhancing both the quality of science and the opportunities available to scholars in our field. To raise awareness of SPSP's policies and resources—and to further improve our publishing process—this panel session is organized to facilitate an educational community discussion and invite input from SPSP members. The moderated discussion will feature representatives from Reviewer Zero (www.reviewerzero.net) and SPSP's Anti-Colorism and Eurocentrism in Methods and Practices (ACEMAP) task force. They will, respectively, present trainee data on the need for cultural change and a model for systemic and policy-level interventions in publishing. Editors-in-Chief of SPSP-affiliated journals – *Personality and Social Psychology Bulletin*, *Personality and Social Psychology Review*, and *Social Psychology and Personality Science* – will then share updates on current

policies, recent changes, and their visions for future improvements. The session will conclude with an open Q&A, audience input, and practical tips and resources for reviewers and authors to support inclusive publishing practices and contribute to meaningful cultural change.

Building Free-Form Pipelines for Human-AI Conversations in Surveys

9:30 AM – 10:40 AM | Location: E450A, Level 4

This interactive session introduces researchers to the foundational skills needed to integrate multi-round, free-form AI chatbot conversations into a survey workflow. Unlike structured interactions, free-style conversations involve unpredictable turn counts and open-ended content, posing unique technical challenges when integrated with platforms like Qualtrics. In this session, you will learn how to scaffold a data pipeline that can initiate, capture, and store full conversational histories between participants and AI models. We will cover basic architecture for coordinating the survey flow with a cloud-hosted server to dynamically manage and log multi-turn chatbot interactions. No prior experience with web servers or AI tools is necessary to participate. By the end of the session, you will leave with the confidence and ability to implement AI-mediated conversational tasks in your studies. To participate fully, please bring a laptop with access to an online account and a cloud-based development environment.

Love Under Pressure: Diverse Relational Risks and Their Consequences

9:30 AM – 10:40 AM | Location: E253AB, Level 2

CLOSE RELATIONSHIPS SEXUALITY

Romantic relationships involve a range of relational risks from sexual objectification to conflict during major life transitions, everyday interpersonal tensions, and financial negotiations. This symposium brings together four programs of research that examine how couples navigate these potentially stressful situations, and the circumstances under which these situations might have positive versus negative consequences for relational, affective, and sexual wellbeing. First, Clapp introduces the newly developed Behavioral Objectification from a Partner (BOP) Scale, demonstrating how sexual objectification within romantic relationships predicts appearance surveillance from a partner, self-objectification, sexual coercion, and decreased sexual desire. Next, León examines partner validation during conflict among expectant parents, showing that acknowledgment, interest, and acceptance of each other's negative affect predicts reduced negative affect and better psychosocial adjustment to parenthood. Next, Ascigil examines everyday relationship stressors, showing that perceived partner responsiveness buffers the emotional costs of these stressors. Finally, Rick examines relationship expectations around a major legal and financial stressor, prenuptial agreements, showing that people's intuitions about their relational consequences often differ sharply from lived experiences. Together, these talks highlight the diverse forms of relational risk couples encounter, and their outcomes.

Development and Validation of the Novel Behavioral Objectification from a Partner (BOP) Scale Among Women Partnered with Men

9:30 AM – 10:40 AM

SEXUALITY

Sexual objectification behaviors (e.g., groping, inappropriate sexual comments) are usually conceptualized as coming from a stranger and negatively impact wellbeing. But what does sexual objectification look like when it comes from a romantic relationship partner, and does it have the same negative impacts? In the current research, we addressed these questions across three studies aimed at developing and validating a new Behavioral Objectification from a Partner (BOP) Scale, which assesses sexual objectification that is specific to relationship contexts. In Study 1, 104 women and gender minorities completed and provided feedback on the BOP Scale. In Study 2 (a and b), women partnered with men completed the BOP Scale and additional measures at Time 1 and Time 2 (four months later). Study 2a (N = 260) used exploratory factor analysis to build the factor structure, and Study 2b (N = 297) confirmed the factor structure. Finally, Study 2 also demonstrated that the BOP Scale showed meaningful cross-sectional and longitudinal associations with increased experiences of appearance surveillance from a partner, self-objectification, and sexual coercion, and decreased sexual desire.

Partner validation during couple conflict predicts reduced negative affect and better psychosocial adjustment to parenthood

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

The transition to parenthood represents a critical period marked by increased stress and shifting interpersonal dynamics. This study examines the role of partner validation during conflict in promoting psychosocial adjustment among 96 expectant-parent dyads. Couples participated in a 15-minute conflict discussion during pregnancy, which was video-recorded and coded for affective behaviors using the Specific Affect Coding System (SPAFF). Shared positive affect during the discussion task was linked to better relationship quality for both partners, while shared negative affect predicted lower relationship quality in men. Using state-space grids and grid-sequence analysis, we tracked real-time affective exchanges to identify coregulatory patterns. Findings indicated that couples who engaged in greater validation—characterized by acknowledgment, interest, and acceptance of each other's negative affect—exhibited more frequent transitions from negative to positive affective states. Moreover, men who validated their partners more frequently reported reduced parenting stress, while women who validated their partners showed stronger parent-infant bonding. These findings underscore the importance of partner validation as a potential behavioral mechanism of interpersonal emotion regulation (i.e., coregulation), suggesting that it may facilitate better adjustment to parenthood.

The Experience of Living with a Prenup: Expectations vs. Reality

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

If you're heading toward marriage, should you get a "prenup" (i.e., a premarital contract in which a couple outlines how assets, debts, and financial responsibilities will be handled in the event of divorce)? In a survey of 985 adults who have never had a prenup, participants were more likely to think that prenups damage relationships than improve them ($p < .001$; Study 1). Are these forecasts well-calibrated? If not, couples may not optimally make decisions about whether to get a prenup. In Study 2, we surveyed 308 married adults who have a prenup. Participants were much more likely to report that creating a prenup improved their relationship than damaged it ($p < .001$). In open-ended responses, many reported that prenup discussions improved their relationship dynamics in lasting ways (e.g., "discussing and disclosing everything with each other improved our trust and sense of safety with each other"). Would these conclusions about prenups be as rosy if we surveyed people who divorced after getting a prenup? In Study 3, we surveyed 50 people who had a prenup and then divorced. Most thought their prenup was a good idea ($p = .002$) and would recommend a prenup to engaged couples ($p < .001$).

When stress comes from within: Perceived partner responsiveness buffers the link between relationship stressors and emotional well-being

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

Romantic relationships are a key resource for coping with stressors—but what happens when the partner also becomes the source of those very stressors? The current research offers a comprehensive test of whether perceived partner responsiveness—feeling understood, validated, and cared for—buffers the emotional costs of everyday relationship stressors. We analyzed data from four dyadic longitudinal studies conducted in a non-Western culture (N = 687 couples), spanning daily diary and longer-term designs and capturing different stages of romantic development, from fledgling to established couples. We found a consistent pattern across studies: Relationship stressors were associated with lower emotional well-being, replicating past work. Crucially, this association was weaker among individuals who perceived their partners as more responsive. This buffering effect was observed across samples, study designs, and relationship stages, and was further confirmed by an internal meta-analysis. These findings extend prior research by identifying perceived partner responsiveness as a key relational resource that can protect emotional well-being in the face of everyday relationship tensions.

Enhancing Elementary Students’ Earth Science and Engineering Knowledge Through an Authentic and Relevant Afterschool Camp

9:30 AM – 10:40 AM

APPLIED SOCIAL PSYCHOLOGY

In 6th grade, interest in STEM decreases, resulting in lower STEM performance. Enhancing students’ STEM experiences through emphasizing STEM’s relevance might reduce decline. Does providing authentic and relevant science and engineering (SE) experiences for 4th and 5th grade students enhance their knowledge of SE and their perceptions of the relevance of what they learned? We designed a 6-session after-school camp about earth SE concepts relevant to the students’ geographical region, the coast of Northeast Florida. In each session we emphasized the relevance of SE to the topic of the session and encouraged students to orally discuss the relevance to the topic. A pretest and posttest examined students’ knowledge, beliefs about the relevance, and (in St. 2) interest in earth science and/or engineering. Students knew more about earth science (St. 1-2) and engineering (St. 2) on the posttest versus the pretest, but no changes in perceptions of the relevance (St. 1-2) or interest (St. 2) in earth SE emerged. Future research will examine alternative measures of relevancy and interest and the mechanisms underlying the performance increases for this afterschool camp.

More Than That: Building Relationships to Reduce Adolescent Drug Use

9:30 AM – 10:40 AM

APPLIED SOCIAL PSYCHOLOGY

Prevailing punitive approaches to adolescent substance use often fail, stigmatizing youth and overlooking the power of relational support. We propose an alternative framework centered on the "possibility architect": a key adult, ideally a teacher in school, who helps an adolescent envision and navigate toward a positive future self, providing a powerful counter-pull to substance use. This talk presents a multi-study investigation of this theory.

First, experimental data reveals that substance-using youth (N=200) exposed to a "possibility architect" report significantly lower intentions to use cannabis ($p<.001$). Building on this, a second study demonstrates a scalable method for fostering this role in teachers (N=305): a brief student letter successfully disrupts negative construals, boosting perceptions of student potential ($p<.01$) and reducing blame ($p<.01$).

These findings informed our "More Than That" field intervention in the Oakland Unified School District. We will discuss qualitative pilot data (N = 25) that document students' experiences with stigma, while also showing how the intervention fostered teachers' commitment to the students. Finally, we will report initial findings from our RCT, offering a scalable, psychologically-wise model to transform school responses to adolescent risk behaviors.

Propensity for overinvolvement and well-being: A 4-year longitudinal study

9:30 AM – 10:40 AM

SELF-REGULATION

College students are overwhelmed and under pressure, experiencing rising rates of mental health challenges. In the face of these academic pressures, students attempting to excel may become overinvolved, leading to stress and burnout. A 4-year longitudinal study investigates the relationship between propensity for overinvolvement, resilience, sleep quality, and well-being among university students. An initial sample of 1,473 university students (47.6% White, 38% female) completed baseline surveys at orientation and across their four undergraduate years, with a subset completing measures of propensity for overinvolvement, resilience, sleep quality, and psychological well-being. Using a random intercept cross-lagged panel model with latent interactions, we examine whether propensity for overinvolvement deteriorates sleep quality and well-being over time, and whether resilience protects against these detrimental effects. Findings from this study highlight the potential dangers of a propensity for overinvolvement, while recognizing that under certain conditions, students may be able to thrive under high intrinsic pressure.

Reducing socioeconomic disparities in math with emotion regulation interventions

9:30 AM – 10:40 AM

MOTIVATION/GOALS

Disparities in U.S. college degree attainment based on socioeconomic status persist (Reber et al., 2023) despite the promise of STEM fields for upward mobility (U.S. Dept. of Labor, 2017). Yet low-SES students remain underrepresented in STEM (NSF, 2021; Theobald et al., 2020). Arousal reappraisal interventions, which frame stress as helpful rather than harmful, improve academic outcomes for low-SES students (Jamieson et al., 2016; Rozek et al., 2019). However, it is unclear why low-SES students benefit most from the intervention. We hypothesize that the message that arousal during high-stakes exams is "normal," though implied, may be particularly impactful for low-SES students. This study (N=534) compared the effects of a "normalizing arousal" message and an arousal reappraisal message in high school math classes. Both interventions reduced performance gaps for low-SES students by improving low-SES student exam scores, but arousal reappraisal led to greater gains. These findings advance theory by isolating the role of arousal normalization as a potential mechanism and suggest that the combined message—that arousal is both normal and helpful—may be particularly effective.

Behavioral Discounting: Its History and Horizons

9:30 AM – 10:40 AM | Location: E258, Level 2

JUDGMENT/DECISION-MAKING

This symposium explores the history and future directions of behavioral discounting, emphasizing its prosocial components and applications to social and intergenerational decision-making. Moderator/Chair Bryan Jones, who developed the Social Discounting Task (SDT), will open by tracing the origins of social discounting in the temporal discounting literature and introducing the broader concept of psychological distance—how dimensions like time and social proximity shape valuation in behavioral decisions. The first talk examines how individuals high in psychopathy show steep social discounting, illuminating the link between reduced valuation of others and antisocial behavior. The second introduces a short-form SDT (SDT-SF), validating it as a time-efficient and reliable tool for assessing generosity. The third presents a meta-analysis and replication series confirming the SDT's robustness and its predictive validity for prosocial and antisocial outcomes. The final talk addresses moral concern for future generations, showing how extreme psychological distance leads to their persistent exclusion from the moral circle.

Severity of Psychopathy in a Community-Recruited Sample is Indexed by Increased Social Discounting

9:30 AM – 10:40 AM

JUDGMENT/DECISION-MAKING

Psychopathy is a personality construct marked by boldness, disinhibition, insensitivity to others' suffering, and persistent engagement in behaviors that harm others. These features suggest that highly psychopathic people may place much less subjective weight on others' outcomes relative to their own. We assessed social discounting - indexing how the subjective value of others' outcomes declines as a function of social distance - in a novel, demographically diverse community sample of very-high psychopathy adults (top 5% of TriPM scorers; $n=288$), and demographically similar controls ($n=427$), who also reported antisocial and criminal behavior. Results show robust increases in social discounting as psychopathy increases ($B = 0.40$, $p < .001$, 95% CI [0.33, 0.47]), and reduced subjective valuation of others' outcomes partially mediates the group differences in antisocial behavior ($p = 0.18$). Our findings provide new insights into how high psychopathy individuals value others, from closest others to strangers, and how this valuation can serve as a protective factor from antisocial behavior, highlighting the need for interventions aimed at increasing how others' outcomes are valued.

Development and Validation of the Social Discounting Task: Short Form

9:30 AM – 10:40 AM

JUDGMENT/DECISION-MAKING

Social discounting—defined as hyperbolic reductions in generosity as social distance increases—is becoming more widely used in psychological research as an indicator of prosocial behavior and is most commonly measured by the Social Discounting Task (SDT). However, while robust, the SDT requires subjects to make 63 dichotomous decisions, which can be cumbersome and time-consuming. Thus, we created and validated a short-form version of the scale (SDT-SF) that reduces the inventory to 7 items. Across two pre-registered studies ($n = 993$), we found that the SDT-SF responses were correlated with classic SDT responses ($r_{study1} = .67$, $p < .001$; $r_{study2} = .69$, $p < .001$) and followed a similarly hyperbolic decay in generosity as social distance increased ($\log k_{study1} = -3.70$, $p < .001$; $\log k_{study2} = -3.42$, $p < .001$). Our findings suggest the SDT-SF is a valid and reliable alternative measure to the SDT for investigating social discounting effects reliably and efficiently for researchers and participants.

Social Discounting and Anti-/Pro-Sociality: A Meta-Analysis and (Short-Form) Replication

9:30 AM – 10:40 AM

JUDGMENT/DECISION-MAKING

Our preregistered meta-regression revealed an inverse relationship between social discounting and multiple prosocial outcomes ($N = 14$, $r = -0.231$, $p < 0.001$), and supported the hyperbolic nature of the relationship between generosity and social distance ($N = 44$, $\log k = -2.37$, $p < 0.0001$). We found evidence for differences in real-world vs. hypothetical rewards on social discounting, such that real-world rewards decreased social discounting. We found no evidence for differences in social discounting from country-level individualism-collectivism or relational mobility. In conceptual replications of 14 prosocial/antisocial outcomes predicted by the SDT, all prosocial effects and two of four antisocial effects replicated, further supporting the SDT's robustness as a predictor of stable individual differences in prosociality.

Future Generations Hold the Lowest Moral Standing, Even Below Present-Day Marginalized Outgroups and the Natural World

9:30 AM – 10:40 AM

JUDGMENT/DECISION-MAKING

Climate change, poverty, and inequality pose significant threats to the well-being of future generations, making it essential to advocate for their interests in present-day decisions. Yet, little is known about how people morally evaluate future generations relative to other distant groups, such as human outgroups and nature (plants, animals). Moreover, does this perception change among those who exhibit impartial intergenerational beneficence (i.e., concern for all future generations), or when moral concern is framed as zero-sum? Across 15 studies, we find that future generations consistently receive less moral concern than present-day targets already ascribed low levels of concern. This pattern holds whether moral expansiveness is framed as unlimited or zero-sum and persists even among individuals who typically care deeply about future generations, regardless of their temporal distance. These findings suggest that future generations hold a uniquely disadvantaged position in the moral hierarchy—not because of perceived constraints on moral concern, but due to factors intrinsic to their exceptional psychological distance from the self, here and now.

Conceptualizing and Motivating Meaningful and Equitable Climate Action

9:30 AM – 10:40 AM | Location: E270, Level 2

OTHER

Addressing climate change and environmental injustice is one of society's most pressing issues. Research on promoting climate action must encourage behavior that is both effective and ethically informed; existing self-centered interventions may hinder transformative change. This symposium focuses on how individuals conceptualize climate change, motivations for climate action, and novel theoretical work informing intervention design. The first talk examines how social and ecological hierarchies drive conceptualizations of and behavior towards environmental injustice. The second talk highlights how cultural threats galvanize climate action in Indigenous Peoples, emphasizing how collective hope can motivate action. In several high-powered generalizable studies, the third talk examines how interconnectedness with future generations fosters climate stewardship. The last talk investigates Regulatory Scope, finding evidence for how expanding scope can predict past and present behavior, and inform future climate action. These works highlight the importance of understanding the theoretical mechanisms that promote real-world impacts related to climate intervention and equity.

Social and Ecological Domains: Hierarchy Preferences on Equality Outcomes

9:30 AM – 10:40 AM

OTHER

Climate change and environmental degradation are social issues as well as ecological issues; attitudes to marginalized humans and non-humans shape care for both groups. As such, this work asks whether and how relevant attitudes are influenced by preferences for social and natural hierarchies. In Study 1 (N= 171), participants were asked about social and ecological hierarchy preferences and explanations. Hierarchy preferences were greater for the ecological domain than the social domain ($t(169)=7.80$, $p<0.001$, $d=0.73$), and positively related ($r(168)=0.27$, $p<0.001$). However, explanations for social hierarchies were more likely to mention cultural construction, equality, and anti hierarchy language, whereas explanations for ecological hierarchies mentioned naturalness, anthropocentrism, coexistence, and responsibility. As such, social and ecological hierarchy preferences may be related, but reflect different sets of underlying beliefs, suggesting that beliefs about equality may be addressed via distinct pathways. Thus, Study 2 (N=176; analysis underway) examines how hierarchical preferences are related to environmental and climate equality attitudes, policy support, and behavior.

As We Have Always Done: Indigenous Affect and Environmental Action

9:30 AM – 10:40 AM

OTHER

Indigenous Peoples' (IPs) cultures and identities are sustained by the environment. Environmental injustice thus threatens IPs' wellbeing. Collective action literature finds that group emotions motivate those perceiving such injustices to take action. The present work examines how unique group emotions similarly motivate IPs' environmental action. Study 1 (N=1037) shows IPs who perceive culture threats from environmental hazards more frequently engage in environmental action in part from feeling more fear about their group's future (i.e. collective angst; $\beta=0.07$, $SE=0.02$, 95% CI[0.03, 0.11]). The effect of collective angst has been supported in the literature, but may not fully account for the unique strengths enabling IPs' resistance since the arrival of settlers. Thus, Study 2 (N=1086; analysis underway) assesses how belief in a positive future for one's group derived from memory of ancestral resilience (i.e. collective hope) interacts with collective angst to motivate action. These studies emphasize how these emotions shape IPs' capacity to protect the environment for their cultures and future generations.

Too Far to Care: Climate Change and Intergenerational Moral Failure

9:30 AM – 10:40 AM

OTHER

Climate change presents a profound moral challenge: its most severe consequences will be borne by people not yet born. Yet across 15 studies, we find that future generations receive less moral concern than even marginalized present-day groups or non-human nature. This exclusion persists across framing conditions (e.g., zero-sum vs. non-zero-sum concern) and even among those who report strong intergenerational commitment. In a complementary set of five preregistered studies (N = 3,876), we examined how many generations people believe individuals and governments should consider when making decisions. While prescriptive horizons vary, highlighting humanity's long-term interconnectedness significantly expands moral concern and reduces intergenerational discounting. Together, these findings reveal that psychological distance—not limited moral capacity—accounts for the neglect of future generations. Addressing this moral blind spot is critical for building sustained public will to act on climate change, and for fostering a deeper ethic of intergenerational climate stewardship.

Understanding and Promoting Pro-Environmental Behavior Through Regulatory Scope

9:30 AM – 10:40 AM

OTHER

Many pro-environmental behavior (PEB) interventions attempt to reduce psychological distance (defined as how far away an object or event is from the self) towards climate change. However, this work is held back by theoretical and practical limitations: psychological distance cannot be reduced, and psychological-distance focused approaches promote an egocentric set of solutions. Recent theoretical advancements in Regulatory Scope provide a different viewpoint, proposing that action (vs inaction) is promoted through expansive (vs contractive) scope, defined as the range of ends and possibilities that one takes into consideration when making decisions. In a novel application of this theory, and across 5 pre-registered studies (N=600 in total), we show that expansive regulatory scope is associated with greater past PEB engagement, more donations to environmental charities, stronger environmental identity, and greater intentions to engage in future PEBs. This work not only contributes to novel theoretical advances in the field by resolving inconsistencies in past literature, but also provides clear and practical guidance for encouraging PEBs as well as other prosocial behaviors.

Divided We Speak: Political Discourse in the Age of Polarization

9:30 AM – 10:40 AM | Location: Lakeside Ballroom E354B, Level 3

POLITICS

How does polarization shape political discourse? This symposium explores how political polarization not only divides citizens but also reshapes how they engage with—and disengage from—political discourse on social media platforms, the primary public squares in the 21st century. The first talk explains how social media distorts perceptions of public opinion, fueling pluralistic ignorance and false polarization across 40 countries. The second highlights a feedback loop between polarization and political memes, showing that polarized individuals are most likely to endorse and spread ideologically congruent content. The third uses large-scale computational methods to show that closed-mindedness is a pervasive and self-reinforcing feature of online political discourse. The fourth demonstrates that heightened electoral threat during polarized elections suppresses in-party criticism, constraining citizens' political expression and public political discourse. Together, these talks reveal how polarization and partisan identity interact to distort perceptions, amplify division, and constrain constructive political discourse.

Online Discourse is Falsely Polarized by Users' Concealment of Moderate Views

9:30 AM – 10:40 AM

POLITICS

Much research and debate about social media concerns its potential to polarize the political attitudes and partisan sentiments held by their users. However, we show how online discourse is falsely polarized by a process of attitude filtration. Thus, online posts are not a random sample of users' political opinions, but one biased towards the most extreme attitudes of each user, and the most extreme users in the population. Across a diverse series of six studies (total N > 47,000), we trace this biased sampling process from users' underlying attitudes to their expression of those attitudes online. First, the association between extremity and posting manifests both in hypothetical and behavioral online speech; second, that this pattern is not simply explained by the heightened political interest of extreme users; third, that it persists in 40/40 countries examined and cultures and across 6/6 US political issues examined; third, that individual users are more likely to post about the issues on which they hold their most extreme views; and fourth, that the opinions they are willing to post tend to engender more negative reactions amongst readers than the opinions they keep private.

Taking Memes to the Extremes: Partisan Polarization Boosts Meme Effectiveness

9:30 AM – 10:40 AM

POLITICS

Memes are increasingly used in lay communication to advance discourse and circulate ideas. Simultaneously, affective polarization is at a high point in the US. Here, we examined whether polarized people rate ideologically consistent moral political memes as more effective than less polarized individuals in three studies (N = 1,809). Participants were presented with morally relevant political memes and rated their meme effectiveness (humor, liking, sharing, agreement, and offensiveness). Both more polarized liberals and conservatives consistently rated ideologically consistent memes as more effective than their less polarized counterparts, and participants generally rated out-group memes as ineffective. This suggests that polarized partisans may have stronger reactions to memes, regardless of the meme's moral content. While this work cannot establish a causal relationship, these results offer insight into the potential bidirectional relationship between online political memes and increased polarization, as polarized individuals were more likely to like and share memes than their less polarized counterparts.

Closed-Mindedness in Online Political Spaces

9:30 AM – 10:40 AM

POLITICS

The unwillingness to consider alternative viewpoints hinders the integration of differing perspectives required to resolve contentious problems. Here, we conducted the first large-scale behavioral study of closed-mindedness in online political spaces. We first developed a text classifier of closed-mindedness by fine-tuning a large language model, then applied it to Reddit comments. Analyses revealed five key findings. Study 1 showed that (i) closed-mindedness was significantly more prevalent in political than nonpolitical communities (N = 10,006 communities; 252 million comments), a difference not attributable to toxicity. Study 2 examined N = 1,000,000 comments from political communities with a partisan lean, finding that closed-minded comments were more likely to: (ii) express partisan views, (iii) receive social disapproval particularly when their partisan views misaligned with the community's lean, and (iv) elicit replies, which were (v) especially likely to be closed-minded. These findings underscore closed-mindedness as a distinctive and self-reinforcing feature of online political discourse.

Under Pressure: Partisans Self-Censor In-Party Criticism in Response to Electoral Threat

9:30 AM – 10:40 AM

POLITICS

In democratic societies, elections offer citizens an important opportunity to influence their representatives. Yet, in politically polarized societies, elections may heighten feelings of intergroup threat, producing a tradeoff between expressing critical opinions of one's party and supporting its success. Prior work shows that perceived threat leads group members to judge ingroup critics more harshly and self-censor their own in-group criticism. Building on this work, we examine whether highly polarized elections, by increasing feelings of intergroup threat, promote self-censorship of in-party criticism. We conducted a two-wave panel survey with a U.S. representative sample recruited via Prolific in the two weeks before the 2024 U.S. Presidential election (N₁=822; N₂=741). We find that under higher electoral threat, participants are less likely to publicly criticize their party, especially when holding strong partisan identities. A pilot experiment (N=961) manipulating electoral threat provided converging evidence. These results suggest that rising polarization can stifle intra-party dissent, limiting citizens' political expression and potentially undermining democracy.

Emotion Norms across Cultures

9:30 AM – 10:40 AM | Location: E353B, Level 3

CULTURE

Culture shapes goals, values, thoughts, and behaviors. This symposium brings together recent advances in the study of what people pursue, value, and believe about emotions. Speaker #1 will show that how much people want to make themselves feel better, when regulating emotions in daily life, differs between US Americans and Japanese. Speaker #2 will demonstrate that how people conceptualize and value compassion differs between US Americans and Mexicans. Speaker #3 will reveal that how people think about emotions is reflected in linguistic patterns that differ between English-speaking US Americans and Dutch-speaking Belgians. Lastly, Speaker #4 will demonstrate that adherence to social norms—including emotion norms—varies both within and between cultures. Together, these novel findings underscore the importance of adopting a culturally-sensitive perspective to understanding what is emotionally normative.

U.S. Americans Want to Feel Better Than Japanese Do

9:30 AM – 10:40 AM

CULTURE

Emotion regulation, which involves attempts to influence emotions, is initiated when a goal to influence emotions is activated. How people want to influence their emotions, however, may differ across cultures. In this investigation, we tested whether individuals from the United States and Japan differ in how they want to influence their emotions in their daily lives. In a preregistered ecological momentary assessments study (N = 221), we examined how U.S. Americans and Japanese students felt, how they wanted to feel, and how they wanted to influence these feelings in daily life. As predicted, U.S. Americans wanted to feel less intense unpleasant emotions and more intense pleasant emotions and were more motivated to decrease their unpleasant emotions and increase their pleasant emotions than Japanese were, even when controlling for differences in experienced emotions. These findings demonstrate that the degree to which people value pleasant and devalue unpleasant emotions in daily life is culture-dependent.

Compassion in Mexico and the United States: Unpacking Cultural Differences

9:30 AM – 10:40 AM

CULTURE

Cultural differences in conceptualizations of compassion exist, but studies including participants from Latin America are rare. Therefore, the present study investigates the conceptualization of compassion in Mexico and the United States, aiming to understand why these cultural differences occur. We hypothesized that Mexicans would want to avoid feeling negative less, would regard emotion sharing as a more critical element of a compassionate response, and would therefore conceptualize a compassionate face as one that expresses sadness more and happiness less compared to U.S. Americans. Participants from Mexico and the United States selected stimuli that most resembled a compassionate face, indicated how much they wanted to avoid feeling negative and described what a compassionate response entails. Supporting our hypotheses, Mexicans, who want to avoid feeling negative less compared to U.S. Americans, place greater importance on emotion sharing in a compassionate response. This variation is associated with Mexicans conceptualizing a compassionate face as one that portrays more sadness and less happiness compared to U.S. Americans.

Cultural Models of Emotion Manifest in Descriptions of Everyday Experience

9:30 AM – 10:40 AM

CULTURE

Language provides a window onto how people conceptualize their emotional experiences, yet linguistic analyses that go beyond individual emotion words are rare. We explored cultural models of emotions prevalent in the US and Belgium using verbal descriptions of recent events collected from speakers of North American (US) English and Belgian Dutch. We analyzed the descriptions in three stages: 1) topic modeling to characterize content, 2) word counting to examine linguistic resources, and 3) inductive analysis to uncover broader themes. Consistent with prior research on US and Belgian culture, our findings revealed notable cultural differences alongside similarities. US English speakers used more first-person pronouns and affective language, emphasized high-arousal emotions, and prioritized personal achievements and open expression. In contrast, Belgian Dutch speakers' descriptions reflected a moderated approach to emotions, illustrating how social standards and broader worldviews gave meaning to events, with use of fewer first-person pronouns and more language focused on relativization. We conclude by evaluating our approach against other means of studying emotion across cultures.

Social Norm Adherence Varies Within and Between Cultural Regions

9:30 AM – 10:40 AM

CULTURE

Leading theoretical accounts in cultural psychology argue that adherence to social norms is greater in certain cultures, irrespective of the content of norms. However, these theories have largely been based on studies focusing on a limited range of behaviors and specific measures. To address this limitation, we assess adherence to social norms across a broader range of features, including norm referent (whether norms are for behaviors vs. emotions), norm type (prescriptive vs. descriptive), norm contextualization (context-specific vs. in general), norm assessment (homogeneity vs. concordances), and valence (for emotion norms: positive vs. negative). Two large-scale studies (total N = 3,344) conducted in Japan, South Korea, the United States (Studies 1-2), and the United Kingdom (Study 2) reveal significant variation across all features, both within and between cultural regions. These findings suggest that theories of cultural differences in norm adherence were based on a limited subset of norms and may have overstated cross-cultural differences, and highlight the need to consider which norms are assessed.

Emotional Responses to Others' Suffering: How (Much) Should I Feel?

9:30 AM – 10:40 AM | Location: E271, Level 2

PROSOCIAL BEHAVIOR

Emotions are deeply embedded in the social fabric of our lives. When encountering others who are suffering, how we generate, regulate, and understand emotions can have long-lasting consequences. Yet, much is still unknown about emotions in these contexts, including when and why individuals regulate their emotions up or down and what processes underlie people's emotional functioning. This symposium aims to spark discussion about emotional functioning in social contexts that raise the specter of emotional discomfort, with four talks presenting data from different theoretical perspectives, using diverse methods (i.e., age-diverse samples, individuals and dyads, self-report and psychophysiology), and with a focus on different emotion processes. Among the questions these talks will address are: Does curiosity bolster empathy for others? Does having empathy for suffering others—or receiving empathy from others— increase or decrease one's own feelings of distress? What is the role of accepting one's own emotions in responding to others' suffering? We will address these questions separately, and we will explore connections among them at the end of symposium.

The Complex Relationship Between Curiosity and Empathy

9:30 AM – 10:40 AM

PROSOCIAL BEHAVIOR

Can curiosity foster empathy across differences? Although curiosity is linked to positive relationship outcomes (e.g. closeness), its causal role in empathy for strangers is underexplored. We conducted two pre-registered studies (N=160 and 210) to test whether sparking curiosity can increase empathic responses toward strangers among undergraduates. Across both studies, participants in curiosity-inducing conditions felt more curious, but didn't show greater empathic motivation or concern. However, there was some evidence for an indirect effect: the more curious participants felt in the moment, the more empathy they at times felt. Curiosity also reduced personal distress and increased participants' willingness to engage with someone different. This suggests that although curiosity may not directly cause empathy, it may support the emotional regulation and openness needed for deeper connection. Rather than shutting down, curious individuals can stay engaged—even when encountering pain or difference—a "keep calm and connect" response that is essential for forming new relationships in pluralistic societies.

Feeling It Without Fixing It: Acceptance When Facing Loss

9:30 AM – 10:40 AM

PROSOCIAL BEHAVIOR

Acceptance (i.e., embracing emotions and thoughts without judging them) in the face of others' loss may be important for well-being and health. Using a within-subjects laboratory-based design, we examined habitual acceptance (using questionnaires) and instructed acceptance (instructing individuals to use acceptance vs. "just watch" when watching film clips depicting people experiencing loss) in 129 older adults (age 64-83). Specificity analyses probed detachment (i.e., mental distancing) and reappraisal (i.e., reframing). Results showed that (1) older adults perceived themselves as most successful when instructed to use acceptance (vs. detachment or reappraisal), (2) habitual acceptance (but not detachment or reappraisal) predicted greater mental health, and (3) habitual acceptance (but not detachment or reappraisal) predicted greater vagal reactivity during instructed emotion regulation. Findings show distal and proximal benefits of acceptance in the face of others' loss; underscore differences between acceptance, detachment, and reappraisal; and highlight distinctions between habitual and instructed emotion regulation.

Empathy and Emotions During Conflict Resolution in Dementia Caregiving Dyads

9:30 AM – 10:40 AM

PROSOCIAL BEHAVIOR

When relational partners navigate conflict, perceptions of the empathy expressed by each other can influence the emotional quality of the interaction. This may be particularly true in interactions between people with dementia and their caregivers (CGs) because disease processes may alter empathy in the care recipient (CR). In a sample of 61 CGs and CRs with various kinds of dementias, we examined the associations between perceptions of empathy and reported affect during a 10-minute relationship conflict discussion. Results indicated that higher ratings of CR empathy by CGs were associated with greater CG reports of positive emotions (i.e., affectionate, amused, calm, proud) and lesser reports of negative emotions (i.e., afraid, angry, ashamed). Similarly, higher ratings of CG empathy by CRs were associated with greater CR reports of positive emotions and lesser reports of negative emotions. Exploratory analyses revealed that higher ratings of CR empathy by CGs were associated with greater CR empathic accuracy for negative emotions (measured as the discrepancy between CG and CR reports of CGs' emotions). Implications of these findings for CG health and well-being will be discussed.

Caring Despite Pain: Compassion Predicts Stability in Response to Suffering

9:30 AM – 10:40 AM

PROSOCIAL BEHAVIOR

Exactly what compassion for others' suffering consists of is the source of some debate: can it include aversive feelings, sometimes labeled empathic distress, or is it solely positive in valence? We propose that the defining feature of compassion is not the valence of one's affective response but the degree to which one values that response and accordingly is willing to sustain it. Across three studies (total N = 567) using psychophysiological methods in order to sidestep limitations of self-report, our lab has found that those who report high levels of compassion in response to a depiction of suffering others tend to maintain the same level of physiological threat across a period of roughly one hour, while physiological threat tends to change more for those who report low levels of compassion. In the third study (N = 98), we find initial evidence that this phenomenon is specifically driven by people's favorable appraisals of having empathy for suffering others. These effects were not driven by self-reported personal distress. Compassion for others may be best defined as valuing one's emotional reactions to their suffering, including possible discomfort.

How Gratitude and Awe Foster Adherence to Prosocial Commitments

9:30 AM – 10:40 AM | Location: E253CD, Level 2

PROSOCIAL BEHAVIOR

What drives people to do the hard thing when it's the right thing to do? While cognitive deliberation can help people navigate morally difficult actions, this symposium demonstrates the importance of two emotions. Specifically, it explores how gratitude and awe encourage commitment to personal and societal values, even when doing so is effortful, costly, or goes against self-interest. Talk 1 uses a multi-method approach that includes survey data from 22 countries (N>200k) and field studies at blood drives and flu shot clinics to show that more grateful individuals are more likely to engage in costly prosocial actions. Talk 2 draws upon 3 million individuals to examine how experiences of awe morally transform collectives by expanding social perspectives from narrow self-interest to others' needs. Talk 3 finds that expressions of gratitude shape third-party moral judgments, which in turn influence cooperative behavior. Talk 4 uses field data from celebrity events, linguistic analysis of Reddit users' language and behavior, and experiments to demonstrate how awe strengthens commitment to public figures, even at great personal cost.

Gratitude Is Associated with Taking Costly Prosocial Action

9:30 AM – 10:40 AM

PROSOCIAL BEHAVIOR

Gratitude is not without its critics. Some have argued that it encourages system-justification, thereby discouraging efforts to challenge the status quo. Although gratitude has been shown to promote prosocial behavior, most studies have focused on actions with relatively minor costs. To address this gap, we analyzed data from a nationally representative sample of U.S. respondents (Study 1; N = 2016) and a longitudinal study of nationally representative samples across 22 countries (Study 2; N = 207,919), and we conducted a field study at blood drives and flu shot clinics (Study 3; N = 396) and three experiments (Studies 4a–4c; N = 643) that manipulated feelings of gratitude. We found robust evidence that more grateful individuals are more likely to engage in costly prosocial actions. Our manipulations of state gratitude, however, did not increase participants' willingness to engage in costly prosocial behavior, although those who scored higher on trait gratitude in these experiments reported greater willingness to engage in costly prosocial actions. Together, our findings challenge claims that gratitude reinforces the status quo and undermines efforts to bring about societal change.

The Moral Grounding of Awe

9:30 AM – 10:40 AM

PROSOCIAL BEHAVIOR

Experiences of awe are profound and transformative for individuals. In this talk, we highlight how experiences of awe also morally transform collectives, by expanding people's social perspectives from narrow self-interest to others' needs. We review empirical evidence showcasing how experiences of awe, whether experienced in solitude or simultaneously with millions of others, are associated with systematic shifts in social-cognitive tendencies vital to moral life: attentiveness to others, social connectedness, and prosociality. We end our talk by describing recent studies on the social signaling of awe: it triggers inferences of an individual's potential for moral, virtuous learning and behavior. Moreover, awe-prone individuals are judged to be more moral, more curious, and more full of potential compared to individuals prone to other positive emotions. This talk highlights awe as an experience rooted in human morality. It inspires people to engage with the needs of the collective and to recognize others' potential to do the same.

Awe as an Affective Pathway to Commitment

9:30 AM – 10:40 AM

PROSOCIAL BEHAVIOR

People feel deeply committed to certain public figures, rallying behind their causes, following their trends, and sacrificing resources to support them. What drives commitment to these individuals? We hypothesize that one powerful driving force is the emotion of awe. To test this claim, we measured awe at two large-scale celebrity events in the field (Study 1), induced awe versus amusement in a controlled laboratory setting (Study 2; pre-registered) and conducted linguistic analysis of Reddit users' language and behaviour about a specific well-known figure (Study 3; pre-registered). Across these studies, feeling awe predicted greater reported and behavioural commitment (e.g. prosocial sacrifice) towards public figures, even more extreme forms of commitment (e.g., discrediting a figure's wrongdoings). These results offer the first empirical evidence for theoretical claims that awe is a powerful commitment device, binding us to others outside of close relationships.

More Than a Machine: The Psychology of Human-AI Relationships

9:30 AM – 10:40 AM | Location: E353C, Level 3

CLOSE RELATIONSHIPS

As society grapples with rising loneliness, individuals are increasingly turning to technology to fulfill fundamental relational needs. This symposium explores the emerging phenomenon of human-AI relationships, from parasocial bonds to deep romantic connections with virtual agents. The first talk analyzes how virtual romance can reduce loneliness and enhance well-being, even for those in existing relationships, by fulfilling key emotional needs. The second talk examines the role of anthropomorphism as a key predictor for forming parasocial connections with AI chatbots. The third talk reveals that while individual traits and structured interactions can foster closeness with AI, broader acceptance as a relational partner is limited by critical barriers like social norms and public readiness. Lastly, the fourth talk investigates how relationships with virtual agents are often rooted in general social deficits, rather than romantic ones. Collectively, these presentations provide a multifaceted understanding of why people form bonds with AI, the psychological benefits they can derive, and the complex interplay of individual and social factors shaping the future of human connection.

Guilty Desires and Digital Love: Romantic Anthropomorphism with Virtual Agents

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

Love, traditionally shared between humans, is increasingly being directed toward virtual agents (VAs). Across four studies (N = 1,641), we explored why people pursue romantic connections with VAs (Studies 1 and 2), how romantic needs emerged in these interactions (Study 3), and whether virtual romance offered real-world psychological benefits (Study 4). Our findings revealed that engaging with VAs can reduce loneliness and enhance well-being, regardless of relationship status. Surprisingly, individuals in romantic relationships report stronger emotional engagement and greater psychological benefits from VAs than singles. These partnered individuals also experienced emotional support from VAs, which contributed to their sense of resilience. Men felt more guilt about spending time with VAs but not about spending money on them. Although users felt ambivalent about microtransactions involving romantic VAs, they continued to use these interactions to fulfill emotional and physical needs. These findings highlight the psychological potential of virtual romance and the importance of understanding how emerging technologies are reshaping human relationships.

Artificial Intimacy: The Role of Anthropomorphism in Creating Parasocial Relationships

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

In this study, we examined parasocial relationships, one-sided connections with media figures that lack personal communication. We examined the predictors of meaningful parasocial connections by considering individual differences linked to extant parasocial relationships, and by examining the predictors of forming novel connections with a chatbot. Participants (N=308) indicated whether they engaged in parasocial relationships (and, if they did, indicated the closeness of that relationship) and completed questionnaires assessing various individual differences. Participants then interacted briefly with a chatbot, followed by a questionnaire to assess the perceived closeness and realism of that interaction. We found evidence to suggest that those who currently engage in parasocial relationships tend to anthropomorphize, or apply human traits to, chatbots, and this was associated with a higher level of closeness when engaging in these relationships. Anthropomorphizing the chatbot, and having positive perceptions of technology, predicted relationship closeness with the chatbot. This study sheds light on factors influencing novel parasocial relationships with digital technology.

Relational AI: Examining Willingness to Form Close Relationships with AI

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

As loneliness increases globally, people are increasingly turning to AI to fulfill relational needs. Across 4 studies, we examined the phenomenon of relational AI, and the psychological and contextual conditions under which individuals perceive AI as potential partners. In Study 1, a large-scale semantic analysis of online discourse revealed that AI is linguistically associated with relationships and intimacy. Study 2 demonstrated that individuals with more positive attitudes toward AI and higher attachment anxiety were more willing to consider a romantic relationship with an AI agent. Study 3 tested a descriptive norm manipulation meant to normalize AI-human relationships, but found the norm manipulation reduced people’s willingness to form relationships with AI. In Study 4, an immersive virtual reality interaction with a human-like ostensibly AI agent revealed that structured intimacy-building tasks can increase perceived closeness between humans and AI, particularly among men. Together, these findings suggest that while generative AI can evoke feelings of intimacy and connection under certain conditions, public readiness and normative acceptance remain critical barriers.

Predictors of parasocial relationships with fictional characters across relationship status

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

Parasocial relationships (PSRs) are one-sided relationships, where one person (an actor) has an interest in developing a relationship with another person (the target)—but the target is unaware of the actor's existence. While commonly conjuring thoughts of real people (e.g., celebrities), PSRs can also involve fictional or digital characters. The goal of this study was to understand whether a desire for a relationship with a digital character was predicted by deficits in one's social and romantic needs. We assessed the relationship between personal loneliness, well-being, emotional suppression, romantic loneliness, rates of physical and emotional romantic partner behaviours, and the rates and types of PSRs people experienced. We found an association between loneliness, well-being, emotional suppression, and having a PSR. We also found evidence for a partial mediation wherein having a PSR relates to lower well-being scores. We did not find any association between having a PSR and deficits in one's romantic relationships. These findings suggest that people seek out PSRs due to social deficits, but not due to physical and emotional deficits in one's romantic relationships.

The Journey to Belonging: Challenges, Costs, and Ways Forward

9:30 AM – 10:40 AM | Location: E353A, Level 3

BELONGING/REJECTION

People want to feel that they belong. Indeed, the need to do so is fundamental to what it means to be human. Yet, the journey toward achieving belonging is not the same for everyone. Specifically, feeling belongingness is often more difficult for members of marginalized groups. This symposium highlights the challenges and costs inherent to the inequitable pursuit of belonging, as well as a potential context-level solution. Talk 1 documents the disproportionate challenges members of marginalized groups face as they seek belonging. Talk 2 examines the emotional and opportunity costs of doing so and Talk 3 examines how seeking out one type of belonging can even take tolls on other types of belonging. Finally, Talk 4 will propose an ecological approach to alleviating the challenges people face on their journeys toward belonging. These talks present a rigorous set of studies often featuring thousands of participants, recruited in both lab and field contexts, and working primarily with marginalized groups. They do so to tackle the important and timely problems of how, under what conditions, and with what consequences, members of marginalized groups pursue a sense of belonging.

Who Gets to Belong? Belonging Opportunities in College Vary by Race and First-Gen Status

9:30 AM – 10:40 AM

BELONGING/REJECTION

Belonging is critical to student success, yet not all students experience college as a place where they can come to belong. Even more concerning, there are patterns of inequity by student racial identity and first-generation status. In this talk, we present findings from a study of over 15,000 students across 22 U.S. colleges showing that opportunities for belonging—what we call belonging affordances—are not equitably distributed. Black, Asian, and first-generation students were especially unlikely to have even minimally adequate belonging affordances on campus. These disparities, however, are not inevitable: some colleges create better conditions for belonging than others. We highlight this institutional variability and describe how colleges can identify who is well-served and who is not yet well-served. By engaging students directly and sharing their insights with campus leaders, support staff, and faculty, institutions can take concrete steps to equitably expand belonging affordances.

Exploring College Students' Cost to Belong

9:30 AM – 10:40 AM

BELONGING/REJECTION

School belonging is often seen as a panacea for enhancing college student development and academic outcomes. However, few empirical studies have focused on understanding how students perceive the costs to belong, or the things students may give up or difficulties they may experience when they try to belong. Particularly in predominantly White institutions or institutions racialized by whiteness, college students of color face additional threats to their belonging, and, what we argue to be, greater cost to belong. In two studies, we validated a measure of psychological costs to belong that assessed students' perceived emotional and opportunity costs when trying to belong in college. Psychometric analyses revealed that the 15-item cost to belong scale was unidimensional with high internal consistency. First, we found that students of color reported a higher level of cost to belong compared to White students. Second, for students of color, cost to belong was a significant and negative predictor of college belonging, help-seeking, and academic performance. We discuss implications for the belonging dynamics that occur among marginalized students navigating educational contexts.

Belonging According to Whom? The Effects of Distancing from a Stigmatized Identity on Felt and Perceived Belonging

9:30 AM – 10:40 AM

BELONGING/REJECTION

Stigmatized group members face barriers to belonging. In response, many try to bolster their belonging by concealing their stigmas. Yet, studies show concealment reduces belonging. We tested two hypotheses to reconcile this paradox. The first is that people anticipate that concealing will bolster their belonging but that it in fact backfires (Inaccurate Forecasting Model). The second is that people conceal to bolster one type of belonging—how much others see them as belonging—even if they know it will harm another type of belonging—how much they feel they belong (Multiple Belongings Model; “MBM”). In Studies 1-2, sexual minorities were assigned to anticipate or retrospect on concealing or disclosing their sexual orientation. Consistent with the MBM, participants both anticipated and recalled feeling less belonging when they concealed but anticipated that others would perceive them as belonging more when they concealed. Study 3 replicated these findings with religious minorities, further supporting the MBM. This work shows how the need to belong motivates our intergroup behaviors and clarifies whether identity-distancing behaviors like concealment strengthen or weaken belonging.

Transforming Social Contexts with Ecological Belonging Interventions

9:30 AM – 10:40 AM

BELONGING/REJECTION

Social psychological interventions often use individual-level random assignment in controlled settings. This session highlights the value of a socially focused approach that targets newly formed group contexts, such as classrooms and teams. We present results from four longitudinal field studies (N ~ 6,000) testing an ecological belonging intervention in introductory STEM college courses. By embedding elements of the social belonging interventions inside classrooms and creating space for dialogue around its core themes, the intervention aims to foster classroom ecologies that recursively support the individual and their sense of belonging. Results show the intervention improved students' sense of belonging, class attendance, peer collaboration, sleep quality, and academic performance. Many effects were especially pronounced for students from historically marginalized backgrounds, demonstrating the power of contextually embedded, socially grounded interventions.

The Social Meaning of Institutional Signals and Actions

9:30 AM – 10:40 AM | Location: E450B, Level 4

NORMS AND SOCIAL INFLUENCE

To address large-scale societal challenges, psychology must develop a multi-level and institutionally-embedded understanding of the factors shaping human behaviors, beliefs, and attitudes. Actions by formal institutions (i.e. institutional signals) can exert direct influences on behavior but also significant indirect influences through the social meanings they convey (i.e. their expressive function). The research presented here examines the relationship between institutional signals and perceptions of social norms, and how signal features impact how they are interpreted by the public. The first study uses natural experiments to understand the direct effects of legal reform and direct democracy on the rights of disadvantaged groups and the normative environments in which they live. The second study examines how the relationship between Supreme Court rulings and perceptions of social norms depend on perceptions of public preferences. The third study examines how institutional signals interact, and which ones take precedence, in shaping responses to social challenges. The fourth presentation examines the language of corporate commitments to climate change, and how features of those commitments are interpreted by the public. Together, these studies have implications for our understanding of how institutional signals might bring about widespread social change.

How Institutional Decisions Influence Perceived Norms on LGBTIQ+ Rights

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Institutional decisions—whether through legal reform or direct democracy, where citizens vote on issues—can lead to significant changes in the rights of disadvantaged groups. Beyond the effects on rights, such decisions may also influence the normative climate in which these groups live. This talk presents findings from three large-scale natural experiments conducted around public votes on LGBTIQ+ rights in Switzerland and Australia. Across five samples (N = 3,360), including LGBTIQ+ people and cis-heterosexual supporters and opponents, we find that progressive votes expanding rights significantly shifted perceived norms. These shifts were linked to improved well-being among targeted minorities—particularly among those who had previously underestimated public support (i.e., pluralistic ignorance). While our studies focus on inclusive outcomes, we discuss the broader implications of our findings and ongoing research for institutional decisions that restrict rights, such as recent anti-trans legislation in the U.S. Understanding these processes highlights the powerful role of institutional signals in shaping the lived experiences of minority groups.

The Effects of a US Supreme Court Ruling on Affirmative Action on the Norm Perceptions and Attitudes of the Public

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Prior research shows that US Supreme Court rulings can shape the public's social norm perceptions, but the direction of the effect may depend on perceived public support for the opinion. In this study, we examine the impact of the 2023 US Supreme Court decision that banned race-based affirmative action in college admissions, a contentious policy with mixed support from the public. Using an interrupted time-series design (N = 2,694 white Americans) with four survey waves across four months, we show that after the decision, compared to before, respondents perceived Americans as less supportive of affirmative action, more racially resentful, and more racially colorblind. Subjective accounts of the public's reaction to the ruling moderated the effect on norm perceptions, such that the more perceived support for the decision, the greater the negative effect on perceptions of American support for affirmative action. The decision also influenced respondents' personal attitudes toward affirmative action, race, racism, and diversity, as well as their perceptions of the Court, but the direction of the effect differed by political party.

Public Responses to Organizational Narratives about Climate Change Commitments

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Understanding how publics interpret organizational climate signals is crucial since reaching global climate goals requires private sector actions. Across four studies, we examine corporate climate commitments and their effects on employee and public attitudes and beliefs. In Study 1, we use NLP methods to analyze reports from 34 financial organizations, revealing increased prominence of climate topics over time. In study 2, we analyze 338 climate commitments and find that firms become more concrete in their commitments over time, reflecting growing organizational ambition and accountability. In two conjoint experiments (N=2,522), we examine how features of commitments shape preferences and beliefs. Both employees and the public prefer policies with specific monetary and timeline information and from large organizations with environmental track records. These findings reveal how features of corporate climate commitments shape public responses and beliefs.

The Societal Signals Needed to Motivate Action on Societal Challenges

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Public response to social problems is guided by signals from many entities: the government, scientists, industry, and salient norms. How do these signals come together to mobilize public response to societal challenges related to climate change, health, and technology? Further, when people receive conflicting messages about what to do, do some entities, or combinations of entities, matter more than others? In two conjoint experiments (Ns = 1,500 & 2,000), and in one behavioral experiment (N = 1,600), we show the relative influence from government entities, experts and scientists, key stakeholders in industry, and public consensus (norms) in determining people's response to a variety of societal challenges. We also contrast types of signals from each entity, including support vs. opposition and actions vs. words. Across domains, we find that combining support from scientists and norms is especially influential in decision making, and motivates action even in the face of opposition from government and industry. We also find asymmetries such that support signals are more influential than opposition signals. We discuss implications for coalition building for major issues of the day.

Under Pressure: Tendencies and Tactics for Navigating the Social Hierarchy

9:30 AM – 10:40 AM | Location: E351, Level 3

NORMS AND SOCIAL INFLUENCE

Not everyone stands on equal ground—people vary in social status. When you are on the bottom of the heap, how do you connect with others and gain respect? This symposium shows how those with lower status climb the social ladder or ingratiate themselves with others. Paper 1 investigates popularity as a social hierarchy emerging in childhood. School-aged children think kids selectively copy popular kids, not all high-status kids. Paper 2 asks why low-status employees do not voice their opinions, suggesting it is because they see hierarchies as rigid barriers. Paper 3 probes people's beliefs about how those with less power negotiate better treatment. Specifically, people expect women and children to rely on indirect, emotional tactics. Finally, Paper 4 assessed the physiological attunement of lower- and higher- SES adults. How much is a person's physiological change predicted by another's? Lower SES adults demonstrated greater attunement to partners. Together, these studies illuminate the sophisticated behaviors used by people with lower social status and offer new insight into how the 99% maneuver and attempt to transcend social hierarchies (or why they sometimes choose to not).

“Cool” Sages: Social Influence is a Core Feature of Popularity

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

From classroom cliques to influencer culture, popularity is a potent form of social status that emerges early and persists into adulthood. Popular kids have been called “prestigious” because they are copied by peers (Cillessen, 2011), like prestigious leaders (Henrich & Gil-White, 2001). But most popular people have many positive traits (e.g., athleticism, wealth), making it unclear what drives their influence. Who do people copy: the fittest athlete, the richest magnate, or the most popular icon? In four preregistered studies (N=380), we isolated popularity from its confounds by presenting 5–10-year-olds with novel kids. Children compared a popular kid, who lacked a trait (athleticism in S.1, wealth in S’s.2-4) to someone who was not popular but had that trait. We asked, “Who do all the kids in the class copy?” Between ages 7-9, children chose the popular kid, not the athletic or rich kid. Specifically, they copy their style, not homework (S.4). We argue being copied is a defining feature of popularity, distinguishing it from other forms of social status. This early copying prepares them for the adult social world, with norms curated by powerful peers and influencers.

Motivated by Mutability: Mutability Perceptions and Low-Status Employees’ Status Pursuits

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Having low-status is an aversive experience. Low-status employees, then, should be particularly motivated to engage in behaviors that would enhance their status. A particularly salient way they could gain status in the workplace is through expressing organizational voice, or providing ideas and perspectives that are meant to enhance organizational functioning. However, the voice literature has consistently found that high-status employees express voice significantly more frequently than low-status employees. Consequently, low-status employees not only disengage from status competition but impair their organization from benefiting from their unique perspectives. We seek to reconcile this tension by developing theory on how status considerations instigate voice. Specifically, we anticipate that low-status employees’ reduced voice expression stems from beliefs that their voice will be less likely to result in elevated status – i.e., that the hierarchy is less (versus more) mutable. We test these predictions across four studies and discuss the theoretical and practical importance of our findings.

Stereotypes of Aggression May Track Reality Across Five Nations

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Aggression is widespread tactic used to gain, maintain, or negotiate status. Decades of aggression research reveal that men tend to use more direct, physical aggression than women, whereas both men and women use indirect tactics (e.g., gossip, exclusion). To navigate status conflicts, perceivers may benefit from holding somewhat accurate expectations (stereotypes) about the types of aggressive tactics others might be likely to use. Yet, little research has tested whether such stereotypes exist. Past work often centers physical aggression—neglecting (a) women’s strategies and (b) common low-cost responses like avoidance. We examined a broad range of aggressive and de-escalatory tactics (e.g., appeasement, deflection) across five nations (Argentina, Kenya, Nigeria, Ukraine, US; N=948), comparing people’s stereotypes (what tactics men vs. women are expected to use) with reality (what tactics male/female participants report). Data suggests (1) people expect and prefer low-cost avoidance tactics; (2) people possess sex-specific stereotypes; (3) stereotypes are sometimes accurate. Notably, stereotypes about men’s aggression were generally more accurate than those about women.

Socioeconomic Status Shapes Dyadic Interactions: Examining Behavioral and Physiologic Responses

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

With more opportunities for diverse interactions, little is known about how social interactions involving people of different socioeconomic status (SES) may unfold. We studied social attunement patterns in dyadic interactions involving high- and low-SES individuals. Unacquainted adults recruited from the community in the US interacted with similar-or different-SES partners in the lab (Ndyads = 130). Attunement was assessed throughout the interaction by examining physiological linkage—how much a person's physiological change is predicted by another's physiological change, over time. Overall, low-SES participants showed stronger physiological linkage—indicating greater attunement—to partners across SES. Participants also appeared more comfortable when interacting with low-SES partners. There were no SES differences in dominance during the conversation. Post-interaction, participants reported liking similar-SES partners more than different-SES partners. These patterns suggest that during interactions, lower-SES individuals are more "other-focused" than high-SES individuals, and ingroup preference prevails. We note limitations in the racial representation of our sample.

Using Social Network Approaches to Understand Social Connection Formation

9:30 AM – 10:40 AM | Location: E265, Level 2

BELONGING/REJECTION

Social connection is essential for health and wellbeing. However, real-world social environments present complex webs of ties with both opportunities and risks. Here, we showcase how social network approaches can offer new insight into how people navigate these environments to form connections. The 1st talk quantifies a novel construct of "social risk-taking," finding that students who are more open to uncertain interactions become more liked in their dorm network over time. The 2nd talk finds that students who exhibit early and accurate representations of their network's structure rise to more influential network positions over time. The 3rd talk examines how people generalize experiences of rejection and acceptance based on social network ties, leading them to approach or avoid novel individuals. Finally, the 4th talk identifies "neural homophily" as a precursor of bonding in networks: Strangers with synchronous neural responses to movies form closer friendships eight months later. Together, these talks offer new insight into how people form connections in complex social environments and highlight the value of examining psychological phenomena using social network approaches.

Quantifying the Value of Social Risk Taking

9:30 AM – 10:40 AM

BELONGING/REJECTION

Taking social risks, such as starting a conversation with a stranger or sharing vulnerabilities with a friend, is fundamental to building meaningful connections. Yet, many people avoid them, often at a cost of their wellbeing. The present study investigates why people avoid social risks and how these decisions relate to their positions in real-world social networks. Ninety-six first-year students from a larger social network sample (N = 990) completed a behavioral task designed to quantify the subjective value of social risk taking. We found that mood factors differentially shaped social risk avoidance: anxiety was linked to heightened threat perceptions of social risk decisions, whereas depression was associated with lower interpersonal trust. Moreover, individuals who were more willing to take social risks in the lab were more likely to be seen as well-liked in the community-nominated social networks. These findings provide new insights into how people navigate social uncertainty, and highlight social risk behaviors as a promising target for interventions aiming to strengthen social ties and promote belongingness.

Early Insight into Social Network Structure Predicts Gaining Social Influence

9:30 AM – 10:40 AM

BELONGING/REJECTION

While occupying an influential position within one's social network brings many advantages, it is unknown how certain individuals rise in social prominence. Leveraging a longitudinal dataset that tracks an entirely new network of college freshmen (N = 187), we test whether "climbing the social ladder" depends on knowing how other people are connected to each other. Those who ultimately come to occupy the most influential positions exhibit early and accurate representations of their network's general, abstract structure (i.e., who belongs to which communities and cliques). In contrast, detailed, granular representations of specific friendships do not translate into gains in social influence over time. Only once the network stabilizes do the most influential individuals exhibit the most accurate representations of specific friendships. These findings reveal that those who climb the social ladder first detect their emerging network's general structure and then fine-tune their knowledge about individual relationships between their peers as network dynamics settle.

Generalization of Rejection and Acceptance in Social Networks

9:30 AM – 10:40 AM

BELONGING/REJECTION

Social environments present opportunities for connection but also risks of rejection. How do people learn who will reject or accept them upon entering a novel environment? We propose that people use knowledge of social network ties to infer who will likely accept or reject them. We designed a paradigm where participants experienced rejection and acceptance within an artificial group, learned network ties among members, and decided whom to approach in a new task. Studies 1-2 found participants generalized rejection and acceptance by avoiding individuals socially closer to the rejector and approaching those closer to the accepter, forming gradients of avoidance and approach based on network distance. Study 3 found stronger generalization when networks reflected friendship vs. randomly assigned ties, suggesting partner choices depend on inferences about meaningful relationships rather than associative learning alone. Finally, a longitudinal study extended these findings to real-world networks, revealing similar generalization patterns in college organizations. Together, these findings inform the cognitive processes that help humans adaptively form connections in social environments.

Neural Similarity Predicts Whether Strangers Become Friends

9:30 AM – 10:40 AM

BELONGING/REJECTION

What determines who becomes and stays friends? Recent work used neuroimaging to detect similarities among friends by capturing how they process the world around them. However, given the cross-sectional nature of past research, it is unknown if neural similarity is the cause or consequence of friendship. Here, we show that similarities in neural responses to movie clips predicted proximity in a friendship network eight months later. We also examined changes in distances between participants in their social network between two months and eight months after meeting one another. Compared to people who drifted further apart, people who grew closer over time were more neurally similar as strangers. Thus, later-emerging and longer-lasting friendships may be rooted in "deeper" interpersonal compatibilities that are indexed by pre-existing neural similarities. The localization of these results suggests that preexisting similarities in how people interpret, attend to, and emotionally respond to their surroundings facilitate future friendship. These results provide evidence for neural homophily, such that pre-existing neural similarities may foster friendship and increased social closeness.

Mindworks: The Science of Thinking, A Chicago-only Experience During SPSP 2026

11:00 AM – 5:00 PM | Location: Offsite

Mindworks is a public-facing discovery center and active behavioral research lab in downtown Chicago, approximately a 15-minute ride from the convention center. Operated by the Roman Family Center for Decision Research at the University of Chicago Booth School of Business, Mindworks invites visitors to explore how people think and decide while participating in real studies that advance behavioral science. Participation in these studies helps researchers better understand human behavior, while participants earn prizes and contribute to advancing science.

Drop in on your own (hours listed here: <https://www.chicagobooth.edu/mindworks/visit>). A visit to Mindworks lasts about 30 to 60 minutes, depending on how many studies you'd like to take.

Boxed Lunch Pick-up (pre-registration required)

12:00 PM – 2:00 PM | Location: Exhibit Hall D1, Level 3

Lunch will be served in the Exhibit Hall. Seating is available in the Exhibit Hall, Cafe on Level 3, and the Lobby on Level 2. Boxed Lunch Options (first come, first serve) *V = Vegetarian | VG = Vegan | GF = Gluten Free | DF = Dairy Free (sauces on the side)

oThai Rice Noodle Salad: Grilled Chicken Breast, , Rice Noodles, Red Bell Pepper, Carrots, Cucumber, Mixed Greens, Spicy Peanut Sauce

oHam and Smoked Gouda: Smoked Ham, Smoked Gouda, Dijon Mustard-Aioli, Flaky Croissant

oThai Noodle Salad - No Chicken(VG | GF | DF): Rice Noodles, Red Bell Pepper, Carrots, Cucumber, Mixed Greens, Spicy Peanut Sauce

oRoasted Vegetable Wrap with Gluten Free Wrap (V | GF): Roasted Red Peppers, Zucchini, Eggplant, Red Onion, Fresh Mozzarella, Basil Pesto

Professional Headshots at the Convention

12:00 PM – 5:00 PM

Elevate your professional profile with a high-quality headshot—right at the convention! This opportunity is especially valuable for students and early-career researchers looking to refresh their CVs, websites, LinkedIn profiles, or job-market materials.

Details:

- **When:** Friday, February 27 from noon–5:00 pm
- **Cost:** \$50 per headshot
- **Availability:** First come, first served
- **Payment:** Credit card only, accepted onsite

Don't miss this chance to leave the convention with a polished, professional image that reflects your work and career goals. All headshots will be delivered electronically to your email.

Student Mentoring Event

12:30 PM – 1:30 PM | Location: Lakeside Ballroom E354B, Level 3

Pre-registration required. [SIGN UP HERE](#)

The SPSP Student Committee offers several mentoring opportunities designed specifically for undergraduate and graduate students. These events provide a supportive, small-group environment where students can connect with experienced scholars, advanced trainees, and peers to discuss academic pathways, career development, identity and inclusion, and professional growth within social and personality psychology.

Student mentoring events foster networking, community building, and candid conversations about navigating graduate school and early professional decisions. All student mentoring events require pre-registration, and space may be limited.

[1] Group-Based Medical Mistrust, Race, and Colorectal Cancer Screening: A Multi-Group Probit Path Analysis

12:45 PM – 1:45 PM

INTERGROUP RELATIONS

Group-based medical mistrust (GBMM: the belief that one's racial/ethnic group is treated unfairly in medical contexts), is a key barrier to health engagement and outcomes. The present study examines whether and how perceptions of mattering to one's doctor - i.e., an individual's sense of being important and significant to his or her doctor - in conjunction with health insurance status are related to three dimensions of GBMM (Lack of Support, Suspicion, and Group-based Disparities). A diverse sample of American adults (N = 2,162) completed the GBMM scale (Thompson et al., 2004), a validated measure assessing mattering to doctors, and reported their primary source of health insurance (grouped into no insurance, public insurance, and private insurance for analyses). We will use moderation and mediation analyses to explore two hypotheses. Our moderation hypothesis proposes that a negative association between mattering and reported GBMM will decrease as we progress from having no insurance to public insurance to private insurance). Our mediation hypothesis proposes that the relationship between health insurance and GBMM will be mediated by mattering such that those with private insurance (compared to public and no insurance) will have a higher perceptions of mattering and thus a lower GBMM.

[2] "Dr. ChatGPT, what can I do to improve my health?": Exploring the Role of Citation Quality in the Perception of AI as a Source of Health Information.

12:45 PM – 1:45 PM

PHYSICAL HEALTH

As more people turn to AI for health information, understanding how such a source is perceived is critical (Lund et al., 2025). This study explored factors shaping perceptions of health messages attributed to ChatGPT, specifically compared to traditional sources. Across two studies (n = 658), participants consistently rated ChatGPT-attributed messages less positively than those to doctor. In study 1, personalization did not enhance perceived message effectiveness and source credibility when messages were from ChatGPT. In study 2, citation characteristics (relevant, irrelevant, none) of ChatGPT had no effect on perceived message effectiveness. However, ChatGPT was rated more credible when relevant citations were included (vs. none), though irrelevant citations made no difference. This effect was moderated by media health literacy: only participants with higher media health literacy were sensitive to citation relevance, rating relevant citations more credible than irrelevant and no citations. Overall, findings show that low perceived credibility may limit AI's effectiveness in health communication, and that personalization and relevant citations may, at present, do little to help.

[3] "Joint Effects of Psychosocial and Health Indicators on Cognitive Development: Gender-Stratified Associations in Pre-Adolescents"

12:45 PM – 1:45 PM

GENDER

Multiple psychosocial and health indicators shape cognitive development, yet most studies examine exposures individually. The present study (n = 8,152; ages 9–12) modeled the joint effects of 22 psychosocial and health indicators on cognition, testing for gender-specific patterns. Use of Group Factor Analysis yielded five latent domains: economic security, perinatal health, parent ecology/ACEs, school/community, and physiological health. Gender-specific Structural Equation Models (MLR estimator) tested associations between five latent factors and NIH Toolbox composite scores for fluid and crystallized cognition and their subtests, covering a broad range of cognitive domains. All five factors were significant predictors of both fluid and crystallized cognition for boys and girls, except parent ecology/ACEs, which was nonsignificant for both composite scores in boys and for girls' crystallized scores, suggesting delayed effects. Subtest associations were generally similar across genders or stronger in girls, indicating greater environmental sensitivity. Findings highlight gender differences in cognitive sensitivity to psychosocial and health factors, informing targeted interventions.

[4] Perceiving Bias from Humans and AI: Reactions of Minorities to Discrimination during an Ultimatum Game

12:45 PM – 1:45 PM

SOCIAL JUSTICE

Use of generative AI platforms (e.g., ChatGPT) for health advice is rapidly increasing. While there is potential for generative AI to increase access to health information, it can provide inaccurate, potentially biased or stigmatizing responses. This is amplified for people with identities or conditions that are socially devalued. In this exploratory work, we aimed to characterize the language ChatGPT uses to provide information and advice about new medications such as GLP-1 and conditions (diabetes) and identities (gender) with intersecting stigmas. During 10-turn conversations, we had 35 hypothetical ChatGPT users of varied gender identities ask if they should use GLP-1 agonists for managing type 2 diabetes. We then conducted a thematic analysis on conversations with two rounds of qualitative coding and expert review. Coding is ongoing but will be completed by the conference. Preliminary results from 28 coded conversations suggest responses contained phrases that evoked implicit weight stigma (88 codes) and gender-based stigma (9 codes). Interestingly, ChatGPT also called out societal stereotypes (7 codes), suggesting dissonance between ChatGPT's awareness and use of language.

12:45 PM – 1:45 PM

PHYSICAL HEALTH

Most psychosocial research on Muscular Dystrophy (MD) has used qualitative interviews and self-report survey assessments of quality of life (QoL), showing that MD patients have lower QoL. However, less is known about the risk and protective factors for QoL in MD. This study aims to identify concerns for people within the MD community through a linguistic content analysis.

We analyzed posts from an online MD subreddit, selecting every 10th post (through post 200) when flittering by top of all time. Posts were cleaned and then analyzed using a linguistic content analysis program (LIWC), which has been validated for psychological and health contexts.

Compared to typical reddit posts, MD subreddit posts contained significantly more mentions of health, illness, substance use and expressed significantly more anger.

This study is a meaningful step forward towards understanding what people in the MD community deem important and learning what factors may be contributing to lower QoL in this population. Future research should continue to explore the biopsychosocial factors which lead to lower QoL for MD patients, in the hopes of identifying targets for resilience in this population.

[6] Ethnic Ingroup Identity in the Sympathetic Perception of Protestors

12:45 PM – 1:45 PM

INTERGROUP RELATIONS

When sympathy affects how the public and the media legitimize a protest, it matters how third parties perceive protestors from a political standpoint. The current study proposes an explanation rooted in Social Identity Theory: through the identification of shared characteristics—such as ethnic features—protestors are designated as either ingroup or outgroup members. With the contentious nature of violent protests affecting sympathy towards protestors, the current study hypothesizes that ingroup favoritism will thus affect the perception of the severity of the violence, which mediates how sympathetic participants feel towards the group of protestors. Using a vignette experimental design, non-Hispanic White-American participants (N=823) were randomly assigned to read an article about a protest led by either White or Black protestors that began peacefully but escalated into violence. Participants were hypothesized to perceive ingroup (White) protestors more favorably: expressing more sympathy, demanding more accountability for them, and being more likely to describe them with positively connoted words, compared to outgroup (Black) protestors. Results showed that ethnic congruence between the participants and the protestors in the article only directly affected accountability—with participants more likely to demand accountability for Black protestors. The mediation analysis showed that perception of violence mediated accountability but only indirectly affected sympathy. These findings imply that while ethnic identity may not directly induce sympathy, it may influence cognitive judgments of justice and spur people to action. Future directions for the study include improving the construct validity and broadening the scope of the research to include other ethnic groups.

[7] A mixed-methods study of multiply marginalized women: Daily discriminatory experiences across transgender status and racial identity

12:45 PM – 1:45 PM

GENDER

Transgender women of color experience high rates of discrimination in the U.S. Yet, limited research has observed how they respond to everyday experiences of discrimination. To bridge these gaps in literature, the present study explored the discriminatory experiences of transgender women of color in comparison to cisgender women of color and white transgender women, N = 100. Through a mixed-method analysis, we examined how women with multiple marginalized identities reacted and responded to discrimination based on their perceived social support, social isolation, frequency of discrimination, and harm from discrimination. Results revealed that overall, most women did not confront regardless of our measures (e.g., social support). Furthermore, majority of the women (62%) were discriminated against in public by strangers. However, if the perpetrator was someone whom they had an established relationship with (e.g., family), the victims were more likely to verbally confront. Future work can explore more on how those with multiple marginalized identities navigate unsafe spaces through an intersectional approach.

[8] A Social Dance Intervention to Alleviate Depression in Young People: The Oxford SOMA Study

12:45 PM – 1:45 PM

MENTAL HEALTH/WEELL-BEING

Background

Depression, a predominant public health concern, is highly prevalent among young people. Despite this, relatively few treatments specifically target this critical developmental period, and under-addressed mental health difficulties in youth often have lifelong consequences. Social isolation is commonly reported by young adults and is both a risk and maintenance factor for depression. There is a need for accessible, engaging interventions that can reduce depressive symptoms and improve social connectedness.

Methods

Building on evidence of the therapeutic potential of social dance-based activities for depression, this randomized controlled trial evaluated the efficacy of an eight-week salsa dance intervention for young adults (aged 18-24) with mild-to-moderate depression. 121 participants were randomly assigned to either the salsa dance group or a waitlist control. Participants completed the Patient Health Questionnaire (PHQ-9) and additional mental health questionnaires and task-based measures at baseline, during, and after the intervention.

Results.

Participants in the salsa dance condition showed a clinically meaningful reduction in depressive symptoms compared to the waitlist condition. The size of this effect exceeded the NICE criterion for clinical significance with large within- and between-group effect sizes. While both groups reported improvements in social anxiety, generalized anxiety, loneliness, and daily mood, salsa participants had significantly greater reductions in social anxiety and greater improvements in daily mood.

Conclusions.

These findings support the potential value of social dance as a novel, accessible intervention for depression in young people. Implementing such programs as part of a suite of wellbeing-oriented interventions to university students and in non-clinical wellbeing settings could provide cost-effective mental health benefits.

[9] A within-subjects experiment of the effects of social facilitation on food-related emotions

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

The social facilitation of eating is the tendency to eat more foods high in fat, sugar, or salt (HFSS) when eating with familiar co-eaters. Does social facilitation also affect food-related emotions? We conducted a preregistered, within-subjects experiment ($n = 91$) where participants read vignettes about eating with a large and small group of friends, a romantic partner, and alone and reported their anticipated emotions. Co-eaters were described as eating HFSS. Contrary to our hypothesis, when imagining eating HFSS with a large group of friends co-eating HFSS, participants expected they would feel less positively than eating HFSS alone (Bonferroni-adjusted $p = .003$). Consistent with our hypothesis, when imagining eating fruit and vegetables with a large group of friends who were eating HFSS, participants expected they would feel more negatively than eating fruit and vegetables alone (Bonferroni-adjusted $p = .003$). Imagining eating with a small group of friends or a romantic partner had no effects. Eating with a large group of friends who are eating unhealthily may inhibit emotional rewards if eating unhealthily too but lead to "fear of missing out" if eating healthily.

[10] ADHD Moderates the Relationship Between Emotional Dysregulation and Problematic Internet Use

12:45 PM – 1:45 PM

GENDER

Technology use is rapidly increasing and as a result, so is the prevalence of excessive or unhealthy internet use. Problematic Internet Use (PIU) has been found to be positively associated with emotional dysfunction, as well as ADHD, and is more common in males than females. Because of this, past literature often proposes that because males typically have less emotional regulation than females, males with ADHD should be at the highest risk for PIU. However, there is a possibility that due to the interaction between biological sex and ADHD, females with ADHD may struggle more with emotional dysregulation and PIU than previously believed. The present study assessed the differences in emotional dysregulation and PIU across four groups (ADHD female, non-ADHD female, ADHD male, and non-ADHD male). Emotional dysregulation and PIU were positively associated in the overall sample. Females with ADHD scored the highest on PIU and emotional dysregulation measures out of the 4 groups, followed by males with ADHD, males without ADHD, and lastly, females without ADHD. Females with ADHD were found to have significantly higher emotional dysregulation and PIU compared to females without ADHD.

[11] Age, death-related concern, and religious faith among believers and atheists: Large samples from the World Values Survey

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Prior work finds death-related concern motivates religious faith among believers but not atheists, yet it remains unclear whether age might impact that relationship. A set of four pre-registered studies used data from the World Values Survey to test a set of competing hypotheses among believers and atheists: 1) death-related existential concern (DEC) is not associated with faith regardless of age; 2) DEC is associated with faith regardless of age (age-universal perspective); 3) the DEC-faith relationship weakens with age (age-mitigated perspective); and 4) the DEC-faith relationship strengthens with age (age-amplified perspective). Among religious believers, in Studies 1 ($N = 105,586$; 79 nations; ages 16-103, $M = 42.60$, $SD = 16.68$) and 2 ($N = 39,570$; 34 nations; ages 16-100, $M = 44.42$, $SD = 17.43$), DEC was associated with faith regardless of age. Among atheists, in Studies 3 ($N = 10,368$; 64 nations; ages 16-95, $M = 42.61$, $SD = 16.59$) and 4 ($N = 2,343$; 34 nations; ages 17-93, $M = 37.92$, $SD = 15.58$) DEC was not associated with faith regardless of age. These data are consistent with the idea that DEC motivates religious faith among believers, but not atheists, regardless of age.

[12] AI Mind Perception and Meaning in Life: A Cross-Cultural Test of a Competing-Pathway Model of Empowerment and Threat

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

AI is rapidly acquiring qualities we once considered uniquely human, and its capabilities are advancing at an unprecedented pace. Before AI achieves strong intelligence and while we still have the ability to guide and adjust its development, it is crucial to understand how its progress impacts human well-being. A fundamental question remains: how does perceiving mind in AI influence a person's sense of Meaning in Life (MIL)? This research proposes and tests a model where high-mind AI can enhance MIL by fostering a sense of empowerment, while simultaneously undermining it by evoking realistic and symbolic threats. Across four studies (N = 2100), we first established the model's core correlations and causality in a Chinese context (Study 1, 2a, and 2b), and then confirmed its cross-cultural generalizability with an American sample (Study 3). The positive pathway through empowerment was robust across both cultures. Conversely, a negative pathway via realistic threat also emerged, particularly when Chinese participants perceived AI as highly experiential. These opposing forces often suppressed each other, explaining the complex and sometimes null overall effect of AI mind perception on MIL. Our findings reveal a nuanced framework where the psychological impact of AI depends on the specific mind dimension perceived (agency vs. experience) and cultural context (China vs. America), offering crucial insights for designing human-centric AI that maximizes empowerment while mitigating existential threats.

[13] AI Reliance and Executive Functioning

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

This study investigates the relationship between artificial intelligence (AI) reliance and executive functioning among individuals from marginalized communities. As AI becomes increasingly embedded in daily life, reliance on such technology may interact with core cognitive processes such as planning, attention, and decision-making. Using a cross-sectional, correlational design, participants will complete validated self-report measures assessing AI reliance and executive functioning. The study hypothesizes that higher reliance on AI will be associated with lower levels of executive functioning, reflecting potential over-dependence on technology for cognitive tasks. A mixed-methods approach will be used, combining quantitative surveys to capture measurable patterns of AI reliance and cognitive ability with qualitative interviews to explore participants' lived experiences and perspectives on technology use. By integrating cognitive and sociotechnical perspectives, this study aims to expand understanding of how AI shapes human functioning, particularly in populations that are often underrepresented in psychological research. Findings from this research may inform interventions, policies, and digital literacy efforts that promote healthier relationships between technology and cognition.

[14] Applying the Tripartite Influence Model to Fasting in Undergraduate Students

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

The Tripartite Influence Model proposes that three sociocultural appearance pressures (i.e., peers, family, and media) contribute to body dissatisfaction and disordered eating through internalization of the thin ideal. This model has yet to be applied to fasting behaviors, which increase the developmental risk for eating disorders. Female undergraduate students (N=455) completed a cross-sectional survey including the SATAQ-4 and the EDE-Q 6.0. The sample was restricted by sex to align with prior measure validation. Multiple regression tested the direct associations of each pressure with fasting frequency, and Hayes' (2022) PROCESS model 6 examined whether internalization and body dissatisfaction explained the effects, consistent with a modified pathway of the Tripartite Influence Model. Peer and media pressures were directly associated with fasting ($p=.002$ and $p=.001$, respectively), while family pressure was nonsignificant ($p=.433$). Serial mediation models revealed that media and family pressures were associated with fasting indirectly via internalization and body dissatisfaction, whereas peer pressure was only associated with fasting directly, independent of established pathways.

[15] Are Methods Created Equal? Psychology methods courses signal field-specific values

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Underrepresented undergraduates (UGs) may view psychology's use of quantitative (over qualitative) work relying on p-values above or below an arbitrary threshold as preventing a nuanced study of identity and intersectionality, lowering motivation to persevere. We study the frequency and outcomes of training UGs in both methods. Study 1 analyzed 800 psychology department websites to see if UGs are differentially exposed to both methods at the top 200 US and world universities; liberal arts colleges and psychology programs. As predicted, more programs offered quantitative (over qualitative) courses in all 4 groups; coding of program goals supported this. Given this difference, do UGs value quantitative over qualitative work? In Study 2, 120 UGs reading a quantitative abstract viewed it as more similar to psychology research writ large than those reading a comparable qualitative abstract. Abstracts' perceived representativeness of psychology was predicted by ratings of the research as scientific, rigorous and theoretical; and researchers' competence and ability. We discuss how curricula may signal psychology's values, shaping underrepresented UGs' motivation to persevere in the field.

[16] Assessing People's Perceptions of Domestic Climate Migrants

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

As the effects of climate change worsen, there is a need to understand how changes in the environment will impact human behavior, like climate migration (i.e., the movement of people because of a change in their local environment due to climate change). When people migrate to a new region, established residents may feel pressured to compete with climate migrants over community resources. Perceived competition may lead residents to view climate migrants as threatening. When threatened, community members may dehumanize climate migrants and become less willing to help. We conducted a study investigating how the realistic and symbolic threat of climate migration may lead people to dehumanize and oppose helping climate migrants. Analyses demonstrated that increased realistic and symbolic threat were associated with increased dehumanization of climate migrants, and increased dehumanization was associated with less willingness to help (significant indirect effects for both realistic and symbolic threat). Our study provides a first step toward understanding the factors that impact people's willingness to help climate migrants.

[17] Associations of Air Pollution and Socioeconomic Deprivation with Depression and Pain

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Air pollution and socioeconomic deprivation have been independently associated with negative health outcomes. This study examined the joint influences of air pollution and individual- and neighborhood-level deprivation on depression and pain. 1113 adults (aged 18-88 years) completed surveys about their mental and physical health and living environment. Participants' geocoded addresses were used to obtain their long-term average exposure to PM2.5 and their neighborhood's socioeconomic status and resource access via the Area Deprivation Index (ADI). We found significant age interactions with PM2.5 and several deprivation indicators. Individual- and neighborhood-level deprivation on their own significantly predicted experiences of depression and pain. We also found that relative deprivation, the measure of an individual's socioeconomic deprivation compared to their neighborhood, was significantly associated with both depression and pain. These findings are important to understanding the impacts of environmental stressors, particularly on the aging population, which may contribute to improved interventions and public policy targeting detriments on human health.

[18] Authentic Reappraisal: Understanding the Impact of Trait Authenticity on Cognitive Reappraisal in Everyday Life

12:45 PM – 1:45 PM

SELF-REGULATION

Authenticity plays an important role in self-regulation and decision making (Sedikides & Schlegel, 2024). Research has shown that authenticity is positively associated with several adaptive self-regulating behaviors (Kernis & Goldman, 2006; Li et al., 2023) and negatively associated with maladaptive coping strategies (Kernis & Goldman, 2006; Vess, 2022). The current research tests the relationship between trait authenticity and use of cognitive reappraisal (i.e., reframing an event to reduce the emotional impact) in response to daily stressors. A community sample of adults (N = 203) age range 18 - 55 completed a two-week experience sampling study wherein they reported emotional states, appraisals, and emotion regulation in response to stressful events. Furthermore, participants were trained and instructed to use cognitive reappraisal in response to daily stressors. Using multilevel modeling, we will test if trait authenticity predicts reappraisal use, effort, and perceived success in response to daily stressors. These findings will provide novel insights into the relationship between authenticity and emotion regulation.

[19] Avoiding personalized melanoma risk: Health cognitions, coping resources, and math

12:45 PM – 1:45 PM

PHYSICAL HEALTH

People may avoid learning their disease risk, such as when they feel threatened, lack coping resources, or feel unable to understand the information. We predicted that coping resources, melanoma-related health cognitions, and math factors would influence avoidance of personalized melanoma risk estimates. Participants (n = 940, 49.5% male, 73.8% White)—recruited via Prolific—completed self-report measures of coping resources (implicit theories of health, health self-efficacy, optimism, spontaneous self-affirmation), melanoma beliefs (perceived susceptibility, severity, worry), and math factors (attitudes, ability). Participants then completed a melanoma risk calculator and decided whether they wanted to learn their risk. Few respondents (15.5%, n = 146) avoided learning their risk. In regressions controlling for sociodemographic factors, participants who reported lower spontaneous self-affirmation, believed melanoma was less severe, or who had more negative math attitudes were more likely to avoid versus learn information. No other factors were associated with avoidance. Further understanding who avoids personalized health information can inform interventions to reduce avoidance.

[20] Awe and Psychological Richness

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

The emotion of awe is psychologically and physically impactful. Among those impacts are benefits for well-being. A new facet of well-being, psychological richness, has been found to have an association with awe. This study aims to empirically prove that experiencing awe causes increased psychological richness more than any other facet of well-being. A 3 (condition: awe video, happiness video, control) x 3 (psychological richness, meaning in life, life satisfaction) mixed-subjects design with 100 participants per condition is utilized to test this. We will be conducting a 3 X 3 mixed-model ANOVA followed by pairwise tests to evaluate the data. We hypothesize that psychological richness will be significantly higher for participants in the awe video condition than the control condition. We also expect that within the awe condition, psychological richness will be significantly higher than meaning in life and life satisfaction, whereas in the happy video condition, life satisfaction will be significantly higher than meaning in life and psychological richness. These results would further substantiate how psychological richness is distinct from other facets of well-being.

[21]Avoidant Traits and Alcohol Abuse

12:45 PM – 1:45 PM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Growing evidence demonstrates that the Big Five personality traits tend to cluster spatially within countries, and that these regional patterns are linked to consequential social, economic, and health outcomes. However, most such research has focused on Western settings, leaving a gap in the understanding of non-Western regional personality variations and their societal impact. To remedy this, the current study combines aggregated Big Five personality data across 26 provinces in China, based on a large dataset from the China Family Panel Studies (N = 37,104), and diverse societal indicators, such as innovation, marriage rates, and life expectancy. The data collection is completed, and analyses (i.e., spatial regression, conditional random forests, and SHAP analysis) are currently underway. Based on prior research, we expect regional differences in personality across China and significant associations with key societal outcomes. Taken together, this research offers insights into how regional personality influences macro-level societal outcomes in China and serves as a cross-cultural replication of previous studies in an Eastern context.

[22] Being Present: Witnessing Landmark Historical Events Boosts Meaning in Life

12:45 PM – 1:45 PM

MENTAL HEALTH/WEILL-BEING

Although not everyone shapes history, everyone is present as it unfolds. Traditional perspectives often emphasize a retrospective, macro-level view of landmark historical events, distancing them from personal significance. In this research, we locate individuals in the ongoing process of history, examining how linking personal narratives to broader historical narratives fosters meaning in life (MIL). Specifically, we hypothesize that witnessing history (i.e., viewing oneself as a witness to history by being aware of and reflecting on significant historical events) enhances the presence of meaning and the search for meaning, separately through connectedness to history and a broadened perspective.

We examined our hypotheses through five methodologically diverse studies. In Study 1, we utilized big data analytics, processing 2,317,527 Weibo posts. We found that people who felt they were witnessing history about Queen Elizabeth II's death (vs. those who did not) used more meaning-related words during the event explosion phase, suggesting a deeper contemplation of MIL. In Studies 2-5, we separated the presence of and search for MIL, using experimental design to examine causality and a field study to assess ecological validity. We found that witnessing events of historical significance enhances the presence of and search for MIL, whether manipulated by recalling historically significant events (Study 2), framing an event as historically significant (Studies 3-4), or visiting a historical site (Study 5). Throughout Studies 2-5, we also consistently found that connectedness mediated the effect of witnessing history on the presence of MIL, and a broadened perspective mediated its effect on the search for MIL.

In conclusion, this research bridges macro-level historical narratives and micro-level personal narratives, revealing that even without being a prominent figure in history, perceiving oneself as a witness to historical events can imbue one's life with meaning.

[24] Beliefs about Suffering, Psychological Well-being, and Reactions to Intergroup Conflict

12:45 PM – 1:45 PM

MENTAL HEALTH/WEELL-BEING

People's beliefs about suffering likely play a role in how they cope with life's inevitable challenges. In four studies, we examined the relationships between beliefs about suffering and psychosocial well-being, responses to hypothetical and actual suffering experiences, and attitudes toward an outgroup during conflict. Results showed college undergraduates who perceived their problems to be common were less upset by them. U.S. adults who perceived similar amounts of suffering in their own and others' lives and who viewed suffering as enriching (i.e., unpleasant but potentially meaningful) had better psychological adjustment and more adaptive responses to hypothetical challenges. Jewish Israeli participants with an enriching view of suffering reported better mental health, acknowledged Palestinian suffering more, and preferred peaceful resolution to the Israeli-Palestinian conflict. Believing that suffering is common and multi-faceted is associated with adaptive responses to challenges.

[25] Beneath the Surface: What's Really Driving You?

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Recently, research on religiosity has shown inconsistent relationships with flourishing during emerging adulthood (18-25 years). While this may be due to decline in religious participation, Christianity still remains the most common religion within the emerging adult population. A common concept found within Christianity is the seven vices (i.e., anger, envy, pride, sloth, lust, greed, gluttony), which are seen as behaviors meant to be avoided in order to live a fulfilling Christian life. The goal of this study was to explore how religiosity was related to flourishing in emerging adults while testing the mediation of engagement in the seven vices. While the three assessed religiosity variables were positively correlated with each other, path modeling revealed that intrinsic religiosity was negatively related to flourishing and use of the vices significantly mediated the relationship between non-organizational religious activities and flourishing. These findings contribute to a research plan aimed at identifying the importance religion might hold within the flourishing of emerging adults, and additional insights will be shared.

[26] Beyond Benevolence: How Altruistic Acts Can Trigger Psychological Distress—Findings from an RCT

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Background: Emerging evidence indicates that anxiety stems from control discrepancy—the gap between perceived and desired control. Sociocognitive appraisals (felt social and consequential responsibility) may induce perceived over-control, triggering distress via altruistic and anticipatory guilt. Trait compassion and psychopathy act as mediators, amplifying or attenuating these effects. Method: 576 community adults (M age = 41.6; 53% women) completed baseline measures of state anxiety, control discrepancy, compassion, and psychopathy. In a staged grant-allocation task, they were randomized to either sole decision-maker or advisory-only conditions and then selected which of three applicants would receive funding. Data Analysis: Linear mixed models and structural equation models were used for hypothesis testing. Results: Felt social and consequential responsibility increased perceived over-control, which indirectly elevated state anxiety via combined altruistic and anticipatory guilt. Higher trait compassion strengthened these indirect effects, whereas higher psychopathy weakened them. Conclusions: These findings identify sociocognitive and personality-driven mechanisms by which control discrepancy fosters anxiety, suggesting nuanced targets for prevention and intervention.

[27] Beyond Parasocial: Constructing A New Scale

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

One-sided bonds with public figures as well as those involving perceived face-to-face contact with them are termed parasocial relationships and interactions, respectively. However, recent increases to media richness improves individuals' capacity to transmit social information to their audience and vice versa. Given this change, the separation of relationships from interactions does not reflect today's experiences on social media, necessitating a new construct—quasisocial engagement. Quasisocial engagement likely reflects dimensions of likability, interdependent identity, and need fulfillment as indicated by 13 subdimensions. As a first step toward establishing a measure of quasisocial engagement, we sampled adult social media users (n = 182) to explore items generated using existing social and parasocial phenomena. Exploratory factor analyses combined with VSS, PA, and MAP analyses suggested an eight-factor model as the most parsimonious solution. The top three items per factor will be retained for a follow-up CFA. Full results, interpretations, and limitations will be discussed.

[28] Beyond the Binary: The Role of Warmth in Shaping Attitudes Toward Androgynous Faces

12:45 PM – 1:45 PM

GENDER

According to the Stereotype Content Model, social perceptions are guided by dimensions of warmth and competence. We applied this model to the context of gender perception, examining how gender presentation (androgynous vs. gender-matched faces) and perceived warmth shape partner evaluation. In a sample of 250 college students, participants were shown photos depicting either an androgynous or gender gender-matched face, selected one as their preferred partner, and then rated their attitude toward the chosen partner. Among female participants, a significant interaction emerged ($p = .03$). At high warmth, androgynous targets were evaluated more positively than female targets, whereas at low warmth, female targets were evaluated more positively. Among male participants, warmth consistently predicted positive attitudes ($p < .001$) regardless of target gender presentation. These findings suggest that warmth can buffer the ambiguity of androgynous identities and highlight the role of perceiver gender in shaping partner evaluations.

[29] Beyond the Borders of Wellbeing: Network Analyses Reveal the Fuzzy Boundaries Between Wellbeing Domains

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Understanding what constitutes a good life is central to psychological research, yet wellbeing models remain contested with respect to their structure and borders. We employ a network approach to investigate how wellbeing dimensions interrelate and whether they form distinct or overlapping constructs. Using a large, population-based sample from the European Social Survey ($N = 45,122$; 29 countries), we identified strong links between a broad range of wellbeing indicators across different theoretical domains. Community detection revealed six empirical clusters that partially align with existing distinctions (e.g., hedonic versus eudaimonic wellbeing). However, we also identified 11 indicators belonging to multiple clusters, demonstrating the fuzzy boundaries between wellbeing domains. These results highlight the need for integrative frameworks that better capture the interconnected nature of wellbeing. Our findings encourage more granular analyses and underscore the need for comprehensive measurement tools to advance wellbeing research, inform policy, and guide public health efforts.

[30] Beyond the Self: Investigating the Psychological Benefits of Mystical Experiences

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Mystical experiences, characterized by a profound dissolution of self and a sense of interconnectedness with all existence, are surprisingly common and often ranked among the most meaningful events in a person's life. Prior research links these experiences to enhanced well-being, yet the psychological mechanisms driving these benefits remain unclear. Existing studies frequently rely on retrospective reports of naturally occurring mystical experiences, limiting causal inference. To address this gap, the present study examines the effects of experimentally priming a recalled mystical experience. Using a between-subjects design, participants were assigned to one of three conditions: recalling a prior mystical experience, recalling an ordinary life event, or recalling an event without prior mystical experience. We hypothesized that participants primed with a mystical experience would report higher levels of well-being compared to the other groups. This research investigates the psychological benefits of mystical experiences as a promising tools for enhancing mental health and well-being.

[31] Beyond Utility: How People Engage Existential Questions

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

How do people engage with "life's big questions", such as those on meaning in life? Our studies ($N = 1300$, U.S. adults) examined questions and answers people expect for existential versus material or emotional well-being issues. Study 1 ($N = 600$) coded peoples' top questions on meaning—a typical existential topic, finding that it elicited more philosophical (61%) than scientific or practical questions, more so than financial success or happiness did. Study 2 ($N = 300$) found that to answer existential questions, people expected approaches to feature perspective stimulation and novelty of ideas more than practical utility (Kruskal-Wallis $H(2) = 51.33$, $p < .001$). Philosophical approaches were seen as featuring these factors (M novel = 73.70, M stim = 68.10) more than the scientific or practical (all $p < .001$). Study 3 ($N = 400$) found most people (68%) believed that, when scientific methods (e.g., in psychology) are tailored to feature these factors, they too can help in answering existential questions. Results suggest individuals prioritize conceptual enrichment over practical tips for existential issues, informing future study of existential cognition in satisfying existential needs.

[32] Body Dissatisfaction and Attention to Celebrity Culture on Social Media is Linked to Interest in Seeking Ozempic for Weight Loss

12:45 PM – 1:45 PM

GENDER

Objectification theory (Fredrickson & Roberts, 1997) and the tripartite model (van den Berg et al., 2002) are helpful for explaining why people seek GLP-1 weight-loss drugs such as Ozempic to modify their appearance. We hypothesized that women who consume media that promotes the use of GLP-1 drugs, combined with a high body dissatisfaction, are less concerned about the risks Ozempic poses and more interested in using them for appearance-related motivations rather than health-related motivations. Women (N = 335) from an online panel service completed validated scales of body satisfaction, social attitudes towards appearance, attitudes toward celebrity media. Furthermore, we altered an interest in cosmetic surgery measure to assess different reasons for interest in weight-loss drugs, which revealed that sociocultural pressures and body image were linked to this interest. The findings highlight the key role that appearance-based concerns play in shaping the high demand for these GLP-1 drugs, and the importance of monitoring the effects of using these drugs for body modification.

[33] Body Image and Perceived Desirability Among Lesbian and Bisexual Women

12:45 PM – 1:45 PM

GENDER

Many sexual minority women navigate sociocultural objectification pressures to attain specific body deals, which impacts their body satisfaction and perceptions of their desirability. Bisexual women may internalize objectification pressures differently as a result of different sociocultural pressures. These experiences are further shaped by the desire to advertise or mute their sexual orientation via clothing choices and altering aspects of physical appearance. This study examined whether lesbian and bisexual sexual orientation is associated with body image and perceived desirability, and how these feelings are linked to different motivations to advertise or mute identity. A total of 372 women (127 lesbian, 245 bisexual) recruited from online survey panels completed validated measures of body satisfaction, degree out outness, internalized homophobia, and a measure for assessing motivations to alter appearance among LGBTQ populations. The findings suggest that cultural pressures to manage appearance expectations differ for bisexual and lesbian women, and are associated with differentially with feelings of body satisfaction, perceived desirability, and motivations for body change.

[34] The many faces of luck: Exploring the complexity and coherence of luck attributions

12:45 PM – 1:45 PM

OTHER

Luck shapes how people interpret events, assign responsibility, and understand fairness, yet it remains under-theorized in psychology. Researchers often equate luck with chance or randomness, overlooking the broader ways people use the term. Across three studies, we show that beliefs about luck are multifaceted. In Study 1, interviews revealed that individuals apply different dimensions of luck depending on context, blending superstitious and structural explanations. Study 2 used a large-scale survey to show consistent attribution patterns, with chanciness and controllability emerging as key factors. Study 3 developed a Luck Inventory distinguishing between superstitious and non-superstitious beliefs, and between chance and control accounts. These findings suggest that luck attributions reflect a coherent set of intuitions—about chance, control, and deservingness—that can be empirically studied and meaningfully applied. We argue that social psychologists need to acknowledge this complexity and clarify which account of luck they are adopting in their research.

[35] Brief Eye Contact Exercise Enhances Social Connection: An Experimental Study

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

This study investigated whether a brief (2-minute) eye contact exercise increases social connection. Female college students (N = 108) were paired and randomly assigned to one of three conditions: "deep" contact (making eye contact while meditating on the shared experience), "shallow" contact (making eye contact while counting backwards), or "no" contact (counting while looking away). Before and after the exercise, participants filled out surveys with measures of social connection, including the Inclusion of Other in the Self Scale (IOS) and explicit connection questions. Regression analyses controlling for baseline scores revealed that people in the "deep " condition reported significantly higher levels of social connection compared to people in the "no " contact control condition. Although we found no significant difference between the "deep" and "shallow" eye contact conditions, this could be due to the brevity of the exercise. While we are still exploring other covariates that might contribute to feelings of closeness, these findings highlight the promising role of eye contact in fostering interpersonal connection.

[36] But I'm Trying so Hard to be Good! The Effects of Regulatory Focus on Early- and Late-Stage Processing of Black Faces

12:45 PM – 1:45 PM

SOCIAL NEUROSCIENCE

Engagement with regulatory goals (Higgins, 1997) can suppress biased behavior that follows social identity perception and stereotype activation. In addition, engagement with regulatory goals can influence cognitive processes that precede behavioral responses (Cunningham et al., 2012; Moskowitz et al., 1999). We posit that regulatory goals may suppress biased behavior by influencing automatic social categorization and encoding during face processing. Across two studies, assessments of recognition accuracy and event-related brain potentials (ERPs) were used to test whether regulatory goals to promote prosocial behavior influence intergroup processing biases between Black and White faces. Consistent with previous work, Black faces were recognized less accurately than White faces and were differentiated as early as 80 ms after Face perception. Importantly, results indicate that a promotion regulatory focus increased the emotional salience and attentional significance of faces, regardless of race. Overall, the present work provides a new framework to conceptualize associations between race and goals to regulate biased behavior at the perceptual level in the context of face processing.

[37] Can AI Benefit Human Well-being? A Longitudinal Field Experiment

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

College campuses are facing record levels of anxiety, depression, and loneliness, yet many students struggle to access professional support due to stigma, time constraints, and concerns about anonymity. Strengths-based approaches, which aim to proactively build well-being, may help overcome these barriers—but have rarely been delivered through scalable technology. We conducted the first multi-institutional, preregistered randomized controlled trial of a strengths-focused, LLM-powered conversational agent using a mobile app. Over six weeks, 486 students from three U.S. universities were randomly assigned to either receive app access or serve as a no-treatment control. Mixed-effects modeling revealed two primary benefits. First, engagement with the AI agent boosted social well-being, yielding greater reductions in loneliness and increased campus belonging. Second, it buffered against the typical mid-semester downturn, preventing declines in positive affect, mindfulness, and overall flourishing. Participants also reported increased resilience. These findings provide longitudinal experimental evidence that a strengths-based AI agent can deliver personalized, proactive well-being support to university populations at scale.

[38] Can Creating a More Growth-Mindset Supportive Culture Help USA Win the World Cup?

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

In the world of sport, the slightest edge can mean the difference between success and failure. This reality inspires researchers to study an array of factors related to performance, such as physiology, technical skill, and tactical knowledge. One area not as extensively studied is the relationship between psychological factors and elite performance, even though coaches frequently report that players' psychological mindsets (i.e., the psychological characteristics, beliefs, attitudes, or perceptions that people have that affect their behavior) are critical for their success (Strudwick, 2016). In collaboration with a large elite soccer organization in the United States over the course of six years, we collected data on players' growth mindsets, their perceptions of their coaches' growth mindsets, player well-being, and player performance (e.g., goals scored). Surprisingly, we found that players' perceptions of their coaches' growth mindset was a stronger predictor (relative to players' own growth mindset) of key mental health outcomes (e.g., well-being) and performance outcomes (e.g., goals scored among attacking players). These findings showcase a critical opportunity in coaching education to support elite athletes to maximize their potential.

[39] Can Moral Judgments be used to Detect Deception Implicitly?

12:45 PM – 1:45 PM

NONVERBAL BEHAVIOR

People's ability to distinguish truthful from deceptive statements is marginally better than chance. Some researchers have proposed that people may be able to detect lies implicitly, via judgments of personality traits or affect; however, critics have pointed out that implicit lie detection measures rarely surpass explicit measures. One potential channel for implicit deception detection is judgments of speakers' morality. In a previous sample of mTurk participants ($n = 152$), we found that participants were unable to distinguish speakers' truths from lies either explicitly (via truthfulness judgments) or implicitly (via judgments of speakers' morality). However, in a recent sample of undergraduates ($n = 170$), we found that participants distinguished the same speakers' truthful vs. deceptive statements both explicitly ($p < .05$), and implicitly, via judgments of speakers' morality ($p < .005$). Currently, we are attempting to replicate this finding with a new sample of undergraduates. Results will be discussed in the context of a series of studies by the authors examining the utility (or lack thereof) of several techniques purported to increase deception detection accuracy.

[40] Changes in Dysfunctional Coping and Increases in DBT-Skills Use are Associated with Reductions in Symptom Severity in a Short-term Residential DBT Program for Adolescents

12:45 PM – 1:45 PM

SELF-REGULATION

Reductions in dysfunctional coping and increases in DBT-skills use (measured by the DBT-Ways of Coping Checklist) have been associated with less symptom severity for borderline personality disorder, affective disorders, trauma, and suicidal thoughts and behaviors (STBs) in adults, though evidence in adolescents is limited. We examined whether decreases in dysfunctional coping and increases in DBT skills use were associated with reductions in the above symptoms from intake to discharge among adolescents ($N=64$) in a short-term residential DBT program. Change was calculated using residuals from discharge scores regressed on intake scores. Linear regressions showed decreases in dysfunctional coping were associated with decreases in all outcomes ($ps < .05$), while increases in skills use were associated only with STB decrease ($p = .04$). Reductions in dysfunctional coping are broadly tied to symptom improvement, while skills use relates specifically to STBs. Limitations include a small sample, self-report, and heterogeneous responses. Future research should employ larger, multi-site, longitudinal designs and test moderators to guide targeted adolescent DBT interventions.

[41] Characterizing the Stigma of Widespread Chronic Physical Illnesses

12:45 PM – 1:45 PM

PHYSICAL HEALTH

In the United States, an estimated 129 million people have a major chronic disease (e.g., diabetes). Further, managing these diseases comprises 90% of the annual \$4.1 trillion health care expenditure (Benavidez et al., 2024). Along with the physical health detriment, the stigma felt by those with these conditions is detrimental to treatment outcomes. This stigma needs to be remedied, as it can be a barrier to treatment and a deterrent to successful treatment outcomes, further exacerbating the social and monetary costs (Crapanzano et al., 2018). Recent work has characterized the stigma toward people with mental illnesses (e.g., anxiety) as having two primary dimensions: social desirability and controllability (Krendl & Freeman, 2017). We aim to characterize whether similar dimensions emerge for the 10 most common chronic illnesses in the United States. To this end, participants will complete a multidimensional scaling task where they rate the similarity of different illness pairs. Other participants will rate each illness on 13 stigma-related beliefs. A factor analysis will reveal stigma dimensions on which people think about chronic physical illnesses. Results will be discussed.

[42] Children's Evaluations of Household Chore Neglect Across Gender and Justification

12:45 PM – 1:45 PM

GENDER

Building on evidence that women do more household labor and that children both recognize and endorse this unequal division as fair (Midgette et al., 2023), we tested whether children react negatively to individuals who neglect household chores. Specifically, we examined whether evaluations differ by the target's gender, the justification for neglect (career vs. preference), and chore type (trash vs. laundry). Participants were 108 children (56 girls, 52 boys; Mage = 8.05, range = 6.02–9.99 years). In a 2 (target gender: male vs. female) $\times$ 2 (justification: career vs. preference) between-subjects design with chore type as a within-subjects factor, children judged the permissibility of neglect, anticipated backlash from the target's family members, and endorsed intervention. Children judged neglect as more permissible when justified by career demands, $b = 0.36$, $SE = 0.16$, $p = .03$, and were less likely to recommend intervention, $b = -0.70$, $SE = 0.27$, $p = .01$. Younger children anticipated greater backlash than older children, $b = 0.12$, $SE = 0.04$, $p = .002$. Across outcomes, target gender and chore type had no reliable effects.

[43] Comparing Three Experimental Manipulations of High-Quality Listening

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

High-quality listening (HQL) aims to help listeners understand, connect with, and foster goodwill toward speakers. For speakers, HQL increases well-being, reduces loneliness, and boosts social connection. Yet whether HQL benefits listeners remains unclear. This study tested three HQL manipulations (written instructions, video instructions, and combined) against an active control in 195 undergraduates who had a 10-min conversation with a confederate. We expected all three HQL conditions to increase listening quality, social connection, and subjective well-being and decrease rumination and negative affect. Fixed-effects models showed that all the HQL manipulations improved listener- and speaker-rated active listening relative to the control group. Speakers also reported higher conversation quality and connection when their partners received HQL instructions rather than control instructions. For listeners, exploratory principal components analysis indicated that the combined condition uniquely increased compassion and openness toward others. These findings underscore the potential of brief HQL interventions to strengthen social connection and well-being for both conversation partners.

[44] Competence or Just Confidence? Reference Letters, Gender Biases, and the Weight of Evidence in Candidate Evaluation

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This research explores potential interactions between candidate gender and the content of their reference letters – in particular, the extent to which male vs. female job candidates “get credit” for concrete examples of high performance vs. subjective assurances the candidate can succeed. In a 2 (male vs. female) × 2 (concrete evidence vs. expressed potential) pilot study, a pattern of cross-over interactions emerged on several judgments: female candidates were rated more positively when presented with documented success, while male candidates were either indistinguishable or evaluated more positively when merely described as having potential. Recognizing limits in our initial design, we refined our stimuli and measures. A second study with a 3 (male vs. female vs. gender redacted) × 2 (concrete evidence vs. expressed confidence) × 2 (marketing vs. human resources) design validated our new stimuli and manipulation checks (8-item scale; $\alpha=.87$ for concrete evidence condition, $\alpha=.84$ for expressed potential condition). Data from an online participant pool provided partial evidence for our hypotheses, though data quality concerns necessitate ongoing data collection.

[45] Concerned But Comfortable: The Privacy Paradox in Large Language Models

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Large language models (LLMs) are trained on massive corpora that inevitably include personal data (PD) and are increasingly used in contexts where people knowingly or unknowingly share PD. Yet, little is known about how users perceive and react to these privacy risks. In Study 1 (N=155), we showed that participants (a) recognized risks of data disclosure, (b) have intuitions about why LLMs can generate PD, and (c) anticipate feeling “very concerned” if an LLM could produce certain features about them (e.g., medical condition, net worth). 60% of participants also expressed interest in learning what PD LLMs can generate about them, so we introduced and validated LMP2, a tool that lets users query GPT-4o for model-generated PD linked to their names. In Study 2a (N=303), we gave participants access to LMP2 and demonstrate that GPT-4o can generate 11 features about everyday Prolific participants with $\geq 60\%$ accuracy (e.g., gender, language, hair color). Strikingly, however, only 4% of LLM-generated PD was viewed as a privacy violation. Indeed, the modal response to LLM output was indifference (68%). These findings reveal an LLM privacy paradox: people express concerns about LLM data disclosures in theory but respond with indifference when confronted with evidence of model-generated PD in practice.

[46] Connecting to Care: A Relational Pathway from Nature Connectedness to Pro-environmental Personal Norms

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Recent insights suggest that connecting with nature may provide a relational pathway for cultivating moral obligations toward the environment. However, causal evidence linking nature connectedness to pro-environmental personal norms remains limited, and the underlying mechanisms are not well understood. Across two surveys and two experiments, we examined whether and how nature connectedness fosters pro-environmental personal norms through compassion toward nature. A large-scale survey of Chinese college students (N = 3,955) showed that nature connectedness made a unique positive contribution to pro-environmental personal norms beyond established predictors. A second national survey (N = 331) replicated this positive association and identified compassion towards nature as a key mediator. Two experiments then provided causal evidence: participants who engaged in nature photography (N = 146) or immersive nature videos (N = 256) reported heightened nature connectedness, which in turn strengthened pro-environmental norms via compassion. Overall, these results demonstrate that the human–nature relationship can translate into internalized moral obligations, resonating with recent work on moral expansion toward nature and highlighting a potential route for promoting enduring pro-environmental motivation.

[47] Conscientiousness Moderates Multiple Neuroimmune Pathway Mediators Between PRS and Stroop

12:45 PM – 1:45 PM

SOCIAL NEUROSCIENCE

African Americans experience major stress from racial discrimination, contributing to higher inflammatory responses, lower quality of life, and higher mortality, yet the specific pathways among body systems are incompletely understood.

This research pursues the stress neuroimmune network hypothesis, and asked whether perceived racism negatively impacts neurocognitive functions like cognitive control and may be mediated by neurotransmitters (dopamine, norepinephrine, epinephrine), and by proinflammatory cytokines (TNF- α , IL-1- α , IL-6,).

120 African Americans from the community participated providing both psychological (Perceived Racial Stress (PRS); Stroop (a measure of cognitive control) and the above neurotransmitter and cytokine data from hospital provided blood/urine testing.

Hays Process statistic tested for moderated mediations of PRS's impacts upon Stroop, finding that PRS damages cognitive control but does that least for low trait conscientiousness which moderates multiple included serial paths (e.g., PRS>Dopamine>TNF>IL6>Stroop) providing support for the neuroimmune pathway as mediator between racial stress and diminished executive functioning moderated by central traits.

[48] Context Cues: Can Signals of Explicit Anti-Transgender Bias Exacerbate Aggregate Levels of Implicit Anti-Transgender Bias?

12:45 PM – 1:45 PM

GENDER

Anti-transgender rhetoric has increased in recent years and become more visible through political advertisements and other campaigns. New theories on implicit bias emphasize the role of environments on bias (e.g., Calanchini et al., 2022; Payne et al., 2017), yet, to our knowledge, few studies have examined specifically what (and how) environmental features might affect implicit bias. In the present work, we examined whether public, anti-transgender messages (e.g., on billboards, yard signs, etc.) impact average implicit anti-trans bias. Participants (N = 726) were exposed to one of four types of public messages (anti-trans, pro-trans, positively valenced, and negatively valenced) prior to completing a transgender implicit association task (Trans IAT; Axt et al., 2021). Although the type of message did not affect implicit bias, we found that the correlation between implicit and explicit bias was significantly stronger in the anti-trans messaging condition compared to all other conditions. We discuss the implications for theory and future research on the relation between implicit and explicit bias across levels of analysis.

[49] Contributions of Smiles and Gendered Traits on Evaluations of Women

12:45 PM – 1:45 PM

GENDER

Aspiring women leaders are commonly told to smile. Whether this advice is beneficial is understudied. We test this by investigating evaluations of aspiring women leaders. Leaders are expected to be agentic (e.g., strong), consistent with expectations of men. Women are expected to be communal (e.g., warm). Agentic women could smile to convey communality and thus bypass a perceived deficit. Yet, agentic women's smiles could be perceived as less trustworthy, making smiling unhelpful. Here, participants will evaluate the trustworthiness of smiling and non-smiling men and women paired with agentic or communal traits or no traits. We expect a three-way interaction on trustworthiness ratings. Based on past work, we expect similar evaluations of smiling men and women, and non-smiling men. Targets paired with communal versus agentic or no traits should be more positively evaluated. Targets paired with agentic, or no traits should be similarly evaluated. We expect non-smiling women paired with communal versus agentic or no traits to be more positively evaluated. Further, we expect non-smiling women paired with no versus agentic traits to be more positively evaluated. Results to be discussed.

[50] Counterterrorism Strategies and Crowd Behavior Management: Insights from Global Protection Professionals

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

The emergence of terrorism has become a growing global concern, largely influenced by shifts in political ideology. The purpose of this study is to explore the experiences of protection professionals across Africa, Europe, and the Americas, focusing on their perceptions and approaches to counterterrorism strategies. A qualitative research design was adopted, using primary data collected through unstructured, open-ended questionnaires and one-on-one interviews. The study specifically sought to answer the following research questions: How do police and protection professionals describe their experiences with crowd behavior management? How do these professionals describe their use of crowd behavior techniques within counterterrorism contexts? This presentation will highlight the literature review and methodology of the research, as well as an analysis that contributes to expanding both current and future research in the field.

[51] Couple identity clarity predicts neural synchrony in right dorsolateral prefrontal cortex during conversations

12:45 PM – 1:45 PM

SOCIAL NEUROSCIENCE

Couple identity clarity, or the degree to which individuals believe they and their partner have a clear and coherent sense of who they are as a couple, has been associated with important relationship outcomes such as commitment. What underlies this shared belief, however, remains underexplored. Here, 41 couples (82 individuals) engaged in a 10-minute discussion recalling how they met and their relationship trajectory while undergoing functional Near-Infrared Spectroscopy. We computed inter-subject correlation (ISC) in the prefrontal cortex, such that greater ISC indicates greater neural synchrony between partners. During this conversation, activity in the dorsolateral prefrontal cortex was synchronized between couples. ISC in this region was also associated with higher self-reported couple identity clarity, commitment, and perceived partner's commitment. Together, these findings suggest that couple identity clarity is reflected not only in self-reported relationship quality but also coordinated neural activity during meaningful conversations, highlighting the neurocognitive basis of shared relationship identity.

[52] Depressed Mood in a Crowded Place: An Evolutionary Mismatch Perspective

12:45 PM – 1:45 PM

MENTAL HEALTH/WEILL-BEING

Governments and mental healthcare professionals worldwide seek better ways to diagnose and treat depression (Nesse, 2019). Despite their efforts, the rate of depressed mood continues to increase rapidly (APA, 2021). Within this context, this project aims to elucidate the mechanistic underpinnings of depressive disorder and unravel the reasons for the increase in people reporting experiences of depressed mood and depressive disorders. Drawing upon literature from evolutionary medicine and evolutionary mismatch, this project hypothesizes that depressive disorder is the outcome of psychological mechanisms designed to respond adaptively to environmental stressors that signal loss, particularly status loss, but are now chronically processing evolutionarily novel environmental stressors. With two studies, we examined the effect of high population density- an evolutionarily novel stimulus that signals intense competition and potential loss - on depressed mood. Our findings suggest that high population density contributes to depressed mood through heightened perceptions of competition and social comparison.

[53] Development and Validation of a Problematic Short-form Video Use Scale

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This study aimed to develop and validate the Problematic Short-form Video Use Scale to capture problematic behaviors unique to short-form video platforms. An initial pool of 37 items was developed through a literature review and focus group interviews. EFA and CFA were conducted with heavy users aged 19-40, who watch short-form videos more than 2 hours daily. EFA (N = 719) identified a six-factor structure comprising 21 items. CFA (N = 1,009) supported both six-factor and higher-order two-factor models. Given theoretical considerations, the higher-order structure was adopted: Attachment-Driven Use (two subscales: Emotional Dependency and Compulsive Use) and Dysfunctional Use (four subscales: Neglect of Obligations, Dysregulation, Time Distortion, Mindless Use). The scale demonstrated strong positive correlations with SNS and smartphone addiction, and negative correlations with digital well-being. Nomological network analysis confirmed construct validity: Avoidance Motivation for short-form video use predicted Attachment-Driven Use, whereas Approach Motivation predicted Dysfunctional Use, with both problematic use patterns subsequently predicting depression.

[54] Development and Validation of the Short-Form Video Use Motivation Scale

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This study developed and validated the Short-Form Video Use Motivation Scale to examine multidimensional motivations behind short-form video use. An initial pool of 33 items was generated through literature reviews and focus group interviews (FGIs), followed by content validation. Both exploratory (EFA) and confirmatory factor (CFA) analyses were conducted with heavy users aged 19-40, who watch short-form videos more than 2 hours daily. A 22-item, five-factor structure was finalized post-EFA: Fun Seeking, Information Seeking, Convenience, Maladaptive Coping, and Fear of Missing Out (FoMO). CFA supported both multidimensional and higher-order two-factor models. Given theoretical considerations, the higher-order structure distinguishing Instrumental motives (Fun Seeking, Information Seeking, Convenience) from Avoidance motives (Maladaptive Coping, FoMO) was adopted. Criterion validity was supported by significant correlations with boredom, self-control, loneliness/social isolation, and behavioral activation/inhibition system (BAS/BIS). Findings reveal that short-form video use encompasses both adaptive and maladaptive motivations, unlike traditional smart media dependency patterns.

[55] Disaggregating Agency: Dynamic Stereotypes Differ Across Dimensions of Agency

12:45 PM – 1:45 PM

GENDER

Dynamic stereotypes refer to beliefs about how gender traits change over time. As women in the U.S. in the late 20th century increasingly held employment positions, they were increasingly considered to possess agentic characteristics. Yet agency includes multiple dimensions (i.e., dominance, independence, competence) that may differentially relate to role shifts and thus show divergent dynamic stereotypes. In Study 1A-B (N = 1205), perceivers projected that women increasingly gain dominance and independence but maintain high competence over time. Trait projections for dominance and independence were associated with beliefs about the gendered division of labor. Study 2 (N = 221) aimed to explain the projected stability in competence for women by examining perception of traditionally female-dominated roles. As predicted, these roles were seen as requiring high competence, which explained the projected stability in competence for women despite women's movement into nontraditional roles. By disaggregating agency dimensions, we uncovered distinct patterns of dynamic gender stereotypes, offering a nuanced understanding of how gender role shifts shape dynamic gendered trait perceptions.

[56] Discrimination and the Dramaturgical Perspective: Implications for BIPOC Wellbeing

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

This study investigates how experiences of discrimination shape the endorsement of a dramaturgical perspective (DP; Sullivan et al., 2014)-the belief that life is like a play and people perform as actors among employed Black, Indigenous, and People of Color (BIPOC). Drawing on previous research on the DP and impression management, we examine whether exposure to discrimination contributes to burnout and reduced workplace investment, as well as what role the DP plays in this process. Using survey data from BIPOC and White participants (N = 200), analyses show that BIPOC participants endorsed DP significantly more than White participants. Mediation analyses suggest that heightened vigilance in response to discrimination plays a role in BIPOC individuals' heightened endorsement of the DP as a strategy for navigating workplace dynamics. Prior research has linked DP to adverse outcomes such as psychological distress and professional burnout (Young, 2020). If BIPOC individuals are more likely to endorse DP, further research is needed to examine how this process may influence their overall wellbeing and to identify interventions that mitigate its negative effects.

[57] Distinct Motivational Pathways to Problematic Short-Form Video Use: A Structural Equation Modeling Approach

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This study examined the relationship between motivations for short-form video use and problematic short-form use patterns using structural equation modeling. A total of 1,009 Korean adults aged 19–40 completed the Short-form Video Use Motivation Scale (SVMS) and the Problematic Short-form Video Use Scale (PSVU). Results showed that five motivations (Fun-Seeking, Information-Seeking, Convenience, Maladaptive Coping, and Fear of Missing Out (FoMO)) were differentially associated with six patterns of problematic use [Emotional Dependency, Compulsive Use, Neglect of Obligations, Dysregulation, Time Distortion, Mindless Use]. Maladaptive Coping and FoMO emerged as the most problematic motivations, significantly predicting multiple problematic patterns and dependency. Convenience motivation commonly causes issues with daily maintenance of responsibilities and control. Fun-seeking enhanced absorption and mindless use patterns. In contrast, Information-Seeking motivation demonstrated minimal risk, showing either no or negative associations with problematic patterns. These findings highlight the importance of considering motivational pathways in understanding and addressing problematic short-form video use.

[58] Divine Forgiveness Shapes Emotion and Probes Moral Licensing

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Across 4 preregistered studies, we examined whether writing about Divine Forgiveness shapes emotions and moral behavior by fostering prosocial emotions and, as theorized, moral licensing. Study 1 (N=382) found Divine and interpersonal forgiveness increased gratitude and transcendent indebtedness over Control. Study 2, an in-person live-offense paradigm, focuses on behavioral measures of interpersonal forgiveness, with data collection ongoing. Study 3, under analysis, examines state gratitude and allocation motives after a favor. Study 4 examined whether Divine Forgiveness, compared with Transgression, produced moral licensing, with cheating as the indicator. A pilot (N=164) found Divine Forgiveness raised gratitude and self-transcendent emotions, Transgression raised guilt and negative affect, and cheating was nonsignificantly higher in Divine. The main study (N=523) confirmed these emotional effects—Divine Forgiveness boosted positive emotions and reduced guilt—but neither study showed reliable differences in cheating or moral/religious dispositions. Overall, Divine Forgiveness elevated prosocial emotions, while support for the preregistered moral-licensing prediction was limited.

[59] Do Endearments Sound Different Coming From Men or Women?

12:45 PM – 1:45 PM

GENDER

Language can shape perceptions in powerful ways. Previous research has found that men who use terms of endearment (ToE; e.g., honey, dear) are viewed negatively (Hildebrand et al., 2022). However, less is known about how women who use ToEs are perceived. In this study, participants read one of four vignettes describing a woman or man who did or did not use ToEs. They then rated the character on positive and negative attributes. We hypothesized a significant interaction between ToE use and gender, expecting stronger negative ratings for men who use ToEs. Preliminary data (N = 250) showed significant main effects of gender and ToE use. For example, ToE users were rated higher in hostile sexism ($p < .001$), and gender-specific system justification ($p = .044$), and lower in competence ($p < .001$). Men were rated higher in hostile sexism ($p < .001$), and gender-specific system justification ($p < .001$), and lower in competence ($p < .001$). We found no significant interaction between ToE use and gender. ToE use and gender may have additive, independent effects, but we await more data to confirm this. Findings support recommendations for both men and women to limit ToE use.

[60] Do Facial Expression Dynamics Differ Between Friends and Strangers During Conversation?

12:45 PM – 1:45 PM

NONVERBAL BEHAVIOR

Facial expressions encode communicative information, yet little is known how partners' expressions fluctuate over the course of a dyadic conversation. The present study investigates how the complexity and dynamics of facial expressions support playful conversation and facilitate social connection. We ask whether facial expressions become more unpredictable and complex when people interact with friends compared to strangers, treating such variability as an index of social openness and play. Undergraduate participants (N = 132) engaged in separate recorded conversations with both friends and strangers. Facial expressions were analyzed using principal components of facial landmarks, from which we will calculate entropy and evaluate the distribution of facial components throughout a conversation. Participants then reported conversational enjoyability and closeness to both conversation partners. By linking facial expression complexity and dynamics to conversational outcomes, the study will test whether facial behavior functions as a relational tool that fosters playful interaction and feelings of connection between unacquainted and close pairs.

[61] Do messages about science affect reactions to conflicting health information?

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Exposure to conflicting health information (CHI) can negatively affect people's beliefs about science and health recommendations. An initial study found that a message which helps people make better sense of the scientific process mitigated these effects. We conducted two pre-registered studies examining the timing of this message by varying whether it came before or after exposure to CHI. In study 1, Prolific participants were randomly assigned to read a message about science or sustainability either before or after exposure to CHI (n = 604). In study 2, Prolific participants were randomly assigned to read a message about science before or after CHI exposure or received no message at all (n = 223). Positive construal of science, counterarguing science, and knowledge of science were assessed. We found that when delivered after exposure to CHI, the message about science was effective at sustaining positive perceptions of science compared to receiving no message. However, there is mixed evidence for effectiveness when the science message is read before CHI exposure. Next steps and implications for interventions for CHI will be discussed.

[62] Do Volitional Change Goals Predict Growth? Evidence from a Large-Scale Well-Being Intervention

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Do volitional personality change (VPC) theories extend to well-being growth? We test two VPC claims: (1) change goals predict growth and (2) goal-aligned behaviors facilitate change. We analyzed data from Pathways to Happiness, a 4-week online intervention (N=4373). Participants selected change goals targeting well-being characteristics: resilience (handling stress), compassion, mindfulness, connection (improving relationships), happiness, and purpose. Change goals predicted both perceived and actual change in corresponding characteristics at check-in and post-test. However, effects were stronger for perceived than actual change, suggesting goals motivate perceptions exceeding measured growth. Using independent ratings (N=685), we identified activities best/least aligned with each characteristic. Goal-holders completing highly aligned activities perceived greater improvement than those completing poorly aligned activities, but actual change did not differ significantly. These findings extend VPC beyond personality traits to well-being, highlighting the need to differentiate subjective perceptions from objective change in interventions where participants hold strong growth expectations.

[63] Does 'Bi-partisan' = Unbiased? How Neutrality Labels Affect Trust in Fact-Checks

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

As misinformation proliferates online, fact-checking is vital for countering false narratives. Yet, trust in science and fact-checking has declined in recent years, prompting major social media platforms to remove fact-checks, further facilitating the spread of inaccurate information. Given the role of ideological congruency on trust and skepticism toward information generally, we investigated whether political neutrality labels, (e.g., "bipartisan" or "nonpartisan") affect trust and skepticism towards fact-checks. Using a politically diverse sample of U.S. adults (N = 300), participants viewed real, politically congruent and incongruent fact-checks conducted by fact-checkers (politically neutral or no label) and rated the fact-check's trustworthiness and objectivity. Among both Democrats and Republicans, neutrality labels had no effect on trust in fact-checks, and evaluations were primarily driven by ideological congruency. The findings thus far reveal the limitations of political neutrality labeling, and suggest alternative strategies are needed to increase trust in political fact-checking.

[64] Does Religion Promote Virtue Development? Testing two Hypotheses

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Religions are theorized to support the development of moral virtue, either through socialization processes or by providing self-transcendent meaning systems that guide and motivate the exercise of virtue. Yet, studies testing these hypotheses have primarily employed cross-sectional methods. Hence, in two preregistered, longitudinal studies, we investigated the association between religiosity and virtue and tested the two candidate hypotheses. Study 1 (N = 32,485 observations from N = 977 adults) found that present religious affiliation, but not a religious upbringing, is associated with higher levels of several virtues in individuals' daily activities. Study 2 (N = 1,888 undergraduates) found that, over a two-year period, the degree to which individuals oriented their lives around their religions' teachings was associated with growth in their generosity, courage, patience, and self-control. By contrast, religious affiliation and religious community involvement were not associated with virtue growth. Overall, the findings are consistent with the hypothesis that religion fosters virtue development, and in particular by providing self-transcendent meaning systems.

[65] Does Self-Reported Knowledge Moderate Wishful Thinking in the 2024 U.S. Election?

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This study investigated how wishful thinking manifests in relation to predictions about the 2024 election. A total of 500 participants were recruited and were asked to complete a total of four surveys over the span of several weeks, with a total of 410 completing all four surveys. As expected in light of prior research on wishful thinking, it was found that the more people preferred a candidate, the more likely they were to predict that they would win. Additionally, among the questions asked was how knowledgeable participants thought they were about recent political news. It was found that self-reported knowledge moderates one's preference and their predictions. The less knowledge someone reported, the less they predicted their preferred candidate would win and vice versa. This is of interest because the intuitive expectation is that more knowledge would lead to more accurate predictions.

[66] Does social media app use explain why liberals are unhappier than conservatives?

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Recent work suggests a partisan “well-being gap,” with liberals reporting lower well-being than conservatives. One possible explanation is that liberals use social media more frequently, which may undermine their well-being. We test whether social media usage mediates the relationship between political orientation and well-being at the momentary, weekly, and monthly levels. Participants (N = 1,578) reported their political orientation in a one-time survey. They reported their social media use (i.e., minutes spent on social media platforms in the past hour) and affective well-being (i.e., how they felt at that moment) in ecological momentary assessments up to seven times a day over one month (i.e., 120,599 total assessments). They also completed weekly reports of their social media usage using their smartphones’ screen time app (i.e., Hours spent on social media platforms in the past week), as well as monthly well-being reports (i.e., life satisfaction, loneliness, and affective well-being). By analyzing data from multiple sources at multiple temporal levels, this study clarifies whether and which everyday social media habits contribute to partisan differences in well-being.

[67] Doing it like a girl: A brief masculinity threat paradigm

12:45 PM – 1:45 PM

GENDER

Precarious manhood theory (Vandello & Bosson, 2013) argues that manhood—compared to womanhood—is a tenuous status that must be socially earned but can be revoked. Since the theory’s inception, researchers have explored ways to experimentally examine the consequences of lost manhood using paradigms which either describe men as feminine or asks them to engage in feminine behaviors (e.g., Bosson et al., 2009; Rudman & Fairchild, 2004). The present work contributes to the literature by validating a new paradigm called The Daily Choices and Personality Quiz which improves previous tools by addressing issues with instrument length, feedback believability, and general construct purity. Grounded in theory that gender is a social performance (West & Zimmerman, 1987), this ten item, forced-choice quiz asks about individual behaviors/preferences across everyday situations, implying that certain behaviors indicate one’s level of masculinity or femininity, before providing randomized false feedback. Across three studies (N = 804), this research aims to validate that the paradigm can produce theoretically relevant affective and behavioral outcomes as previously established instruments.

[68] Dressing for the Occasion: Affordance-Management Theory and Women's Appearance Choices Based on Gender of the Threat

12:45 PM – 1:45 PM

GENDER

Affordance-management theory suggests changes in human behavior are based on the identification and management of potential threats and affordances in the environment with assessments often based on stereotypes. This study asked college-aged heterosexual women (N = 116) to make clothing, hair, and makeup choices after being assigned to imagine attending a bar at night with the presence of either a threatening woman or man who had previously made sexual advances, a potential mate, or no specified individual. In accordance with affordance-management theory, women spent less time on hair in the threatening man condition than the potential mate condition. However, clothing and makeup choices did not differ between the potential mate condition and the threatening man or woman condition. Moderation by fear of rape, mate value, and sociosexual orientation were tested as explanatory mechanisms, but were not significant. These findings suggest that any threat, regardless of gender stereotype, may trigger similar defensive strategies when it comes to appearance choices regardless of individual differences.

[69] Duty Calls: Civic Obligation Buffers Psychological Well-being in Face of Functional Decline

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Functional decline – reduced physical or cognitive abilities that limit one’s capacity to perform common daily tasks – affects over 12% of U.S. adults. Individuals with functional limitations experience reduced social participation and worse psychological health. This study examined civic obligation—the motivation to engage in and contribute to the community—as a novel protective factor against physical decline-related distress. Using the Midlife in the U.S. (MIDUS) data, we tested whether civic obligation moderates the relationship between functional decline and well-being. Results showed that functional decline negatively predicted well-being beyond aging effects. Civic obligation, however, contributes positively to well-being. Crucially, higher civic obligation most strongly protected well-being among those with severe functional limitations, even when controlling for participation in various civic activities. This buffering effect complements existing models by demonstrating that psychological orientation toward civic duties, rather than behaviors alone, shapes well-being. Implications for designing accessible civic engagement programs for vulnerable populations are discussed.

[70] Dynamics of Compliance with Preventive Measures during the COVID-19 Pandemic

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Previous longitudinal studies highlighted variability in compliance with COVID-19 preventive measures, noting the heightened sensitivity of the least compliant groups to contextual changes such as easing restrictions. However, they overlooked other forms of variability. We investigated compliance with social distancing and staying-at-home measures, its dynamic nature, and associations with social and individual factors. Data came from a longitudinal study of 1,984 Canadians across six waves from April–July 2020. Compliance was measured with self-reports alongside trust in Canadian health services and the Prime Minister, perception of social norms, and subjective health literacy. Latent Class Growth Analysis identified three compliance trajectories: “Low and constant” (shifting to “Low and decreasing” post-restrictions), “High and decreasing,” and “High and constant.” Trajectory transitions showed relative stability. Subjective health literacy consistently predicted trajectory membership, while provincial norms and trust in health services moderately predicted change. Findings reaffirm variability in the lowest compliance group while unveiling heterogeneity among higher compliance groups, notably in trajectory transitions.

[71] Effect of spiritual body metaphors on food preferences

12:45 PM – 1:45 PM

PHYSICAL HEALTH

Body metaphors are often used by health professionals and advertisers to help individuals understand how their body works. One of the most widespread metaphors portrays the body as a machine. However, past research has shown that this metaphor has limitations in how it shapes food beliefs and behaviors, and recent work has demonstrated that portraying the body as a machine can backfire depending on consumers’ eating self-efficacy (Weihrach & Huang, 2021). Alternatively, spiritual metaphors can also be used to describe the body and consist in assimilating the body to a sacred place created by a higher entity, e.g., comparing the body to a temple. Yet, little is known about how such metaphors may influence beliefs and behaviors. Across four studies, one correlational and three experimental, we show that a spiritual (vs. mechanical) body metaphor is associated with a healthier diet and lower BMI, leads individuals to favor highly nutritious foods and avoid processed and low-nutrition foods, and increases preference for healthier options when choosing between similar foods. These findings suggest that spiritual body metaphors may be effective in promoting healthy eating behaviors.

[72] Effects of Discrimination on Prenatal/Postnatal Mental Health: A Scoping Review

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Meta-analyses have repeatedly shown associations between discrimination and mental health in the general population. There is, however, a lack of reviews on discrimination and perinatal mental health, with prior reviews on discrimination in the perinatal period focused on birth and obstetric outcomes. As the extent and nature of the literature on this topic is unknown, a scoping review of quantitative studies examining associations between discrimination and perinatal mental health was conducted.

The review was preregistered on Open Science Framework. 6111 records were identified via a systematic search using Web of Science, PsycINFO, PubMed, and CINAHL. Studies were included if participants were pregnant or within 1 year postpartum and examined associations between discrimination (exposure/predictor) and a mental health variable (distress or well-being; outcome). All abstracts and full texts were screened by two independent reviewers. 67 studies met inclusion criteria. Preliminary results suggest the most frequent variables examined were race-based discrimination and depression. Study extraction and interpretation is ongoing and will be complete by the conference.

[73] Emotion Through a Biased Lens: Misgendering and Negativity in Judgments of Transgender Individuals

12:45 PM – 1:45 PM

GENDER

Transgender people are subject to various biases. For example, people may hold general, negative attitudes towards transgender women and men, or they might treat them more like their sex assigned at birth than their gender identity. In the context of emotion, these two biases pose an interesting puzzle. Strong gender stereotypes about emotion persist that dictate which emotions women and men should display, meaning that negativity and misgendering biases predict opposite outcomes when perceiving transgender people's emotions. To test which bias best predicts emotion perception, participants rated angry, happy, neutral, and fearful faces of women and men. We counterbalanced which faces were labeled as transgender or cisgender. Misgendering bias was observed for happiness and fear—transgender men were perceived more like cisgender women, while transgender women were perceived more like cisgender men. Yet, we also found evidence of negativity bias for happiness among people high in gender essentialism and transphobia. Data collection is currently underway to test whether these biases may emerge simultaneously, but through different systems (i.e., automatic and controlled).

[74] Emotional Support Through AI: Venting to Artificial Intelligence or a Human May Offer Comparable Emotional Well-Being Benefits

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Artificial intelligence (AI) chatbots are increasingly used as sources of informal emotional support, with evidence suggesting that venting to them can reduce negative affect. Yet, it is unclear whether such benefits depend on the responder's perceived identity. Since emotional relief often hinges on authenticity and validation, this study investigated whether well-being gains differ when users believe they are venting to an AI versus a human, even when responses are identical. In a pre-registered between-subjects experiment (N = 279), participants were randomly assigned to an AI-assisted or a perceived human-assisted venting condition. In both cases, responses were generated by an AI chatbot, though in the human condition they were lightly edited and presented in a context designed to enhance their credibility as coming from a real person. Venting improved well-being across groups, reducing stress and loneliness while increasing perceived social support. Improvements were comparable across conditions, suggesting AI chatbots can provide emotional benefits similar to those from perceived human responders.

[75] Empathy for the Pain of Punishment Helps Cheaters Avoid Justice

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Cheating breaches fairness norms, yet observers are often content with weak penalties that effectively reinforce rather than punish cheating behavior. Our study examined how punishment preferences are disproportionately shaped by empathetic loss aversion (ELA), a social extension of loss aversion bias that describes sensitivity to the pain others experience from loss. In a vignette-based survey, participants evaluated a professional golfer who used an illegal club to qualify for the PGA Tour, which enabled them to accrue millions of dollars and valuable properties. Participants selected monetary and property sanctions for the cheater, and then reported the emotions they expected the cheater to feel in response to being punished. Results showed leniency through reluctance to reduce cheaters' ill-gotten gains below their pre-cheating baseline. Their leniency appeared to result from their myopic focus on the distress they expected cheaters to feel in response to losing assets. Participants were more disinclined to revoke property gains than monetary gains. Harsher punishments were chosen by the half of participants induced to also consider the perspective of a professional golfer who did not reap the benefits of cheating. Participants' scenario-specific punishment decisions were notably more lenient than their separately-stated abstract views about appropriate justice.

[76] Endorsement of honor beliefs and women's acceptance of sexual objectification

12:45 PM – 1:45 PM

GENDER

Our previous work showed that endorsement of honor beliefs predicted sexist beliefs and acceptance of intimate partner violence, and, in turn, acceptance of stalking among both US and Turkish participants. The present work examines how honor endorsement predicts women's acceptance of broader sexual objectification, which we conceptualize as restrictions on their bodily autonomy. In the current study, we focused on women in the US, given that sexual objectification is a widespread issue among US women. In two studies, we looked at participants' responses to measures of honor endorsement and honor concerns (masculine, feminine, family, and morality honor); participants then reported how acceptable sexual objectification would be if certain behaviors happened to them. Data collection is under way. Paralleling prior work, we expect that endorsement of honor beliefs will serially predict benevolent and hostile sexism and subsequent acceptance of intimate partner violence that, in turn, will predict acceptance of sexual objectification. The results and the implications of the findings will be discussed.

[77] Engaging Students in Social Issues Through Sequencing and Moral Framing

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Researchers have found that topic sequencing affects student engagement (Bernstein, 2019) and that moral framing impacts responses to social issues (Feinberg & Willer, 2019). We examined the impact of course sequencing (class- vs. race-based bias) and moral framing (binding vs individualizing) on students' (N= 142) attitudes in a social psychology class.

We hypothesized that framing the class using binding morals (e.g., loyalty) and introducing class-based bias first would resonate more with conservative students compared to individualizing moral framing (e.g., fairness) and first covering racial bias.

Overall, liberal students showed more interest and expected greater comfort in the course, and had more positive attitudes toward DEI. Importantly, results were moderated by framing and sequencing. When content was framed using binding morals and class-based bias was introduced first, conservatives anticipated feeling as comfortable and supportive of DEI as liberals (who were largely unaffected by condition). As such, thoughtful framing and sequencing may help foster productive discussions on challenging social issues. Research isolating framing vs. sequencing effects is ongoing.

[78] Escaping a Future Stigmatized Identity: An Examination of Ageist Misogyny and Aging Prevention Work in Women

12:45 PM – 1:45 PM

GENDER

While both men and women are devalued as they age, women experience age stigma more harshly, being judged more severely for their appearance. Consistent with Goffman's (1963) theory of stigma management, older women often manage this stigma through age concealment practices. However, young women who are not yet part of this group engage in time-intensive "preventative" practices, generating billions for the anti-aging industry. In a sample of young women (N = 415), this study used latent variable modelling to determine whether the westernized cultural disparagement of older women contributes to young women's engagement in aging prevention work (e.g., cosmetic products and procedures), and whether this link can be explained by a theorized set of intermediary (anticipated stigma, aging expectations, aging anxiety, youth as moral imperative beliefs, anti-aging motivations) and moderator (self-objectification, conformity to feminine norms, beauty as currency ideology) variables. Overall, findings support the utility of the proposed model to explain aging prevention work as a form of beauty work that allows young women to control or escape eventual entry into a stigmatized group.

[79] An Exploration of Potential Moderators of Support for Context-Specific Democratic Norm Violations

12:45 PM – 1:45 PM

POLITICS

In the wake of the 2024 presidential election, we conducted a cross-sectional study of undergraduate students at the University (N = 260). Participants reported their attitudes regarding the election. Participants also reported their attitudes toward abortion, the extent to which those attitudes are moralized, the perceived norms of those attitudes, community value congruency, and the perceived difficulty of pro-choice advocates achieving any policy goals. As the primary dependent variable, we assessed support for democratic norm violations in general and pertaining to abortion. As predicted, liberals endorsed support for abortion specific norm violations to a greater degree than conservatives, $t(184) = 8.67, p < .001$. Conservatives, on the other hand, were more likely to endorse generic norm violations, $t(184) = -2.26, p = .025$. We anticipated that one of the other assessed variables would moderate the relationship between ideology and support for context-specific democratic norm violations. We found moralization, perceived community norms, and perceived difficulty to be significant moderators in these models.

[80] Ethnic Identity Connection and Stress: Exploring Generational Differences

12:45 PM – 1:45 PM

SOCIAL NEUROSCIENCE

Immigration involves transitions that shape psychobiological responses. Ethnic identity is a key contextual factor that can exacerbate stress in some cases, while buffering stress in others. This study examined associations between ethnic identity, measured by the Multigroup Ethnic Identity Measure (MEIM), immigrant generational status, and a biological marker of stress within the hypothalamic-pituitary-adrenal (HPA) axis, measured from the cortisol awakening response (CAR). Participants were 19 ethnically diverse college students, grouped into 1st/2nd generation and 3rd/later generation categories. Findings revealed significant generational differences in ethnic identity connection, with 1st/2nd generation participants reporting higher MEIM scores compared to 3rd/later generation ($p = .034$). No association between MEIM and CAR was observed for the full sample nor when looking at generation groups separately ($ps > .05$), suggesting the relationship may be conditional on contextual factors not captured. These findings show the complexity of ethnic identity and generational status and suggest a need to further integrate psychobiological perspectives into immigration research.

[81] Evaluating Faces: Effects of Smiling, Face Gender, and Gender-Related Traits

12:45 PM – 1:45 PM

GENDER

Smiles guide social evaluations, but stereotypes affect how people perceive smiles. People expect women to be communal (e.g., warm) and men to be agentic (e.g., dominant). When people violate these expectations (i.e., agentic women), they often incur negative evaluations. Because impressions are dynamic and integrative, people may combine this information to form initial impressions of others. We examined how people integrate information about smiles (true vs. false), face gender, and gendered traits into impressions. In Experiment 1, people rated the happiness and genuineness of White men's and women's smiling faces paired with communal or agentic traits. Faces paired with communal traits were rated more positively, independent of smile type. Women's faces received a positivity boost regardless of smile type, whereas men's true versus false smiles were evaluated more favorably. Experiment 2 replicated the trait effect in Black faces, but the gender x smile interaction was less pronounced. Findings suggest that gendered trait information and nonverbal cues shape impressions separately, and that the gender cue boosting White women's evaluations did not extend to Black women.

[82] Everything is connected: Reminders of environmental and social connectedness strengthen environmental attitudes

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

In two studies, we examined the effects of receiving reminders of environmental and social connectedness on environmental attitudes. We developed a novel experimental paradigm to induce feelings of connectedness with vignettes. Environmental attitudes were assessed with the Environmental Concern scale, which included three subscales (biospheric, social, and egoistic). In Study 1 (N = 774), we found that receiving a reminder of environmental connectedness increased environmental concern (biospheric) for individuals who did not feel connected to nature or other people. In Study 2 (N = 854), we replicated and extended these results, showing that receiving a reminder of environmental or social connectedness also increased environmental concern (biospheric and egoistic) for individuals who did not feel connected to nature or others. The findings show that reminders of environmental and social connectedness can promote people's awareness of, and concern for, the environment, especially among individuals with low dispositional connectedness.

[83] Examining Racial Differences in a Personalized UV-Photo Intervention

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Healthcare providers rarely prioritize skin cancer detection and prevention for non-White individuals (Shao & Feng, 2022). Interventions using UV-photos increase skin damage awareness and encourage sun protection behaviors by exposing skin damage not visible to the naked eye (Gibbons et al., 2005). 83 White and 76 Black female college students were assigned to receive a UV photo or no UV photo (a Black and White photo only) plus health information about the risks of UV exposure and protective recommendations specific to the race of the participant. ANCOVAs revealed participants in the UV condition report: more skin damage, greater negative affect, and higher perceived vulnerability to the effects of skin cancer and skin damage than same-race participants in the no UV condition. Moreover, participants in the no UV condition reported greater willingness and intentions to engage in risky sun behaviors (i.e. going to the beach without sunscreen) compared to those who viewed their UV photos. Our findings suggest that our intervention is effective thus far in increasing awareness of skin damage as well as promoting healthier sun protection cognitions among both Black and White females.

[84] Examining threats to gender typicality on children's motivation in STEM subjects

12:45 PM – 1:45 PM

GENDER

Gender differences in STEM interest and self-efficacy emerge early in childhood and persist throughout development. Individuals often assess whether their own gender identity aligns with societal stereotypes of a given domain, potentially explaining the gender differences in STEM. Research shows that threats to gender typicality can increase conformity, particularly for those who feel pressured to be gender typical. In the current study, we use a gender knowledge paradigm to threaten children's (5-14 years old) gender typicality, and subsequently measure their interest and self-efficacy in four domains: male-typed STEM subjects (computer coding and engineering) and non-STEM subjects (reading and music). In line with the current research, we expect that threatening boys' gender typicality will lead to more interest and self-efficacy in STEM subjects, while threatening girls' gender typicality will lead to more interest and self-efficacy in non-STEM subjects. The current project is ongoing, and we anticipate that data collection will conclude by November 2025.

[85] Expanding self-determination theory: Examining the role of nature relatedness in agroforestry adoption among Indigenous landholders in Mexico

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Understanding what motivates land users to adopt conservation practices is critical for addressing climate change and biodiversity loss. Yet adoption alone is not enough—behavioral intensity and persistence are also key. We tested an expanded self-determination theory (SDT) framework to examine autonomous motivation among Indigenous land users in Yucatán, Mexico. Drawing on semi-structured interviews and surveys from 28 communities participating in Sembrando Vida, a national agroforestry program, we used thematic analysis and structural equation modeling to assess the relevance of SDT in this context. Results support SDT's cross-cultural applicability and emphasize the need for culturally adapted psychometric tools. Nature relatedness was positively associated with autonomous motivation and in turn, adoption intensity. These findings suggest that including people's relationship with nature may strengthen SDT and offer a more inclusive understanding of the psychological drivers of sustainable land management.

[86] Expectancies as Contributors to Health Disparities in Transgender Adults

12:45 PM – 1:45 PM

PHYSICAL HEALTH

Expectancies are well-established predictors of health behaviors and outcomes, yet their role in transgender health remains understudied. This study explored whether different types of expectancies help explain health disparities among transgender individuals. A community sample recruited from Prolific (N = 200; Mage = 39.16, SD = 12.75; 27% transgender) completed measures of health history, physician trust, and care barriers. Participants then imagined attending a doctor visit for common and ambiguous symptoms (e.g., headache, dizziness) that interfered with their daily functioning and reported their interpersonal, affective, and outcome expectancies. Transgender participants were less likely to have had a recent physical, more likely to have delayed needed care, and reported worse overall health. They also reported significantly lower interpersonal expectancies, positive affective forecasting, and outcome expectancies. Mediation analyses showed that these expectancies helped explain health differences between transgender and cisgender participants. These findings highlight expectancies as a key psychological factor shaping transgender health experiences and care engagement.

[87] Experimental Evaluation of Gratitude Journaling on Psychological and Physiological Stress Outcomes

12:45 PM – 1:45 PM

SELF-REGULATION

This research investigates the role of gratitude in mitigating anxiety and enhancing well-being through a 3-part study. Study 1 (N = 219) examined the effectiveness of an anxiety induction method and explored the immediate subjective impact of gratitude journaling on anxiety levels and affect. Results show that gratitude journaling significantly improves mood compared to complaint and control conditions (p = 0.004). The effect of the anxiety induction was supported, with no significant difference between groups in anxiety levels post-induction. Study 2 (N = 100) focused on establishing habituation of gratitude, testing its long-term effects on self-esteem, emotional regulation, and self-efficacy. Gratitude journaling over a week was associated with decreased anxiety, improved emotional regulation (p = .002), positive affect (p = .001), and reduced negative affect (p = .004). Study 3 (N = 100) will incorporate neurophysiological measures (EEG, cortisol, blood pressure) to expand on study 2 findings. In addition, it will explore moderating elements longitudinally to probe interactions with psychological aspects such as self-concept clarity, self-esteem stability, and internal beliefs. This research aims to elucidate the mechanisms behind gratitude's potential as an intervention for managing anxiety, offering insights into its practical applications in mental health contexts.

[88] Exploring Adherent Associations Across Gender Identities

12:45 PM – 1:45 PM

GENDER

Transphobia-based discrimination and prejudice toward these individuals has risen dramatically in recent years due to increased exposure in media and societal change. In many countries, politicized groups and even some feminist movements have turned the existence of transgender individuals into a political debate (Gupta et al., 2024). For a previously exploratory study, stereotypes about nonbinary individuals were collected and analyzed, as previous research has only identified stereotypes regarding cisgender and transgender men and women (Howansky et al., 2019). The goal of the current study is to identify the interrelations between transphobia, tolerance, sexism and conservatism utilizing a framework that distinguishes non-binary gender from other transgender identities. This study will task participants to rate common stereotypes collected from the literature and previous study using the same novel characteristic content coding scale used by the research team. Content coding ratings include believability, warmth, and competence, as well as social acceptance and sexuality. The full content-coding scale and content analysis of stereotypes will be further discussed in the poster..

[89] Exploring Mental Health Symptom Recognition and Help-Seeking Behavior

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

An essential precursor to mental health help seeking (MHHS) is the recognition of symptoms. That is, MHHS will not occur if mental health symptoms are not first recognized as being serious enough to warrant help seeking. The present study examined how adults (N=364) perceive mental health symptoms varying in severity. Participants read randomly assigned scenarios about mild, moderate, or severe symptoms, then indicated whether the symptoms required help and whether they would seek help. ANCOVA results revealed that participants exposed to the severe symptoms displayed a greater need for help (M = 3.80) compared to those exposed to the moderate (M = 3.50) or mild symptoms (M = 3.57); F(2,359) = 3.78, p = .024, $\eta^2 = .021$. Anticipated help seeking did not differ with symptom severity. Open-ended responses to why participants would or would not seek help were coded for emerging themes. These findings highlight the importance of considering symptom recognition as a first step in MHHS.

[90] Exploring Social Support, Motives and Well-Being in LGBTQIA+ Online Spaces

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

For gender and sexual minorities (GSM), social media use can increase exposure to discrimination and toxicity but also provide an environment where knowledge and community are cultivated. A disproportionate empirical focus on negative outcomes, however, highlights the need for additional investigations of the positive aspects of social media use for GSM. In the present study, self-identified GSM adults (N = 332) completed an online survey measuring their use of different social media platforms and spaces, motives for social media use, digital well-being, general social support from social media, and GSM-specific social media benefits. Spending more time in GSM-specific (relative to broader) social media spaces predicted greater social support from social media and greater GSM-specific benefits. It was also indirectly associated with greater digital well-being through the tendency to obtain social support from social media. This association was not, however, mediated by GSM-specific benefits. These findings can help build a better understanding of the potential impact of social media use on factors that contribute to well-being among gender and sexual minorities.

[92] Exploring the Effects of Mattering and Health Insurance Status on Group-based Medical Mistrust

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Group-based medical mistrust (GBMM: the belief that one's racial/ethnic group is treated unfairly in medical contexts), is a key barrier to health engagement and outcomes. The present study examines whether and how perceptions of mattering to one's doctor - i.e., an individual's sense of being important and significant to his or her doctor - in conjunction with health insurance status are related to three dimensions of GBMM (Lack of Support, Suspicion, and Group-based Disparities). A diverse sample of American adults (N = 2,162) completed the GBMM scale (Thompson et al., 2004), a validated measure assessing mattering to doctors, and reported their primary source of health insurance (grouped into no insurance, public insurance, and private insurance for analyses). We will use moderation and mediation analyses to explore two hypotheses. Our moderation hypothesis proposes that a negative association between mattering and reported GBMM will decrease as we progress from having no insurance to public insurance to private insurance). Our mediation hypothesis proposes that the relationship between health insurance and GBMM will be mediated by mattering such that those with private insurance (compared to public and no insurance) will have a higher perceptions of mattering and thus a lower GBMM.

[93] Exploring the Link Between Loneliness, Mind-Wandering, and Idiosyncratic Perceptions

12:45 PM – 1:45 PM

SOCIAL NEUROSCIENCE

Social connection is fundamental to well-being and shapes how individuals perceive and relate to the world. Prior research shows that lonely individuals often hold idiosyncratic views, but the cognitive mechanisms underlying this link remain largely unknown. Building on another line of research suggesting a link between loneliness and mind-wandering, the present study tested whether such idiosyncratic perceptions of lonely individuals can be partly attributed to their mind-wandering tendencies. Using functional near-infrared spectroscopy (fNIRS), we tracked neural responses while participants viewed naturalistic stimuli and completed a Sustained Attention to Response Task (SART), examining their relation to loneliness. Preliminary findings from our pilot study (N = 22) suggest that mind-wandering is positively associated with loneliness and idiosyncratic neural responses. Both mind-wandering and loneliness showed non-significant but consistent links with lower intersubject correlation (ISC) across regions of interest (e.g., vmPFC). We are extending this work with a larger sample (N ≈ 100) to test whether mind-wandering explains lonely individuals' idiosyncratic perceptions.

[94] Exploring Women's versus Men's Motivation for Appearing Gender Stereotypical

12:45 PM – 1:45 PM

GENDER

Many people feel pressure to conform to gendered appearance norms, i.e., what is considered stereotypically attractive for women and men. While prior work links this pressure to health risks (e.g., disordered eating), less research has examined its social-motivational roots. We ask whether people's drive to appear gender-typical is shaped by a need for approval (vs. fear of disapproval) from same- vs. other-gender peers, and how this predicts health behavior intentions. In Study 1 (N=394; 198 women), fear of disapproval from same-gender peers (e.g., "I feel judged when [women/men] criticize my body") predicted women's desire to appear feminine (e.g., "I'd prefer thinner thighs") and men's desire to appear masculine (e.g., "I'd prefer bigger biceps"). In Study 2 (N=400; preregistered), we will replicate and extend these findings by testing a serial mediation model from (dis)approval motives to desire for stereotypicality and health-related intentions—ranging from low-risk (e.g., protein use) to high-risk (e.g., illegal steroid use). Based on Study 2, we will conduct an experimental Study 3, manipulating approval via threat and testing downstream effects on motivation and health.

[95] Differential associations of group-based and role-based identification with fans' well-being.

12:45 PM – 1:45 PM

SELF/IDENTITY

Using the social identity approach (SIA), prior studies showed that identification with a sport team is associated with enhanced well-being. However, they examined fan group-based identification (FGID) only, ignoring the role of fan role-based identification (FRID). This study investigates how FGID and FRID are differently linked with fans' eudaimonic well-being. Survey data were gathered from 641 middle-aged and older fans of the Chunichi Dragons, a Japanese professional baseball team performing poorly in recent years. The results of structural equation modeling showed that FGID was positively associated with five aspects of eudaimonic well-being except for purpose in life. In contrast, FRID was negatively associated with autonomy, environmental mastery, and positive relationships with others. Furthermore, middle-aged and older fans who watched the team's baseball games more frequently reported stronger FGID and FRID, which, in turn, affected their eudaimonic well-being differently. Our findings advance the SIA by indicating that the effect of FGID on fans' eudaimonic well-being is independent of a favorite team's performance, whereas the effect of FRID depends on its performance.

[96] Faith in Contrast: LDS and Evangelical Students at Outgroup Universities

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

According to Erikson's Theory of Psychosocial Development, students should ideally solidify their identity and move on to intimacy formation during their time at college (Erikson, 1963; Erikson, 1968). Within identity formation, spiritual development may be one of the more important areas of growth, especially for students attending religiously affiliated universities (Bowman & Small, 2010). For religious minorities at these universities, there is the potential for a lack of belonging due to strong in-group cohesion. Existing research disagrees as to whether the struggle of religious minorities has a positive or negative effect on their spiritual growth and identity formation (Small & Bowman, 2012; Bryant & Astin, 2008; Bryant, 2011). This case study will focus on two specific religious minorities: LDS undergraduate students at Baylor and Evangelical students at BYU. This study will aim to answer three research questions: 1) To what extent do Latter-day Saint students at Baylor and Evangelical students at BYU feel like they belong at their universities? 2) What are the interfaith experiences of Latter-day Saint students at Baylor and Evangelical students at BYU with peers, faculty, and university programming? 3) How can Baylor and BYU improve interfaith interactions for religious minorities? Data for this mixed methods case study comes from online surveys with scales measuring self-esteem, university belonging, peer belonging, institutional belonging, roommate friendship, and isolation as well as semi-structured interviews. These were completed by 5 undergraduate students: 2 LDS students at Baylor University and 3 Evangelical students at Brigham Young University. Using narrative inquiry and reflexive thematic analysis, this case study gained insight into the experiences of these religious minorities and provided ideas for how Baylor, BYU, and other similar universities can improve the experiences of students with beliefs differing from their institution. This case study also sets the stage for future research into the nuance of ecumenicity that proves beneficial for spiritual growth and identity development.

[98] Feasibility of an appearance-based intervention to shift behavioral beliefs about heavy alcohol use for male and female college students

12:45 PM – 1:45 PM

GENDER

Long standing gender differences in heavy drinking patterns over the past five years have vanished such that heavy alcohol use is similar for males and females. This implies that interventions aimed at reducing young adult heavy drinking may not need to be tailored to gender. This study is one of the first to test whether a personalized, appearance-based intervention could shift beliefs linking heavy alcohol use to negative facial aging outcomes among male and female college students. Undergraduate students (N = 238) were randomly assigned to one of four conditions: photoaging and written information (P+W), photoaging only (P), written information only (W), or control. Participants in the P+W condition viewed a facial-aged photo of their face and received written information about the effects of heavy alcohol use on facial appearance. Beliefs were assessed by combining expectancy and valence ratings across four facial changes: wrinkles, under-eye puffiness, midface volume loss, and visible blood vessels. After controlling for past alcohol use and appearance concerns, results revealed a main effect of condition, such that male and female participants in the photo conditions (P+W and P) reported significantly stronger alcohol-appearance beliefs than those in W or control conditions. There were no differences in beliefs between participants in the P+W and P conditions, and no main effect of gender on beliefs. This study provides promising initial evidence that personalized, appearance-focused feedback may offer a novel, motivational pathway for reducing problematic alcohol use among male and female college students. Future work should examine whether these belief shifts translate into behavioral change.

[99] Feeling Me in the World of We: Self-Esteem and Loneliness Across Time

12:45 PM – 1:45 PM

SELF-ESTEEM

How does individuals' self-perception shape their perceptions of their social relationships? A growing body of research suggests that self-esteem, defined as individuals' subjective evaluation of their own worth, is closely related with relationship quality. Yet, the temporal dynamics between self-esteem and loneliness remain underexplored. Loneliness, defined as the perceived inadequacy of one's social relationships, is a growing public health concern linked to poor well-being. This preregistered study investigates the bidirectional association between self-esteem and loneliness using 16 waves of data from the Dutch LISS panel (total N = 19,841). Grounded in sociometer theory and related frameworks, we test two hypotheses: (1) low self-esteem predicts greater subsequent loneliness (vulnerability effect), and (2) loneliness erodes self-esteem over time (scar effect). We apply Random Intercept Continuous-Time Structural Equation Modeling (RI-CT-SEM) to estimate within-person autoregressive and cross-lagged effects while accounting for stable trait differences. We also explore differences across loneliness subtypes and potential moderators including gender, self-other inclusion, and objective social indicators. The findings aim to refine theoretical frameworks of self-social regulation and offer critical insights for interventions targeting the feedback loop between self-esteem and loneliness.

[100] First Look at the Beauty Myth Scale in Japan

12:45 PM – 1:45 PM

GENDER

The present study examined the psychometric properties of the Japanese version of the Beauty Myth Scale (BMS). The sample included college students and graduate students entering the workforce after completing their job search. Data were split for exploratory (EFA; n = 279) and confirmatory factor analyses (CFA; n = 278). The EFA indicated a three-factor solution—prescriptive beauty norms, attainability beliefs, and bodily-related standards—rather than the four-factor model reported in prior work. CFA supported this three-factor structure with adequate fit indices ($\chi^2(51) = 126.18$, $p < .001$; CFI = .91, RMSEA = .07, AIC = 180.18). Subscales showed acceptable reliability ($\alpha = .76-.81$). Gender comparisons revealed higher endorsement of attainability beliefs among women than men ($d = -.61$). Prescriptive beauty norms correlated positively with physical attractiveness beliefs, gender role awareness, and traditional marital/work aspirations. Findings suggest that while core aspects of beauty-related ideology are consistent cross-culturally, prescriptive and grooming standards consolidate differently in Japan, reflecting cultural nuances. This work provides a reliable tool for investigating how beauty myths shape beliefs and practices in Japanese society.

[101] Flourish to Move, Move to Flourish: A Reciprocal Link Between Psychological Well-Being and Exercise in 22 Countries

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

To test reciprocal associations between exercise and psychological well-being (PWB), we analyzed two annual waves of the Global Flourishing Study (N = 207,919 adults, 22 countries). We hypothesized that higher levels of each variable would predict increases in the other over time.

Exercise was treated as a binary variable (no exercise vs. the rest), and PWB was measured using a 12-item flourishing index. In each country, we fitted survey-weighted Poisson (exercise outcome) and linear (PWB outcome) models, adjusting for sociodemographic and health status.

Meta-analytic results show that, relative to non-exercisers in Wave 1, those who exercised scored higher on PWB in Wave 2 (B = 0.08, 95 % CI [0.06, 0.10]; $I^2 = 66.7\%$). Greater Wave 1 PWB predicted higher odds of exercising, with a pooled RR of 1.01 (95 % CI [1.01, 1.02]; $I^2 = 58.9\%$). In subcomponent analyses of PWB, only eudaimonic (purpose), not hedonic (pleasure) well-being, predicted higher odds of exercising with a pooled RR of 1.01 ($p < .001$). Most countries showed effects in the expected direction except Israel.

The exercise-PWB loop appears mostly universal, with eudaimonia as the main driver.

[102] Forgetting What You Don't Express: Does Working Memory Capacity Moderate the Impairment of Memory by Expressive Suppression?

12:45 PM – 1:45 PM

SELF-REGULATION

While the suppression of emotional expressions is vital to social functioning, habitual use may have unintended negative consequences for well-being and cognitive functioning. Namely, it is well documented that expressive suppression impairs memory. Richards and Gross (2000) explained this by proposing that expressive suppression is cognitively costly and diverts attentional resources away from emotional stimuli. The current study aims to replicate the memory impairment effect by expressive suppression and examine working memory capacity (WMC) as a moderator. Participants (N = 411) viewed a negative emotion-eliciting video clip under instructions to either suppress their emotional expressions or view naturally. Following a short distraction task, participants completed a 20-question memory test about the film. We predict that memory will be worse when participants suppress their emotions versus viewing naturally. We will test competing hypotheses for WMC. Higher WMC may counteract the cognitive costs of suppression, reducing the impairment effect. In contrast, higher WMC may enhance individuals' suppression, paradoxically increasing the impairment effect.

[103] From Meme to Malady: Social Media, Concept Creep and Mental Health

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Concept creep is a research domain which refers to the gradual expansion of the meanings of harm-related concepts, such as mental illness and trauma. This phenomenon has become particularly relevant to social media. The medium of social media may promote the rapid spread of mental health language, potentially contributing to the expansion of mental health concepts.

Participants will be exposed to either 5 minutes DSM-5 ADHD congruent TikToks or 5 minutes DSM-5 ADHD incongruent TikToks, potentially highlighting how social media may cause definitions of mental health to concept creep. Outcome variables include; self-diagnosis, general health questionnaire, positive and negative affect, group identification, distress, and self report ADHD. Moderators include; prior social media exposure, content engagement, need for cognition, mental health group identification, mental health literacy and Big-5 personality characteristics. We predict that DSM-5 incongruent TikTok ADHD content will expand definitions through concept creep subsequently effecting all outcome variables and potentially be moderated by highlighted moderators.

[104] From Trauma to Resilience: Transformative Neurobiological Adaptations Across Generations

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

This presentation draws from Project Alpha's six-year longitudinal data (N=387) to illuminate the transformative journey from trauma to resilience through two compelling narratives within the same cohort. Our first narrative compares third-generation Holocaust survivors vs. matched controls, revealing how intergenerational trauma manifests in distinct patterns across HPA axis functioning, oxytocin regulation, and dopamine pathways. Descendants exhibited significantly lower attachment avoidance alongside DNA methylation profiles indicating enhanced oxytocin system activation and heightened HPA axis reactivity through CRH, CRHBP, FKBP5, and NR3C1 modifications—yet showed no elevated psychopathology. Project Alpha's longitudinal tracking demonstrates how descendants develop compensatory neurobiological adaptations that paradoxically transform ancestral suffering into enhanced stress resilience.

Our second narrative follows participants orphaned in childhood vs. matched controls within the same cohort, documenting their remarkable capacity for post-traumatic growth through these same neurobiological systems. Results reveal how early parental loss catalyzes extraordinary adaptations: lower attachment avoidance paired with oxytocin system enhancement and dopamine transporter modifications yielding higher synaptic dopamine availability and enhanced creativity.

These intertwined stories demonstrate trauma's dual legacy: while neurobiological dysregulation persists, these same systems simultaneously evolve protective mechanisms. Project Alpha's longitudinal perspective reveals that resilience emerges not despite trauma, but through the active transformation of suffering into biological and psychological strength—offering profound hope for healing and growth.

[105] Gay and Sexist?: Women's Perceptions of Sexualizing Comments from Gay Men

12:45 PM – 1:45 PM

GENDER

Gay men endorse hostile sexism at the same rate as straight men, though sexism from gay men may go unrecognized because they are viewed as honorary ingroup members and afforded more leeway to make sexist comments. Two experimental studies (N = 447) tested whether women's perceptions of sexualizing comments depend on the commenter's sexual orientation (Study 1) and gender presentation (Study 2). As predicted, sexist (vs. neutral) comments from gay (vs. straight) men were rated more positively and elicited more positive emotions, more positive perceptions of the commenter, less social distance from the commenter, and greater interest in future interaction with the commenter. Viewing the commenter as being more closely aligned with women predicted more favorable perceptions. Altogether, these results support the notion that women view gay men's sexist comments more leniently than straight men's; this effect is driven by gay men's alignment with femininity. This research has practical and theoretical implications for our understanding of when sexism may go undetected and excused, which can help to inform interventions that aim to reduce sexism and empower people to confront sexism.

[106] Gender Bias in Reactions to Mild Moral Transgressions: The Role of Personal Benefit

12:45 PM – 1:45 PM

GENDER

Prior correlational research suggests that women receive more lenient sentences than men for legal transgressions, especially violent and sexual crimes. We examined in a preregistered experiment (n = 801) whether a transgressor's gender (woman v. man; between-subjects) shaped observers' judgments of relatively mild moral transgressions (e.g., academic plagiarism), and whether these effects depend on who benefited from the transgression (transgressor v. others; within-subjects). Regardless of transgressor gender, we found that transgressors who self-benefited (v. benefited others) were overall judged more negatively (i.e., worse moral character, more blame and responsibility, punished more harshly). However, punishment varied by transgressors' and participants' gender: Regardless of who benefited, male (v. female) participants punished female transgressors less harshly, and male (but not female) participants punished female (v. male) transgressors less harshly. These findings suggest that mild transgressions with noble ends (e.g., helping others) tend to be excused regardless of gender, and that men (who comprise the majority of judges) may be particularly lenient toward women.

[107] Gender Differences in Adolescents' and Adults' Leadership Interests After Failure

12:45 PM – 1:45 PM

GENDER

All leaders face the risk of failure, yet it affects women's interest in leadership more than men's, perhaps because women leaders expect to—and do—receive less social support if they fail. Across two studies, we examined whether expecting less social support after failure helps explain previously observed gender gaps in adolescents' and young adults' leadership interests. Participants reported their interest in a hypothetical classroom-based leadership role before and after experiencing a public failure, as well as social support they expected to receive from peers, family, and instructors. In Study 1 (undergraduates; $N = 95$), women—but not men—who expected lower social support after failure reported lower interest in pursuing the role again. In Study 2 (10- to 14-year-olds; $N = 176$), girls aged 13.5 and older reported lower post-failure leadership interest than boys of the same age. Both girls and boys who anticipated lower social support after failure were less interested in pursuing the role again. Our findings suggest that social support after experiencing failure is a crucial and underexamined contributor to gender gaps in leadership interests, especially among young adults.

[108] Intimate Partner Violence and Self-Sufficiency in an Emergency Maternity Shelter

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Intimate partner violence (IPV) is a public health concern associated with adverse health outcomes that are particularly concerning during pregnancy, where vulnerability to the consequences associated with experiencing IPV may be amplified and involve long-term negative outcomes for the developing fetus. Emergency maternity shelters provide support for at-risk pregnant women by increasing self-sufficiency. This study explored the relationships between IPV, length of stay, and self-sufficiency outcomes using archival data of 337 pregnant women (ages 18-46) residing in a local emergency maternity shelter. Most women ($N=205$) reported experiencing IPV. Preliminary analyses revealed that IPV and length of stay at the shelter emerged as predictors of self-sufficiency outcomes ($\beta = .44$, $p < .001$). Moderation analyses indicated that length of stay at the shelter moderated the relationship between IPV and self-sufficiency change scores ($R^2 = .14$, $p = .03$). This study provides evidence that targeted interventions in emergency maternity shelters can increase self-sufficiency for pregnant women in crisis and that these benefits continue to accumulate over time.

[109] Gender Identity, Gender Affirmation, and Self-Perceptions of Birth Name

12:45 PM – 1:45 PM

GENDER

A newborn's birthname is typically based on the baby's sex assigned at birth, and body-based gender labeling plays an important role in a baby's socialization through expectations from others and internalization of norms. Though scholars have investigated gender stereotypes associated with a baby's name, empirical research has primarily been done on cisgender samples and has neglected the examination of names for transgender and gender nonconforming people (TGNC), despite the particular importance names may hold for this population. The current study focused on the role that the (mis)match between one's name assigned at birth (NAB) and gender identity plays in gender dysphoria, the gender affirmation process, and harm from close others. Surveying a TGNC sample ($N = 66$), we found that the greater the mismatch between one's NAB and gender identity, the greater gender dysphoria and harm from others experienced; participants who changed their NAB reported a greater mismatch between their NAB and their gender identity than those who had not changed their NAB; and participants who changed their NAB reported greater harm from social networks but not from family. The research underscores the importance of one's name in the gender affirmation process for TGNC people. This research also explores the complex role of one's name and one's gender identity in harm experienced from others.

[110] Gender Roles of Evil: How Gender Roles Shape Our Perceptions of Perpetrators

12:45 PM – 1:45 PM

GENDER

This study examined whether perceptions of moral wrongdoing differ depending on the actor's gender and the type of role they occupied. Drawing on research that links gender roles with expectations for caregiving (female) and authority (male), participants rated scenarios where male or female actors committed "evil" actions framed in either Care or Authority positions. A 2×2 repeated-measures ANOVA revealed a strong main effect of Frame, $F(1,117)=17.35$, $p<.001$, $\eta^2=.13$, with actions described in terms of Care judged as more evil than those described in terms of Authority. No overall difference emerged between male and female actors, $F(1,117)=0.19$, $p=.66$, $\eta^2=.002$. However, the effect of Frame was moderated by the actor's gender, $F(1,117)=5.00$, $p=.027$, $\eta^2=.04$, suggesting the Care–Authority gap was larger when the actor was female. These findings suggest that judgements of evil are shaped not only by the type of role invoked but also by gendered expectations about who is "supposed" to occupy those roles.

[111] Gender System-Challenging Beliefs Predict Biased Leadership Judgments

12:45 PM – 1:45 PM

GENDER

We examined how individual differences in beliefs about the gender status quo shape biases in leadership judgments. Across three studies ($N = 1,157$), we tested whether those with system-challenging versus system-justifying beliefs show divergent patterns in how they evaluate leadership decisions and leaders themselves. Participants evaluated CEOs based on their decision to appoint either a female or a male leader (Study 1) and evaluated female and male leaders themselves (Studies 2 & 3). Results showed that those with stronger gender system-challenging beliefs consistently rated male leaders and those who appointed them more negatively compared to their female counterparts. In contrast, participants with system-justifying beliefs did not display gender-based bias. These findings demonstrate that those who reject the status quo may be actively motivated to challenge it, giving rise to biased evaluations that reflect system-challenging motivated cognition. The final study showed that individuals with stronger system-challenging beliefs devalued leaders who supported the gender status quo, further underscoring the role of ideological motives.

[112] Gendered physical appearance and exclusion from women's sports

12:45 PM – 1:45 PM

GENDER

Debates about trans and intersex women's participation in sports often center around their assumed advantage over competitors. Concerns about adherence to gendered appearance norms, however, may also play a role in informing beliefs about who should and should not be allowed to compete. The current study ($N=816$) examined the effects of gendered appearance (masculine vs. feminine) and physiological capability (advantage vs. no advantage) on the extent to which people supported excluding an athlete from women's sports. Participants not only supported excluding an athlete with a physiological advantage more than an athlete without one, $B=0.35$, $SE=0.08$, $p<.001$, but also supported excluding a masculine-looking athlete more than a feminine-looking athlete, $B=0.23$, $SE=0.08$, $p=.004$. Mediation analyses suggest that gender/sex categorization may explain the effect of appearance on endorsed exclusion from women's sports. These findings suggest that opposition to certain athletes' inclusion in women's sports may not be straightforwardly grounded in beliefs about their physiological advantage but also motivated by concerns about what they look like and what gender/sex category they belong to.

[113] Gendered Self-Environment Fit and Its Impacts on Academic Experience in Engineering

12:45 PM – 1:45 PM

GENDER

Engineering fields are widely recognized as operating under a "masculine default," yet few studies have examined how this environment shapes gendered psychological experiences that influence students' academic experiences. Drawing on the state authenticity as fit to environment (SAFE) model, this study investigates how different forms of self–environment fit (self-concept fit, social fit, and goal fit) within masculine-coded engineering contexts contribute to academic identification and life satisfaction. Surveying 248 first- and second-year engineering students, we found that women and non-binary students reported a lower level of engineering identification and career commitment, which was mediated by lower self-concept fit. Additionally, women and non-binary students reported lower levels of social fit, which predicted lower life satisfaction; however, this effect was offset by other factors, resulting in no overall gender difference in satisfaction. These findings illuminate the psychological processes through which gendered academic environments relate to student academic motivation and well-being and underscore the importance of fostering person–environment fit in interventions.

[114] Gender-Race Perception in Gender-Neutral Names

12:45 PM – 1:45 PM

GENDER

How do racial cues in names shape gender perception, a basic social categorization process with consequences for evaluation and hiring? Prior work offers mixed predictions: some studies suggest East Asian targets are feminized (Galinsky et al., 2013), whereas other research finds weaker gender judgment towards East Asian names (closer to neutral on femininity/masculinity) than White names (Goh, 2025). A key limitation is that the latter contrasted unfamiliar East Asian names with familiar White names, confounding race and name familiarity. We preregistered an experiment (target N=352 US undergraduates) pairing racialized last names (East Asian vs. White) with U.S. gender-neutral first names, keeping name familiarity constant. Participants rate the masculinity/femininity of each target. We advance intersectionality theory by adjudicating competing accounts: gendered-race theory vs. reduced gender judgment vs. androcentrism.

[115] Gesture Talks: Racial Pride and Affect for Black and White Same-Race Dyads

12:45 PM – 1:45 PM

NONVERBAL BEHAVIOR

Racial identity shapes communication as prior work links Black identity to greater gesture use than White identity, suggesting that identity centrality can influence affect during interactions. We tested whether gesture use differs between Black and White same-race dyads (27 Black, 27 White, N = 108) and how racial pride relates to affect changes after a sensitive discussion about diversity, equity, and inclusion. Black dyads reported higher rates of gesturing and decreases in negative affect during the interaction. Similarly, for Black participants with less racial pride, the interaction resulted in the largest decreases in feelings such as anxiety, tension, and discomfort. Neither effect was seen for White participants. Because racial pride relates to self-esteem (Phinney, 1998), Black participants with lower pride may experience same-race interactions as more reassuring, which reduces anxiety more than for those with high pride and self-esteem. These findings suggest that nonverbal expressions and racial pride jointly shape emotional trajectories in sensitive in-group conversations, supporting potential options for decreasing anxiety in same- and cross-race interactions.

[116] Hearing the Memory: Using Guided Meditation as a Route to Connection

12:45 PM – 1:45 PM

MENTAL HEALTH/WEELL-BEING

In 2023, the U.S. Surgeon General declared a loneliness epidemic, raising the question of how to “solve” this epidemic. Prior literature has demonstrated a couple ways to increase feelings of social connection even when one is not with others: meditation (Hutcherson et al., 2008) and recall of past experiences with close others (Ross & Inagaki, 2023). The current research attempts to leverage both of these ideas simultaneously. Employing a 2 (guided meditation content: Grand Canyon specific vs. hypothetical ideal space) x 2 (personal experience with the Grand Canyon: yes or no) factorial design across two datasets. Results revealed that participants who listened to the Grand Canyon meditation and had visited the Grand Canyon reported more social connection than any of the other 3 groups (i.e. those who listened to the same meditation but had not visited the Grand Canyon or those who listened to the ideal space meditation regardless of if they had been to the Grand Canyon or not). These results suggest that guided meditations that relate to personal memories may be particularly potent for fostering feelings of social connection in a lonely world.

[117] Hedonic deficit and interference profiles and co-occurring posttraumatic stress disorder, depression, and anxiety among South Asian Americans: A latent profile analysis approach

12:45 PM – 1:45 PM

MENTAL HEALTH/WEELL-BEING

Hedonic deficit and interference co-occur with posttraumatic stress disorder (PTSD), depression, and anxiety. The comorbidity has been examined among diverse populations, but little is known about how they present in the South Asian American (SAA) community. Using a trauma-exposed SAA sample, the study examined (a) subgroups based on the hedonic deficit and interference clusters (hedonic deficit [HD], negative affect interference [NAI], & positive emotionality [PE]); and (b) how these latent subgroups varied on PTSD, depression, and anxiety symptom severity. 254 SAAs were recruited from Amazon Mechanical Turk (MAGE=34.22 ± 8.52 years, 44.5% women, 45% had provisional PTSD). Latent profile analyses (LPA) indicated a three-profile solution: low HD/low NAI/high PE (Profile 1), high HD/low NAI/high PE (Profile 2), and high HD/high NAI/high PE (Profile 3). Profile 1 ($p=.001$) and Profile 2 ($p=.005$) reported significantly lower PTSD symptom severity than Profile 3. Profile 2 reported significantly lower depression ($p=.008$) severity than Profile 3. Results indicate that trauma-exposed SAAs differ in their responses to positive stimuli, yet, positive emotions were elevated across subgroups, suggesting that positive affect may be preserved despite psychological vulnerabilities following trauma exposure. NAI may be a target for comorbid PTSD and depression among trauma-exposed SAAs.

[118] Hijab & Education

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

This exploratory qualitative study seeks to understand the influence of wearing the hijab in college through the voices of Hijabi college students. Between 20 and 30 semi-structured interviews are being conducted with Muslim women ages 18-28 who wear the hijab across the United States and Canada. Participants are recruited primarily through the researcher's personal contacts in addition to snowball sampling and campus recruitment. Interviewees will be asked to share their personal experiences regarding: how they came to wear the hijab, what it means to them, their level of autonomy in choosing to wear it, experiences of acceptance or discrimination, and the role of religion in academic motivation. Sociocultural factors will also be explored such as friendship choices, their Gen Z experience, and whether familial culture and the culture they live in shape how they wear the hijab. Thematic analysis will be performed across participants' responses. This study aims to offer researchers greater insight into the challenges and potential advantages experienced by this Muslim population and their role in shaping identity and purpose.

[119] Honor Ideology, Political Ideology, and Perceptions of Backlash toward Gender Nonconforming Children

12:45 PM – 1:45 PM

GENDER

Gender nonconforming behavior is often perceived negatively, and people are backlashed for these behaviors. That being said, most of the existing work in this area has focused on the backlash of adults with few studies examining these effects in children, with what little research there is showing boys and girls may be penalized for gender deviant behavior but that this backlash is typically stronger for boys than girls. We will present data from 3 recently published studies examining perceptions of backlash of gender deviant children by parents and 1 more recent unpublished study examining how this backlash is perceived by those higher in masculine honor ideology. We found that parents who backlash their children are perceived quite negatively compared to parents who affirm their child (Studies 1[N = 170] and 2 [N = 187]) and this is true at all ages (up to 18; Study 3 [N = 328]) but more conservative individuals reported more support of backlashing children across all studies. Extending these findings, Study 4 (N = 326) showed that honor ideology uniquely (and quite strongly) predicted more favorable perceptions of parents who backlashed their child for gender deviant behavior.

[120] How (Not) to Inspire Leadership Aspirations: When Possible Selves Contradict Women's Socialized Gender Role

12:45 PM – 1:45 PM

GENDER

Americans tend to describe leaders as assertive and direct (agentic; Koenig et al., 2011). This stereotype conflicts with a facet of women's socialization (to be communal), which can signal that leadership misaligns with their gender role. Possible selves is one method to inspire women to pursue leadership, yet how possible selves are depicted determines their effectiveness (Hoyt & Simon, 2011). We hypothesized that depictions of women leaders on TV are agentic, but not very communal, and that viewing these depictions dampens women's leadership aspirations. In Study 1, we sampled 139 clips of leaders from 18 popular TV shows. Leaders were highly agentic and not very communal in their interactions with subordinates, and this was especially true for women leaders. We pilot tested whether this pattern had any effect on women's interest in leadership. Women (N=119) viewed clips from the content analysis depicting women leaders as either communal or agentic. Participants in the communal (vs. agentic) condition were more interested in leadership roles, though the effect was small and marginal. We are now collecting a fully powered sample (N=540) to replicate and extend this effect.

[121] How Counselors Navigate Religious/Spiritual Value Conflict in Counseling: A Scoping Review

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

The neutrality principle in counseling requires therapists to remain impartial and avoid imposing personal values, preserving client autonomy and therapeutic rapport (Jackson et al., 2013). Yet counselors inevitably bring moral convictions and personal values into the room, especially as it pertains to religious/spiritual convictions. This study aims to explore how therapists with strong spiritual/religious standards navigate counselor-client value conflict in practice—whether these convictions constrain empathy or could be transcended into enriching therapeutic alliance and enhancing treatment effectiveness. Guided by Arksey and O'Malley's framework and PRISMA-ScR guidelines, we searched on EBSCOhost, PsycINFO, Google Scholar, and social work databases using terms "value conflict in counseling" AND "(religion or religious or religiousness or religions or religiosity or spiritual or spirituality or faith)", which yielded a total of 304 articles. Two independent raters will code the articles in Rayyan (interrater reliability $\geq .90$), with a third adjudicator resolving discrepancies. Using the jigsaw perspective, we will then identify domains and themes on how counselors address spiritual/religious value conflict based on the findings. By exploring this dynamic, this study seeks to provide nuanced insights into the ethical tensions that arise in the interplay between counselors' and clients' value systems in complex socio-cultural contexts.

[122] How Distinct Are Personality Traits and Self-Regulated Learning Skills?

12:45 PM – 1:45 PM

SELF-REGULATION

Self-regulation predicts educational success and thriving. Parents and educators are interested in fostering self-regulation in students, but it is unclear whether they should focus on broad personality traits (such as conscientiousness) or contextualized self-regulated learning (SRL) skills. We examined the (1) predictive validity and (2) overlap between personality, non-cognitive skills, and self-regulated learning with exploratory structural equation modeling. In Study 1, we administered the Motivated Strategies for Learning Questionnaire, the SRL Profile and Self-Diagnostic Instrument, and the Chernyshenko Conscientiousness Scales to 311 undergraduate students. SRL skills such as effort regulation, time management, and planning had primary loadings on a "general conscientiousness" factor alongside conscientiousness facets. SRL skills such as rehearsal, elaboration, and critical thinking loaded onto a separate "self-regulated learning" factor. General conscientiousness predicted GPA ($r = .31$; $p < .001$) while self-regulated learning did not ($r = -.11$; $p = .129$). In Study 2, we will investigate the predictive validity and latent structure of SRL scales and non-cognitive skills.

[123] How Gender Essentialism Drives Bias in Leadership Evaluations

12:45 PM – 1:45 PM

GENDER

Role congruity theory holds that women leaders face a double bind—penalized when they appear "too masculine" and violate feminine norms, and when they appear "too feminine" and fall short of leader expectations. Gender essentialism intensifies this bind by treating gender differences as biologically fixed, casting men as more "natural" leaders. We examine evaluations of women leaders whose profiles emphasize power versus status: power signals dominance and authority and is less aligned with the female gender role, whereas status conveys competence and respect and is more gender congruent. We assess whether individuals higher in gender essentialism prefer gender-role congruence (women signaling status) or leadership-role congruence (women signaling power). Using a between-subjects design, participants will evaluate a female or male candidate for a political leadership position whose resume emphasizes power or status. They will also complete measures of gender essentialism and two potential mechanisms: perceived gender-role violation and role demands. This research will help refine theory of gender bias in leadership and inform more equitable leader selection.

[124] How Gender Essentialist Beliefs Shape Interest and Belonging in Gendered Fields

12:45 PM – 1:45 PM

GENDER

Gender essentialism holds that women and men have inherent, fixed, biologically determined qualities that define their gender and shape everyday roles and behaviors. Beyond influencing perceptions of others, these beliefs also shape self-perceptions and how people view their own potential. In this research, we test the causal role of gender essentialist beliefs in shaping women's and men's interest and belonging in gender-dominated fields that either align or conflict with their gender identity. We hypothesize that stronger essentialist beliefs will predict lower interest and belonging in gender-incongruent fields compared to weaker beliefs. To test this, participants will read one of two messages emphasizing either essentialist or non-essentialist views of gender before reporting their interest and sense of belonging to gendered work domains. This work contributes to understanding the causal impact of essentialist beliefs, including their role in men's underrepresentation in female-dominated domains, and offers insight into why gender segregation persists while pointing to strategies for encouraging more flexible career pathways.

[125] How Personal Values Shape Daily Stress: A Multilevel Value-Situation Analysis

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Understanding what drives everyday stress is crucial for psychological well-being. Yet the role of personal values in shaping stress responses remains surprisingly understudied. We developed a model integrating Schwartz's (1992) theory of basic human values with psychological situation characteristics (Oreg et al., 2020) to predict stress appraisals (Lazarus & Folkman, 1984) in daily life. In an experience sampling study, 303 participants reported their personal values and completed three daily reflections over five consecutive days ($K = 3,520$), reporting on the situation they were in, the values it expressed or conflicted with, its familiarity, and stress. Results showed that for benevolence and power values, the interaction between personal values and the values the situation expressed predicted familiarity, such that conflicted patterns were perceived as less familiar. This, in turn, predicted higher stress. Moreover, the link between familiarity and stress was stronger for those who prioritized security and weaker for those who valued stimulation. Findings show that personal values shape daily stress by predicting familiarity and moderating its effect on stress.

[126] How Thinking Styles Shape The Perceived Clash of Science and Religion

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Previous research has shown that Christians are more likely than Muslims to subscribe to a conflict narrative between science and religion. We propose that these differences may be rooted in distinct thinking styles associated with each belief system. Drawing from the literature on cross-cultural differences between Eastern and Western thinking styles (Nisbett et al., 2001; analytic versus holistic thinking), We hypothesize that Christians may adopt a more analytic approach to science-religion compatibility, whereas Muslims may employ a more holistic perspective. Across two studies (one preregistered; Study 1: Christian Americans vs Muslim Iranians, Study 2: Christian Americans vs Muslim Americans), We explored evidence for these hypotheses. This project aims to investigate reasons behind different perceptions of science-religion relationship and explore potential strategies to reduce conflict perspectives, thereby increasing Christians' engagement with science.

[127] How to Embrace Flow: Positive Self-Regulatory Thinking as a Means to Enhance Flow Experiences

12:45 PM – 1:45 PM

SELF-REGULATION

Flow is defined as an intrinsically rewarding state of complete engagement with a goal-oriented activity. We assume that individuals can use their self-regulatory thinking to facilitate flow and conducted a correlational and an experimental study to test this assumption: First, we investigated whether participants ($N = 549$) who spontaneously used different modes of self-regulatory thought, as formalized in fantasy realization theory, differed in their flow proneness. Second, we compared two self-regulatory thinking interventions, indulging in positive future thought vs. mental contrasting of the positive future with the critical obstacles of reality, with regard to their effect on flow in chess players ($N = 132$) who solved relatively low-demand chess riddles. In Study 1, we found flow proneness to be positively related to modes of self-regulatory thought focused on a positive future. This finding was substantiated by Study 2: When controlling for skill, we found increased flow in chess players who had been instructed to indulge as compared to those who had mentally contrasted. Taken together, our findings suggest that positive thinking can promote flow in everyday and/or low-demand tasks. Positive thinking may facilitate flow by making individuals more likely to "embrace" their tasks, whenever it is largely up to them in how far they become engaged.

[128] How to Use LLMs to Model Public Opinion on Government AI: Synthetic Focus Group LLMs

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Humans rely on a range of nonverbal behaviors to signal threat, yet it remains unclear why certain cues consistently appear threatening across cultures. We propose that humans evolved a broad association between geometric angularity and danger, and that this association became co-opted for the nonverbal communication of threat. Across five studies, we provide converging evidence for this account. In Study 1, people with stronger cognitive associations between geometric angularity and danger formed greater perceptions of threat in response to prototypical human threat expressions (across all visual modalities). In Study 2, a novel facial expression that increased facial angularity—without activating the corrugator—was perceived as threatening. Study 3 replicated the results of Studies 1 and 2 in two non-Western nations, South Africa and India, providing evidence for the cross-cultural generalizability of this phenomenon. In Study 4, participants spontaneously increased their facial angularity when expressing threat. In Study 5, individual differences in facial angularity across neutral faces guided perceptions of dominance and threat among participants from 11 diverse world regions spanning 44 countries. Taken together, these findings suggest that geometric angularity serves as a core perceptual feature underpinning the nonverbal communication of threat.

[129] Ideal Small vs. Big Happiness: Cross-cultural Research in Japan and the U.S.

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

The ideal level of happiness is higher in Western (e.g., American) cultures than in East Asian (e.g., Japanese) cultures (e.g., Kryszewski et al., 2024). However, previous studies on happiness have not distinguished between Big Happiness (special, rarely occurring, and intense types of happiness) and Small Happiness (mundane, frequently occurring, and subtle types of happiness). We hypothesized that the cultural difference in the ideal level of happiness would be more prominent for big happiness compared with small happiness, because the ideal level of big happiness may reflect the high-arousal positive (HAP) affect, which is valued in Western cultures. 499 Japanese adults and 544 American adults participated in an online survey. Results showed that the Americans' ideal level of happiness was higher than the Japanese for both big and small happiness, but this cultural difference was greater for big happiness compared with small happiness. Additional mediation analysis showed that the cultural difference in ideal big happiness was partially mediated by ideal HAP. The importance of applying the small–big continuum to cross-cultural research on happiness will be discussed.

[130] Ideologically Aligned Language Models Predict Partisan Brain Responses to Political Content

12:45 PM – 1:45 PM

SOCIAL NEUROSCIENCE

Conservatives and liberals exhibit divergent brain activity when viewing the same political content. This divergence is thought to reflect different ideological lenses that partisans use to interpret the content. Here, we test this hypothesis using neural network-based language models. Specifically, we fine-tuned BERT models separately on news articles from conservative and liberal outlets, yielding two models that approximate the distinct semantic representations of each group. We then used these models to predict brain activity from fMRI data as conservative (n=19) and liberal (n=19) participants viewed political videos. Brain responses were better predicted by the ideologically aligned model, particularly in regions associated with narrative comprehension and perspective-taking, including the precuneus and posterior cingulate cortex. Moreover, we were able to classify participants' political orientation based on how well each model fit their brain activity. Our findings suggest that divergent neural responses to political content reflect differences in how the brain represents meaning, supporting the idea that partisans perceive the same message in fundamentally different ways.

[131] Immediate Emotional Benefits of Religious Service Attendance: Evidence from a natural experiment at Easter

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Religious service attendance has consistently been associated with greater life satisfaction and positive emotions. However, most evidence comes from correlational and longitudinal studies based on long-term patterns of attendance, leaving open questions about the immediate effects of worship. In a pre-registered within-subject study, adult Christians (N = 138) completed surveys both at a control time (counterbalanced to be a few days before or after Easter) and directly after attending an Easter service. Participants reported higher satisfaction with life, self-transcendent positive emotions (e.g., awe, peace), lower negative emotions, greater love for God/others, and stronger gratitude to God after attending the service compared to the control time. By directly comparing experiences within the same individuals across worship and control contexts, this study provides rare quasi-experimental evidence that communal worship is followed by immediate improvements in emotional well-being.

[132] Impersonal Statements: LLM-Era College Admissions Essays Exhibit Deep Homogenization Despite Lexical Diversity

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Despite the increasing popularity of and importance ascribed to talent identification and development, the notion of talent remains murky. Beyond that, gender gaps in leadership and positions of power continue to be a persistent issue, with a notable "leak" in talent pipelines. The present research explores the possibility that gender bias manifests even before leadership opportunities arise, namely in talent associations. Language provides unique insights into collective representations (i.e., societal-level systems of meaning that permeate everyday social life and both reflect and reinforce widespread ways of thinking). Applying natural language processing methods, we uncover and quantify the strength and prevalence of gender stereotypes around talent perceptions across large and diverse language corpora. Through the analysis of billions of words, we demonstrate that the collective representation of talent is not gender-neutral but is associated with men as well as masculine traits and behaviours.

[134] In Her Own Words: A Qualitative Exploration of Women's Attitudes Towards Edited Instagram Photos and Mental Health

12:45 PM – 1:45 PM

SELF-ESTEEM

As social media sites like Instagram's popularity has risen exponentially, so has the demand for image editing applications. Indeed, hundreds of millions of users flock to download such apps, with 30% to 90% of users editing photos before posting on Instagram. This trend may contribute to declining self-esteem and even increase the risk of disordered eating behaviors. Evidence suggests that time spent on Instagram worsens self-esteem and mental health, and further indicates that exposure to altered photos on Instagram can directly worsen body image. However, to our knowledge, no prior work has explored women's perspectives on why this occurs. Thus, the current study qualitatively examined the perspectives of women (N = 55) regarding digitally altered images and psychological well-being. Specifically, participants shared in-depth experiences of how exposure to edited images on Instagram harms their mental health. Data, to be analyzed Fall 2025 using relational content analysis, will represent a novel investigation into the perceived mental health effects of edited imagery on Instagram specifically, capturing women's experiences and interpretations in their own words.

[135] Increasing the Efficacy of Hope Interventions Through Self-Concordant Goal Selection

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Short-form hope interventions, like goal mapping, effectively enhance well-being (Davidson et al., 2012). Yet people benefit more from goals that align with their values (i.e., self-concordant goals) rather than those driven by self-esteem or pleasure (Sheldon, 2014). We suggest that selecting self-concordant goals will enhance the efficacy of goal-mapping interventions. The current study examines how self-concordant goal orientation affects the effectiveness of a goal-mapping exercise among college students. Participants (N=150) will be randomly assigned to one of two conditions. In the goal self-concordance condition, students will be guided to select two self-concordant goals to pursue using a goal mapping exercise. Participants in the control group will select any two goals before completing the goal mapping exercise. Students' well-being will be assessed immediately after the intervention and two weeks later. We predict that those who pursue self-concordant goals with goal mapping will report greater goal progress, goal attainment, and greater well-being, including higher meaning in life, positive emotions, hope, and life satisfaction.

[136] Inform and Do No Harm: How to reduce false self-diagnosis caused by mental health awareness

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Mental health awareness efforts are growing, especially for ADHD. While beneficial, such efforts may also cause false self-diagnosis and worsening symptoms; however, there are no feasible validated methods to prevent these. We tested whether teaching about the nocebo effect, where negative expectations cause symptom misattribution and worsening, could reduce the unintended harms of ADHD awareness. In a pre-registered double-blind randomised controlled trial, 215 healthy young adults (77% women) were randomised to participate in a group workshop on either ADHD awareness, ADHD combined with nocebo education, or control (sleep). We measured changes in self-diagnosis and ADHD symptoms immediately after the workshop (self-diagnosis), and one-week later (self-diagnosis and symptoms). ADHD group reported substantially higher self-diagnosis scores immediately and one week after the workshop, compared to controls. These effects persisted despite no changes in reported symptoms. Nocebo education halved the false self-diagnosis scores immediately after the workshop and eliminated them at follow-up. Learning about ADHD increases false self-diagnosis for healthy young adults for at least one week, while a brief nocebo education intervention substantially reduces and eliminates it. We propose a promising adjunct for balanced awareness efforts applicable in various contexts.

[137] Ingroup solidarity drives social media engagement after political crises

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Social media are often said to exacerbate polarization by platforming hostility between groups. However, positive social emotions like ingroup solidarity may also drive social media engagement, particularly after major threats such as military invasions or terror attacks. In this preregistered study, we examine the socioemotional drivers of engagement following group threats in the context of the US 2024 presidential campaign trail, where both major political parties faced crises in July of 2024. We test how ingroup solidarity and outgroup hostility predicted social media users' engagement with 62,118 posts by 484 US partisan accounts before and after the first Trump assassination attempt (July 13) and Biden's re-election campaign suspension (July 21). We find that, while outgroup hostility is typically the dominant predictor of engagement, interactions with ingroup solidarity surged among Republicans after the Trump shooting and among Democrats after Biden's withdrawal. We show that negativity toward other groups is not always key to going viral. Rather, positive ingroup emotions appear to play a leading role in times of crisis.

[138] Integrating self-affirmation into the care of patients with Type 2 Diabetes: A methodological overview of an ongoing clinical trial

12:45 PM – 1:45 PM

PHYSICAL HEALTH

Because of the association with higher body weight, type 2 diabetes (T2D) is a highly stigmatized health condition. Weight stigma has been shown to be significantly associated with changes in cortisol reactivity, dysregulation of lipid and glucose metabolism, depression, anxiety and decreased motivation for condition management. Despite these amplifying consequences, reducing stigma is not part of the clinical treatment paradigm for T2D. Self-affirmation interventions are an efficacious strategy for buffering the self against threats (i.e., stigma) and encouraging health-promoting behaviors, such as healthful eating and increased physical activity. We will share a methodological overview of our ongoing clinical trial where we have adapted and integrated a self-affirmation intervention for stigma into the clinical care of patients with T2D. We will share the results of our enrollment survey, including a cohort description, a known groups analysis, and validation of adapted psychological scales (e.g., diabetes-based stigma consciousness). We are still enrolling patients; however, we are 85% enrolled (n=127) and will be prepared to present preliminary results by the conference.

[139] "Not a magic pill": Analyzing the use of stigmatizing language in ChatGPT's advice about GLP-1 use

12:45 PM – 1:45 PM

STEREOTYPING/PREJUDICE

Use of generative AI platforms (e.g., ChatGPT) for health advice is rapidly increasing. While there is potential for generative AI to increase access to health information, it can provide inaccurate, potentially biased or stigmatizing responses. This is amplified for people with identities or conditions that are socially devalued. In this exploratory work, we aimed to characterize the language ChatGPT uses to provide information and advice about new medications such as GLP-1 and conditions (diabetes) and identities (gender) with intersecting stigmas. During 10-turn conversations, we had 35 hypothetical ChatGPT users of varied gender identities ask if they should use GLP-1 agonists for managing type 2 diabetes. We then conducted a thematic analysis on conversations with two rounds of qualitative coding and expert review. Coding is ongoing but will be completed by the conference. Preliminary results from 28 coded conversations suggest responses contained phrases that evoked implicit weight stigma (88 codes) and gender-based stigma (9 codes). Interestingly, ChatGPT also called out societal stereotypes (7 codes), suggesting dissonance between ChatGPT's awareness and use of language.

[140] Intentional cisgender allyship and its setbacks

12:45 PM – 1:45 PM

GENDER

Minority stress theory states that individuals with a minority identity experience unique stressors due to that identity, which leads to health disparities. Allyship has been proposed as a buffer to the negative impacts of minority stress. The purpose of this study was to evaluate allyship related to the transgender and nonbinary community, centering community member voices. We analyzed 47 anonymous responses from transgender and nonbinary individuals to the question, "What is an unintentionally harmful thing an ally can do to the transgender and nonbinary community in good faith?" We utilized grounded theory methods, specifically line-by-line, axial, and selective coding strategies, which resulted in distinct categories. These categories included overcorrecting mistakes, using exclusionary language, misgendering, involuntary outing, forced pronoun disclosure, amplifying and spreading misinformation, and lack of support. This study sheds light on harmful ways that allies may engage with transgender and nonbinary communities unintentionally. We suggest ways for cisgender individuals to provide more effective allyship to buffer effects of minority stress.

[141] International Clinical Clerkships Improve Physician Empathy in Medical Students

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

In healthcare, physician empathy (physician's ability to understand the inner experiences of the patient and communicate this understanding to the patient) is a significant factor in successful treatment outcome. Ways to develop empathy in medical students could improve the quality of their medical care. Medical students who studied abroad have reported increased compassion toward patients and a broadened perspective, but this study directly assessed the potential link between studying abroad and improved empathy.

In a pre-post, repeated-measures design, Japanese medical students who participated in a 1-month international clinical clerkship (n=33) reported significant improvements in physician empathy, compared to a cohort of classmates who didn't study abroad (n=19). However, no differences were found in general empathy or mindfulness. In a sub-set of participants, we also included a behavioral measure of physician empathy using standardized patients (SPs), but found no significant differences between groups. Our results suggest that studying abroad can improve physician empathy in medical students, although these effects may be qualified by the study-abroad duration.

[142] Interpersonal Correlates of The Brief Self-Control Scale: Traits, Problems, Values, and Experiences

12:45 PM – 1:45 PM

SELF-REGULATION

Self-control, measured via the Brief Self-Control Scale (BSCS), predicts adjustment and achievement, but also better relationships. It has not been validated with interpersonal concepts and methods, which can identify mechanisms in social functioning. We used the Structural Summary Method (SSM) to evaluate associations of the BSCS and its two factors (i.e., restraint/self-discipline; responsibility/deliberation) with interpersonal style and problems, and other social experiences. In Study 1 (N = 999), all three BSCS scores were associated with a warm-submissive (i.e., cooperative, accommodating) interpersonal style and fewer interpersonal problems, and with higher social support, less loneliness and fewer negative interpersonal experiences. These correlates were strongest for the responsibility/deliberation factor. Study 2 (N = 1,356) replicated associations with interpersonal problems and found parallel of associations of BSCS scores with online functioning (i.e., online social support, negative experiences, excessive social media use). A cooperative and accommodating interpersonal style may promote positive social functioning for individuals high in self-control.

[143] Well-Intended, Widespread, and Risky: Labeling Workplace A “Family” May Erode Organizational Commitment and Citizenship

12:45 PM – 1:45 PM

ORGANIZATIONAL BEHAVIOR

Organizations of employment sometimes describe themselves as families. We term this practice family framing: using a linguistic device in which an entity, its stakeholders, or its characteristics are described using familial labels. We draw on the label-framing, social exchange, and family metaphors literatures to investigate family framing via a multimethod approach including correlational and experimental studies both in online and field settings. Across five studies, we test what motivates family framing, as well as the relational expectations that it generates—and consequences for violations thereof. In an archival study of Fortune 500 organizations (Study 1), we find that over one-third of the firms use family framing in their external communications, and integrate the findings with a second dataset of Glassdoor ratings to reveal that family framing is a meaningful predictor of employee experiences. In Study 2, a pre-registered field study of managers, we find that individuals who desire employer-employee relationships characterized by trust and care are motivated to use family framing. In a pre-registered online experiment, Study 3, we test whether these relational motives are mirrored via heightened perceiver expectations of positive exchange relationships if working at the firm. We then explore the consequences of perceived violations of the relational motives implied by family framing. Across a pre-registered field study with employees and two preregistered online experiments, we find that when firms violate the relational expectations generated by family framing, employees and third parties respond negatively. Employees may respond with diminished OCB-Os and affective commitment, driven by perceptions of family framing as being inauthentic (Studies 4A-B). Third parties may exhibit especially harsh affective backlash toward family framed firms enacting such violations, driven by perceived firm hypocrisy (Study 5). Together, these findings underscore the power of linguistic references to family in shaping relational motives, expectations, and outcomes—and the potential backlash for violations of familial treatment.

[144] Introspective Reflection Sustains Daily Loneliness

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Loneliness manifests as both a stable trait and a dynamic state, marked by daily fluctuations in emotions and social behavior. This study examined how trait and daily state loneliness relate to linguistic features in how individuals process and recall daily experiences and whether these features predict future loneliness. In a week-long daily diary study, participants (N = 153) self-reported their daily loneliness and journaled about their day. Daily levels of loneliness showed moderate stability across the week (ICC = .68). Using sentiment analysis, we found that individuals higher in trait loneliness and experiencing elevated state loneliness wrote diary entries with increased negative (b = -0.268, p < .001) and introspective language (b = 0.191, p = .018). Critically, lagged analyses revealed that if participants wrote more negatively (b = -6.00, p = .007) and introspectively (b = -6.67, p = .031) than the day before, they felt lonelier that day. These findings suggest a dynamic feedback loop in which negative, inward-focused reflections may perpetuate loneliness over time, highlighting the potential of promoting positive, socially oriented reflection as an intervention strategy.

[145] Investigating Household Labor Inequality: How Much is Too Much?

12:45 PM – 1:45 PM

GENDER

Women continue to do most of their family's household labor (Garcia & Tomlinson, 2021), yet almost half of men and women find this fair (Jansen et al., 2016; Öun, 2013). However, prior research has been limited by assessing couples' self-reported perceptions of existing inequality, where fairness may be influenced by relational concerns (Midgette, 2020). This study uses behavioral coding of video recordings of dating and stranger male-female dyads as they complete household tasks in real time. Preliminary analysis of 47 stranger-dyads (Mage = 19, SD = 0.92) found that although women spent more time doing tasks overall than men (d = 0.72, p < .001), both men and women found this to be fair (Mwomen = 6.16, Mmen = 5.89; 1 = very unfair, 7 = very fair). The correlation between the within-dyad work time difference and fairness rating was not significant (r = -0.17). Further, while 19 dyads had divisions beyond a broadly egalitarian range (60-40), these dyads still found the division fair (M = 5.76, SD = 1.21). Findings highlight the need for future theorization and research to unpack why, free of relational considerations, individuals still find objectively-defined inequality fair.

[146] Is Stress Mindset One or Many? Validation of a French Multidimensional Scale

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Introduction: Stress mindset refers to the extent to which an individual believes that stress has either enhancing or debilitating consequences for outcomes such as performance, health, and growth (Crum et al., 2017). While its definition is consensual, its conceptualization and measurement remain debated. This study examines whether our data support a multidimensional view or not by comparing existing scales at the same time.

Methods: We were able to perform exploratory and confirmatory factor analyses to determine which items and factors were salient and to compare an unidimensional model to a multidimensional model.

Results: Confirmatory factor analyses supported a multi-factor structure. Reliability, convergent validity, discriminant validity has been supported in our second sample.

Conclusion: Current data provide preliminary evidence that the stress mindset scale is a valid multidimensional measure with good psychometric properties, supporting its use in future research on stress mindsets induction and performance outcomes."

[147] Learning from failures and successes driven by value perceptions

12:45 PM – 1:45 PM

SELF-REGULATION

With nearly every experience designated as successes or failures, people may iteratively develop attitudes toward these experiences, which may shape perceptions of their value for learning. Learning value perceptions (LVP) are how individuals view successes and failures through the subsequent lessons that can be learned from these experiences. Four preregistered studies examine how learning value perceptions may impact well-being, goal progress, and feedback behaviors. A study (N = 262) measuring progress on two goals over a two-week interval suggests that LVP fully mediates the effect of attitudes toward success and failure on feedback and goal progress and that more positive attitudes toward success and failure are associated with overall well-being. Two studies (N = 323; N = 322) link LVP to a range of feedback behaviors, such as feedback-seeking, and failure-centric self-regulation, like dealing with errors adaptively. Lastly, a pattern-recognition experiment (N = 328) examines how LVP affects learning from feedback and expectancies. These studies demonstrate the potential impact of learning value perceptions on how people interact with experiences and engage with feedback.

[149] Literature as Legacy: Generational Trauma in African and African American Narratives

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This research examined how literary narratives encoded and repaired intergenerational trauma in African and African American communities. Through qualitative textual analysis with Thematic Codes, this research analyzed five texts including: Homegoing; So Long a Letter; Things Fall Apart; No Longer at Ease; Quiet as It's Kept identifying trauma patterns and mechanisms of narrative repair. Thematic Codes—intergenerational trauma, structural violence, racialized harm, adverse childhood experiences—were applied to trace how harm moved across generations through character arcs and plot, and how storytelling practices such as ancestral memory, communal witness, renaming supported resilience. Results indicated that [AM1] trauma was culturally embedded yet often silenced; characters regained agency by reframing lineage and telling counter-stories; and scenes centering care rituals (letters, funerals, naming) functioned as micro-interventions that reduced isolation. Visual tools such as word clouds, frequency graphs, and network maps further illustrated thematic interconnections. This research contributes to trauma studies and literary criticism by demonstrating how African and African American literature transforms silence into narrative agency and supports communal healing.

[150] Living for now or forever: Can different afterlife beliefs reinforce similar goals?

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

To explore how afterlife beliefs relate to time perspective and life goals, we conducted semi-structured interviews with participants (n=25) across age groups (18-35 and 60+) and religious backgrounds (LDS and non-religious). Participants were asked if/how their afterlife beliefs influence how they live, including motivation for learning and relationships. 87% reported that their beliefs (or non-beliefs) about life after death affected how they lived. Most described increased motivation to learn (75%) and focus on relationships (71%). A Fisher's Exact Test indicated that those with afterlife beliefs were significantly more likely to report increased motivation for learning goals ($p=.017$), but this was not significant for relationship goals. Interestingly, the reasons differed: some participants reported belief in eternal life led them to focus on relationships because they believed their relationships continue forever, whereas others with no afterlife beliefs emphasized relationships because they believed they only had one chance. These responses suggest that individuals with very different afterlife beliefs may frame those beliefs in similar ways that reinforce valued motivations.

[151] Living with Focus and Purpose: An Experience-sampling Investigation of Meaning, Attention, and Well-being

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

People in this technological age grapple with a meaning crisis while navigating life under constant distractions. We conducted a one-week experience-sampling study (N=191; 4,778 entries) to examine whether meaning and attention are related in everyday life, and how they are related to boredom, negative emotions, and subjective well-being. Participants completed a baseline survey and then responded to brief surveys five times a day over seven days. We found that meaning and attention were positively associated at dispositional, situational, and cross-levels. When participants paid more attention, they experienced greater meaning—a within-person effect that was consistent across all daily activities (e.g., work, socializing, entertainment). Across levels, stronger attention control predicted higher situational meaning, while higher life meaning predicted greater situational attention. Moreover, meaning and attention consistently predicted lower boredom, lower negative emotions and better subjective well-being at dispositional, situational, and across levels. Together, our results suggest that paying attention during daily situations may enhance the experience of meaning.

[152] Loneliness mindsets: A new measurement approach and implications for predicting wellbeing

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Loneliness is increasingly prevalent, with substantial mental health costs. Thus, research often seeks to understand the characteristics of lonely individuals and where to intercede to reduce loneliness. Interventions often target social skills, social support and social interaction. In the current work, we investigate individual differences in the meaning assigned to loneliness as another potential lever on which to intervene to reduce loneliness. Specifically, we focus on mindsets, examining the factor structure and predictive validity of the Mindsets of Loneliness Assessment Tool (M-LAT) (N = 382). We examined four factors: Lonely Attribute Mindset (LM_Attribute), Lonely People Mindset (LM_Person), Loneliness as Enhancing Mindset (LM_Enhancing), and Loneliness as Debilitating Mindset (LM_Debilitating) in relation to social and psychological wellbeing. People and debilitating mindsets had the strongest links with loneliness, self-esteem, and optimism. The results suggest that loneliness mindsets are associated with wellbeing and targeting these mindsets may offer insight for future interventions.

[153] Lonely individuals learn social information idiosyncratically

12:45 PM – 1:45 PM

SOCIAL NEUROSCIENCE

Prior work suggests that lonely individuals hold distinct, non-normative representations of well-known celebrities, and neurally process naturalistic stimuli such as short video clips in idiosyncratic ways. When and how do these differences arise? Here, we tested if loneliness is associated with idiosyncratic learning of new people via rich social narratives. While undergoing fMRI, participants watched a TV show trailer which consisted of a naturalistic narrative involving 5 characters and their relationships. They then rested for 6 minutes. Post-scan, participants gave free-response descriptions of all characters and their relationships. We used Universal Sentence Encoder to transform all text entries into semantic embeddings and computed the similarity between participants' descriptions. We also assessed the similarity of participants' neural responses while watching the trailer and during rest. We found that lonelier participants had more idiosyncratic semantic descriptions and neural responses, suggesting that lonely individuals process and learn new social information differently than each other and their non-lonely peers.

[154] Longitudinal Relations between Self-Esteem and Academic Engagement in College

12:45 PM – 1:45 PM

SELF-ESTEEM

Despite widespread interest in the relations between self-esteem and academic success, most research has focused on adolescent or high school populations (e.g., Zheng et al., 2020), leaving a gap in our understanding of how these constructs may reciprocally influence each other in higher education. Using a longitudinal sample of 714 undergraduate students, we used a Random-Intercept Cross-Lagged Panel Model to investigate autoregressive and cross-lagged effects for self-esteem and academic engagement (e.g., actively participating in classes) across seven semesters. Although we found evidence of inertia for academic engagement ($b = 0.15, p < .01$) and self-esteem ($b = 0.38, p < .01$), we did not find any cross-lagged effects (p 's $> .096$). However, there was modest time-specific similarity in participants' levels of academic engagement and self-esteem ($r = .13, p < .01$) and medium-to-strong associations in participants' corresponding trait levels ($r = .42, p < .01$). These findings suggest that although self-esteem and academic engagement may not reciprocally predict each other over time, they both display carryover and show a modest association in their time-specific fluctuations.

[155] Making Intervention Do-ABLE: Police Officers' Perceptions of Active Bystandership Training.

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This study investigated feedback from law enforcement officers to improve the use of active bystandership training. While previous research has linked officer intervention programs with reduced use of excessive force and fewer citizen complaints, there is a gap in understanding how officers perceive the effectiveness of Active Bystandership for Law Enforcement (ABLE) training. The study involved data from a national survey of 48,077 law enforcement officers who completed ABLE intervention training. Researchers analyzed responses to open-ended questions exploring perceptions, attitudes, and beliefs about peer intervention. Results showed that officers emphasized the importance of ongoing training, real-world practice, open discussion, leader accountability, and policies that mandate training and protect against retaliation. They also highlighted the need for a supportive culture that builds trust and well-being, along with individual responsibility, openness to feedback, and self-improvement. These findings suggest that departments can refine ABLE's delivery format, frequency, and content to officers' needs, while also implementing the requested policies that support intervention.

[156] Masculinity and Environmentalism: The Role of Identity Threats versus Affirmations

12:45 PM – 1:45 PM

GENDER

Threatening masculinity leads to a range of compensatory responses across social contexts to recover manhood, which may also impact men's engagement in sustainable behaviors. The current research applies processes of gender socialization and identity maintenance to environmentalism. Study 1 (N = 394) assessed if pro-environmental behaviors (PEBs) aligned with masculine norms would be embraced as recovery strategy in response to an identity threat. Male participants completed a masculinity test, then were randomly assigned to an identity threat condition (threat or control). Results showed men with higher masculine identification distance from all PEBs, demonstrating that even sustainable behaviors which align with masculine norms may have underlying feminine associations. In Study 2, male participants will complete the same masculinity test from Study 1, and a third threat condition (affirmation) will be added to assess the effect of masculinity affirmations on environmentalism. Our prediction is that men whose masculinity is threatened will show decreased willingness to engage in environmentalism, in line with findings from Study 2. However, when masculinity is affirmed, men will show increased sustainable engagement. This research highlights the importance of masculine identification in how men experience and recover from identity threats in sustainable contexts.

[157] Masculinity Workplace Culture is for Straight White Men: How Work Norms Devalue and Discourage Marginalized Groups

12:45 PM – 1:45 PM

GENDER

Masculinity workplace norms that reward dominance and competitiveness reinforce a status hierarchy privileging those who embody hegemonic masculinity (straight White men), while devaluing others. In five preregistered experiments, we examined how masculinity workplace norms influence the perceived status of different social identities (based on gender, sexuality, and race), which in turn shapes individuals' personal status and interest based on their social group membership. Across studies, participants perceived female and gay employees, and employees of color, as lower status than male, straight, and White employees in workplaces with strong (vs. weak) masculinity norms. These perceptions were linked to lower interest in joining such workplaces (via low anticipated personal status) among White straight women (vs. White straight men; S1), White gay men (vs. White straight men; S2), and straight men of color (vs. White straight men; S3). Experimentally enhancing the status of female (S4) or Black employees (S5) buffered against these negative effects. The findings illuminate group-based and individual-level processes through which masculinity norms undermine occupational diversity.

[158] Meaning in Life in Individuals with Dysautonomia and Long-COVID

12:45 PM – 1:45 PM

PHYSICAL HEALTH

Research shows that individuals experiencing long-COVID (LC), a dysautonomia subtype, suffer an existential loss of identity. While quality of life and existential concerns in LC are studied, minimal research explores meaning in life (MIL). This study examined predictors of search for and presence of MIL in dysautonomia patients. Participants (N = 305, ages 18-68, M = 34.09, SD = 10.98) from global online dysautonomia support groups completed a Qualtrics survey on demographics, symptom severity/duration, MIL levels, and lived experiences. Of participants, 85.2% were female; 50.8% had LC or similar post-viral syndromes. Symptom duration and active religious practice positively predicted presence of MIL, whereas symptom severity was negatively related. Age negatively predicted search for MIL. Qualitative responses added nuance to quantitative findings. Results suggest longer symptom duration and religious practice may enhance MIL in dysautonomia, while severe symptoms may negatively impact it. Age being the only significant predictor of search for MIL indicates that older people with dysautonomia may feel less need to search for meaning than younger people.

[159] Meaning-making after experiences of intimate partner violence among young sexual minority men: A qualitative study

12:45 PM – 1:45 PM

SELF-REGULATION

Young sexual minority men (YSMM) are at elevated risk for intimate partner violence (IPV) compared to their heterosexual counterparts due to minority stress, which exacerbates adverse health outcomes among sexual and gender minorities. Yet, studies indicate that YSMM often underreport IPV experiences and face barriers to help-seeking resulting from systemic anti-gay discrimination and internalized stigma. Recent research on the role of self-regulation on trauma recovery has increasingly focused on the process of meaning-making, particularly among IPV victims. This study analyzes interviews with 26 YSMM with IPV histories to explore how they make sense of past IPV experiences. Using the consensual qualitative research approach, five interrelated themes emerged that reflect both adaptive (increased understanding of IPV, posttraumatic growth, awareness of desensitization to violence) and maladaptive (minimization of violence, pervasive distrust) meaning-making. Findings suggest that recognition of abuse typically occurred well after the relationship ended often through therapy or other forms of meaning-making. Additionally, delayed recognition of IPV was shaped by earlier exposure to violence during childhood or adolescence, highlighting the sustained impact of violence exposure on YSMM's vulnerability to IPV. Future directions for research and suggestions for developing culturally responsive social services and policies are discussed.

[160] Measuring Gender Identity as an Individual Difference Variable

12:45 PM – 1:45 PM

GENDER

"Gender identity" has been variously understood as a person's self-categorization into a gender category as well as a person's participation in (non)conforming gender roles. This investigation takes the former meaning—gender identity as an individual difference—to determine whether this construct can be validly and reliably measured using new self-report items that are not simply demographic questions. The new items focus on gender-category-and-self overlap for samples of transgender, nonbinary, and cisgender respondents (across sexual orientations). The new items are also evaluated against existing scales for gender roles and displays to reveal the empirical distinctions among the measures. Results show that the new items function similarly for the binary self-categorizations (i.e., trans women and cis women, and, separately, trans men and cis men), showing a contrastive pattern for category overlaps, but differently for the nonbinary self-categorizations—namely, showing no contrastive pattern. What is more, the new items have a high test-retest reliability (for a mixed sample of cis, trans, and nonbinary respondents), suggesting stability of the individual differences over time.

[161] Mental Health and Dating Attitudes among Men Who Are Involuntarily Celibate (but Not Necessarily “Incels”)

12:45 PM – 1:45 PM

GENDER

Flirting with a woman and asking her on a date can be an anxiety-inducing experience for some men who face the possibility of rejection. The “incel” (involuntarily celibate) movement consists of an internet subculture of men who tend to hold negative views of women's mate preferences and toward themselves. Less explored are the experiences of men who are involuntarily celibate but who do not necessarily identify with this subculture. We surveyed 435 men ages 18-40 via Cloudresearch online panels about why they were currently single. While very few participants said they identified as incels ($N = 11$), many more ($N = 94$) agreed with the statement that they were involuntarily celibate. Men who agreed with the statement more strongly tended to report lower self-esteem ($r = -.258$), lower dating confidence ($r = -.258$), and greater anxiety when dating ($r = .319$). Even when including the “incel” identifying men, however, there was only a weak correlation with a higher drive for power over women ($r = .150$). These findings highlight the importance of examining the challenges and concerns faced by men who are involuntarily celibate (but not necessarily “incels”).

[162] Mental Health Disclosure Preferences in Romantic Relationships

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

This study assessed mental health disclosure timing differences in romantic relationships, as well as openness to dating someone who is seeing a therapist or taking medication. Participants were 672 (511 female) undergraduate students at a University in California recruited through SONA who completed the study via Qualtrics. Disclosure timing differed between diagnosed couples (both had mental health disorders) versus mixed couples (one had a disorder, one did not), $\chi^2(4, N = 233) = 23.34, p < .001$. Most participants reported disclosing their diagnosis before officially becoming a couple (46.1%). Establishing trust preceded disclosure in mixed (32.9%) more than in diagnosed couples (13.3%) as diagnosed couples were comfortable disclosing "once it came up" (40.0%). This suggests that diagnosed couples disclose mental health earlier in the relationship than mixed couples, who delay disclosure until trust is established. Also, participants who have ever been diagnosed are more open to dating someone who takes medication (77.8%) or is in therapy (83.8%), whereas those who have never had a disorder say "it depends" (34.5% and 24.8%, respectively).

[163] Mental Models Matter for the Psychology of Climate Change

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Mental models are internal, dynamic, approximate representations of reality that shape how individuals process and interpret information and translate it into action. As such, mental models play a crucial role in determining how people understand, predict, and react to the world around them. They can be thought of as both dynamic solutions to navigating complexity and as potential barriers to learning and problem solving.

In this review we draw on work from cognitive and environmental psychology, environmental science, public policy, and participatory modeling to propose that understanding how people from different cultures and backgrounds form and use mental models of environmentally-relevant phenomena can provide insight into the conceptual foundations of climate-related perceptions, risk assessment, decision-making, and behavior. Moreover, because mental models allow people to understand and anticipate complex problems, they provide a lever to assess and intervene on both individual and collective perceptions of the world, and to facilitate solutions among people who differ in their models of climate change.

[164] Mindset Medicine: How Beliefs About Your Body's Abilities Predict COVID-19 Recovery

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Background: Mindset theory suggests that body mindsets influence health in various ways. We tested whether body mindsets predicted COVID-19 symptom severity and duration, and whether hypervigilance, immune-boosting behaviors, and affect mediated these relationships.

Method: U.S. adults ($N = 846$) completed surveys three times from 2020–2022. Body mindsets were measured in May 2020, mediators in September 2020, and COVID-19 outcomes in March 2022.

Results: More adaptive body mindsets predicted less severe symptoms ($b = -.11, p < .001$) and shorter symptom duration ($b = -.13, p < .001$). Body mindsets also predicted more engagement in immune-boosting behaviors ($b = .13, p < .001$), which in turn predicted shorter illness ($b = -.15, p = .025$). The indirect effect was small but statistically significant ($-.018, 95\% \text{ CI } [-.04, -.001]$). All analyses controlled for race, gender, education, political affiliation, vaccination status, and health history.

Conclusion: Our findings provide evidence about body mindsets. Body mindsets prospectively predicted COVID-19 illness experiences. Findings extend health mindset theory and highlight the connection between core beliefs and health outcomes.

[165] Mother–Adolescent Conflict and Adjustment: The Role of Self-Esteem

12:45 PM – 1:45 PM

SELF-ESTEEM

Mother–Adolescent Conflict and Adjustment: The Role of Self-Esteem

Adolescence is marked by heightened sensitivity to conflict, yet mechanisms linking mother–adolescent conflict about peers (MACP) to social adjustment are unclear. We tested whether self-esteem mediates these associations in a sample of 66 adolescents (Mage=12.39). Participants completed measures of MACP, self-esteem, social competence, victimization, loneliness, anxiety, and depression. PROCESS Model 4, controlling sex and age, showed that higher MACP predicted lower self-esteem ($b = -.40$, $p = .003$). Lower self-esteem, in turn, was linked to higher loneliness ($b = -.38$, $p < .001$), higher depression ($b = -1.49$, $p < .001$), and higher anxiety ($b = -4.86$, $p = .03$) with significant indirect effects, though the direct path for anxiety remained significant, indicating partial mediation. Higher self-esteem was related to higher social competence ($b = .15$, $p = .03$), although the indirect pathway was marginal, suggesting possible but inconclusive mediation. Higher MACP directly predicted greater victimization ($b = .37$, $p < .001$), with no mediation effect. Findings identify self-esteem as a key pathway from MACP to internalizing outcomes and a potential target for intervention.

Keywords: Self-esteem, mother–adolescent conflict, adolescent social adjustment, mediation, internalizing symptoms

[166] Motivational and Cognitive Factors may each Influence the Demand of Effortful Self-Control

12:45 PM – 1:45 PM

SELF-REGULATION

Over reliance on effortful self-control (ESC) is a central challenge in self-regulation as it often feels aversive, making it difficult to sustain behaviors that promote long-term goals. Theories of motivation and cognition suggest that ESC demands may be shaped by both motivational factors and cognitive control capacities. We examined these influences in the domain of physical activity, a behavior linked to numerous positive outcomes. A sample of 120 young adults (70 female; Mage=23.8) who intended to engage in physical activity completed weekly surveys for five weeks assessing ESC, preference, habit strength, and mental fatigue related to their most recent activity. Inhibitory control was assessed at baseline using the N2 event-related potential during a Go/No-Go task. Results from a multilevel model showed that preference ($B = -0.15$, $p < .01$), habit strength ($B = -0.14$, $p < .01$), mental fatigue ($B = 0.25$, $p < .01$), and inhibitory control ($B = 0.04$, $p < .01$) were all associated with less ESC. These findings highlight that motivational and cognitive factors may jointly influence the perceived demand for ESC. Thus, interventions aimed at reducing ESC may be most effective by targeting both motivation and cognition.

[167] Mourning Our Relatives: Distress Due to an Absence of Funeral Ceremony Amongst Indigenous Peoples

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

The Missing and Murdered Indigenous Relatives (MMIR) crisis leaves Indigenous Peoples and communities in a state of grief and depression due to the absence of proper mourning rituals that are central to healing. The present study assesses how distress due to an absence of burial ceremony (end of life/funeral ceremony) relates to levels of depression, and how levels of cultural involvement (i.e., enculturation) impact this relationship. In an online survey ($N=79$), Indigenous participants completed the Ambiguous Loss Inventory +, a depression measure (CESD), and an enculturation measure (NAAS). We found a significant positive relationship between distress due to an absence of burial ceremony and depression. Enculturation marginally moderated this relationship, such that the relationship between distress and depression was stronger when enculturation was high (vs. low). These results illustrate the significant impact of MMIR on Indigenous Peoples and encourage more research, legislation and accurate databases that are crucial to stopping this crisis.

[168] Movement Medicine: Reducing the Impact of ACEs Through Sports

12:45 PM – 1:45 PM

MENTAL HEALTH/WEELL-BEING

This study investigates the role of sports participation in promoting post-traumatic growth (PTG) and mitigating mental health challenges among individuals with adverse childhood experiences (ACEs) and trauma histories. Using a mixed-methods, quasi-experimental design, the research will recruit 200 participants aged 18–65 who are actively involved in collegiate or intramural sports. Participants will be classified into groups based on the type and frequency of sports participation (team, individual, or non-participant) and assessed at baseline and six-month follow-up. Standardized measures will include the Post-Traumatic Growth Inventory (PTGI), Beck Depression Inventory-II (BDI-II), State-Trait Anxiety Inventory (STAI), and a custom Sports Participation Questionnaire. Data will be analyzed using repeated-measures ANOVA and regression models to examine whether sports participation predicts changes in PTG, depression, and anxiety over time. A qualitative component, consisting of semi-structured interviews with a subset of participants, will further explore lived experiences of resilience and coping through sports. Findings are expected to clarify the protective role of athletic engagement in trauma recovery, highlighting the potential of sport-based approaches to reduce the psychological impact of ACEs and foster long-term mental well-being.

[170] Navigating Oneself: How Psychological Flexibility and Self-Structure Interact within Trans and Gender Non-Conforming Populations

12:45 PM – 1:45 PM

GENDER

This study examines how self-concept clarity (SCC) and self-concept differentiation (SCD) interact with psychological flexibility to predict wellbeing within transgender and non-conforming individuals (TGNC). It was hypothesized that SCC and flexibility would be positively associated with wellbeing, that SCD would be negatively associated with wellbeing, and that flexibility would moderate the relationships between both SCC and flexibility and SCD and flexibility. The study had 139 TGNC participants who filled out a Qualtrics survey that examined the constructs outlined above. Both SCC and flexibility were found to be positively associated with wellbeing ($b = .353, t = 5.688, p < .001$ and $b = .517, t = 7.854, p < .001$). However, the negative relationship between SCD and well-being was not significant when SCC and flexibility were in the model ($b = -.139, t = -0.84, p = .40$). Flexibility did not moderate the relationship between SCC and wellbeing ($b = .0065, t = 0.10, p < .9235$) nor the relationship between SCD and wellbeing ($b = -0.2113, t = -1.0865, p = 0.2792$). This study links the SCC and SCD literature with psychological flexibility within the context of TGNC mental health.

[171] Navigating Transition: A Longitudinal Qualitative Study of Transgender Teens in U.S. High Schools

12:45 PM – 1:45 PM

GENDER

Gender transition is a critical developmental milestone for many transgender adolescents, yet the role of U.S. high schools in shaping this experience remains understudied. This longitudinal qualitative study followed 43 transgender teens (ages 14–18) from across the U.S. over one year as they underwent social and medical transition. Participants engaged in recurring remote focus groups, and transcripts were analyzed using reflexive thematic analysis. Findings reveal that institutional policies, teacher behavior, peer culture, and geographic context significantly shaped transition ease or difficulty. Key themes included (1) institutional recognition as affirmation or erasure, (2) educators as gatekeepers of safety, (3) peer culture as a site of both solidarity and stigma, and (4) the burden of self-advocacy. These findings demonstrate how school structures and social climates function as powerful mediators of adolescent gender transition, with implications for school policy, developmental psychology, and trans-affirming interventions.

[172] Network Analysis of Stressors and Mental Health in Chinese MSM

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Minority stress theory posits that both sexual minority stressors (SMS; e.g., discrimination) and general stressors (GS; e.g., financial strain) contribute to internalizing mental health problems. Yet, how these stressors interconnect remains unclear. We surveyed 4,310 Chinese sexual minority men (MSM) and measured 18 stressors through validated scales and content analysis of open-ended responses. Network analysis revealed central SMS nodes of situational stress sensitivity and discrimination, and central GS nodes of financial, work, and romantic relationship stress. Three nodes—outness (SMS), and romantic relationship and interpersonal problems (GS)—bridged the two node communities. When mental health outcomes were added, internalized homophobia (SMS), discrimination (SMS), psychological health concerns (GS), physical health concerns (GS), interpersonal problems (GS), and financial stress (GS) showed the strongest associations with depression, anxiety, and somatization. Findings highlight the intertwined effects of discrimination, achievement, health, and relational stressors on internalizing problems among Chinese MSM.

[173] Not All Platforms Are Created Equal: Platform Differences in Social Media and Well-Being

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Social media use (SMU) is ubiquitous among emerging adults (Villanti et al., 2017), yet its impact on well-being remains unclear. A multidimensional framework may be needed, such as the PERMA model (Seligman, 2011), which emphasizes positive emotions, engagement, relationships, meaning, and accomplishment. Our study examined how SMU and various platforms relate to one's sense of meaning and accomplishment, mediated by experience of positive emotions, daily engagement, and perceived quality of relationships. Participants (N = 593) reported daily SMU across Instagram, Snapchat, TikTok, and X/Twitter, and completed the PERMA-Profilier (Butler & Kern, 2016). Analyses showed positive emotions mediated the link between average daily SMU and meaning, but no significant associations emerged with accomplishment. Between-platform differences highlighted unique patterns: greater Snapchat use predicted greater positive emotions and stronger relationships, and thus higher meaning, whereas greater X/Twitter use predicted lower relationship quality, and thus diminished meaning. As such, it may be that the type of platform (image-based vs. text-based) may underlie well-being benefits of SMU.

[174] Online Cognitive Processing Therapy for Chinese MSM: Feasibility Study

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

This pilot randomized controlled trial tested the feasibility, accessibility, and efficacy of a 9-day online cognitive processing therapy for men who have sex with men (MSM) in China. Twenty-four participants were randomized to therapist-feedback (n = 7), automated (n = 7), or waitlist groups (n = 10); 21 started and 20 completed (95.2%) the study. Internalizing symptoms, concurrent issues, and minority stress were assessed at baseline and 2-week follow-up. Intervention satisfaction was high (M = 4.36, SD = 0.66; 1–5 scale). Although non-significant, effect sizes from between-group analyses suggested that intervention groups showed decreases in somatization, anxiety, internalized homophobia, and gay-related rejection sensitivity. Within-group evidence corroborated these findings and further suggested reduced rumination and shame, and increased friend support. Meanwhile, effect sizes indicated adverse shifts in depression, outness, self-esteem, and support from significant others and families in intervention groups. Overall, high retention and satisfaction support feasibility and acceptability; effect size trends suggest potential efficacy and the need for larger trials.

[175] Parental Identity and Bias: Predicting Children's Outcomes Based on Parents' Gender and Sexuality

12:45 PM – 1:45 PM

GENDER

This study explores whether perceivers' evaluations of children are influenced by the gender and sexual identity of the children's parents. Specifically, we examine how people evaluate children based on visual exposure to different types of parental relationships, including heterosexual, gay, lesbian, and transgender couples.

Participants viewed randomized photos of five types of romantic partners: cisgender heterosexual couples, cisgender gay men, cisgender lesbian women, transgender couples, and transgender pregnant men with partners. All groups except the transgender pregnant men were shown holding an infant. After each image, participants rated the likelihood of various child outcomes for the child depicted in the picture, such as experiencing trauma, becoming a good person, changing pronouns, or graduating from college, using a seven-point Likert scale.

Participants then completed the twelve-item Religious Fundamentalism Scale (Altemeyer & Hunsberger, 2004) and answered demographic questions, including age, political affiliation, religiosity, gender and sexual identity, and whether they personally know someone who identifies as transgender.

This ongoing correlational study aims to uncover the social and psychological predictors of biased assumptions about children based on their parents' identity. By examining how demographic and ideological factors influence perceptions of children's futures, this research aims to examine the extent to which stigma may be extended from marginalized parents to their children.

Findings will contribute to a deeper understanding of the social consequences of bias against LGBTQ + and transgender individuals, particularly in the context of family and parenting.

[176] Parental Risk and Resilience Factors for Mental Well-Being in Adolescents

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Parenting practices and parental well-being are key determinants of adolescent mental health, yet few studies have examined these factors within a risk and resilience framework among youth with neurodevelopmental disorders (NDDs). This study investigated how positive and negative parenting, caregiver well-being, and parenting stress relate to adolescents' emotional well-being and internalizing problems. Participants were 105 adolescents aged 11–14 (61.9% female; 52.4% with NDDs) and their caregivers (82.9% mothers). Correlations showed emotional well-being and internalizing problems were strongly negatively related. Positive parenting was associated with lower parenting stress and higher caregiver well-being; negative parenting was linked to greater stress. Parenting stress was negatively correlated with caregiver well-being. Hierarchical regressions revealed no main effects of parental factors on adolescent outcomes. However, higher negative parenting predicted poorer child emotional well-being only at low caregiver well-being. Findings highlight caregiver well-being as a protective factor, underscoring the role of parental factors in resilience among youth with and without NDDs.

[177] Parents see genes at play: Parenthood and heritability attributions about “lifestyle” diseases

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Parenthood offers unique insight into how genes and environments shape human traits. We investigated whether parenthood is linked to beliefs about the heritability of various health attributes. In Study 1 (N = 720), parents estimated higher genetic influence for obesity, weight, and type 2 diabetes compared to non-parents. This effect was more about being a parent than number of children. Mothers were more likely to endorse genetic causes than fathers. Study 2 provided a meta-analysis of existing data (k = 5, total N = 2353) showing a small but reliable link (g = 0.11, p = .007) between parenthood and greater attribution of genetic causes, especially for “lifestyle” attributes like obesity, type 2 diabetes, and cardiovascular disease. We did not replicate the gender effect from Study 1. These findings suggest parenthood may heighten awareness of genetic factors in specific health attributes through observing developing children's traits or reconciling caregiving experiences with disease stigma. Implications highlight the need for health messaging that acknowledges parents' more gene-focused perspectives while addressing environmental and behavioral health risks.

[178] The Impacts of Asian-Targeted Stigmatization on Identity & Intergroup Appraisals

12:45 PM – 1:45 PM

STEREOTYPING/PREJUDICE

Many Asian Americans face targeted stigmatization. This research investigated, through self-report measures, whether the impact of such stigmatization predicts worse intergroup and intra-individual outcomes, and if these effects are moderated by racial group identification. Group differences were also tested between Asian Americans and White Americans ($N = 220$, $n/\text{group} = 110$). Bivariate correlations showed that Asian Americans who reported greater impact from stigmatization also perceived more discrimination. However, multiple linear regression tests revealed that group identification did not moderate these effects. Independent samples t-tests determined that Asian Americans reported being more impacted by stigmatization and experiencing worse intergroup outcomes than White Americans. Exploratory analyses further suggested that stigmatization impact was associated with appraising one's identity as more demanding, and that Asian Americans viewed their identity as more demanding than White Americans. These exploratory findings highlight the need for future confirmatory research on how stigmatization shapes individual appraisals of Asian American identity and related social outcomes.

[179] Perceived safety during the 2025 presidential administration, caregiver acceptance, and mental health outcomes in LGBTQ+ young adults

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Sociopolitical contexts characterized by anti-LGBTQ+ rhetoric and policies amplify the impact of structural stigma on the mental health of LGBTQ+ communities. Low perceived safety during stressful sociopolitical contexts has been linked with poorer mental health outcomes (e.g., depression, anxiety) among LGBTQ+ people. Caregiver acceptance has been found to buffer the negative psychological impacts of sociopolitical uncertainty. This study explored the moderating role of caregiver acceptance in the association between perceived safety during the 2025 presidential administration in the U.S. and three mental health outcomes (i.e., depression, anxiety, nonsuicidal self-injury) in a sample of 470 LGBTQ+ young adults ($\text{Mage} = 21.60$). Higher perceived safety was associated with lower anxiety and nonsuicidal self-injury, but only among LGBTQ+ young adults with accepting caregivers. Findings emphasize the importance of targeted clinical interventions toward increasing caregiver acceptance among LGBTQ+ populations in the context of stressful sociopolitical climates. Furthermore, policymakers and community leaders should recognize the need for establishing safe environments for LGBTQ+ people.

[180] Perceived Threats to Masculinity: How Honor, Just World Beliefs, and Hostile Attribution Bias Shape Attitudes Toward Feminism

12:45 PM – 1:45 PM

GENDER

Masculine honor ideology, the belief that men must uphold their reputation often through aggression and the rejection of femininity, and just world beliefs, the view that the world is just and people get what they deserve, may predict men's hostility toward women and uphold patriarchal values, rejecting the goals of the feminist movement. The present study ($n = 481$) analyzed how these two beliefs contribute to hostility toward feminism, with hostile attribution bias as a potential mediator. We measured male participants' honor, just world beliefs, and to manipulate male participants' perceived hostility, they were randomly assigned to an audio clip of a feminist message (either high or low threatening) said by a female or male speaker, and asked to rate their agreement. Our results showed that men higher in honor and just world beliefs were more likely to view the message as hostile, especially when the speaker was a female. Further, they exhibited greater sexist attitudes, had lower agreement with the speaker, and lower identification as a feminist. We highlight how traditional gender ideals and biased perceptions can fuel hostility toward women and the rejection of feminism.

[181] Perceptions and Gatekeeping of American Jewish Identity

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Jewish identity is uniquely made up of related but distinct components: religious identity, ethnic identity, and cultural identity. Depending on the individual, Jews living in the United States may identify as all three, a combination of two, or only one of these identity components. Being that religious and cultural identity are related to many psychological outcomes, including well-being and quality of life, differences in identification with each of these components of Jewish identity may be related to different outcomes. While each specific form of Jewish identity is a valid way to identify as Jewish, some identities may be viewed more or less favorably by other Jewish individuals, at times resulting in "identity gatekeeping" or the act of denying someone else's Jewish identity. The present project includes three studies: 1) conducting qualitative interviews on participants' lay perceptions of Jewish identity (N = 29), 2) examining how different forms of Jewish identity are related to psychological outcomes, values, and behaviors (N = 216), and 3) experimentally testing whether threat can influence gatekeeping towards different Jewish targets among Jews (N = 251).

[182] Perceptions of Nonbinary Individuals Among U.S. Adults and College Students

12:45 PM – 1:45 PM

GENDER

Between 1–2% of U.S. adults identify as nonbinary, a gender identity that falls outside the traditional categories of "man" or "woman." Though research is limited, emerging evidence suggests nonbinary individuals face prejudice and stigma. This study surveyed 100 college students and 182 American adults to explore perceptions of nonbinary people, specifically regarding warmth and competence. As expected, among adults, positive perceptions of warmth and competence were associated with favorable thermometer ratings, general attitudes toward the nonbinary community, and attitudes toward nonbinary individuals in both gender-integrated (e.g., employment) and gender-segregated (e.g., sports) settings. These perceptions also correlated with greater contact with LGBTQ+ and nonbinary people, while negative associations were found with transphobia, gender essentialism, and binary gender beliefs. Political orientation significantly predicted these perceptions, but religious affiliation did not. For students, findings were similar, though religiosity also significantly predicted ratings of warmth and competence. The findings suggest that ongoing dialogue and interactions with nonbinary people may improve attitudes.

[183] Perceptions of Rural and Urban Community Members' Mental Health Help-Seeking

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Research has identified unique barriers to mental health help seeking (MHHS) (i.e., attitudinal barriers, health literacy, seriousness of symptoms) in rural populations that may lead to poor health outcomes. The current research examined urban and rural differences in perceptions of typical community members' mental health symptom recognition and help seeking behaviors. Urban (n=181) and Rural (n=183) adults participated in the mixed-methods survey. Independent t-tests revealed significant differences between urban and rural participants' perception of others in help-seeking behaviors (Urban: M = 3.25, Rural: M = 2.72); $t(362) = 4.87, p < .001$; and professional help-seeking (Urban: M=3.23, Rural: M=2.55); $t(362) = 5.74, p < .001$. A qualitative thematic analysis was also used to compare participants' description of a typical community member and help seeking behaviors. Findings provide insight into rural and urban differences in the perception of others recognition of mental health symptoms and help seeking behaviors, ultimately informing a cohesive understanding of stigma and barriers to MHHS to better inform interventions.

[184] Personal Relative Deprivation and Well-Being: Longitudinal and Experimental Investigations

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Although Personal Relative Deprivation (PRD) is known to correlate with greater psychological distress, the causal directions between these variables remain unclear. To address this gap, we investigated the longitudinal associations between PRD and psychological distress/well-being across monthly and daily variations in PRD. Participants completed measures of PRD, psychological distress, and well-being every 2-months for 6-months in Study 1 (n = 602), and every day for 14 days in Study 2 (n = 200). Random intercept cross-lagged panel models showed that while neither bi-monthly nor daily cross-lagged associations were present, consistent occasion-specific associations were observed. To further investigate the causal direction of these effects, Study 3 (n = 422) asked participants to think about equally/more affluent similar peers, to induce momentary changes in PRD. Experiencing greater PRD increased (decreased) feelings of negative (positive) affect. These studies shed new light on the dynamic relationships between PRD, psychological distress, and well-being, highlighting that, while not long-term, experiencing greater PRD affects psychological distress.

[185] Personality Predictors of Flourishing Among Nationally Representative Samples in Japan and the United States

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

The current project used Wave 1 of the Global Flourishing Study (2022-23) to investigate associations between personality and flourishing among participants in Japan (n=20543) and the U.S. (n=38312). Measures included the Ten-Item-Personality-Inventory and the 12-Item Flourishing Scale (VanderWeele et al., 2017), containing overall satisfaction items (with life, physical health, mental health, relationships) and degree of worry (safety, meeting monthly living expenses). The survey was translated from English into Japanese. To ensure the samples reflected each nation's population, the data were weighted by primary sampling units, strata, and the annual_weight1 variable, which adjusts for sampling design, nonresponse, and population demographics. Neuroticism was the strongest correlate of flourishing in both Japan (r=-.43) and the U.S. (r=-.48); and persisted when flourishing was regressed on the Big 5 (entered simultaneously; Japan $\beta = -.26$; US $\beta = -.39$). Extraversion and Conscientiousness positively predicted flourishing in Japan ($\beta s = .21, .16$) and the US ($\beta = .23, .16$). Additional regression models included several covariates (e.g., age, education, annual household income).

[186] Politicians' Bipartisan Appeals to Civility: Effects on Partisan Divides and Favorability

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Most depolarization efforts focus on grassroots approaches, with less attention to politicians' ability to bridge partisan divides and the conditions that make such efforts effective. To address this gap, we partnered with the U.S. National Governors Association (NGA) to test its "Disagree Better campaign," PSAs featuring Democratic and Republican governors jointly promoting cross-party dialogue, across three survey experiments before, during, and after the 2024 presidential election (N = 11,233). In January 2024 (pre-election), exposure increased support for bipartisan cooperation, reduced partisan animosity, and heightened openness to cross-party conversations. By contrast, during the peak campaign period (Aug–Sept 2024), no detectable effects emerged. Post-election (July 2025), treatment effects reappeared, though weaker than pre-election, with conversational receptiveness showing an increase. Across studies, exposure also improved governor favorability. Modeling bipartisan civility can increase politicians' favorability and reduce partisan divides, though its depolarizing effects may weaken during periods of high polarization, like election season.

[187] Positive Affective Expectations and Perceived Discrimination as Predictors of Positive Health Behavior in Lesbian, Gay, and Bisexual Individuals

12:45 PM – 1:45 PM

PHYSICAL HEALTH

Positive affective expectations (PAE), expectations of experiencing positive affect in given contexts, are associated with various health behaviors. Prior studies show that lesbian, gay, and bisexual (LGB) individuals engage less in positive health behaviors (e.g., annual physicals) than straight individuals, likely due to perceived discrimination. This study explored the links between LGB individuals, PAE, perceived discrimination, and positive health behaviors. 203 participants (Mage= 38.5,SD=12.8;75.7% White;61% LGB) completed a Prolific survey assessing psychological and health variables. Higher PAE predicted a reduced likelihood of delaying care, increased likelihoods of having a primary care provider, and attending annual physicals. LGB individuals noted lower PAE around doctor visits than straight individuals. Mediation models revealed that PAE fully mediated the relationship between LGB status and both annual physical attendance and delaying care. Another mediation model indicated that fear of discrimination may explain lower PAE among LGB individuals. Results support PAE as a key psychological pathway through which perceived discrimination shapes LGB health disparities.

[188] Positive Awe Enhances Disaster Preparedness Intentions: Evidence from Educational Interventions

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Disaster education has typically emphasized the negative aspects of disasters, often employing fear appeals to promote preparedness. While effective in eliciting immediate action, such approaches have limitations in fostering autonomous and continuous preparedness. To address this issue, Toyosawa et al. (in press) focused on positive perspectives in disaster education. Building on findings that awe promotes prosocial behavior (e.g., Piff et al., 2015), they demonstrated that positive awe, elicited by recognizing nature’s vastness and reinterpreting disasters as part of the earth’s natural processes, enhanced disaster preparedness intentions.

The present research replicated and extended this finding by examining whether introducing multiple reinterpretations of preparedness (e.g., from special events to everyday practices) would further strengthen its effects. Study 1 (N = 73) and Study 2 (N = 73) implemented approximately 20 minutes of disaster education, after which participants completed questionnaires assessing awe and preparedness intentions. Results replicated the effect of positive awe but showed no additional benefits from multiple reinterpretations.

These findings confirm the effectiveness of positive approaches to disaster education while suggesting that additional reinterpretations might not provide incremental benefits.

[189] Predictors of Climate Change-Related Coping Strategies

12:45 PM – 1:45 PM

MENTAL HEALTH/WEELL-BEING

As a global ecological threat, climate change has negatively impacted the environment and people’s mental health and psychological well-being. It is important to examine strategies used to cope with such challenge. Therefore, this study aims to assess predictors of climate change-related coping. Data collection is ongoing; 142 participants (mean age=42.2; non-White=42.1%) have completed the study thus far. Preliminary results from hierarchical multiple regression analyses showed that after controlling for personal experience with extreme weather events, higher levels of eco-anxiety and more positive pro-environmental behaviors and attitudes were associated with more use of meaning-focused (R=.66, p<.001) and problem-focused (R=.68, p<.001) coping. Furthermore, higher levels of de-emphasizing coping were predicted by fewer personal experiences with extreme weather, lower perceived risk of climate change, and less positive pro-environmental attitudes (R=.68, p<.001). These findings suggested the importance of developing programs that promote pro-environmental behaviors and adaptive coping strategies, particularly among vulnerable populations frequently exposed to extreme weather.

[190] Psychological Distance: The Relation Between Self Distancing and Prosocial Behaviors

12:45 PM – 1:45 PM

SELF-REGULATION

Global inequality has increased over the past decades, significant results have shown a growing wealth gap. This study examines psychological correlates of the attitudes individuals have towards global inequalities by analyzing the implications of processes of emotional regulation on prosocial behaviors. We reasoned that Americans may make fewer donations to developing countries because they distance themselves from people in developing countries to avoid negative feelings. This distancing allows them to see problems in developing countries as further from themselves thereby supporting misconceptions about global inequalities. We surveyed participants (N=598) about psychological distance – how subjectively close people relate a person, concept, or event – and we measured attitudes toward global inequality and prosocial behaviors using participants' open-ended responses. We found greater psychological distance is significantly related to participants' reduced concern about global inequalities and lower intentions to donate to those countries. The study helps us better understand how psychological distance relates to prosocial behavior and speaks to a need to diminish the wealth gap.

[191] Psychological flexibility and self-structure predict wellbeing in trans and gender non-conforming individuals

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

This preregistered study examined whether self-concept clarity (SCC), self-concept differentiation (SCD), and psychological flexibility promote well-being in transgender and non-conforming individuals. As predicted, SCC and flexibility were positively correlated with well-being, whereas SCD was inversely related to well-being. Multiple regression showed that both SCC and flexibility predicted unique variance in well-being, whereas SCD was not a significant predictor, overall $R^2 = .36$, $p < .001$. Additionally, flexibility explained the largest amount of unique variance in well-being. Serial mediation analyses found that the effects of SCD on well-being were fully mediated by SCC and flexibility. Moreover, flexibility partially mediated the effects of SCC on well-being. The total standardized indirect effect was $b = -.23$, $t = -4.60$, $p < .001$. These findings underscore the importance of flexibility and SCC in promoting well-being. We discuss the relevance of the findings within the broader literature on well-being and mental health in transgender and non-conforming individuals and highlight flexibility's potential as a resilience factor.

[192] Psychological Flexibility, Digital Masculinity, and Gender Role Conflict

12:45 PM – 1:45 PM

GENDER

This study examines whether psychological flexibility (PF) moderates the association between engagement with online masculinity content (OMC; e.g., the manosphere) and gender role conflict (GRC). PF is the ability to accept and adapt to challenging situations (Hayes, 2011). Research links traditional masculine norms with increased GRC, which predicts poor mental health and relational outcomes (Levant, 2011; O'Neil, 2008; Pederson & Vogel, 2007; Pleck, 1995). PF has been associated with decreased rigid adherence to male role norms (Zarling et al., in press). Little is known about how algorithm-driven digital environments promoting extremist content may influence GRC (Botto & Gottzén, 2023; Ging, 2019; Roy & Allen, 2022).

To address this gap, we introduce a measure of exposure and adherence to OMC: Masculinity Explored through Digital Interactions and Attitudes (MEDIA). Using cross-sectional survey data, we test whether PF moderates the association between MEDIA scores and GRC. PF may buffer GRC by promoting adaptability in response to OMC. We hypothesize that greater engagement with OMC is related to greater GRC, and elevated PF may serve as a protective factor.

[193] Psychological Need Fulfillment in a Virtual Context: Gaming-Contingent Self-Worth, Basic Psychological Needs, and Problematic Gaming

12:45 PM – 1:45 PM

SELF-ESTEEM

Gaming-contingent self-worth (GCSW) occurs when feelings of self-worth fluctuate strongly based on perceived successes and failures in virtual gaming environments. According to self-determination theory, CSW may develop in response to basic psychological needs (BPN) not being met, resulting in a reliance on external sources of self-worth. This preregistered cross-sectional study (n=261 gamers) examined the relationships between BPN fulfillment and frustration experienced generally and virtually, GCSW, and problematic gaming. Primary hypotheses expected general need frustration and virtual need satisfaction to be positively related to GCSW, and vice versa for general need satisfaction and virtual need frustration, which were partially supported. Simultaneous multiple regression analyses indicated that virtual needs remained significant predictors of GCSW whereas general needs did not. Exploratory mediation models suggested that GCSW may explain why experiencing virtual need fulfillment or frustration predicts greater problematic gaming symptoms. These findings increase our understanding of how dependence on gaming environments may have implications for self-esteem and gaming behaviors.

[194] Purchasing Status: Family Income, Father's Education and Conspicuous Consumption

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This study aims to shed light on the interplay between income, family background, and the enduring relevance of conspicuous consumption as a status-seeking behavior in today's society. Building on prior work since Veblen (1899/2007), we hypothesize that the effects of family income on conspicuous consumption are stronger among youth from lower social classes than those from higher ones. Using data from the 2009 J1W9S wave of the Taiwan Youth Project, we analyze a sample of 1,513 respondents aged 22–23. Key variables include the father's highest educational attainment, monthly family income, and purchasing behavior related to high-priced goods. To examine the interaction between income and parental education, we apply splined linear probability models and LOWESS smoothing. Our findings support Veblen's theory of conspicuous consumption: individuals from lower socioeconomic backgrounds are more likely to "purchase status" via conspicuous consumption, whereas those from higher-status families do not experience the same psychological drive to acquire luxury goods.

[195] Racial differences in side effect expectations are mediated by beliefs about medicines

12:45 PM – 1:45 PM

PHYSICAL HEALTH

Expecting more side effects increases side effect experience and the early discontinuation of treatment. It may be that side effect expectations also contribute to health disparities, such as elevated treatment discontinuation by African Americans. In a pre-registered online study, White (N=265) and African American (N=248) participants viewed a standardized medical vignette describing a fictitious medication. Participants reported expected global and specific side effects of the treatment, and beliefs about medicines. Results demonstrated that African Americans reported greater global side effect expectations ($F(1,505) = 29.79$, $p < .001$) and both specific prompted ($F(1,505) = 15.02$, $p < .001$) and unprompted ($F(1,505) = 24.58$, $p < .001$) symptom expectations as compared to White American participants. Further, mediation analyses indicated that negative beliefs about medicines partially mediated the relationship between race and side effect expectations. The results show racial disparities in side effect expectations which may be due to beliefs about medicines. These findings may help explain racial differences in treatment discontinuation and point to an important point of intervention.

[196] Racial Objectification and Minority Stress as Predictors of Body Dissatisfaction and Attitudes Towards Sex Among Asian American Women

12:45 PM – 1:45 PM

GENDER

Objectification theory states that the consistent sexualization of female bodies causes women to view themselves from an outsider's perspective from a young age. These pressures are compounded by racial objectification that Asian American women face, such as being perceived as submissive and hypersexualized. These body image pressures intersect with expectations passed down generationally from families and cultures of origin, presenting unique challenges for Asian American women. This study examined whether ethnicity moderated the associations of body image pressures and dissatisfaction to sexual functioning and satisfaction among 397 Asian American women recruited from online panels. Participants completed validated measures of body image (Appearance Evaluation; Overweight Preoccupation scale), self-objectification (Body Surveillance), disordered eating (Binge Eating Instrument), general appearance pressures (Sociocultural Attitudes Towards Appearance Questionnaire), and racial objectification (Sexual Objectification Racial Microaggression Scale). These findings provide insight into how the racial objectification experiences of minorities connect to sexual functioning.

[197] Ethnic Identity Sometimes Protects Latinx's Health from Workplace Harassment

12:45 PM – 1:45 PM

INTERGROUP RELATIONS

We tested whether ethnic identity (EI) centrality moderated/weakened the physical and mental health burden of workplace ethnic harassment, in Southwestern US Latinx, who worked as an ethnic minority, majority, or in an ethnically balanced work group. EI centrality can act like a buffer or catalyst in different contexts. Given research, we predicted a positive relationship between harassment and health symptoms and that this relationship would be weakened in Latinx with strong EI centrality. We also assessed features of EI centrality to test possible mechanisms. A Prolific sample of 407 Latinx-American employees of a variety of jobs in the Southern USA answered survey items assessing their health symptoms, workplace ethnic harassment, EI centrality and elements, work group composition, and mental distress. Suggesting protection, regressions showed strong EI centrality weakened the positive relationship between harassment and physical/mental symptoms, when Latinx worked as a minority or as a majority. In contrast, in balanced work groups, Latinx's weak EI centrality reduced the harassment – symptoms relationship. We tested possible reasons for these effects and discuss implications.

[198] Rare = Severe: People Perceive Rare Illnesses as More Severe Than Common Illnesses

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Perceived illness severity shapes coping, adherence, satisfaction, and well-being. We test whether communicating prevalence shifts severity judgments. Across four preregistered studies, we document a "rare = severe" heuristic: holding other information constant, rarer illnesses are judged more severe.

Study 1 (N=131) and Study 2 (N=220): a diagnosis framed as rare (vs common) yielded higher composite severity ratings (p 's < .001). Study 3 (N=458) used a virus scenario and added a no-prevalence control; severity was highest for rare, lowest for common, with control in between. A mediation via perceived treatment availability was not supported (bootstrapped 95% CI included 0). Study 4 (N=343) showed downstream consequences: framing a virus as rare increased perceived severity, which in turn raised intentions to buy/take a preventive supplement (indirect effect 95% CI [.135, .509]).

These findings indicate that prevalence information alone can shift severity perceptions and preventive intentions. Future work should unpack mechanisms and boundary conditions.

[199] Receptiveness Evaluated as a Predictor of Responsiveness in Therapy

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Mindsets, or beliefs about whether attributes such as anxiety and depression can change, have been linked to symptom severity, with growth mindsets generally associated with lower levels of corresponding symptoms (De Castella et al., 2013). Evidence shows this relationship is significant, but the mechanisms underlying it remain unclear. Clarifying these processes at the intersection of social and clinical psychology is a central aim of the present study. One potential pathway is through coping style, or the way individuals respond to stressors. Evidence indicates that coping styles are linked to symptom severity both independently and alongside mindset (Henshaw et al., 2023). In this study, we will analyze the relationship between mindsets, coping styles, and symptom severity using data from undergraduate students receiving services at the university's counseling center. We hypothesize that coping style, specifically reappraisal and suppression, will mediate the relationship between mindsets and symptom severity over the course of therapy for depression and anxiety. This work has implications for how patient receptiveness influences their responsiveness to therapy.

[200] Reductions in Smartphone Use Through Mental Contrasting of a Negative Future: Findings Across Three Time Frames

12:45 PM – 1:45 PM

SELF-REGULATION

As smartphone use becomes increasingly pervasive, identifying effective self-regulation strategies is essential for reducing excessive screen time. Across three studies (N = 235, including Study 1: N = 89, Study 2: N = 71, Study 3: N = 75), we examined whether mental contrasting of a negative future, a strategy that involves imagining a negative outcome associated with excessive smartphone usage and reflecting on a precious thing in the reality that can be lost with unregulated smartphone usage, can reduce daily smartphone use compared to negative fantasizing alone. Participants were randomly assigned to either mental contrasting or negative fantasizing condition, and their screen time was tracked across 7 days (Study 1), 5 weeks (Study 2), and 9 weeks (Study 3) after the intervention. Polynomial trend analyses revealed significant differences between conditions in overall screen time in Studies 1 and 3, and significant linear trend differences between the two conditions over both the 7-day and 5-week periods of Study 2. Specifically, participants in the mental contrasting condition (compared to those in the negative fantasizing condition) exhibited lower screen time over 7 days (Study 1) and across 9 weeks (Study 3). In Study 2, participants in the mental contrasting decreased their screen time linearly over both the 7 days and the 5 weeks after intervention. Limitations and directions for future research are discussed.

[201] Regulating Motivation Dynamically: Stability, Predictors, and Outcomes of Motivation-Regulation Profiles

12:45 PM – 1:45 PM

SELF-REGULATION

How do students dynamically regulate their motivation over time, and how are these dynamics related to their strategic mindset, motivation, and performance? We surveyed 1,019 sixth-grade students about their use of motivation regulation strategies four months apart before their final exams. Latent transition analyses revealed four stable, distinct profiles: High, Moderate, and Low levels of motivation regulation strategy use, and a Goal-Driven profile, which primarily relied on mastery and performance goals. Most students remained in the same profile over time, with few exhibiting transitions. Those who remained in high profiles demonstrated higher levels of motivation and performance; students who shifted from higher to lower profiles maintained high performance but showed declines in motivation; students who transitioned to high profiles only right before the exam exhibited the lowest levels of performance and motivation. Notably, students with more of a strategic mindset were less likely to shift into lower motivation regulation profiles. These findings reveal that motivation regulation profiles are stable, and their variation have implications for important academic outcomes.

[203] Religious Engagement and Affective Polarization

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Affective polarization, animosity towards members of opposing political parties, has dominated our news cycles and threatened the functionality of our democracy. This study examined whether a Bible study intervention would reduce affective polarization and foster compassion and intellectual humility, traits often found and encouraged in religions. These traits have the potential to combat affective polarization by encouraging individuals to consider the similarities as opposed to the differences of those who hold different beliefs. American Christians (n =206) were randomly assigned to engage with either fifteen minutes of a Bible study or meditation materials. Participants in the Bible study manipulation reported higher levels of compassion and intellectual humility and lower affective polarization (measured via social distance) in comparison to the meditation manipulation. These findings suggest that religious engagement increases compassion and intellectual humility and lowers affective polarization.

[204] Remote Research for Real-World Risks: Social-Ecological Pathways to Mental and Physical Health

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

The social-ecological conditions in which we live have important implications for mental and physical health. By increasing accessibility of research to rural and low-income neighborhoods, fully-remote research can elucidate the pathways through which environments impact physical and mental health. We demonstrate this concept through a multimodal, fully-remote clinical depression trial (N = 1,157), which we use to explore the influence of social adversity (Area Deprivation Index) and environmental risk (Environmental Justice Index) on mental health and inflammation profiles measured via dried blood spot sampling. Using structural equation models, we examine hypothesized pathways through which socio-ecological adversity contributes to chronic inflammation via anxiety and depression symptoms. This work builds upon a growing body of research documenting the biological embedding of structural inequalities and informs best approaches for scalable interventions.

[205] Resolving the Education-Wellbeing Paradox: Education Enhances Psychological Richness but Not Happiness or Meaning

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

There is a longstanding paradox in wellbeing research: while education is widely theorized as important to living well, it does not consistently predict empirical measures of wellbeing—typically happiness or meaning. We resolve this paradox by considering education's impact on psychological richness, a recently proposed dimension of wellbeing marked by interesting, perspective-changing experiences. Studies 1-2 analyze nationally representative surveys across 23 European countries (n=43,852) and between 1972-2022 in the U.S. (n=72,390). Results reveal a positive link between individuals' years of education and richness, but not with happiness or meaning. Study 3 analyzes 10,642 course evaluations at a U.S. college: students reported heightened psychological richness after taking courses, especially challenging ones. Study 4 experimentally manipulated an everyday activity of education—reading. Participants (N=131) exposed to texts with reduced literariness reported lower richness, but not happiness or meaning. Together, these findings suggest education contributes to a psychologically rich life, potentially informing public discourse and governmental decisions on education.

[206] Revisiting the Link Between Childhood Trauma and Post-Traumatic Stress Disorder: Does Gender Matter?

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Childhood trauma is a well-documented risk factor for post-traumatic stress disorder (PTSD), yet less is known about whether specific abuse types (e.g., physical, sexual) differentially predict PTSD symptoms for women versus men. Prior work suggests that women are at higher overall risk for PTSD, but gender socialization may shape how different forms of abuse threaten self-concept. For example, men are socialized to value physical strength whereas women are socialized to value sexual purity. In a recent pilot study (N = 388), I found that physical abuse predicted PTSD symptoms for men but not women, whereas sexual abuse predicted PTSD symptoms for women but not men. In ongoing research, I aim to replicate these findings and explore potential explanatory mechanisms (e.g., men's endorsement of rigid masculinity norms). Cisgender women and men (estimated N = 400; 200 women) will complete validated measures of trauma, PTSD symptoms, and potential mediators. I hypothesize that physical abuse will predict PTSD in men more than women, sexual abuse will predict PTSD in women more than men, and that these patterns will be explained by participants' endorsement of stereotypical gender norms.

[207] Self-kindness in a critical world: Investigating self-compassion as a protective factor against mental illness stigma

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Mental health stigma remains a pervasive part of the human condition. Those with mental health disorders are assumed to be unpredictable and dangerous, sparking prejudicial emotions that lead to avoidance. Further, those who seek treatment can be viewed as weak or incompetent. The internalization of these attitudes leads to self-stigmatization, which increases symptoms and suicidal ideation while decreasing self-esteem. Thus, persons become burdened by the mental health stigma that exists both without (in society) and within themselves.

Fortunately, research has identified protective factors against mental health stigma, including self-compassion—the ability to relate to oneself in a healthy, nonjudgmental, and kind manner during adversity. In these instances, higher levels of self-compassion predict greater resilience (i.e., the ability to adapt to and recover from stress).

We examine self-compassion as a causal factor in reducing stigma and fostering resilience with experimental use of the Self-Compassionate Mindstate Induction (SCMI), which induces self-compassion through brief writing exercises. We predicted that those who complete these activities will report decreased levels of stigma alongside increased help-seeking intentions and resilience (compared to those in the control condition). Our results and clinical implications will be discussed in greater detail.

[208] Shades of Ideology: Dissecting How Ideological Orientations Predict Attributions and Policy Attitudes Towards Unhoused Individuals

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Across two cross-sectional samples (N = 612), we examined how people's ideological orientations related to their attributions about the causes of homelessness, and how these attributions relate to policy preferences. In both studies, we assessed eight ideological orientations, four domains of attributions about homelessness, and three domains of policy attitudes. In Study 1, we measured attributions using self-report scales, whereas in Study 2 we measured qualitative answers that were coded using a large language model (ChatGPT 4o). Across both studies, stronger right-wing authoritarianism (RWA) and protestant work ethic (PWE) related to endorsing more individualistic attributions for homelessness, while stronger conservatism related to less endorsement of structural attributions. Lower endorsement of structural attributions was related to less support for economic policies to address homelessness in society. These findings underscore the importance of both ideology and attributions as predictive factors of people's perceptions of homelessness and the solutions our communities use to address it.

[209] Shifting Cultural Attitudes on Sexual Objectification: Testing an Integrative System Justification Lens

12:45 PM – 1:45 PM

GENDER

Sexual objectification of women is a ubiquitous sexist practice. Integrating theories on objectification and system justification, we tested whether harnessing the system justification motive would reduce support for sexual objectification. In the first correlational study ($N = 404$ mixed-gender), we found moderate to strong associations among support for sexual objectification, gender-related ideologies, and gender system justification. In the second experimental study ($N = 376$ men), men were randomly assigned to read about sexual objectification as a threat to the gender status quo that needs to be eradicated or a control condition. Men reported less support for sexual objectification when sexual objectification was framed as the threat, viewing sexual objectification as more harmful and less normative and stable compared to the control condition, which was moderated by gender essentialism. These findings provide preliminary evidence for sexual objectification as an integral part of the gender status quo and gendered patterns of support for sexual objectification. Harnessing system justification motives may provide a way to legitimize social change around this sexist practice.

[210] Shifting the Scale: A Cognitive Dissonance Approach to Reducing Explicit and Implicit Anti-Fat Bias in Premedical Students

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Healthcare providers are among the most frequent sources of weight-based discrimination, with significant consequences for patient trust, healthcare utilization, and outcomes. To address these biases early in professional development, the present study tested a brief, theory-driven intervention targeting both implicit and explicit anti-fat attitudes in premedical undergraduates. Grounded in cognitive dissonance theory and integrating principles from attribution theory, social identity theory, and sociocultural theory, components of the intervention included educational materials, a counterattitudinal essay, and a public pledge. Participants were randomized to an intervention or control condition and completed pre- and posttest measures of implicit and explicit bias via an implicit association test and surveys. Results indicated significant reductions in both implicit and explicit anti-fat bias among participants in the intervention condition, with medium-large effect sizes. These findings suggest that single-session, dissonance-based interventions can reduce weight stigma at both explicit and automatic levels, with implications for early intervention in healthcare training.

[211] Side effect expectations mediate racial differences in intended medicine adherence

12:45 PM – 1:45 PM

PHYSICAL HEALTH

African Americans (AAs) experience greater treatment-related burden and lower treatment adherence compared to White Americans (WAs), which may partially explain racial disparities in health outcomes. One previously unexplored hypothesis, based on the nocebo effect, is that AAs may have increased expectations for side effects from treatments, which may thereby increase the occurrence of side effects and encourage treatment discontinuation. In a U.S. nationally representative sample, WA ($n = 909$) and AA ($n = 189$) participants self-reported side effect expectations and prior medication adherence. Results demonstrated that AA participants reported more frequently reducing their medication dosage as a result of side effects as compared to WA participants, $t(258) = -3.537$, $p < .001$. These effects were partially mediated by expectations for severe medication side effects [.06, .18]. These results are the first to suggest that reducing severe side effect expectations may be a potentially valuable intervention point for lessening racial health disparities in the United States.

[212] Signals of Progress and Commitment Influence Willingness to Support Others' Goals

12:45 PM – 1:45 PM

SELF-REGULATION

The way people perceive their own goal-directed behavior has implications for motivation and self-control, but little theory or research has investigated the antecedents or consequences of perceptions of others' goal-directed behaviors. We aimed to understand how interpreting others' self-control behaviors through either a progress or commitment framework influences willingness to provide support to another person's goal pursuit. We asked participants to reflect on the self-control success (failure) of a close other. Then, participants reported their perceptions of the other person's goal progress (commitment) and willingness to support that person. Self-control indirectly predicted support intentions through perceived motivation, and this indirect effect was larger when motivation was framed as commitment (vs progress). Findings from this study underscore the influence of perceived goal commitment on support intentions and contribute to an understanding of how people's behavior affects the support they receive in goal pursuits.

[213] Similarity over Status in Partner Selection under Competition

12:45 PM – 1:45 PM

GENDER

This paper investigates a theoretical tension between status-based performance expectations, derived from Status Characteristics Theory, and preferences for same-gender partners, rooted in the principle of homophily. Across three pre-registered experiments, we examine whether participants prioritize strategic advantage or gender similarity when selecting competitors and teammates in competitive settings. Study 1 tests partner selection patterns in individual and team-based competitions involving an arithmetic reasoning task. Study 2 assesses whether participants hold gendered performance expectations about this task that might influence their selections. Study 3 tests the robustness of gender homophily by introducing past performance information that conflicts with homophilous preferences. Across all three studies, we find a consistent pattern of gender homophily, even in the face of conflicting performance cues, highlighting the enduring pull of social affinity in contexts where strategic decision-making is presumed to dominate. These findings carry implications for organizations relying on voluntary partner selection and team formation, suggesting that performance incentives alone may be insufficient to encourage cross-gender partnerships and capture the benefits of diversity.

[214] Social Anxiety and Help-Seeking Intentions

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Social anxiety is a diagnosable mental health concern that affects about 13% of US adults in their lifetime (Kessler et al., 2012). Despite the effectiveness of psychological treatment on improving symptoms, many people with social anxiety do not seek treatment (Bruffaerts et al., 2022). The present study explores the relationships between social anxiety, social support, stigma, and help-seeking intentions. Undergraduate students completed an online survey reporting symptoms of social anxiety, intentions for help-seeking from various sources, perceived social support, anticipated stigma, and internalized stigma. Greater social anxiety symptoms are predictive of less help-seeking intentions. However, a simultaneous linear regression showed that greater social support, greater anticipated stigma, and lower internalized stigma were related to higher intentions to seek help. Present findings may highlight important factors preventing help-seeking of those experiencing a mental health concern and pathways for intervention.

[215] Social Comparison to Past Self: Implications for Body Image Satisfaction among Adult Women

12:45 PM – 1:45 PM

GENDER

The tripartite model posits that peers, parents, and media are the three primary sociocultural influences that lead to internalization of the thin-ideal and social comparison to peers and media, which leads to body dissatisfaction and disordered eating (van den Berg et al., 2002). The current study enhances the tripartite model by assessing social comparison to one's past self: the extent to which people's feelings about their appearance are related to comparisons to their past self is underexplored. Participants (N=1099) drawn from an online panel service completed measures of these constructs. Consistent with our hypotheses, women who engaged in more downward comparisons to their past self were preoccupied with their weight and less satisfied with their appearance, and women with higher BMIs tended to engage in more of these past-self comparisons. This study highlights the importance of exploring the role of past self comparison in women's current body dissatisfaction and risk for disordered eating, and of incorporating these comparisons into the broader tripartite model.

[216] Social Integration and Contribution as a Moderator Between Military Self-stigma and Well-being

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Self-stigma refers to the process of internalizing feelings of inadequacy that arise from negative messages within one's social environment. Military self-stigma (MSS), a specific form of self-stigma, has been linked to a range of adverse mental health and well-being outcomes. However, it is unclear how social integration (i.e., sense of community) and social contribution (i.e., contributions to their community) may influence the links between MSS and negative outcomes, especially in populations with high exposure to trauma. The current study uses The Military Health and Well-Being Project, a nationally representative sample of post-Vietnam US military veterans (N=1,461), to examine these relationships. In preregistered analyses, we hypothesize that an increased level of social integration and social contribution after service moderate the negative effects of self-stigma, such that a stronger social integration and contribution will weaken the relationship between military self-stigma and negative wellbeing. Better understanding the moderators of the relationship between MSS and negative wellbeing may help veterans thrive as they transition back into civilian society.

[217] Social Media Psychology: A Framework for the Past and Future

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Since the introduction of social media, psychologists have studied links between social media use and well-being – yet, we have struggled to contextualize findings into a broader psychological framework. We therefore propose a four-level framework to organize past and future research on social media: the sociocultural level asserts that social media operates as a cultural force that shapes life off- and online; the platform landscape level refers to the experience of a given social media platform vis-a-vis other platforms; the stimulus level refers to a singular piece of content a consumer engages with (e.g., a singular post); finally, the meta-discourse level refers to the ecosystem of user interaction within each stimulus (e.g., comment sections). For each level, we explain its theoretical utility, how existing research fits within the level, how the level interacts with others within the framework, and suggestions for future research. Our goal for this project is to pave the way for a deeper, more holistic understanding of our emotional and cognitive experiences online. This research will empower people to co-exist with social media and thus take charge of their well-being.

[218] Social Psychological Risk Factors of Psychosis

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Psychosis is a mental state characterized by hallucinations, delusions, abnormal speech, and a detachment from reality (de la Lune et. al., 2020). Perception, belief, and behavior are affected (Khadivi & Kleiger, 2024). Psychosis is often associated with mental health disorders such as schizophrenia, depressive disorders, anxiety disorders, and PTSD. However, these do not need to be present for an episode of psychosis to occur (Wright et. al., 2014). Biological and psychological abnormalities are historically understood to be root causes of psychosis (Cardinal & Bullmore, 2011). What is less understood are the social factors of psychosis. Research suggests that poverty is among the leading social causes of psychosis (Read, et.al., 2013). High rates of marijuana misuse, and substance misuse in general, are found in first-episode psychosis patients (Van Mastrigt, et. al., 2004). Motivations for misuse include higher levels of sociability (Pencer & Addington, 2008). Using data collected by the Substance Abuse and Mental Health Services Administration (SAMHSA, 2025), U.S. Marijuana Use Disorder rates among age groups will be analyzed. Then, using data from the United States Census Bureau (USCB, 2024), U.S. poverty rates among racial/ethnic groups will be examined. Together, the social psychological factors of marijuana misuse and poverty will be evaluated to determine which groups pose the highest risk-factor for developing psychosis.

[219] Sorting and Psychological Resources: Lasting Psychological Effects of Elite Education and HBCUs

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

We examined some long-term consequences of attending elite colleges (Ivy and Ivy Plus), selective schools (very competitive schools that are a level down from the Ivys), and HBCUs. Much has been written about the financial benefits of attending elite and selective schools, but barely any work has been done on psychological outcomes. This is strange given the status conferred by these schools (and the resources and plaudits these schools shower on their students). Surprisingly, in a prospective study, we find little psychological effect of attending elite schools, and those that do exist are mostly negative. Selective schooling also has little effect, with one exception: people from lower SES backgrounds who attend selective schools develop a more internal locus of control and have better mental health in middle age. There is one type of school that does seem to have robust, lasting mental health benefits for those who attend, however: HBCUs. These benefits start with post-college self-esteem and proceed to better mental health in middle age, with HBCU attendees being particularly resistant to depression.

[220] Status and Time Entitlement: How Status Shapes Everyday Expectations

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Time is an essential but limited resource, and entitlement to others' time may depend on social status. This study investigated how status shapes judgments about time in professional interactions. Participants evaluated hypothetical one-on-one meetings with a higher- or lower-status individual and indicated what they expected of themselves and the other person. Their responses revealed consistent patterns: higher-status individuals were expected to have longer meetings, show less respect for others' time, and face fewer demands to prepare or stay on task. At the same time, participants indicated they themselves would be more motivated to prepare carefully, stay focused, and show respect when interacting with a higher-status individual. Lower-status individuals, in contrast, were expected to carry the burden of being considerate, adjusting their behavior, and protecting others' time. In short, these judgments show how participants defer to status, granting high-status individuals more freedom and reinforcing structural advantages that perpetuate inequality in professional settings.

[221] Stigma Consciousness and Mental Health in Students with Learning Disabilities

12:45 PM – 1:45 PM

MENTAL HEALTH/ WELL-BEING

Students with specific learning disorders (SLDs) who experience stigma are at risk of higher levels of anxiety and depression, which may be decreased by participating in social and emotional learning (SEL) programs. This study examined associations between stigma consciousness and mental health symptoms before and after SEL interventions in students with SLDs. Participants were 68 students diagnosed with SLDs (Female=50%; Mage=13.32 years) in grades 5–12, randomized by classroom into two intervention groups: Normal Isn't Real (n=34), teaching about stigma and neurodiversity, and MindUP (n=34), which taught mindfulness. Data were collected at pre- and post-intervention timepoints. Results showed that there was no significant difference in the groups for any variables before and after the interventions. In both groups, stigma consciousness was not related to anxiety and depression symptoms before the interventions, but after the intervention, greater stigma consciousness was associated with lower anxiety and depression symptoms. These findings suggest that educating students about stigma and mindfulness may help reduce anxiety and depression symptoms in neurodivergent students.

[222] Stoic Training as a Brief Psychological Intervention: A Longitudinal Study on Enhancing Resilience and Well-Being in a College Population.

12:45 PM – 1:45 PM

MENTAL HEALTH/ WELL-BEING

Stoicism emphasizes adaptive emotion regulation, but is often mischaracterized as emotional suppression. Stoic Training for Achieving Resilience (STAR) has recently emerged as an intervention to improve resilience and wellbeing. We extend this research to undergraduates and new variables such as emotion regulation and fear of negative evaluation (FNE). 75 college students were randomly assigned to control or STAR conditions. We hypothesized that STAR training would decrease FNE and increase Stoic attitudes, resilience, and cognitive reappraisal. Participants completed a baseline and final survey with an 8-day training in between. The STAR group completed daily journals reflecting on several ancient Stoic practices. Control participants read fiction excerpts and predicted their endings. We used paired t-tests for within-group analyses and a 2x2 ANOVA for interactions. STAR participants demonstrated significant increases in all target variables, and significant interactions were observed for Stoic attitudes and FNE. No change in emotional suppression was observed. The difference in change in resilience scores between groups was also trending towards significance.

[223] Stranger Danger? Crime Misconceptions, Ambivalent Sexism, and Travel Attitudes

12:45 PM – 1:45 PM

GENDER

Men are more likely to be victims of violent crime by strangers, whereas women are more likely to be victimized by known perpetrators (U.S. Bureau of Justice Statistics, 2023). However, women report higher fear of crime overall and are often the focus of travel safety initiatives—many emphasizing “stranger danger.” Some theorists (Brownmiller, 1975) argue that fear of crime is imposed on women as a form of social control, reinforcing restrictions on their mobility. The present correlational study (N = 200) explored this idea in the context of travel. We assessed people’s crime risk estimates, fear of crime, ambivalent sexism, and attitudes toward women’s travel. We found that participants estimated that women are at a much higher risk of violent crime than men—and importantly, incorrectly assumed that women’s offenders are more often strangers than known. Moreover, consistent with past research, women reported higher fear of crime than men. Notably, benevolent sexism predicted more protective attitudes toward women’s travel, whereas hostile sexism predicted more overtly restrictive attitudes toward women’s travel. Implications for women’s exploration will be discussed.

[224] Structural Support Matters: A Multilevel Model of Sexism, State Equality, and Mental Health

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Depression and anxiety rates are nearly twice as high in women than men. One contributor to this gender difference may be structural sexism—a systemic factor that manifests both at the macro (e.g., policies) and micro (e.g., individual beliefs) levels. Drawing on structural sexism and health theory, we tested whether state gender equality and hostile sexism were associated with depressive and anxiety symptoms. U.S. adults (N = 603; 48 states) were recruited via Prolific. We computed multilevel models with fixed effects for gender, state equality, sexism, and a state equality*sexism interaction. Depression was associated with lower state equality ($b = -5.99$, $p = .01$) but not significantly associated with sexism. Anxiety was not directly associated with either predictor. Interaction effects were significant, indicating that higher sexism was associated with higher depression ($b = -3.83$, $p = .01$) and anxiety ($b = -3.21$, $p = .02$) in low-equality states. Women reported higher anxiety and depression than men, but gender did not moderate effects. Findings reveal novel evidence of the buffering role of structural equality, its cross-gender relevance, and its unique links to mental health.

[225] Subjective SES and Feelings of Social Inclusion Among Marginalized Young Adults

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This study examined the associations among first-generation college students, subjective socioeconomic status (SES), and academic self-handicapping in a sample of 333 undergraduates at a Mountain West university. First-generation status had a significant association with lower subjective SES, but not with academic self-handicapping behaviors. Additionally, the study revealed a small positive correlation between subjective SES and academic self-handicapping, suggesting a pattern where students with lower perceived SES report greater self-handicapping tendencies. The data imply that being a first-generation student is associated with lower perceived SES; however, academic self-handicapping may be more closely related to students' subjective SES than their first-generation status.

[226] Family Support as a Moderator in the Relationship between Subjective Socioeconomic Status and Psychological Distress among FGCS

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

The number of first-generation college students (FGCS) pursuing higher education has grown substantially in recent years. While much research emphasizes academic outcomes, less attention has been given to factors that influence FGCS mental health. Subjective SES is particularly relevant in this context because it has been previously linked to mental health outcomes. By examining subjective SES as a moderator, we can more holistically understand how FGCS' perceived social standing impacts their psychological well-being. This study examines whether family support predicts psychological distress across FGCS' first academic term, and whether subjective socioeconomic status moderates this relationship. Participants were 357 FGCS who completed online surveys prior to starting college and again after their first term. It was hypothesized that higher levels of family support would predict lower psychological distress over time, and that this protective effect would be stronger for students reporting higher subjective socioeconomic status compared to those reporting lower subjective socioeconomic status. Implications for future research will be discussed.

[227] Subjective socioeconomic status is a tool and we replicated it, a second time

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Our prior work found a false feedback technique (Brown-Iannuzzi et al., 2015) to be replicable. Here we retest if false feedback could influence subjective socioeconomic status (SSES) for participants ($n = 507$, $M = 35.46$, $SD = 11.18$) and introduced new dependent variables: Belief in social mobility, sense of control, and approval of opportunistic hoarding behaviors. Results found a statistically significant difference where participants who got high SES feedback placed themselves higher on the MacArthur Ladder ($M = 6.22$, $SD = 1.45$, $n = 180$) than those who received neutral ($M = 6.06$, $SD = 1.44$, $n = 174$) or low ($M = 5.82$, $SD = 1.53$, $n = 155$) feedback, suggesting the false feedback paradigm worked to make people feel wealthier, $F(2, 506) = 3.07$, $p = .024$, one-tailed. We also found that SSES positively correlated with belief in social mobility, $r(507) = .13$, $p = .004$, 95% CI [.04, .21], but not with approval of opportunistic hoarding behaviors, $r(302) = .08$, $p = .188$, [−.04, .19], or with perceived personal mastery, $r(507) = .04$, $p = .363$, [−.13, .05], or perceived constraints, $r(507) = -.01$, $p = .859$, [−.09, .08]. Our study provides empirical support for the use of the SSES tool in future research.

[228] Subjective Well-Being as Prediction Error in a Reinforcement Learning Model of Evolutionary Fitness

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

We present a framework integrating evolutionary motives and reinforcement learning to examine how daily goal achievement relates to subjective well-being. Participants reported baseline motivation across 11 evolutionary domains and then rated their daily achievement for each goal, as well as affect and life satisfaction, over six days. Using reinforcement learning paradigms, we modeled how prediction errors updated perceived success on each goal and tested whether daily affect covaried with these errors, moderated by baseline motivation. We also examined whether life satisfaction related to prediction error on a latent evolutionary fitness construct, defined as the aggregate of motive-specific success, again moderated by motivation strength. This project bridges three research traditions: laboratory studies linking affect to prediction errors, longitudinal work connecting goal pursuit and well-being, and evolutionary models mapping diverse goals onto fitness-relevant motives. Combining these traditions offers an integrative account of how well-being is represented in a learning system guided by evolutionary fitness.

[229] Sweet consumption-femininity stereotype and its effect on sweet consumption

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Why do men avoid sweet products? Drawing on prior research indicating that men are more motivated than women to adhere to gender-congruent behaviors, we investigate whether a sweet consumption–femininity stereotype discourages men from consuming sweet products to maintain a masculine self-image. Across five studies ($N = 1,056$), we establish the cognitive link between sweet consumption and femininity, which serves as a barrier to men's sweet consumption. Men were perceived as and felt more feminine when consuming sweet (vs. non-sweet) products (Studies 1–2) and exhibited reduced willingness to engage in sweet consumption when their gender identity was threatened (vs. affirmed; Study 3). Substantively, advertising sweet products with a masculine (Study 4) or an innovative branding (Study 5) could weaken the cognitive link between sweet consumption and femininity, thereby increasing men's purchase intention of sweet products. These findings introduce the notion that gender identity maintenance can influence men's likelihood of purchasing sweet products due to the sweet consumption–femininity stereotype, offering managerial strategies for marketers in the confectionery industry.

[230] Swipe, Scroll, Soothe: TikTok Use, Emotional Regulation, Well-being in Young Adults

12:45 PM – 1:45 PM

SELF-REGULATION

Studies have identified how and why young adults use TikTok. These studies illustrate that individuals use TikTok to scroll, post, or comment and the motivations vary from entertainment or to get the news. The goal of this study is to understand how TikTok use predicts emotional regulation, well-being, and self-esteem while testing motivations for using TikTok as a moderator. Longitudinal data for this study comes from young adults who complete two online surveys, spaced 2 months apart. Participants are being recruited through flyers posted around an area in the southern central United States. Data collection is ongoing, with 40 young adults having providing data at Time 1. This preliminary data shows that participants spend approximately 2.5 hours on TikTok a day, checking the application 3-30 times a day. Initial analyses reveal a negative relationship between TikTok use and emotional regulation and well-being. Actor-partner independence models will be used to analyze the bi-directional effects of TikTok use and young adult emotional regulation and well-being. Results from this study can be used to support healthy mobile media behaviors with young adults.

[231] Systematic review of Identity and Student Well-Being in South Africa, Brazil, and Russia

12:45 PM – 1:45 PM

MENTAL HEALTH/WEILL-BEING

This systematic review examines how student identity and well-being are shaped within the socio-cultural contexts of South Africa, Brazil, and Russia. Student well-being is increasingly recognized as central to academic success, mental health, and long-term quality of life, yet the ways in which identity influences these outcomes vary across cultural and historical settings. In South Africa, persistent inequalities and the legacies of apartheid affect belonging, resilience, and access to support. In Brazil, issues of community, cultural diversity, and social stratification strongly influence students' self-concept and educational experiences. In Russia, identity and well-being are negotiated at the intersection of tradition, modernization, and shifting socio-economic realities. By synthesizing findings across these contexts, this review identifies common themes, such as the importance of peer networks, inclusive learning environments, and the impact of socioeconomic background, while also highlighting country-specific dynamics. The comparison provides insights into how cultural narratives and structural conditions shape identity development and well-being differently across regions. The findings underscore the importance of culturally sensitive approaches to educational policy and student support. Practical implications include developing interventions that address both individual needs and systemic inequities, ensuring that higher education institutions foster belonging, resilience, and holistic flourishing for diverse student populations.

[232] Talking gender: Parental communication of gender-stereotypical content

12:45 PM – 1:45 PM

GENDER

Across cultures, men are stereotyped as agentic and women as communal, with such beliefs emerging in early childhood. We examined the role of parental language as a possible mechanism in the transmission of gender stereotypes. In two preregistered experiments, we tested whether parents use more agentic [communal] language with sons [daughters]. In Study 1, parents of 5-7-year-olds (N = 328) imagined advising their child on the first day of school, focusing on achievement, making friends, or recess. Text analysis using validated dictionaries showed parents used more communal language with daughters (vs. sons); no gender difference emerged for agentic language. Parents' gender attitudes predicted their gendered language use. These findings suggest parental language may reinforce communal (but not agentic) gender stereotypes. However, this pattern could reflect the school context, where parents may emphasize academic success for all children. Study 2 (ongoing; N = 500) applies the same method in less constrained contexts (e.g., how to lead a "good life"). The research provides novel evidence for parents' potential role in the emergence of gender differences in communal domains.

[233] Tangible versus Intangible Losses and Health and Well-Being

12:45 PM – 1:45 PM

MENTAL HEALTH/WEILL-BEING

Bereavement has been linked to deleterious mental and physical health outcomes, but the research focusing on the differences between tangible and intangible grief, and their relation to health, is limited. We conducted this study to examine (1) the prevalence of tangible and intangible losses experienced by an undergraduate population and (2) associations between tangible vs. intangible losses and health outcomes. Participants (n=378) completed survey questions regarding the types of losses they experienced in the past year, their most impactful loss, and various health outcomes. 77.8% of respondents experienced at least one loss, with 71.4% reporting at least one intangible loss and 61.1% reporting at least one tangible loss. Whereas tangible losses did not correlate with any well-being outcomes, intangible losses related to poorer well-being (e.g., sleep and mental health). Neither related to health behaviors (e.g., exercise and eating habits). Findings highlight potential differences in the health consequences of loss, depending on the type experienced. The results further underpin the importance of further research examining differences between tangible and intangible losses.

[234] The Bright Side of Being Alone: How Solitude may Support Flourishing

12:45 PM – 1:45 PM

MENTAL HEALTH/WEILL-BEING

Research on solitude has revealed both risks and benefits for well-being, with some studies emphasizing its links to loneliness and depression, while others highlight its potential to foster resilience and growth. Building on qualitative work suggesting that curiosity and optimism may support positive experiences in solitude, the present study quantitatively examined these factors, as well as basic psychological needs drawn from Self-Determination Theory, as pathways to flourishing among emerging adults (18–25). We found that solitude was significantly related to flourishing, mediated by optimism as well as the satisfaction of autonomy, competence, and relatedness. These findings suggest that, for emerging adults, optimism and the fulfillment of basic psychological needs are key mechanisms linking solitude to well-being, providing new insight into how time alone can contribute to flourishing during this developmental stage.

[235] The Camouflaged Heart: Cultivating Empathy Among Amherst College Students

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This project examines the effects of three theoretically grounded interventions on empathy, belonging, and well-being in a college student population. Participants are randomly assigned to read a brief research passage aligned with one of three conditions: (1) a malleability theory of empathy emphasizing that empathy can be cultivated, (2) an ethnocultural theory emphasizing that adapting to new cultural contexts enhances perspective-taking, or (3) a fixed theory emphasizing that empathy is largely stable (control). After reading, participants reflect on a personal experience and compose a letter to a fictional high school student facing social and emotional challenges, applying insights from the passage. Pre- and post-test surveys measure empathy, belonging, loneliness, affect, and psychological distress, with follow-up assessments two months later. This design allows comparison of immediate and sustained effects across conditions. Findings will provide evidence on whether brief interventions can foster empathy and belonging, reduce loneliness and distress, and contribute to strategies for cultivating inclusive, supportive campus communities.

[236] The Colors of Perfectionism: Feedback Mechanisms in Personality and Learning Contexts

12:45 PM – 1:45 PM

SELF-REGULATION

Perfectionism influences how individuals process evaluative feedback, with implications for performance and stress regulation. This study examined the link between perfectionistic traits, task performance, and physiological responses to feedback in a controlled experimental setting. Eighty-three participants (Mage = 20.7, SD = 3.4; 64 female) completed the Short Almost Perfect Scale (SAPS) and engaged in a 10-minute mandala coloring task while receiving positive, negative, or neutral performance feedback. Task performance was quantified by the number of correctly colored pixels, and autonomic responses were measured via heart rate variability (HRV). Correlation analyses revealed significant negative associations between SAPS High Standards, Discrepancy, and total scores with coloring accuracy, indicating that stronger perfectionistic tendencies predicted poorer performance. Moreover, HRV indicators during negative feedback were linked to decreased task accuracy, suggesting a physiological stress response that impaired execution. These findings highlight that perfectionism not only shapes subjective reactions to feedback but also manifests in measurable performance and biomarker changes, emphasizing the importance of tailored feedback strategies in educational and clinical settings.

[237] Bad Vibes or Good Info: The Effects of Foreboding Feelings on Perception and Counterfactual Thought

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Prior research has shown that gut feelings are seen to be formed from the true self and worthy of action and that unusual and controllable events increase generation and endorsement of counterfactual thoughts. This study plans to draw from this to examine how foreboding feelings affect perceptions of strange events and generation of alternative explanations with or without validating information. Participants will imagine a scenario with a lingering, momentary, or no foreboding feeling on a drive home, stopping at the roadside or a stop sign. Next, each imagines driving home normally or seeing a car drive across the road ahead. It is predicted that those responding to a foreboding feeling will generate and agree more with counterfactual thoughts, consider the scenario more eerie, more likely to have a deeper meaning, and more likely to be guided by external forces when that feeling is validated by a strange event. These relationships are predicted to be strongest in the lingering, then the momentary, and non-foreboding conditions in this order. By examining these data, this study will begin to elucidate the effects of foreboding feelings, a gap in current psychology literature.
