The role of gender in subjective intoxication remains unclear. "Holding one's drink," or avoiding appearing drunk, is tied to masculine norms, suggesting men may report lower intoxication than women at equivalent BACs. Yet prior studies find little evidence for this effect. We tested gender differences in intoxication reports using data from three alcohol administration studies (N=274; 573 observations). Participants consumed a controlled dose of alcohol, completed repeated breathalyzer tests, and rated their intoxication at each assessment. Multilevel models examined the impact of gender, BrAC, and binge drinking frequency. Results showed no effect of gender on subjective intoxication ($B=1.62$, $p=.947$). In contrast, BrAC ($B=635.29$, $p<2e-16$) and binge drinking days ($B=-0.70$, $p=.023$) significantly predicted intoxication ratings, with a BrAC $\times$ binge interaction also emerging ($B=-30.25$, $p=.002$). However, this interaction model explained little more variance than BrAC alone. Findings suggest intoxication reports are shaped by drinking patterns and BAC rather than gender.

[239] The effect of masculine defaults on men's attitudes toward sexism

12:45 PM – 1:45 PM

GENDER

In cultures with masculine defaults, traits or behaviors considered typical and appropriate for men (e.g., self-promotion) are valued, rewarded, or regarded as standard (Cheryan & Markus, 2020). Previous work has focused on how masculine defaults affect women's interest and performance (e.g., He & Kang, 2025). The current work examines whether masculine defaults affect men's attitudes toward sexism. Men were shown descriptions of company cultures (study 1, N = 46) or interaction patterns in college group work (study 2, N = 85) with masculine or feminine defaults (within-subjects design). In both studies (Cohen's $d = 0.44-1.29$), men believed that sexism was significantly more acceptable, common, and free of negative consequences in masculine-default cultures compared to feminine-default cultures. In study 1, men also reported significantly lower intentions to monitor their own sexism and marginally higher intentions to engage in sexist behavior in the masculine-default company compared to the feminine-default company. These findings indicate that masculine defaults cause weaker perceived social norms and sanctions against sexism and may even lead to sexist behaviors.

[240] The Effect of Search for Meaning on Maximizing and Patience

12:45 PM – 1:45 PM

MENTAL HEALTH/WEILL-BEING

Search for meaning refers to the drive and orientation toward finding meaning in one's life. When people look for meaning, they may desire better opportunities and earlier resources to achieve greater purpose and significance. In this research, we tested how search for meaning affected maximizing tendencies (Study 1, pre-registered) and patience in intertemporal choices (Study 2, pre-registered). Study 1's participants ($n = 300$) received instructions to pursue meaning in a consumer choice (meaning condition) or were given no goal-related instructions for the same task (control condition). Participants in the search for meaning group reported significantly higher maximizing tendencies in the choice task than the control group. Study 2 ($n = 122$) randomly assigned participants to think about an area of life in which they were searching for meaning (meaning condition) or an area of medium importance to someone else (control condition). Participants' preferences for sooner and smaller (vs. later and larger) rewards were significantly higher in the meaning condition. Search for meaning increases eagerness to receive the best outcomes, indicating greater maximizing and less patience.

[241] The Effectiveness of Appearance Interventions on Sleep and Alcohol Cognitions

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

College students commonly drink alcohol above moderation and get poor sleep, behaviors seen as socially rewarding despite risks. Appearance-based interventions can counter these motives, with few targeting alcohol or sleep, and none testing a combined approach. This study tested an intervention using Future Face software among 298 college females reporting poor sleep and drinking above moderation. Participants randomized to alcohol, sleep, or combined conditions received health risk information and facial transformations reflecting alcohol use, poor sleep, or both, while controls completed the post-survey only. ANCOVAs revealed that compared to control, the alcohol condition produced higher appearance vulnerability perceptions (APV), less favorable attitudes, and lower behavioral willingness (BW) and intentions (BI) to drink above moderation. The sleep condition only produced higher APV to poor sleep. The combined condition produced less favorable attitudes and lower BW and BI to drink above moderation, get poor sleep, and sacrifice sleep to drink. Findings support multi-behavior appearance interventions as feasible for addressing interconnected health risks in at-risk populations.

[242] The effects of family social support on young men's sexist beliefs: the roles of empathy and loneliness

12:45 PM – 1:45 PM

GENDER

Sexist attitudes among men in emerging adulthood are on the rise (Ng et al., 2024). Family support may serve as a protective factor against the development of misogynistic views in young men due to its links to socioemotional skills that may be integral to young men's ability to relate to women, such as greater empathy (Marta et al., 2011) and decreased loneliness (Wang et al., 2018). A sample of 192 U.S. males aged 18 to 25 reported perceived family support (Zimet et al., 1988), empathic concern (Davis et al., 1980), loneliness (Russell et al., 1980), and ambivalent sexism (Glick & Fiske, 1997). The hypothesized path model fit the data well ($\chi^2(6) = 5.44, p = .49$; CFI = 1.00; TLI = 1.00; RMSEA = .000; SRMR = .032). Family support indirectly predicted benevolent sexism via increases in empathy ($\beta = 0.42, 95\% \text{ CI } [.01, .09]$), as well as hostile sexism via decreases in empathy ($\beta = -.04, 95\% \text{ CI } [-.09, -.01]$) and increases in loneliness ($\beta = -.10, 95\% \text{ CI } [-.19, -.02]$). These findings highlight how family support may inform socioemotional competencies relevant to sexism and offers insights for interventions aimed to reduce gender bias in young men.

[243] The Gift of Time: Why Givers Underestimate What Recipients Really Want

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Gift-giving is a universal ritual that conveys care and strengthens bonds, yet in a time-scarce and economically conscious world, givers face a dilemma: Should they invest money in costly but convenient gifts, or devote time to meaningful but less expensive ones? This research examines the asymmetry between givers' and recipients' perceptions of such gifts and its mechanisms. Across three experiments (N = 823 Chinese participants, Mage = 31.43, SD = 8.94), we document a robust misalignment. Study 1 (n = 172) established the basic phenomenon: While givers believed recipients valued monetary and time-intensive gifts equally, recipients preferred time gifts, rating them as significantly more effective for enhancing interpersonal closeness. Study 2 (n = 249) identified the psychological mechanisms: Givers underestimated the thoughtfulness and quality of time gifts relative to recipients' actual evaluations. Study 3 (n = 402) showed that this asymmetry persisted across social distances: Whether with intimate partners or distant acquaintances, givers consistently failed to recognize recipients' preference for time-invested gifts. These findings extend resource theory by showing that time and money are not psychologically interchangeable, cautioning against overemphasizing monetary value in marketing, and highlighting the relational significance of time in gift exchanges.

[244] The Impact of Facial Recognition Technology on Eyewitness Identifications

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Police departments increasingly use facial recognition technology (FRT) to generate suspects, often requiring FRT matches be followed by identifications from a witness or third-party who viewed surveillance footage. As witnesses may be told a suspect was identified through FRT, it is critical to examine its influence on decision-making. Participants viewed a simulated crime and attempted to identify the culprit from a six-person photo array in a 2 (Suspect Development: FRT vs. No Information) $\times$ 2 (Culprit Presence: Present vs. Absent) $\times$ 2 (Lineup Instructions: Biased vs. Unbiased) design. Disclosure that a suspect originated from FRT significantly increased identifications from culprit-absent but not culprit-present arrays. When the arrays were culprit-absent, knowing that the suspect was developed through FRT did not affect the rate of mistaken identifications of the suspect. When the arrays were culprit-present, knowing that the suspect was developed with FRT, increased the rate of suspect identifications, but through mechanisms other than improving memory. Police should avoid revealing suspect development methods to reduce bias and wrongful conviction risk.

[245] The Influence of Gender Conformity on Perceptions of Nonbinary Identities

12:45 PM – 1:45 PM

GENDER

People who deviate from traditional gender roles tend to be rated more negatively than those who conform. This study will examine the influence of gender expression and gender identity on perceptions of nonbinary individuals. Participants will be randomly assigned to read one of six vignettes featuring a target described as either a cisgender man or a nonbinary person assigned male at birth who presents as masculine, feminine, or androgynous. Participants will evaluate the target on feeling thermometers, distinctiveness threat, social distance, and perceived gender expression.

We predict results of the 2 (gender identity: man, nonbinary) X 3 (gender expression: masculine, feminine, androgynous) ANOVAs will reveal that people will feel more positively toward the cisgender target compared to the nonbinary target. We also predict masculine targets will be perceived more positively than androgynous and feminine targets. Additionally, we predict participants will feel more positively toward the masculine nonbinary target compared to the feminine and androgynous nonbinary targets. We expect results to support previous findings that adhering to traditional gender roles is preferred.

[246] The Ingroup-Outgroup Effect: Effects on Open and Closed-Minded Cognitive Style

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Prior research provides evidence of an Ingroup-Outgroup effect on open-mindedness, specifically group members intended to be more open-minded towards critics of their ingroup when those critics belonged to the ingroup as opposed to the outgroup. The present study aimed to extend these findings, examining actual manifestations of open-minded cognition, as opposed to how open-minded participants say they would be. The present study tested using political party group membership (ingroup versus outgroup, and measured open-mindedness using information selection and information sharing. Participants read criticism of their political party from two groups of voters, Group A and Group B. Group A, whose party was not mentioned, remained constant and served as a standard of comparison. Group B was comprised of voters from the participant's own party (ingroup condition) or the opposing party (outgroup condition). Participants completed the SOMC scale, measuring the intention to be open-minded, and then selected statements from Group A or Group B about various political topics to read and share with the next participant in the study. The results supported the Ingroup-Outgroup effect. Participants who read about the ingroup Group B scored higher on SOMC and selected more Group B statements to read and share than participants who read about the outgroup Group B. Additionally, SOMC mediated the effect of condition on Information Selection and Information Sharing. Furthermore, participant political party moderated the relationship between condition and SOMC, and condition and Information Selection and Information Sharing.

[247] The Order of Information and Debiasing Tools Matters Concerning Irrelevant Candidate Attributes

12:45 PM – 1:45 PM

NONVERBAL BEHAVIOR

Multiple factors can bias an employer's perceptions of a candidate's fit for a job. Charisma or likeability can exert an inordinate effect, leading managers to weigh feel over actual skill competency. This offers a unique challenge for neurodiverse candidates, whose presentation of atypical social ability may lead to the formation of negative perceptions when they are otherwise strong analytical and technical fits. Our results show that the effect of these perceptions were robust, holding through diagnosis disclosure and various interventions. However, our research has found efficacy in leveraging the order in which candidate information is presented. Overwhelmingly, candidates whose social ability was viewed second, following their skill competencies, were affected by a nearly 20 point reduction on overall ratings. Following these insights, we found debiasing tactics suggested by competency-based hiring models worked most effectively when conducted following candidate information, but before final overall ratings were completed. This research outlines that not only does the order of information matter, but it matters when debiasing tools are implemented in the hiring process.

[248] The Politicization of Desire: Ideological Asymmetries in Romantic Interest Toward Transgender Women

12:45 PM – 1:45 PM

GENDER

This study examined how political ideology moderates romantic and sexual interest in transgender versus cisgender women. A sample of 140 participants rated 12 female targets—pretested to be either high or low in physical attractiveness—on overall attractiveness, long-term relationship suitability, and short-term sexual desirability. Half of the targets at each attractiveness level were randomly described as transgender women and half as cisgender women, with gender identity descriptions randomly assigned between subjects. Participants also completed a brief measure of political ideology. Political ideology was unrelated to perceived attractiveness of transgender women when controlling for attractiveness ratings of cisgender women. Political ideology moderated the relationship between liking for cisgender and liking for transgender targets. Liberal participants showed a strong correspondence between their romantic interest in transgender women and their interest in similarly attractive cisgender women. Conservative participants' romantic interest in targets labeled cisgender was unrelated to their interest in those targets when they were labeled transgender. This pattern held for both long-term and short-term relationship preferences. These findings reveal the extent to which political ideology shapes relationship preferences beyond surface-level perceptions of attractiveness. Intimate relationships serve essential psychological and evolutionary functions, but the fact that political ideology can bias whom we are open to loving—despite equal levels of physical attractiveness—is a striking demonstration of ideology's power.

[249] The Prototype Willingness Model Predicting Daily Food and Alcohol Disturbance

12:45 PM – 1:45 PM

PHYSICAL HEALTH

Food and alcohol disturbance (FAD; caloric restriction before or during drinking alcohol to enhance alcohol's effects [FAD-AE] and/or to compensate for calories from alcohol [FAD-CC]) is common and poses concerns for public health. We applied the prototype willingness model to examine which cognitions predict FAD at the within- and between-person levels. Participants were college students ($n = 73$) who reported weekly alcohol use and past-month FAD. Participants identified primarily as female (73.8%), White non-Hispanic (51.4%), with a mean age of 19.64 ($SD = 1.35$). Participants completed a baseline survey as well as daily surveys for five weeks. At the within-person level, intentions and willingness predicted FAD-AE and FAD-CC. Further, willingness mediated the association between descriptive norms and prototype similarity with daily FAD-CC engagement. At the between-person level, attitudes as well as prototype favorability and similarity positively associated with FAD-AE. Attitudes and prototype similarity positively associated with FAD-CC at the between-person level. This study provides initial evidence of cognitions that may be targeted to reduce FAD among college students.

[250] The Psychological Impacts of Studying Abroad: Evidence from Reddit

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Does studying abroad enhance psychological richness? We conducted text analysis of 2,194,735 Reddit posts from 1,741 users who reported studying abroad by comparing their language before, during, and after the experience. Psychological richness was operationalized as having diverse and memorable experiences. We found that during study abroad, students referenced emotions, spatial surroundings, and cross-cultural terms (e.g. "French," "Chinese," "Indian") more frequently compared to both pre- and post-periods, indicating greater experiential richness. Furthermore, in the years following study abroad, we observed that students used more memory-related (e.g. "remember", "forget") and past-oriented (e.g. "was", "had", "been") language, suggesting that study-abroad experiences are often striking and encourage reflection. Overall, our results suggest that studying abroad can increase psychological richness through the accumulation of varied and memorable experiences.

[251] The Punitive Default

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Despite inconsistent success rates and negative outcomes, punishment remains a popular approach to solving social problems in America. One could argue the nation's largest institutions, not only the carceral system, but our educational and occupational institutions as well, are problematically and disparately punitive. Tough-on-crime responses and zero-tolerance policies have even resurged in the political sphere in recent months, as pushes for alternatives to punishment have receded. Do Americans have an unwarranted affinity for punitiveness? Across three studies, from three different contextual domains, we find participants born and raised in the U.S. err towards suggesting a punitive response to a wide range of misbehaviors which vary in their severity. Data also show little differentiation in punitive responses between American subgroups, suggesting the presence of a broader cultural phenomenon. One we term, the Punitive Default. What triggers it? What drives it? What might reduce its impact? A range of theoretically-supported interventions will be considered.

[252] The Role of Rituals in Helping Children Exert Self-Control

12:45 PM – 1:45 PM

SELF-REGULATION

Children are often expected to show self-control, but this process need not be as cognitively demanding as expected. Rituals—predefined, repetitive sets of actions—can promote self-control in adults (Hobson et al., 2018; Tian et al., 2018), but whether rituals help children exert self-control in a subsequent task is unknown. We will test this in an experiment by randomly assigning children ages 6–9 (target N=140) to enact either a random (control condition) or a ritualized (ritual condition) set of movements. Participants are then asked to complete a boring computerized task—locking pegs onto a board—with the option to take breaks and play a fun game. We will measure the time spent on the boring task, number of pegs dropped and locked, and time spent playing the fun game. Preliminary analyses with our current sample (N=109, N=86, post exclusions) revealed that though there were no main effects of Condition, older children (+1 SD) assigned to the ritual condition dropped significantly more pegs and, descriptively, locked more pegs than older children in the control condition. Preliminary findings suggest rituals may promote self-control in older, but not younger, children.

[253] The Significance of Global Identity in Shaping Pro-environmental Behavior: Focus on Plastic Consumption and Purchase

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

This study aims to clarify the role of Global Identity (GI) by integrating it into existing models of pro-environmental behaviors (PEBs). Research on PEBs has evolved to explain discrepancies between attitudes and behavior. Recently, attention has shifted to macro-level factors beyond individuals, with GI gaining attention as one such factor. GI refers to a sense of unity and belonging to the world and is suggested to enhance motivation to act on global environmental issues. While previous studies reported associations between GI and PEBs, GI's positioning within a comprehensive model remains underexplored. We employed the Comprehensive Action Determination Model (Klöckner, 2013) to examine the contribution of GI to behaviors among well-established determinants. A web-based survey was conducted in February 2025 in Japan (N = 2,400). Structural equation modeling showed a good fit. GI showed positive associations with problem awareness, responsibility ascription, and directly influenced goal intention and pro-environmental behavior. These results suggest GI as a key factor in addressing environmental issues, pointing to the essential next step of deepening investigation in this area.

[254] The socio-geographic environment of one's upbringing predicts individual differences in susceptibility to social media influence

12:45 PM – 1:45 PM

SELF-REGULATION

Social media "influencers" have emerged as a staple of the modern digital landscape, and parasocial relationships can form between influencers and social media consumers (De Castro, 2023). Taking notice of this, we investigated associations between the geographic context of one's upbringing (i.e., degree of urbanicity; Wang et al., 2019), psychological traits (executive functioning, resistance to peer influence, smartphone and social media use habits), and individual differences in susceptibility to social media influence. Urbanicity was indexed via period-dependent recording of environment ratings given by participants for each area where they had lived, while vulnerability to online influence was assessed via the Susceptibility to Social Media Influencers Questionnaire (De Castro, 2023). Correlational analyses showed a pattern opposite to expectation, with individuals growing up in more heavily urbanized communities reporting heavier influence by social media trends ($r = .30, p = .02$); speculatively, because living in more densely populated communities increases exposure to online trends. Patterns of covariation with added measures of executive functioning, general resistance to peer influence, and smartphone and social media use habits provide further constraints on interpretation.

[255] The Varieties of Religious and Spiritual Experience of Gender-Nonconforming Individuals in the U.S.

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

The religious and spiritual life of gender-nonconforming individuals has had little empirical focus, often being grouped with lesbian, gay, bisexual, and other sexual orientations. Also, there are still steep risks to disclosing one's gender-nonconformity both inside and outside organized religions. The current study uses the recent Pew Religious Landscape Survey to explore the religious and spiritual experiences of people who self-identify as neither a man or a woman ($n = 354$). Gender-nonconforming individuals had lower rates of religious behaviors such as prayer, reading scripture, and attending religious services compared to people who identify as a man or a woman. They reported higher or similar rates of spiritual emotions and activities, such as experiencing wonder about the universe and meditating for spiritual reasons. In part, these results mirror general trends in the U.S. – lower religiosity and more private spiritual expression. The results are discussed considering the unique challenges and opportunities of gender-nonconforming individuals in both religious and spiritual spaces.

[257] Towards pleasurable gender futures: How gender/sex/ual minority people envision future realities of gender/sex

12:45 PM – 1:45 PM

GENDER

Despite increases in anti-LGBTQ legislation, gender/sex/ual minority people still imagine futures that are worth striving for, regardless of whether they are possible. This study aimed to better understand how gender/sex/ual minority people envision future realities of gender/sex, or gender futures, and the potential barriers to those futures. We conducted a secondary data analysis from a focus group study centered around gender pleasure, which involved 12 focus groups ($N = 65$) of gender/sex/ual minorities (Beischel et al., 2024). We used reflexive thematic analysis to identify three themes: (a) futures should include radical joy, freedom, and authentic living to foster harmony among the various aspects of one's gender/sex, (b) futures should include social connections that at least tolerate and ideally celebrate gender diversity, and (c) futures should include practical restructuring of existing gendered social systems and, ideally, abolishing regulations of gender/sex altogether. This study provides insights regarding the importance of imagination and future world-making for gender/sex/ual minorities and demonstrates possible pathways necessary to achieve these future ideals.

[258] Trad Wives and the Erosion of Self-Efficacy: Pathways to Misogyny Among Women

12:45 PM – 1:45 PM

GENDER

Authoritarian movements have disproportionate negative effects on women (e.g., overturning Roe v Wade). Yet, many women still support them. We wanted to understand if, even among women, authoritarianism would be linked to misogyny and why. In Study 1 (N=356), we found that right-wing authoritarianism was significantly correlated with internalized misogyny, $r=.29$, $p<.001$, and found self-efficacy to mediate the relationship, $B((SE))=0.11(0.04)$, 95% CI=[0.04, 0.18]). Study 2 (N=478) manipulated self-efficacy and found that increasing self-efficacy acted as an effective buffer against internalized misogyny among women who endorsed authoritarianism (indirect $B(SE) = -.02(0.01)$, 95% CI = [-0.04, -0.02]). A third experiment is testing these ideas in a more ecologically valid context. Here, we will expose women to a series of real Tik-Tok videos made by trad wives (that romanticize 1950s-style domestic submission and traditional gender roles), feminists, or control content. We hypothesize that women exposed to tradwife videos will report lower self-efficacy and higher levels of internalized misogyny, particularly among those higher in RWA, compared to those exposed to feminist or control content.

[259] Trait Self-Control Predicts Moral Decision Making through Lower Automatic Temptation

12:45 PM – 1:45 PM

SELF-REGULATION

Self-control is associated with moral behavior. Traditional theory suggests self-control inhibits antisocial impulses, which everyone experiences. However, recent work outside the moral domain suggests that self-control facilitates goal-pursuit by automatization of that process, thereby reducing temptations. We suggest and find support for the hypothesis that self-control facilitates moral decision making through automatization, and, subsequently, lower temptation to violate proscriptive norms (i.e., should not; e.g., to lie, steal, cheat, harm). Study 1 experimentally manipulates the level of conflict of moral decisions to show that self-control predicts more moral decision making when people face (vs. do not face) temptation. Study 2 demonstrates that people higher (vs. lower) in self-control make more moral decisions, and this is accounted for in part by their automatically classifying immoral decisions as impossible (vs. possible). Study 3 employs an online, behavioral measure of conflict—mouse-tracking, and a novel metric that estimates the time of initiating correct (moral) categorization (decision) (TICC). Decisions of higher (vs. lower) self-control individuals resulted in earlier avoidance of the wrong choice (i.e., TICC) and, consequently, lower total conflict (i.e., AUC). Across operationalizations, self-control is associated with lower levels of automatization and, in turn, temptation in moral decision making.

[260] Trait Self-Control, Strategy Use, and Regulatory Success

12:45 PM – 1:45 PM

SELF-REGULATION

Although trait self-control is widely believed to be beneficial, exactly what it is remains unclear. In this experience sampling study, participants ($n = 222$) reported on self-regulation challenges up to five times per day for one week. Multi-level modelling was used to examine the relationships between trait self-control, regulatory strategies used, and regulatory success. Trait self-control predicted success equally across three types of challenge (self-control, emotion regulation, and stressful events) ($B = 0.02$, $SE = 0.01$, $p < 0.001$). Challenge type did not moderate the relation between trait self-control and success. Trait self-control also predicted more use of preventative strategies (used to ward off potential challenges), other proactive strategies (used before a challenge or potential challenge occurred), reactive strategies (used during a challenge), and response modulation (all $p \leq 0.001$). These results are consistent with recent models of trait self-control that emphasize the use of proactive strategies to prevent or mitigate unwanted desires and emotions, rather than merely resisting those desires and emotions in the moment.

[261] Societal Traditionalism Toward Maternity

12:45 PM – 1:45 PM

NORMS AND SOCIAL INFLUENCE

Research indicates that attitudes toward maternity vary, but little is known about how they relate to broader values and beliefs. This study examined that connection, predicting that more conservative individuals, those higher in religious fundamentalism (RFS) and right-wing authoritarianism (RWA), would hold traditional views on maternity. 270 adults completed an online self-report survey consisting of scales measuring beliefs about gender roles, maternity, RWA, and RFS. Results supported the hypothesis. Though effect sizes are small, conservatism had a significant positive correlation with traditional beliefs toward maternity ($r = .13$, $p < .05$) and negative correlation in support for egalitarianism ($r = -.16$, $p < .05$). A multiple regression analysis showed that religious fundamentalism ($\beta = .20$, $p < .01$) and the RWA aggression/submission subscale ($\beta = .32$, $p < .01$) were unique predictors of traditional attitudes, explaining 34% of the variation. These findings provide evidence that conservatism significantly influences how people view motherhood through a traditional lens. This should incentivize future research on how personal values shape societal perceptions of maternity.

[262] Uncovering implicit representations in informal religious activity: A natural language processing approach using social media data

12:45 PM – 1:45 PM

RELIGION/SPIRITUALITY

Religious representations are often categorized as formal and informal. Formal representations are grounded in the codified doctrines of organized religions, whereas informal representations remain implicit in everyday practices and lack systematic beliefs. As informal representations are often hidden, they have received little attention in the psychology of religion. Therefore, this study aims to examine how informal religious representations emerge in social media in Japan, where people are not explicitly religious yet hold implicit beliefs. We analyzed more than 7,000 Japanese and English YouTube comments on Apple's 2024 "Crush!" advertisements that were criticized for violating traditional beliefs emphasizing respect for objects. The results showed that Japanese comments frequently included culturally specific terms associated with animism (e.g., *mottainai*), often co-occurring with negative emotion- and religion-related language. These findings suggest that informal religious representations can be manifested through culturally specific expressions, offering new insights into the psychological basis of religion beyond the WEIRD context.

[263] Understanding Black Americans' and White Americans' Preferences to Seek Traditional, Alternative, and Religious Treatment Modalities for Depression

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Black Americans have lower engagement in traditional mental health treatment due to many barriers. Complementary and alternative medicines may have fewer barriers associated with them; however, there is limited research on people's preference for different treatment modalities. The current study examined Black and White Americans' preferences for various treatment options across modalities (traditional vs. alternative vs. religious vs. none) and factors associated with treatment preference (i.e. race, symptom severity, religiosity). Participants ($n=185$; 92 Black Americans, 93 White Americans) read vignettes describing depression symptomatology varying in severity and indicated their likelihood of using various treatment options. A repeated measures ANOVA revealed that as symptom severity increased, there was a higher preference for traditional treatments. Conversely, preferences for alternative treatments increased as symptom severity decreased. Linear regression revealed that participants who were higher in religiosity had a higher preference for religious treatments. Further research is needed on how these factors and other social factors affect depression treatment preferences.

[264] Understanding Perceptions of Acceptability, Favorability, and Coercion in Using Financial Incentives as a Policy for Promoting Vaccination

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

There is a dearth of empirical research on how people perceive and respond to financial incentives as a policy for promoting vaccination. Which aspects of a financial incentive policy are seen more positively and more negatively? This pre-registered online study is a 2 (Timing of Policy: Start, Six month delay) x 3 (Justification for Policy: Increase Uptake, Increase Accessibility, None) factorial design with six pilot-tested messages meant to mirror a Canadian government social media vaccination promotion campaign that included a \$100 incentive for a vaccine. Specifically, we examine 1) whether the timing of the incentive program (introduced at the start of a vaccine campaign, introduced after six months) affects individuals' perceived acceptability, favorability, fairness, and coercion of the program such that a six-month delay is evaluated more negatively, and; 2) whether the justification provided for the incentive moderates this effect such that the effect of timing is attenuated when the incentive is justified in terms of accessibility compared to uptake. These results will build our understanding of how financial incentives are perceived and why they can be ineffective.

[266] Using Gendered Race Theory and the Tripartite Model to Understand Appearance Pressures Indian Women Face

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Consistent with gendered race theory, South Asian women are often viewed as phenotypically more masculine than other Asian women. These perceptions are linked to characteristics such as darker skin tone, facial features, facial hair, and body hair, which are also linked to masculine appearance norms. The Tripartite Model identifies how peers, parents, and media shape women's internalization of the thin ideal. We modified this model to assess the racialized gendered ideals placed on Indian American women (N = 76, data collection ongoing) recruited from an online survey panel. They completed the Sociocultural Attitudes Towards Appearance Questionnaire, which was modified to assess appearance pressures from Indian peers and Indian media in addition to family, White peers, and mainstream U.S. media. Indian women who experienced more sociocultural pressures reported greater dissatisfaction with body and facial hair and engaged in more cosmetic hair removal procedures. These findings are consistent with the proposal that racist and sexist ideologies heighten pressure on Indian women to feminize their appearance in ways that minimize features associated with their racial identity.

[267] Picture This: Associations between Mental Imagery and Big Five Personality Domains, Facets, and Items

12:45 PM – 1:45 PM

PERSONALITY PROCESSES/TRAITS

A robust literature connects personality traits to various forms of cognition. However, there is relatively little work linking personality to mental imagery, or the cognitive capacity to represent visual information without external stimuli. We collected data from a large, diverse sample of participants recruited via Prolific (N = 600) and examined correlations between self-reported mental imagery (assessed via the Vividness of Visual Imagery Questionnaire [Marks, 1973] and the Spontaneous Use of Imagery Scale [Kosslyn et al., 1998]) and Big Five personality domains, facets, and items from the BFI-2 (Soto & John, 2017). People who reported more vivid and more spontaneous visual imagery tended to be more extraverted, agreeable, conscientious, emotionally stable, and open-minded. The effect sizes were largest for extraversion (particularly the energy level facet) and open-mindedness (especially creative imagination facet). Overall, patterns were much more complex at the facet- and item-level compared to the domain-level. We will discuss possible mechanisms underlying these associations and implications for understanding the interplay of personality and cognition.

[268] Victim, Verified: Gendered Empathy in Digital Disclosures of Harm

12:45 PM – 1:45 PM

GENDER

On social media, disclosures of harm are often viewed as expressions meant to gain sympathy and engagement, but belief may depend on how well the disclosure aligns with gendered expectations. This study draws on research on moral typecasting and competitive victimhood to examine how gender and emotional tone shape reactions to digital disclosures. In a 2 (gender: male, female) x 2 (emotional tone: high, low) design, participants will view an ostensibly real social media post about emotional mistreatment by a romantic partner. Participants will rate the poster on sympathy and credibility, and indicate their likelihood to engage (like, comment, share). We hypothesize that female posters will receive more sympathy and credibility than male posters, with tone having little effect, as women are viewed as fitting victimhood expectations. For male posters, a highly expressive tone may increase sympathy by aligning them with a “moral patient” role. This project contributes to research on digital empathy, social identity signaling, and gendered emotional norms, highlighting how vulnerability is interpreted through the lens of gender, affecting access to social and moral validation.

[269] Voices of the Next Generation: Research to Inform Social Media Regulations for Youth

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

State lawmakers nationwide are drafting legislation to regulate adolescent social media use, yet teen voices remain conspicuously absent from these policy discussions. Without meaningful youth input, proposed laws risk limiting their effectiveness by focusing on the wrong areas or causing unintended harms—particularly for marginalized adolescents who may rely on digital communities.

This study will center adolescent perspectives by examining how 60 teens (ages 13-17) across 10 focus groups understand proposed social media regulations and their potential impact on wellbeing. Participants will be sampled for diversity across race, ethnicity, socioeconomic status, gender identity, and sexual orientation to ensure representation of varied adolescent experiences. Using Braun and Clarke's six-phase thematic analysis, we will employ both deductive coding informed by Self-Determination Theory and the Displacement, Interference, and Complementarity framework, alongside inductive approaches to capture emergent themes.

We anticipate findings will reveal nuanced teen perspectives on social media's role in their own feelings of autonomy, competence, and relatedness, including how participants view potential restrictions alongside the benefits and risks of their digital engagement. This research aims to provide a timely, empirical synthesis of youth perspectives to policymakers considering social media regulation, offering insights for creating youth-informed, equity-conscious legislation.

[270] Walking away from dichotomous gender perception: Perception of non-binary gender identity from minimal bodily cues

12:45 PM – 1:45 PM

GENDER

Work on gender and sexual orientation perception has primarily examined faces and binary man/woman homosexual/heterosexual judgments. Here, we examined body cues of gender and sexual orientation. In our initial studies (N=281), focusing on sexual orientation, participants viewed point-light walkers (PLWs) and indicated perceived sex (male/female) and sexual orientation (heterosexual/homosexual/bisexual). When bisexuality was explicitly offered as an option, it was applied 22.3% of the time, and most often for walkers who were instructed to walk in a style counter to their explicit gender identity. Because these studies revealed that participants used gender cues in their judgments of sexual orientation, we extended this work (N=121) to focus on non-binary gender options to better observe the relationship between perceptions of nonbinary gender identity through bodily cues. Similar to previous findings, bodies were perceived as bisexual 22% of the time in the forced choice condition and 4.8% of the time in the open-ended condition. Additionally non-binary identities were selected for PLWs that exhibited mixed gender cues. Suggesting that gender ambiguous bodily cues are perceived as signals of non-binary gender identity, underscoring the importance of gender perception research moving beyond dichotomous outcomes.

[271] Watching You Watching Me: Online Proctoring, Anxiety, and Test Performance

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Lower exam performance on proctored online exams is typically attributed to the idea that proctoring curtails cheating. The current study examined the relationship between online proctoring, test anxiety, and test performance longitudinally to test an alternative hypothesis that proctoring may lead to lower exam scores due to the cognitive and affective consequences of being surveilled. We compared the use of a virtual proctoring service in three different online psychology courses (N=112), which each had an experimental section and a control section. The experimental sections used online proctoring for the first exam only, while the control sections had no online proctoring. A mixed factorial ANOVA replicated the effect that students in proctored exams scored lower than students in non-proctored exams, regardless of whether the exam was open-book. A mediation analysis revealed that proctoring negatively influenced exam performance due in part to test anxiety. These results indicate that proctored students may score lower due to the anxiety that can occur from being watched. These results and alternative methods to support academic integrity in an online setting will be discussed.

[272] Water Conservation and Well-Being: Burden or Benefit?

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Both climate scientists and laypeople have been voicing concerns about the effects of climate change for several decades. Correlational research has shown that engaging in pro-environmental behaviors is positively related to well-being, but little experimental research exists to date. To disentangle correlation from causation, we conducted an 8-day experimental deprivation study (N = 200). Participants were randomly assigned to either restrict their water use (water condition) or restrict nothing (measurement-only control condition). Participants in the water condition reported neither strong well-being benefits nor backfiring effects. The control condition outperformed the water condition in terms of subjective well-being benefits—suggesting water conservation behavior may be taxing. However, engaging in water conservation was related to increased feelings of autonomy and competence, which in turn predicted increases in subjective well-being. Additionally, Hispanic individuals benefited more from water conservation than non-Hispanic individuals. Finally, nearly all participants expressed an interest in engaging in water conservation behavior in the future.

[273] Weak/Wanting? Honor ideology predicts differential victim blaming by gender

12:45 PM – 1:45 PM

GENDER

Honor ideology and just world beliefs have both been found to contribute to victim blaming and rape myths. However, the research on male survivors and the specific reasoning behind blame toward men and women, beyond promiscuity for women, is limited. To explore further, we examined the specific reasons that those with higher levels of honor ideology and just world beliefs blame a sexual assault survivor and whether this differs depending on the survivor's gender. We hypothesized that the female survivor would be blamed more for promiscuity, weakness, and general deservingness, whereas the male victim would be blamed more strongly for a heightened desire for sex and perceived weakness, and that these effects would be especially true for those higher in honor ideology. Consistent with our predictions, honor ideology and just world beliefs significantly predicted victim blaming across all measures. The strongest associations observed were blame related to promiscuity for female victims and weakness for male victims. The findings suggest that dominant beliefs affect gendered perceptions of sexual assault victims, urging the need for interventions addressing biased assumptions.

[274] What Makes a Black Man?

12:45 PM – 1:45 PM

MENTAL HEALTH/WEILL-BEING

This study explores how social stigmas related to gender norms and expressions affect the heterogeneity in Black masculinity. Society continuously attacks Black men's masculinity as they are seen as hypermasculine under the light of eurocentric hegemonic gender norms. Systematic abuse aimed to psychologically dehumanize African Americans, strategically diminishes their status to an object, stripping away any sense of humanity (Johnson et al., 2024). It shares how aspects of Black masculinity shape modern Black men while restricting gender expression and enforcing societal norms. Theories such as Intersectionality Theory (Crenshaw, 1989), Hegemonic Masculinity (Connell, 1995), and Double Consciousness Theory (W.E.B DuBois, 1903) will center the lived experiences of Black men as they navigate dominant forms of masculinity. This study uses mixed methods approaches with interview and survey data from Black college men at two U.S. universities. Anticipated results predict that Black college men's current resistance to hegemonic gender norms allows for a high variability in masculine identity. I predict that low conformity to masculine norms will moderate the relationship between social stigma and Black men's gender expression.

[275] When Do Coping Styles Benefit versus Backfire? Associations of Anxiety, Substance Use and Stress during the COVID-19 pandemic.

12:45 PM – 1:45 PM

MENTAL HEALTH/WEILL-BEING

The COVID-19 pandemic caused high levels of stress and anxiety for many people. People used a wide variety of coping strategies to deal with these stresses, some of which involved unhealthy substance use that can lead to further negative consequences. This study examined how eight different coping strategies were linked with anxiety during the pandemic. Participants were 4,141 adults (Mage=39) recruited early in the pandemic in 2020 when safer-at-home orders became common. Some coping styles were strongly linked to feeling greater anxiety ($r = .391$), whereas other coping styles, such as taking direct action or positive reframing, were linked to lower anxiety. It is possible that maladaptive coping strategies may instead increase anxiety by amplifying negative emotions after initial relief, and leading people to not address the causes of their anxiety. Alternatively, other coping strategies may have served as effective buffers against high anxiety. These findings provides insight into which coping styles might be effective in chronically stressful situations.

[276] Breathing and Mindfulness

12:45 PM – 1:45 PM

FIELD RESEARCH/INTERVENTIONS

College freshmen often encounter stressors stemming from environmental adjustment, language barriers, and academic demands. This study examined the effectiveness of two stress-reduction strategies: meditation and breathing exercises. Participants engaged in daily video-guided self-practice sessions lasting fewer than ten minutes over a two-week period. Stress levels were assessed using the Perceived Stress Scale (PSS) at four points: before the intervention, immediately after, one week later, and two weeks later. Demographic information and Big Five personality traits were also collected, with particular attention to students high in neuroticism, a trait closely linked to stress sensitivity. Results indicated that for students low in neuroticism, breathing exercises produced a statistically significant reduction in stress from baseline to post-intervention and maintained lower stress levels than meditation at follow-up, suggesting stronger and more sustained effects. For students high in neuroticism, both meditation and breathing exercises yielded significant downward trends in stress, with no significant differences between groups, indicating comparable benefits.

[278] When Gaze is Under Our Control: Sexual Objectification Behavior Across Contexts

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

People tend to sexually objectify women, but there are open questions around which contexts this is more or less likely to occur in. Certain settings may signal when objectification is considered acceptable (e.g., dating apps vs. workplaces). Therefore, we collected data both in-lab and online to examine how context shapes objectification. Men participants (N=244) watched clips from eight music videos of women artists that either contained sexual content (objectification condition) or not (control condition). Men then viewed and rated full-body images of women while their eye gaze was tracked. Online, men in the objectification (vs. control) condition looked at women's faces less often, but there was no effect of condition for in-lab participants. These findings suggest that sexually objectifying gaze may vary across contexts and, at times, reflect deliberate control. Ongoing work is replicating these effects and testing whether exerting such control imposes cognitive costs on objectifiers.

[279] When Networking Feels Genuine: A Regulatory Focus Approach to Authenticity in Professional Networking

12:45 PM – 1:45 PM

SELF-REGULATION

Professional networking often feels inauthentic and transactional, creating psychological discomfort that reduces relationship-building. This project investigates how people's broad focus on motivations for attaining growth (i.e., promotion) versus motivations for maintaining security (i.e., prevention) affects networking authenticity. Study 1 (N = 457) showed that individuals with stronger promotion concerns felt more authentic in hypothetical networking situations, and this heightened authenticity was associated with greater intention to pursue social contacts. Study 2 (N = 309) brought career-matched participants to the lab for one-on-one, in-person networking conversations. Results replicated and extended Study 1. Promotion-focused participants experienced greater authenticity before, during, and after the interactions, leading again to stronger commitment to pursue connections. Importantly, they also evaluated their networking partners and the experience more positively. These findings suggest promotion motivation creates a positive cycle: growth-focused individuals feel more authentic, experience networking more positively, leading to more successful relationship formation.

[280] Artificial Intelligence Anxiety in College Students: The Roles of Frequency of Usage, Self-efficacy, and Growth Mindset

12:45 PM – 1:45 PM

PERSONALITY PROCESSES/TRAITS

New advancements in artificial intelligence (AI), such as automation and machine learning, raise concerns over potential job displacement for college students planning for their future. This study explored underlying factors associated with AI anxiety among university students. The present research (1) examined the relationship between the frequency of AI usage and AI anxiety among university students, and (2) assessed the moderating roles of growth mindset and self-efficacy in that relationship. Findings indicated a significant negative correlation between the frequency of AI usage and AI-learning anxiety, such that college student participants (N = 122) who use AI technologies more frequently reported lower levels of AI-learning anxiety. Moreover, participants with higher self-efficacy and stronger growth mindset tended to have lower AI-learning anxiety across multiple dimensions, particularly in learning and job-related anxiety. This study contributes to the rapidly growing literature that analyzes human attitudes and perceptions of AI integration, as well as the influences of AI anxiety.

[281] When safety cues become threats: An examination of attributional ambiguity

12:45 PM – 1:45 PM

GENDER

We investigated how external attributional tendency—the degree to which marginalized people perceive positive dominant group member behavior as externally (vs. internally) motivated—affects reactions to safety cues. Previous work examining attributional tendencies has found that this construct predicts racially marginalized people's perceptions of attributionally ambiguous, positive behavior exhibited by White people (e.g., smiling, praise). Thus, in the present work, we predicted that women who make external (vs. internal) attributions for positive behavior exhibited by men will perceive greater threat, report decreased self-esteem, and exhibit decrements in working memory when a company promotes a diversity philosophy but does not have racially or gender diverse employees. An experimental 2 X 2 X 2 between-subjects pilot study supported predictions. We will present data from a full study that tests predictions in a 2 X 2 between-subjects design. The current work addresses questions about when and for whom safety cues are effective, or have the inverse effect and elicit threat. The current work is also the first, to the best of our knowledge, to measure women's attributional tendencies for men's positive behavior.

[282] When You Are the One in Your Way: Practicing Patience with Yourself

12:45 PM – 1:45 PM

SELF-REGULATION

The process model of self-patience conceptualizes self-patience as a form of emotion regulation that responds to the emotion of self-impatience. Initial theoretical work identified close ties between self-patience and self-compassion, suggesting that self-patience and self-compassion are distinct constructs, but self-compassion might enable the process of self-patience. Thus, in an experience sampling method (ESM) study (N = 130), we used multilevel modeling to investigate how trait- and state-level differences in self-compassion relate to self-patience in day-to-day life. Between-person findings indicated that people who were generally more self-compassionate also reported greater self-patience on average. Within-person findings revealed that on days when people felt more self-compassionate than usual, they also practiced more self-patience. These findings provide initial evidence for the relationship between self-patience and self-compassion and suggest that interventions aimed at increasing self-compassion might be one avenue to help people practice patience with themselves, potentially facilitating goal pursuit and achievement.

[283] Who Gets Hired? How Leadership Personality Shapes Attitudes Toward Mental Illness in the Workplace

12:45 PM – 1:45 PM

MENTAL HEALTH/WELL-BEING

Mental illness affects a significant portion of the adult population, yet stigma and misunderstanding continue to shape workplace dynamics. Organizational leaders often hesitate to hire individuals with mental illness, largely due to limited education on how to support their needs effectively. This study explores the relationship between leadership personality traits and attitudes toward hiring individuals with mental illness, aiming to identify traits that correlate with more inclusive hiring practices.

Three key challenges faced by employees with mental illness in the workplace are identified: (1) persistent stigma surrounding mental health, (2) leaders' avoidance of difficult conversations about mental illness, and (3) limited psychological resources available to employees for managing workplace stressors.

To investigate these dynamics, the study examines four leadership personality types—Dominant, Inspiring, Supportive, and Conscientious—using a quantitative correlational design. Two instruments were employed: the DISC Personality Scale, commonly used in organizational settings, and a custom-developed Likert scale designed to assess leaders' attitudes toward hiring individuals with mental illness. Surveys were distributed to over 600 leaders across multiple industries. The resulting data were analyzed to determine whether specific personality traits are positively or negatively associated with inclusive hiring attitudes.

Findings from this research may inform future workplace education initiatives and contribute to reducing stigma by identifying leadership traits that foster mental health inclusivity.

[284] Who Has Deeper Conversations at Work? A Multi-Method Investigation of Gender and Perceived Depth

12:45 PM – 1:45 PM

GENDER

Deep conversations—those that feel meaningful, connective, or trust-building—are crucial for workplace relationships. But who is more likely to experience them? While women are often more emotionally expressive and relationally attuned, our studies reveal a counterintuitive pattern: men are more likely to perceive everyday conversations as deep. Across three studies—using imagined self-perspective, imagined other-perspective, and observed interactions—we show that male participants interpret even moderately personal exchanges as deep. One potential explanation is that men, on average, may apply a lower threshold for what qualifies as a “deep” conversation. These diverging standards have relational consequences: men’s ease in experiencing depth may lead to greater follow-up and broader network-building. This perceptual asymmetry—rooted not in emotional capacity but in cultural norms and conversational context—helps explain gender disparities in informal influence, mentorship, and workplace inclusion. Our findings highlight the social psychology of conversational inequality—and what it takes to bridge it.

[285] Who I am Versus Who My Documents Say I Am: Identity Documentation and Perceptions of Transgender Identity

12:45 PM – 1:45 PM

GENDER

Amid a historic surge of anti-transgender legislation, governments are imposing varied limitations on transgender people’s ability to update identity documents (IDs) reflecting their gender and chosen names. This work examines the potential consequences of having, or lacking, an ID that matches one’s gender and chosen name for the social perception of transgender individuals. Specifically, 411 U.S.-based adults were randomly assigned to read a vignette depicting a typical situation from the perspective of a transgender person who either had updated identity documentation (ID match condition) or did not (ID mismatch condition). Results indicate that identity documents matter, as participants in the ID match condition reported more favorable impressions of the transgender target than those in the ID mismatch condition. Having a matching ID also predicted participants’ likelihood of correctly categorizing the target in question into their self-identified gender category, a critical outcome in facilitating perceived legitimacy of transgender identities. These findings highlight the important implications of restrictions related to identity documentation for transgender individuals.

[286] Who Should Do the Chores? A Cross-Cultural Investigation into Young Adult’s Gendered Assumptions about Housework

12:45 PM – 1:45 PM

GENDER

Prior research finds that North American young adults still hold gender traditional assumptions about how family labor should be divided (Gere & Helwig, 2012; McConnon et al., 2021). To examine these attitudes in a larger sample (N = 1451) and across cultures, the present study examined US (N = 648, 59% women), Chinese (N = 368, 54% women) and Nigerian (N = 435, 60% women) young adults’ (18-29 age range) open-ended explanations for their levels of agreement to the item: “A husband should share equally in household chores if his wife works full time.” Inductive codebook development based on the entire data set yielded 201 codes total, with 86 codes shared between countries, 50 US specific, 54 Nigeria specific, and 11 China specific codes. This codebook will be used to conduct a quantitative content analysis to examine gendered and culturally specific assumptions about how household labor should be divided. Examination of young adults’ justifications may serve to deepen our understanding of the role of culture in influencing gendered assumptions about the division of work and family labor, and potentially inform future interventions.

[287] Whose Line is it Anyway? Self-efficacy Attributions from Feedback on AI-assisted Work

12:45 PM – 1:45 PM

SELF-ESTEEM

AI tools are a powerful aid to student success, supplementing instruction and providing feedback, but can also allow students to offload their learning. How students respond to this offloading, if they recognize the deficit in understanding created by decreased engagement, and how students relate to the material produced, is less researched. This study examines how feedback on work written with the assistance of AI influences the self-efficacy of students. In a 2 (AI assistance: present vs. absent) × 2 (feedback: positive vs. negative) between-subjects design, participants will be randomly assigned to write or generate content before receiving either positive or negative feedback from an ostensibly real evaluator. Afterward, they will complete a general self-efficacy scale. We expect to find that participants who used AI will experience a protective effect to their self-efficacy in response to negative feedback and, most concerning, a dampening effect to their self-efficacy in response to positive feedback. With the use of AI increasing within and without the classroom, understanding the impacts of both use and response is crucial to moving forward in a socially responsible way.

[288] Why are People Opposed to Trans-Inclusive Policies in Sports? Negative Attitudes Toward Transgender Women and the Use of Fairness Arguments

12:45 PM – 1:45 PM

GENDER

Recent years have seen sports organizations and US states enacting policies that ban transgender athletes from competing according to their gender identity, often justified by claims that trans women have unfair advantages over cis women. In Studies 1a and 1b, we found that although opponents of trans-inclusive sports policies cite fairness as the reason for their position, their opposition was better predicted by their attitudes toward trans people. Study 2 found that fairness arguments are applied disproportionately to oppose trans women competing against cis women, and less so to other groups with similar perceived athletic advantages. In Study 3, we will compare support for segregating trans and cis women in sports where perceived physiological differences between biological sexes matter (e.g., boxing), versus sports where those differences matter less (e.g., shooting). We predict that those with more negative trans attitudes will support segregation even for sports where physiological differences do not matter. Overall, our studies to highlight the inconsistencies in the arguments against trans-inclusive sports policies.

[289] Woke Gaming: Evaluations of sexualized character designs

12:45 PM – 1:45 PM

GENDER

The sexualization of female video game characters predicts increased sales, rape myth acceptance, and portrayals of violence. This study examined potential links between masculine sexual entitlement, hostile sexism, and benevolent sexism as moderators of the link between sexualization of female characters and character approval. Participants (N = 148, cisgender, straight men who played videogames > 10 hours/ week) rated their approval of a female character whose attire was either modest or sexualized, in a within-person design. Participants completed measures of masculine sexual entitlement, ambivalent sexism, and hostility and inclusion in gaming spaces. Although participants generally gave higher approval to the modestly dressed character, those lower on masculine sexual entitlement showed higher approval for the more modest design, whereas those who scored higher in benevolent sexism showed higher approval of the sexualized character design. Findings contribute to understanding of how sexism and masculine sexual entitlement informs preference in objectifying portrayals of women in media.

[290] Women's Experiences with Sexism and Job Satisfaction: The Moderating Role of Gender Allies and Mentors

12:45 PM – 1:45 PM

GENDER

Background

Women experience discrimination regarding employment pay and promotion opportunities and sexual harassment (SteelFisher et al., 2019). Women from marginalized communities and young adults are at risk for discrimination. This project explored the association between women's experiences with sexism and job satisfaction. Having a mentor and gender ally in the workplace were hypothesized as moderators.

Methods

495 women (age M = 36.6 years, 21% White, 19% African American, 22.5% Latina, 17.5% Asian, 17.7% Biracial) participated in an online survey and completed the Schedule of Sexist Events, workplace satisfaction, and indicated the extent to which (1 = not at all to 7 = very much) they had a mentor and that the organization had an ally who supported women's success.

Results

Experience with sexism was negatively associated ($B = -.22$). Having a mentor ($B = .54$) and gender ally ($B = .40$) were positively associated with satisfaction ($ps < .01$). Having a workplace ally moderated the association between sexism and satisfaction such that the sexism to discrimination association was not significant ($B = -.17$) for those who strongly agreed they had an ally, but was significant for those who did not agree or were at scale midpoint ($B = -.43$ and $-.28$). All regressions included demographic covariates. These findings have implications for organizational policies that support women in the workplace.

[291] Worthless beyond instruments: Objectification increases perceived AI threat.

12:45 PM – 1:45 PM

APPLIED SOCIAL PSYCHOLOGY

Most research on perceived threats from artificial intelligence (AI) has focused on individual differences and AI design features, while little attention has been given to the broader social context in which humans and AI coexist. Grounded in objectification theory, we propose that objectification heightens perceived AI threat through self-objectification—by prompting individuals to focus excessively on their instrumental value. Across seven studies using mixed methods, we found converging evidence for this process. Archival and ecological analyses (Studies 1a and 1b; N = 13,294 and N = 65,411) showed that regional work objectification predicted both self-reported AI threat and threat expressions in social media texts. Two surveys with Chinese adults (Studies 2 and 3; N = 270 and N = 240) replicated this effect: daily and workplace objectification experiences predicted perceived AI threat via self-objectification, which in turn reduced support for AI adoption. Three experiments provided causal evidence and intervention insights. In Study 4 (N = 240), an imagination task manipulating work objectification increased self-objectification, which heightened AI threat and led to lower support for AI adoption, reduced job satisfaction, and diminished organizational citizenship behavior. In Study 5 (N = 240), a humanizing workplace context reduced AI threat by lowering self-objectification. In Study 6 (N = 220), restoring self-humanization eliminated the effect of objectification on AI threat. Together, these findings demonstrate that social context critically shapes perceptions of AI-related threat. They further suggest that workplace humanization offers a promising pathway to mitigating such threats.

A Survival Guide to Mediation and Moderation Analysis

1:00 PM – 4:40 PM | Location: E255, Level 2

Mediation and moderation are two of the most important models in science. Exploring if effects exist is simply not rigorous enough given modern theory and methodology. More compelling is to explore why effects exist (moderation) or when/for whom effects differ (moderation). Despite many recent advances in mediation and moderation, researchers have not adopted these advances en masse. For example, random measurement error (RME) is oft neglected in mediation (Hayes et al., under review) and important data features are often ignored when plotting interactions (Pek & Flora, 2017).

In this workshop, I first introduce the mathematics of mediation and moderation. I then introduce participants to user-friendly software for SPSS, SAS, and R (PROCESS; Hayes, 2022) that implements these analyses. I also provide code to run these analyses "by hand" in R. Special topics covered in the session include adjusting for RME in mediation, contrasting indirect effects in multiple mediator models, showcasing a new visualization for interaction effects, and addressing common myths about moderation (e.g., effects of mean centering). I will conclude by addressing questions about applying these models.

PUI Committee Sponsored: AI and Pedagogy in Psychology

2:00 PM – 3:00 PM | Location: E252, Level 2

Artificial intelligence is transforming the way we teach and learn, and the conversation is just getting started. Join us as we pick up from SPSP's last Annual Convention to explore how AI is already shaping classrooms today--and where it might take us tomorrow. This interactive session will build on prior discussions, spark new ideas, and invite attendees to imagine together what the future of AI in education could look like.

Affinity Group Meet and Greet

2:00 PM – 3:00 PM | Location: Lobby, Level 2

Come learn about SPSP affinity groups! Representatives from Here and Queer, the Intersectionality Working Group, the Network of Multiracial/Ethnic/Cultural Scholars, the Black Social and Personality Psychology Network, the Disability Advocacy and Research Network, the GLBT Alliance in Social and Personality Psychology, and Marginalia Science will provide information about their group's mission and ways to get involved followed by time to meet representatives and mingle. Information about other affinity groups such as the South Asian Network of Social and Personality Psychologists and the Retirement network will also be provided.

CANCELLED: ChatGPT Ate My Study: AI and the Future of Data

2:00 PM – 3:10 PM | Location: E451A, Level 4

ChatGPT didn't just eat your study—it's redefining how we conduct it.

Generative AI is reshaping the research landscape in both exciting and troubling ways. This panel will explore how psychologists working in applied and academic settings can critically engage with AI, particularly large language models, to support—but not replace—human-centered research. We'll examine real-world applications, such as summarizing findings, generating synthetic data, and simulating participants, while discussing risks like bias amplification, ethical gray areas, and overreliance on unvalidated outputs. With tech companies racing to integrate AI into research workflows, market researchers and behavioral scientists face a critical juncture: adapt, resist, or risk obsolescence. Panelists will debate whether AI-generated insights can substitute for human participants, and what skills today's psychologists need to stay relevant in industry. This session will offer best practices, ethical guidance, and career-focused reflections on what it means to be a researcher in the age of AI. Audience Q&A to follow.

The Hidden Psychology of Market Encounters

2:00 PM – 3:10 PM | Location: E253AB, Level 2

PERSON PERCEPTION/IMPRESSION FORMATION

ATTITUDES/PERSUASION

JUDGMENT/DECISION-MAKING

People do not merely consume products or respond to prices—they navigate social meaning, identity signals, and inferences about others' intentions. This symposium brings together four research programs revealing how subtle psychological forces drive surprising patterns in valuation and behavior: overly high incentives trigger suspicions of hidden drawbacks; novel experiences become most rewarding when anchored in familiar callbacks; random lotteries elevate feelings of specialness, shifting later choices; and secondhand luxury reshapes status and warmth judgments. Together, these talks illuminate how psychological processes shape consumption, value, and status in everyday marketplace interactions.

People Reject Free Money and Cheap Deals Because They Infer Phantom Costs

2:00 PM – 3:10 PM

JUDGMENT/DECISION-MAKING

If money is good, then shouldn't more money always be better? Perhaps not. Traditional economic theories suggest that money is an ever-increasing incentivizer. If someone will accept a job for US\$20/hr, they should be more likely to accept the same job for US\$30/hr and especially for US\$250/hr. However, 10 preregistered, high-powered studies (N = 4,205, in the United States and Iran) reveal how increasing incentives can backfire. Overly generous offers lead people to infer "phantom costs" that make them less likely to accept high job wages, cheap plane fares, and free money. We present a theory for understanding when and why people imagine these hidden drawbacks and show how phantom costs drive judgments, impact behavior, and intersect with individual differences. Phantom costs change how we should think about "economic rationality." Economic exchanges are not merely about money, but instead are social interactions between people trying to perceive (and deceive) each others' minds.

Reinterpret the Familiar: Consumers Prefer Experiences that Use Callbacks

2:00 PM – 3:10 PM

ATTITUDES/PERSUASION

Consumers regularly encounter novel and familiar experiences, but little is known about how novelty and familiarity ought to be combined within a single experience. We identify one uniquely rewarding configuration: the callback structure—where a familiar element returns with a novel reinterpretation. Across nine studies (N = 5,984) using observational and experimental methods, we find that callbacks enhance experiences across emotional, evaluative, behavioral, and social outcomes. Observational data from comedy and films link callbacks to increased laughter, higher star ratings, and higher box office gross. Experimental work shows callbacks increase spontaneous brand recall, willingness to pay, word-of-mouth, and feelings of enjoyment and meaningfulness. These effects are primarily mediated not by surprise or competence, but rather by a sense of “experiential guidance”—the perception of being thoughtfully guided through the experience by its designer. This research builds on prior work on novelty and familiarity, extends the literature on meaning-making, and introduces experiential guidance as a central force in experiential consumption.

The Luck Celebration Hypothesis

2:00 PM – 3:10 PM

JUDGMENT/DECISION-MAKING

Permission lotteries, such as marathon entry lotteries and housing lotteries, randomly select applicants to participate in an activity. However, we argue this random selection can have unexpected downstream consequences on the sequential, permitted activity. Focusing on purchase behavior, our research shows that random selection makes the selected buyers feel special and motivates them to upgrade their purchases. Using field data (50,938,293 obs in China), we examined cities with and without license plate lotteries and found that license plate lottery winners spent 22% more on a single car than they would otherwise have spent without the lottery. Four pre-registered experiments (N=1,498, Hong Kong college students and US online participants) replicated this effect in better-controlled settings and further revealed that the motivation to upgrade purchases is driven by a specific emotion induced by lotteries—feeling special—rather than a generic positive feeling or other financial concerns. Our research sheds light on how affective reactions to random selection influence subsequent decision-making and helps policymakers understand the consequences beyond random selection.

The Social Advantage of Secondhand Luxury: Gaining Warmth, Preserving Status

2:00 PM – 3:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

People often judge others based on what they wear. Indeed, many view those who wear firsthand luxury as high status, but this perception comes with a warmth penalty. As demand for secondhand luxury rises, how do social judgments shift when luxury is purchased secondhand instead? Across seven empirical studies (N = 3,632; six pre-registered), we examine how secondhand (vs. firsthand) luxury affects warmth and status ratings. We find that people are less likely to disclose secondhand luxury purchases, anticipating a status loss and no gain in warmth. Contrary to expectations, secondhand (vs. firsthand) luxury buyers are seen as warmer yet relatively lower in status. Grounded in the Stereotype Content Model, we show that secondhand luxury buyers appear warmer because they seem less wealthy and less attention-seeking. Although secondhand luxury signals less wealth and thus incurs an overall status penalty, it retains full cultural capital, a source of status, per Bourdieu's theory (1984). Notably, this preserved status exceeds that of non-luxury. In interpersonal contexts (e.g., dating, networking), secondhand (vs. firsthand) luxury yields social gains by calibrating warmth and status.

Advances in psychological reactance theory: Do not attend this symposium

2:00 PM – 3:10 PM | Location: E351, Level 3

MOTIVATION/GOALS

Proposed nearly 60 years ago, psychological reactance theory (PRT) describes how people respond to threats to, or elimination of, valued freedoms. PRT has received generally robust empirical support and catalyzed research in various areas (e.g., clinical psychology, communication). Unlike some theories that garner decreasing empirical attention over time, there has been a notable uptick in PRT scholarship—particularly following COVID-19 pandemic-related restrictions. This increased interest motivated a recent special issue (Motivation Science, 2025), devoted to the breadth of PRT's application, primarily focusing on new theoretical developments and recent findings. Drawing from this special issue, the current symposium will highlight four studies on diverse reactance-related topics. The first talk examines pro-gun responses to mass shootings through the lens of reactance theory. The second talk assesses reactance in the context of psilocybin legalization. The third talk examines reactance as a mediator of people's responses to depression help-seeking messages. The final talk assesses the reactive spiral, a phenomenon where people are hit with back-to-back threats to their freedom.

Don't tread on me: How disempowered gun owners assert their threatened freedom in the wake of mass shootings

2:00 PM – 3:10 PM

MOTIVATION/GOALS

This research examines pro-gun responses to mass shootings through the lens of reactance theory—a motivational state triggered by perceived threats to one's freedoms. We tested how disempowerment heightens reactance and leads individuals to prioritize gun freedom over gun safety. In three studies of U.S. gun owners (total N = 2,483), disempowerment consistently predicted stronger reactance to both external restrictions and internal pressures. In Study 1, disempowered participants expressed greater intentions to purchase guns after reading a message advocating restrictions. In Study 2, conducted after the 2017 Las Vegas shooting, opposition to the ban on bump stocks (a semiautomatic rifle accessory) was strongest among disempowered AR-15 owners—those most affected by the ban. In Studies 3a and 3b, following the Oxford and Uvalde school shootings, support for school hardening measures (e.g., armed guards) was partly driven by disempowerment rather than gun safety concerns. Generalizing the model, a fourth study (n = 825 U.S. adults, preregistered) indicated that disempowerment could even predict support for vigilantism: economic disempowerment predicted positive endorsement of the assassination of the UnitedHealthcare CEO as justified resistance against a disempowering healthcare system. Overall, disempowerment reliably moderated reactance-like responses, underscoring the need to consider underlying motivational dynamics when applying reactance theory.

Psilocybin legalization in the United States and psychological reactance: A test of evidence uncertainty, controlling language, and an ambiguous call to action

2:00 PM – 3:10 PM

MOTIVATION/GOALS

Psilocybin legalization continues to surface among policymakers considering the potential benefits (e.g., medicinal) offered by this substance. To better understand audience resistance to legalizing psilocybin, psychological reactance theory was employed to weigh the effectiveness of evidence uncertainty, controlling language, and specific call to action in relation to policy support. Results revealed a negative association between scientific certainty and freedom threat perceptions. As expected, freedom threat was positively associated with reactance, which in turn was negatively associated with intentions to support psilocybin legalization. Against expectations, no relationship between controlling language emerged with freedom threat perceptions. The findings are discussed with an emphasis on the theoretical and practical implications and the role of reactance when promoting the legalization of a currently banned substance.

An empirical investigation into whether psychological reactance can explain the success of the overheard communication technique

2:00 PM – 3:10 PM

MOTIVATION/GOALS

The overheard communication technique is a persuasive strategy designed to enhance the effectiveness of messages by making the recipients feel they are not the intended audience. While classic and contemporary experimental studies support the efficacy of this approach, the underlying mechanism—specifically, the reduction of perceived persuasive intent—has not been empirically tested. This presentation reports on a study that examined whether the overheard technique is effective due to a reduction in psychological reactance. Participants with depressive symptomatology were randomly assigned to receive one of two messages: "Do you know someone with depression?" or "Are you experiencing depression?" As predicted, individuals with depressive symptoms who received the overheard message ("Do you?") reported that the message felt less threatening than those who received the direct message ("Are you?"). Additionally, there was an indirect effect of the overheard message on participants' attitudes and intentions, mediated by lower levels of perceived threat. However, contrary to expectations, there were no significant differences in terms of anger.

The reactive spiral: An initial empirical assessment

2:00 PM – 3:10 PM

MOTIVATION/GOALS

The current study investigated the reactive spiral—an idea long proposed but not investigated. Participants (n = 130) completed a reactance-inducing writing task or a benign one; they then received a message threatening a large or small choice restriction. Participants receiving the reactance-inducing writing task before exposure to a highly restrictive threat reported more negative attitudes and higher levels of threat and anger than those who received the benign writing task before receiving the same threat. There were no statistically significant differences regarding intentions between these two groups (highly restrictive message: reactance-inducing vs. benign writing task). However, an auxiliary analysis comparing these two groups indicated an indirect effect on intentions through increased anger, greater perceived threat, and more negative attitudes among those receiving the reactance-inducing writing task. Overall, data provide preliminary support for the reactive spiral and indicate the cause of the initial reactance does not need to be related to the second freedom threat for the spiral to occur.

Advances in the study of character

2:00 PM – 3:10 PM | Location: E450B, Level 4

MORALITY

Our symposium examines the subject of moral character from a variety of new angles including its measurement and effects. Both Elliot & Kuncel as well as Dykhuis et al. examine college admission criteria in order to extract meaningful character-related information to predict future character development and moral behavior effectively. Elliot & Kuncel focus on the highly skewed data from scales included alongside reference letters in order to find ways to differentiate among candidates according to important non-cognitive admission factors. Dykhuis et al. broaden their focus to West Point's admission criteria and test its predictive validity with respect to actual performance among cadets years later. Our symposium does not just examine the predictors of character, however, but also its important downstream effects. Ravey et al. examine the importance of humility in the fraught experience of intergroup forgiveness following injustice. Finally, Cornwell et al. investigate the consequences of feeling as though one's character growth has stalled, demonstrating that the experience of 'moral vice' has important downstream consequences for behavior and psychological well-being.

Uniform Ratings: Factor Structure of Military Academy Recommendation Letters

2:00 PM – 3:10 PM

MORALITY

Traditional narrative letters of recommendation often lack differentiation and are overly favorable (Kuncel et al., 2014). However, when aggregated across items and raters, they can yield valid personality trait information despite individual-level error (Kuncel & Sackett, 2014). This project responds to Kuncel et al.'s (2014) call for improved letters by analyzing the psychometric structure of School Official Evaluations (SOEs) used in U.S. Military Academy (USMA) admissions. Using data from seven graduating classes (N = 8,666), we will examine 12-item ratings from 3 raters per applicant to build sub-scales that predict cadet and officer performance. We'll explore factor structure, interrater agreement, and develop within- and across-rater scales using exploratory and confirmatory analyses. Interrater reliability will inform composite scale reliability. Ultimately, this study aims to extract more reliable non-cognitive scores from halo-prone data and offer recommendations for improving SOE item design and weighting in USMA and broader military selection.

Future Character: Predictors of character attributes and moral exemplar status

2:00 PM – 3:10 PM

MORALITY

Recently, colleges have been seeking out students that add to the school's moral fabric (see ECI initiative from Wake Forest University), in addition to academic metrics of high performance. Many have supported this movement by recommending how admissions can select students with potential for character development. The US service academies seek to recruit well-rounded, highly motivated individuals, with the goal to commission leaders of character. These institutions, then, should use assessments in admissions that capture meaningful predictors of character downstream. This study explores admissions metrics at West Point (USMA) and how well these—particularly HS teacher reviews of performance, academic, and moral dimensions—predict character-relevant, as well as physical, military, and academic, metrics, of cadets years later. Two years of data (5 graduating classes) were analyzed; results from Year 1 indicate that admissions reviews from teachers predict cadet character. Teacher ratings were also predict of whether a cadet would be peer-nominated as a moral exemplar. Year 2 serves as a replication. This study has implications for the broader college admissions process.

Intergroup apologies and the role of offender humility

2:00 PM – 3:10 PM

MORALITY

While prior studies have examined humility’s role within interpersonal apologies, less attention has been given to humility within intergroup apologies. We aimed to investigate how characteristics of intergroup apologies—particularly expressions of humility—and attributes of the offending group (e.g., status, representation) impact forgiveness. Across two preregistered experiments (N = 649), we manipulated apology content and offender group characteristics to evaluate their influence on intergroup forgiveness. In Study 1 (n = 298), high-status offenders were perceived as less humble eliciting less favorable responses than low-status offenders. Requesting forgiveness enhanced perceived humility, which was associated with intergroup forgiveness. In Study 2 (n = 351), humble apologies were rated as more sincere and of higher quality than simple or no apologies, though any form of apology tended to improve forgiveness outcomes. Consistent with Study 1, perceived humility mediated the apology-forgiveness relationship. These findings underscore the significance of humility in shaping responses to intergroup apologies. Implications for the role of humble apologies are discussed.

Measuring the moral vice experience

2:00 PM – 3:10 PM

MORALITY

Moral “vices,” which are characteristics that, although not obviously immoral, impede the achievement of a virtuous moral character, represent a major philosophical concept. Our research was aimed at the creation and validation of a Moral Vice Experience (MVE) scale. Study 1 confirmed the MVE’s factor structure and its relationship with other moral constructs. In Study 2, the MVE was exclusively associated with self-transgression (omission and commission), rather than heightened scrupulosity more generally. In Study 3, the MVE was associated with moral trait differences between similar and different others, rather than general warmth traits. In Study 4, the MVE was uniquely related to “guilt” emotions on the PANAS, dysphoric (as opposed to anxious) mood, and negatively predicted goal achievement constructs (e.g., promotion, prevention, grit). The MVE completely mediated the relationship between ideal moral discrepancy, dysphoric mood, and guilt feelings in Study 5. In Study 6, the MVE was a better predictor of cheating on a die roll task than moral disengagement. Finally, in Study 7, the MVE predicted failed pornography abstinence, and more internal attributions for that failure.

Advantages of Expansive Thinking: Escaping Self-Limiting Ruts

2:00 PM – 3:10 PM | Location: E353A, Level 3

SELF/IDENTITY

The desire for clarity during moments of uncertainty often motivates styles of thinking that can feel self-protective, but are in reality rigid, ruminative, and restrictive. A more advantageous response to uncertainty is expansive thinking: the process of broadening and plasticizing one’s perspective on self and situation. This symposium examines mechanisms by which expansive thinking contributes to well-being when one is in the midst of navigating challenges and changes related to the self. The presented lines of research use varied methods (e.g., experimental, neural, personality, and narrative) and both quantitative and qualitative data to introduce strategies for increasing expansive thinking: by spending time in nature, by referring to familiar stories to reframe situational meaning, and by reanalyzing memories to inform one’s present sense of self. These four talks offer novel insights into the role of expansive thinking in both intentional and spontaneous emotion regulation, individual and group differences in the propensity to think expansively, and the beneficial effects that expansive thinking can have on self-perception.

How Natural Environments Influence Self-Perspective to Reduce Rumination

2:00 PM – 3:10 PM

SELF/IDENTITY

Abundant findings indicate that rumination, the tendency to focus repetitively on negative experiences from a narrow, self-immersed perspective, is a pervasive problem that undermines wellbeing and people's ability to act. Research has focused primarily on cognitive strategies to curtail this pathological state. Here we examine the role that an underexplored environmental factor may play. Given that nature can reduce self-focused thoughts, we examined if natural environments increase the use of emotion regulation strategies that facilitate a shift away from self-immersion. Participants (N = 200, US adults) were induced to ruminate about an ongoing problem and then randomly assigned to take a walk in a commercial area or an arboretum. Participants in the arboretum reported more use of emotion regulation strategies that shifted self-perspective such as seeing the bigger picture. Using these strategies mediated mood improvements. Participants in the arboretum also used more first person plural pronouns (e.g., we) when reporting recent thoughts. Overall, results suggest that natural environments might help resolve a ruminative episode and improve mood by influencing self-perspective.

The Dynamics of Spontaneous Thought Facilitate Emotional Recovery

2:00 PM – 3:10 PM

SELF/IDENTITY

Can how we think, the structure and flow of our thoughts, shape how we feel? Prior research shows that how we feel shapes what we think about: negative emotions elicit self-focused, past-oriented thoughts, while positive emotions elicit the reverse. But thoughts are more than content, they're dynamic. Emerging work links expansive thought dynamics with positive emotion. We tested whether such dynamics, marked by greater semantic diversity and flexibility, support positive emotional outcomes. In two studies, participants completed a think-aloud task either after recalling a positive or negative memory (Study 1, N = 746) or daily for 21 days, including baseline and negative mood induction days (Study 2, N = 232). To quantify thought streams, we created semantic networks where each node represents a thought and edges reflect similarity. More expansive networks, characterized by large diameters, low clustering coefficients, and high path lengths, predicted greater increases in positive emotion, but only when participants began in a negative state. Content features did not reliably predict change. These findings identify thought dynamics as a mechanism for emotional recovery.

Referring to Familiar Narratives to Make Sense of Daily Life

2:00 PM – 3:10 PM

SELF/IDENTITY

Evidence from a wide array of psychological subfields indicates that people use familiar stories to make sense of themselves and the world. We developed a scale to measure individual differences in the propensity to refer consciously to existing narratives in daily life. To define and operationalize this construct, we interviewed experts (N = 15) in narrative identity, media psychology, personality, and other related areas. Based on the responses, we developed a set of survey items, and refined them using feedback from a student sample (N = 56). We then conducted factor analysis on these items using data from a sample (total N = 240) of college students and people who reported having questioned a major aspect of their identity (gender or sexuality) at some point in the past. Participants also wrote about their use of familiar stories during periods of uncertainty for survey validation. We discuss the theoretical utility of this measurement tool as a point of convergence between several distinct lines of research. We also suggest that some groups might be more likely to reference familiar narratives in daily life due in part to identity fluidity and non-normativity.

Narrative Meaning-Making Confers Resilience During the Development of Psychosis

2:00 PM – 3:10 PM

SELF/IDENTITY

As a person develops a psychotic disorder, familiar things become strange and unsettling. This experience profoundly challenges young people's sense of self, with important functional consequences. Can autobiographical reasoning—intentional effort to make sense of experiences—protect against these effects?

This preregistered study examined narrative identity themes of self-event connections (linking past experience to the self) and meaning-making (deriving lessons/insights from experience) in 139 participants' life stories (mean age 21.9, 55% female): 27 in the early course of psychotic disorder (ECP); 56 at clinical high risk for psychosis (CHR); 56 healthy controls (HC). Meaning-making was lower in the ECP group (mean diff. 0.38, $p=.002$), but not the CHR group (mean diff. 0.14, $p=.128$), compared to HC. Across all groups, meaning-making accompanied better role functioning ($b=1.04$ [0.50, 1.59], $p<.001$) and more positive self-beliefs ($b=0.13$ [0.04, 0.22], $p=.005$). No effects were observed for self-event connections.

Consistent with recent theory, efforts to find meaning in life experiences can partially counteract the negative impact of emerging psychosis.

From Lab to Life: Psychological Interventions for effective social change

2:00 PM – 3:10 PM | Location: E258, Level 2

APPLIED SOCIAL PSYCHOLOGY

Understanding how psychology can be applied to real-world contexts is essential to inducing desired attitudinal and behavioral change in social settings. In this symposium, four talks highlight novel interventions to improve outcomes for understudied populations. The first talk discusses an intervention involving personal reflection to empower individuals to detect and confront sexism in the workplace. The second talk tackles the social issue of racism in the workplace. The authors find that a novel VR intervention combats racist beliefs and influences attitudes towards policing policies. The third talk describes an intervention that incorporates the use of gesture in teaching elementary school students to boost learning outcomes for students of all races. Finally, the fourth talk examines the effects of increasing perceived organizational structure on feelings of belongingness and efficacy for veterans transitioning from military to civilian life. These talks provide theory-based and cost-effective interventions to improve outcomes for four distinct populations empirically backed by findings from psychological science.

An Intervention to Empower People to Confront Sexism

2:00 PM – 3:10 PM

APPLIED SOCIAL PSYCHOLOGY

Sexism in workplaces is common and pervasive. Confronting and speaking up against acts of sexism can powerfully reduce sexism and promote anti-sexist norms, but actual confrontations of sexism in the workplace are rare. People often fail to detect subtle expressions of sexism, see confronting as too interpersonally costly relative to its benefits, or struggle to take action in the moment. To empower people to confront sexism, we developed an intervention inspired by the Confronting Prejudiced Responses Model (Ashburn-Nardo et al., 2008) to overcome all of these obstacles. Intervention recipients completed self-reflection exercises and watched instructional media where they learned about how sexism operates, the benefits of confrontation, and strategies for confronting effectively. In two experiments (total $N = 826$), we found the intervention reliably increased detection of sexism, perceptions that confronting was beneficial, and intentions to confront in a hypothetical workplace scenario relative to a control condition. Together, these findings establish proof of principle that common obstacles to confronting sexism can be overcome through a multi-faceted intervention.

Exposure to anti-Black racism: Can virtual reality improve anti-racist outcomes?

2:00 PM – 3:10 PM

APPLIED SOCIAL PSYCHOLOGY

Two intervention studies examined changes in emotional responses, racial attitudes, and policing policy support after viewing the Traveling While Black Virtual Reality (TWB-VR) simulation—a 20-minute 360° VR experience highlighting race, restricted movement, and Black individuals' reflections on segregation, discrimination, and police violence in the US. Pennsylvania community members (longitudinal study; $N = 1,360$), completed 5 waves of VR surveys (pre-sim, post-sim, 3-mo, and 6-mo after TWB-VR). Emotional responses (anger, shame), racial attitudes, and support for police reform improved after TWB-VR. Negative emotions persisted at 6-mo, while policy support lasted 3-mo before returning to baseline. Additionally, White participants experienced more shame than Black participants, predicting greater support for equitable policing. In an experiment ($N = 347$), participants viewed either TWB-VR or a non-race-related control VR simulation. TWB-VR increased negative emotions, empathy, knowledge, and anti-racist attitudes, with enhanced empathy linked to greater policy support. This research suggests race-related VR can enhance understanding of systemic racism and promote social change.

Unlocking Potential: Incorporating Gesture in Teaching Boosts Learning for Children

2:00 PM – 3:10 PM

APPLIED SOCIAL PSYCHOLOGY

Classrooms represent a context in which differences in communication style may differentially impact children's engagement and learning. Here, we investigate the impact of gesture on learning by testing how incorporating gesture in teaching may improve learning of novel words. Gestures have previously been found to enhance language development and facilitate more effective learning. Further, previous work suggests that Black children, in particular, learn more effectively when they can move their bodies as a learning tool. Across two public elementary schools, first and second grade students (N = 140) completed a six-week learning intervention. Nine classrooms were read storybooks featuring novel target words which were introduced and defined either with an accompanied ASL sign (i.e., gesture condition) or defined without the sign (i.e., control condition). Our preliminary findings indicate that the intervention was effective in increasing vocabulary knowledge for all students regardless of race. The current findings indicate that gesture may be an important factor in vocabulary learning for children from various backgrounds due to both multimodal and cultural benefits.

Structure in Transition: Facilitating Military Veteran Workplace Efficacy & Belonging

2:00 PM – 3:10 PM

APPLIED SOCIAL PSYCHOLOGY

Employment transitions challenge individuals' sense of personal control, such as with military veterans shifting into civilian workplaces. Across three studies, we examined whether perceiving greater organizational structure supports positive workplace outcomes among veterans and civilians. Drawing on Compensatory Control Theory, we proposed that structure serves as an external source of order that can restore self-efficacy and promote belonging during transitions. Studies 1 and 2 (total N = 747) found that perceived structure was associated with greater occupational self-efficacy which, in turn, predicted greater belonging at work. These effects were robust across veterans and civilians. Manipulated structure in a hypothetical job also increased anticipated efficacy and belonging (Study 3, N = 400). Findings suggest that organizational structure plays a meaningful role in successful employment transitions, particularly for those socialized in structured institutions like the military. Ongoing research and development of interventions informed by this research at the individual and organizational level will be discussed.

Honoring Jerry Clore: Affect-as-Information and Beyond

2:00 PM – 3:10 PM | Location: E353C, Level 3

EMOTION

This symposium recognizes the seminal role that Affect-as-Information Theory (Clore et al., 2001) has played over several decades, contributing to an increasingly sophisticated understanding of how emotions guide judgments, thoughts, and behaviors. We describe how recent work that has taken it into new directions. Talk 1 reviews how the original approach was refined into the Affect-as-Cognitive-Feedback Account, which suggests that affective feelings can encourage, or deter, acting on currently salient cognitive tendencies. Talk 2 summarizes recent research suggesting feelings play a more pronounced role for individuals who habitually attend to and value their feelings. The next two talks explore affect in real life contexts. Talk 3 outlines how appreciation of art in a museum increased participants' feelings of self-transcendence, and their abstract thinking. Talk 4 outlines research with emergency room doctors to identify factors that elicit anger or compassion, and effects on medical judgments. Taken together, these new findings point to a complex interplay of affect, cognition and behavior, and how they emerge in everyday life.

How Does Affect Govern Cognition?

2:00 PM – 3:10 PM

EMOTION

Affect-as-information Theory (Clore et al., 2001) has been foundational to the emergence of affective science. Considerable research over several decades had suggested that effects of affective feelings on cognition were almost like etched into psychological stone: Feeling a particular way makes people think in particular ways. New research indicates that this connection is quite flexible, with affective feelings merely dictating whether people act on momentarily dominant cognitive tendencies. Together with collaborators, such findings led the author to develop the Affect-as-Cognitive-Feedback Account. The author presents new research extending this account to group judgment and decision making, and to the moral roots of vaccine hesitancy and refusal.

Roles for Attention to Emotion in Affect-as-Information Theory

2:00 PM – 3:10 PM

EMOTION

One important premise of Affect-as-Information Theory is that feelings are likely to play a more important role in social cognition and self-regulation among individuals who attend to and value their feelings, relative to those who do not (Gohm & Clore, 2000, 2003). The current talk will present new sources of evidence for this idea. A first line of work has shown that people who attend to and value their feelings to a greater extent (high trait attention individuals) exhibit stronger emotional reactions to affective stimuli, with time course analyses implicating elaboration-related processes. A second line of work, using a stream-of-consciousness paradigm, has shown that spontaneous thoughts and feelings are more inter-connected at higher levels of attention to emotion. A third line of work has shown that guidance by a hedonic principle (e.g., approach that which induces pleasant feelings) is stronger among high attention individuals. Feelings are more fluid and influential at higher levels of attention to emotion, providing support for Affect-as-Information Theory and its individual difference postulates.

Affect in the Art Museum: Broadening People's Horizons

2:00 PM – 3:10 PM

EMOTION

Although much research on affect has focused on the positive-negative valence dichotomy, philosophical theorizing points to an important role of specific positive emotions. Kant suggested that feelings of self-transcendence follow from appreciating beauty. We tested this idea in the naturalistic context of an art museum. Participants viewed pottery objects created by a renowned artist, with half being instructed to rate their beauty, and the other half completing a perceptual control task unrelated to beauty. Thus, all participants were exposed to the same stimuli, but only some engaged with their aesthetic and affective value. As predicted, the Beauty Condition reported greater self-transformative and transcendent emotions than the No Beauty Condition. Importantly, however, the two groups did not differ in positive affect, suggesting that the consequences of beauty went beyond mere valence. The Beauty Condition also exhibited more abstract thinking than the No Beauty Condition, especially participants who practiced an art hobby themselves. Thus, experiences of beauty can prompt cognitive and affective responses, beyond what would be expected from positive affect alone.

Affect in the Emergency Room: Doctors' Medical Decisions

2:00 PM – 3:10 PM

EMOTION

Despite having profoundly influenced the scientific understanding of emotions within academia, Affect-as-Information Theory has failed to penetrate the medical field, where affect is typically viewed as a bias to be mitigated and an experience to be avoided and suppressed. Despite the longstanding culture in medicine that discourages affect, our studies demonstrate that clinical practice is inherently affective, and emotions significantly influence Emergency Department (ED) physicians and patients. This talk will present 3 studies employing diverse methods with 445 emergency physicians from across the USA to identify factors that elicit anger and compassion in the ED and the effects of these emotions on physicians' patient assessments and clinical decisions. Results will also be presented from a field study in which emotion reports were collected from 20 ED physicians during 850 clinical encounters with a diverse patient population and correlated with physicians' clinical behaviors (e.g., encounter length). Together, the results underscore the need to integrate affective science into medicine to improve patient care and physician well-being.

LGBTIQ+ Experiences in Troubled Water: Intercommunity Friction, Legal Shifts, and Allyship

2:00 PM – 3:10 PM | Location: E352, Level 3

DIVERSITY

This symposium explores the multifaceted experiences and social dynamics affecting LGBTIQ+ populations across different contexts. The first presentation advances minority stress theory by incorporating intra-community prejudice, revealing that internalized stigma and mental health outcomes are influenced not only by discrimination from cis-heterosexual people but also by prejudices within LGBTIQ+ communities. The second talk presents the Swiss LGBTIQ+ Panel, a longitudinal study tracking LGBTIQ+ people to understand how legal and social changes affect the societal integration, well-being, and health of LGBTIQ+ people. The third presentation examines public attitudes during Hungary's Pride ban, identifying distinct psychological profiles among cis-heterosexual people and their varying intentions to engage in pro-LGBTQ+ activism. It highlights the potential for allyship even among conservative groups. Collectively, these studies highlight the importance of addressing intra-community prejudice, the need for longitudinal research to understand the impact of legal and societal changes on LGBTIQ+ people, and the necessity of ally support to promote LGBTIQ+ health, inclusion, and social justice.

An Exploration of Differential Impacts of the Source of Prejudice on Internalized Bi-sexual Prejudice

2:00 PM – 3:10 PM

DIVERSITY

Minority stress theory posits that prejudice-related stress contributes to poorer mental health among sexual minorities. While most research focuses on heterosexual discrimination, LGBTQ people may also experience stress from within their own communities. This study draws on three waves of longitudinal data (N > 400) to test minority stress theory using a novel measure that captures both heterosexual and intra-community prejudice. The new measure assesses experiences of prejudice and the degree to which these are internalised, separately for heterosexual and LGBTQ sources. Structural equation modelling examined pathways from both forms of prejudice to internalised stigma, and to key psychosocial outcomes, including depression, anxiety, self-esteem, and social connectedness. Results indicate that intra-community prejudice, while less frequent than heterosexual prejudice, uniquely predicted internalised stigma and poorer outcomes over time. These findings extend minority stress theory to account for the layered and sometimes contradictory social contexts LGBTQ people navigate, highlighting the importance of addressing both intergroup and intragroup prejudice in promoting wellbeing.

Impact of Legal and Social Changes on LGBTQ+ People

2:00 PM – 3:10 PM

DIVERSITY

Despite legal advancements, challenges persist for LGBTQ+ people worldwide, and polarization continues to increase. To better understand these experiences, we initiated the Swiss LGBTQ+ Panel in 2019, focusing on the integration of LGBTQ+ people and the evolution of their situations over time. Importantly, the LGBTQ+ community consists of many sub-populations differing in sexual orientation, gender identity, sex characteristics, and other identities. Therefore, the panel includes diverse sub-populations within the LGBTQ+ community. It is further crucial to follow people over time to shed light on how opinions, life satisfaction, and health evolve gradually over time or in response to societal events, such as recent legal changes or increasing anti-trans rhetoric. We conduct the survey annually, with up to 5,500 participants involved. In this presentation, I will discuss the panel, key findings, and scientific projects, including the impact of the legal changes on self-reported and biological stress levels. I will also highlight national and international outreach initiatives and suggest ways to foster greater inclusivity for LGBTQ+ populations in research and society.

Who Stands With Pride? Latent Profiles of Pride Supporters in Hungary

2:00 PM – 3:10 PM

DIVERSITY

In response to Hungary's 2025 Pride ban, thousands mobilized in protest, including many non-LGBTQ+ people. This study aimed to examine how non-LGBTQ+ people respond to LGBTQ+ issues in a real-world scenario—specifically, whether distinct psychological profiles emerge based on identity, perceived injustice, appraisal of legal changes, and intergroup emotions. We conducted a large cross-sectional survey (N = 4213) among Hungarian non-LGBTQ+ adults during the peak of the Pride-ban protests. Latent profile analysis identified three distinct attitudinal profiles: consistent supporters, conditional supporters, and opposers. Consistent supporters showed strong ally identity, emotional engagement, and support for the Pride march regardless of group perception, while conditional supporters' support depended on perceiving LGBTQ+ people as moral. Profiles varied in political orientation, past activism, and future pro-LGBTQ+ action intentions. Findings highlight the complexity of intergroup solidarity in hostile climates and suggest even politically conservative individuals may engage in LGBTQ+ support. This work has implications for mobilizing allies beyond typical identity-based motivations.

New Directions in Existential Psychology for the Religious and Nonreligious

2:00 PM – 3:10 PM | Location: Lakeside Ballroom E354B, Level 3

RELIGION/SPIRITUALITY

As more people move away from religion, questions about meaning, hope, and spiritual connection remain central to psychological life. This symposium presents 4 talks offering new insights into existential psychology across belief backgrounds. The first introduces spiritual yearning—a motivational longing for meaning and transcendence—examining its correlates, stability, and impact on existential security across 3 studies (N = 5,757) focused on nonreligious individuals. The second explores how spiritual yearning relates to spiritual struggles (e.g., doubt, moral conflict) across religious, formerly religious, and never religious participants (N = 3,014), using network and correlational analyses to show variation by worldview. The third examines how religious individuals define and experience hope across 3 studies (N = 1,845), suggesting current models may miss key aspects of religious hope. The fourth (5 studies; N = 3,424) shows that hope predicts meaning in life more strongly for people with lower mental health and social functioning. Together, these talks offer new perspectives on how people pursue meaning, hope, and existential security within and beyond traditional religion.

The Nonreligious Quest for Existential Meaning and Fulfilment

2:00 PM – 3:10 PM

RELIGION/SPIRITUALITY

Religion has long been a source of existential comfort and security. As increasingly more people are leaving traditional religion, these religious doers and nones are turning toward new sources of spiritual connection. We explore spiritual yearning—the motivation for existential comfort and fulfillment—among the nonreligious through a multimethod set of three studies (N = 5757). In Study 1 (n = 2,338), we drew from three separate samples (ns = 585, 883, 870) to examine correlates of spiritual yearning with associated constructs. In Study 2 (n = 424), we conducted a longitudinal study to examine whether spiritual yearning is a state or trait. In Study 3 (n = 2,995), we conducted an experiment to examine the causal effects of having one's spiritual needs fulfilled or frustrated on existential security. The converging results suggest that spiritual yearning is the motivational longing for deeper meaning and transcendent connection, is relatively stable in the short-term, and is associated with existential security and positive emotions. We discuss the implications of this research for the changing religious landscape for many individuals.

Spiritual Yearning and Struggle Across Religious and Nonreligious Groups: Correlational and Network Insights

2:00 PM – 3:10 PM

RELIGION/SPIRITUALITY

Spiritual yearning (SY)—desire for meaning, self-discovery, and/or transcendence—is common in religious and nonreligious individuals. Yet, SY may relate to spiritual struggles (SS), such as doubt and moral conflict. We examined SY–SS associations in 3,014 participants, including religious individuals, formerly religious “doers,” and never religious “nones.” Correlational and network analyses revealed positive associations between SY and SS, with stronger effects in nonreligious groups. Partial correlations showed links between specific domains (e.g., moral guidance yearnings with moral struggles), but other associations varied by group. Religious participants showed stronger ties between spiritual experience yearnings and belief struggles, while nonreligious, especially doers, linked inner peace yearnings to meaning struggles. Network analyses identified doubt struggles as central overall. Among the religious, yearning for spiritual experience was key; for nonreligious, moral guidance was central. These findings show how SY-SS connections vary by background, highlighting existential questions about how people search for and struggle with meaning, identity, and moral direction.

Beyond Rainbows: Religious and Existential Dimensions of Hope

2:00 PM – 3:10 PM

RELIGION/SPIRITUALITY

Hope is central to many religious traditions, yet dominant psychological models - especially Snyder's theory emphasizing agency and pathways toward goals - fail to fully capture its existential depth. In Studies 1 (U.S. representative sample, N = 1,426) and 2 (convenience sample, N = 229), we find only small associations between religiosity and hope when using Snyder's definition. However, when hope is measured without a pre-set definition, the association grows moderate to large. This suggests religious individuals may define hope differently, i.e., less as goal pursuit. In Study 3 (N = 190; diverse in religious identity and background), we replicate these patterns and analyze qualitative definitions of hope across high- and low-religiosity participants. Our results highlight the need to revise psychological models of hope to reflect lived experience, especially among highly religious populations. This work broadens the conceptualization of hope and centers voices often overlooked in scientific research on hope.

Hope in the Dark: Hope More Strongly Predicts Meaning in Life Among Those Who Need It

2:00 PM – 3:10 PM

RELIGION/SPIRITUALITY

Hope is a key emotion for experiencing meaning in life (MIL; Edwards et al., 2025). Hope is specifically relevant to difficult circumstances that ultimately challenge MIL. As such, hope may more strongly predict MIL among people high (vs. low) on individual differences that reflect a challenge to MIL. In Studies 1-4, participants completed measures of hopeful feelings, MIL, and varied individual differences, including neuroticism, despair (Studies 1 N = 912; and 2 N = 973), mental health symptoms (Study 2), insecure attachment (Study 3, N = 288), and loneliness/social relatedness (Study 4, N = 586). As predicted, hope was a stronger predictor of MIL among those high (vs. low) in psychological misery (Studies 1-2) and poor social functioning (Studies 3-4). In Study 5 (N = 665), experimentally induced hope (vs. hopelessness) led to greater purpose (but not coherence and significance, specific facets of MIL) only among those with high adverse childhood experiences. Positive affect did not show the same moderation effects, suggesting this is unique to hope's relation to MIL. Overall, we demonstrate that hope is a stronger predictor of MIL among those who need it most.

Quest for significance: love and war

2:00 PM – 3:10 PM | Location: E253CD, Level 2

AGGRESSION/ANTI-SOCIAL BEHAVIOR

The Quest for Significance refers to the fundamental human motivation to feel worthy, respected, and valued (Kruglanski et al., 2022). This symposium explores how this single psychological need drives both ends of human nature—aggression and love. The first talk presents four studies showing that individuals with high (versus low) significance loss are more likely to resort to aggression rather than non-aggressive strategies like negotiation. The second talk presents four studies demonstrating that the love feelings of Low SES individuals are more affected by partner appreciation but less by partner social status compared to high SES individuals and that significance expansion explained the mechanism. The third talk examines how violent extremists do not justify their behavior based on fixed ideologies but through a deeper psychological drive for significance. The final talk shows that significance loss amplifies belief in violence as effective in real-world conflicts. Together, these talks reveal how love and aggression stem from the same quest for mattering and dignity. The session concludes with a discussion on interventions to enhance significance nonviolently.

Mitigating Aggression: Role of Significance-Frustration in Conflict

2:00 PM – 3:10 PM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Building on the revised frustration-aggression hypothesis, the significance quest theory, and a model of extremism, this research tested whether aggressive (vs. non-aggressive) responses to significance-frustration are more likely when such frustration is high (vs. low). Across four experiments (N = 1,093, from six continents), consistent support for this hypothesis emerged. In Study 1, aggressive means were perceived more effective than non-aggressive ones only under high (vs. low vs. control) personal frustration. Study 2 replicated this in the context of in-group significance loss. Study 3 showed that high (vs. low) frustration increased the actual choice of aggressive responses. Study 4 confirmed this for in-group loss and behaviorally showed that those highly frustrated were more likely to aggress against out-group members seen as responsible. These findings suggest that the magnitude of significance-frustration increases the preference for aggression, offering insights for conflict resolution.

How Social Class Shapes Love Conditions: Partner Status and Appreciation

2:00 PM – 3:10 PM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

A recent motivational theory on romantic love (Kruglanski et al., 2025) posits that love is driven by a sense of significance generated by the partner's merit, appreciation, and their interplay. The current research builds on and extends the theory by examining how personal socioeconomic status shapes the effects of partner social standing (a partner merit) and partner appreciation on love in different ways. Across four studies (total N = 1338) including three experiments (Study 1, 2, 3) and one 21-day dyad daily diary study (Study 4, 226 couples, total daily observations = 7619), we found that the love feelings of individuals with higher socioeconomic status, compared to those with lower socioeconomic status, were more heavily influenced by partner's social standing (how respected the partner is in the society), but less heavily influenced by perceived partner appreciation, both in partner selection phase (Study 1 and 2) and in dynamics of ongoing relationships (Study 3 and Study 4). Study 3 and 4 further showed that the differential moderation effects of socioeconomic status for partner social standing and partner appreciation on love were mediated by the sense of significance.

Cancelled: By Any Means Necessary: Ideologically Inconsistent Radicalization and Significance Quest

2:00 PM – 3:10 PM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

A recent trend in the terrorism landscape is the apparent increasing prevalence of violent extremists who do not appear to adhere to one ideology, instead cherry-picking components of different ideologies to justify violence. This reflects an ideological inconsistency that has not been thoroughly explored through a social psychological lens. Rather than positing that these actors are driven by overlapping components of discrete ideologies, the present theory suggests that ideological inconsistency is the result of an especially strong need for significance with an expanded set of available means to fulfill that need, comprising both more extreme means and means which conflict with one another. A review of prior literature as well as exploratory analysis using eight datasets supports this motivational understanding of an emerging trend in violent extremism, finding that people with higher significance quests report greater support for conflicting, significance-granting actions and ideologies. The results suggest that ideological inconsistency, while confounding to many, is driven by the same underlying motivation as traditional violent extremism: the quest for significance.

*SYMPOSIUM

Primordial Expectancies for Primordial Means: Placing Faith in Violence

2:00 PM – 3:10 PM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Theorizing suggests that aggression compensates for psychological disempowerment. The present research tests how primordial means (aggression) mainly follow primordial expectancies of their effectiveness. In three studies, we test how disempowerment predicts support for violence via an intuitive sense of faith in its effectiveness. In Study 1, Disempowerment predicted support for the January 6, 2021, rioters, which in turn predicted faith in elections (N = 798, correlational). In Study 2, experimentally framing the October 7, 2023, attack on Israel as a significance loss led Israeli civilians to report greater faith in an Israeli military victory (N= 528). In Study 3, disempowered participants who were experimentally reminded that the 2024 United Healthcare CEO shooting was motivated by frustration with the U.S. healthcare system predicted greater faith in the violence as a means of pursuing policy change (N = 865, preregistered). All effects were independent of participants' logic-based expectancies. Consistent with our premise that primordial means involve primordial expectancies, people shift towards faith-based expectancies in the face of significance loss.

Social beliefs and preferences are not social enough

2:00 PM – 3:10 PM | Location: E350, Level 3

SOCIAL COGNITION

Social reality is complex. As social psychologists, we often invoke broad constructs and sometimes simple measures to capture this complexity. But doing so may gain simplicity at the cost of misrepresenting reality. We present evidence that major constructs and measures—moral foundations, collectivism, and social stereotypes—may have missed the complexity of social reality. In moral foundations, conservatives endorse loyalty, and liberals endorse care. But towards whom are conservatives and liberals really being loyal and caring? In collectivism, East Asian cultures prioritize the interests of “others,” more than Western cultures. But who exactly are these “others” that collectivism prioritizes? In stereotyping, people hold generalized beliefs about groups, such as men as being more competitive than women. But who are men really being stereotyped as competitive towards? Finally, our last speaker connects the dots, arguing that many traits are “relational”—describing a person or group’s behaviors towards specific others. We suggest that this broad perspective might lead to insights that have the potential to challenge constructs across our field.

Do Liberals and Conservatives Really Have Different Moral Foundations?

2:00 PM – 3:10 PM

SOCIAL COGNITION

A highly influential theory attributes ideological divides to liberals' and conservatives' fundamentally different moral intuitions. Evidence supporting this claim, we argue, has largely relied on ideologically biased measures, suffering the problem of circularity. Eight studies (seven preregistered; N = 5,446) illustrate this problem. Ideological differences in every moral foundation can be inverted or diminished by changing the target of moral concern. Effects persist across experimental designs (Studies 1-2), questionnaire psychometric qualities (Study 3), geographically and politically diverse countries (Study 4), and numerous representative targets (Studies 5-6). By minimizing ideological bias using open-ended responses (Study 7) or idiographic/participant-specific targets (Study 8), ideological differences in moral foundations shrink or disappear. Liberals and conservatives seem to differ more in their targets of moral concern than in their fundamental moral intuitions.

Fuzzy terms like “other people” explain why collectivism scales fail

2:00 PM – 3:10 PM

SOCIAL COGNITION

Experts are convinced East Asian cultures are more collectivistic than Western cultures. Yet three separate meta-analyses found that self-report collectivism surveys failed to find East-West differences. One factor that can help explain this puzzling finding is that collectivism scales often use fuzzy, unclear relationship terms, like “others.” We argue that people in collectivistic cultures need to know the relationship before they can give a confident answer about how they would treat that person. We tested this in two ways. First, we created a scale that specified a range of specific relationships and tested 16,237 people in 100 cultures. Results showed reliable cultural differences that earlier meta-analyses failed to find. Then, we asked a separate group of participants in China and the US to read the scale items in the top five most-cited collectivism scales and rate the clarity of the relationships. These clarity ratings predicted items' ability to detect actual cultural differences and metrics of criterion validity (such as living with extended family). This evidence suggests that it is crucial to specify relationships to reliably measure cultural differences.

Directed stereotypes: universality and variation

2:00 PM – 3:10 PM

SOCIAL COGNITION

Stereotypes are strategically complex. Perceivers hold not just stereotypes about what groups are generally like (e.g., “men are competitive”), but stereotypes about how groups behave towards specific groups (e.g., “men are competitive towards...”). We call these directed stereotypes. Recent studies find that American perceivers hold directed stereotypes of gender, age, and race, with unique patterns that both qualify and reverse well-documented stereotype patterns in the literature. For example, men are typically stereotyped as more competitive than women. Yet directed stereotypes show that women are stereotyped to be more competitive than men, when this competitiveness is directed toward young women. We present new data that examines gender-age directed stereotypes across 16 countries (N = 2379). Directed stereotype patterns replicate strikingly across societies. Yet there is also significant cross-societal variation in the magnitude of stereotyped differences, which are linked to societal-level gender inequality and sex ratios. We discuss implications for thinking about the nature and measurement of gender and age stereotypes, and stereotype content more broadly.

How and why to study relational attributes

2:00 PM – 3:10 PM

SOCIAL COGNITION

People cannot be competitive, loyal, or empathic by themselves. Identifying who a person may be competitive, loyal, or empathic toward can thus reveal radically different patterns of social perceptions and behavior. This talk provides a big-picture synthesis and roadmap for research on relational attributes: attributes describing one person's behavior toward another. We overview findings from a wide array of topic areas, including stereotypes, social invisibility, morality, prejudice, and empathy to show that relational attributes are both prevalent and highly relevant to many social psychological phenomena. We provide guidance on how to identify whether an attribute is relational, and what to do differently when we are studying one. Specific recommendations are both conceptual (how to identify relational attributes) and methodological (e.g., principled and broad stimulus sampling, examining intraclass correlation coefficients). The talk will thus provide overarching theoretical coherence to this topic, as well as offer concrete next steps for researchers who want to explore relational attributes in their own work.

Structure's Double-Edged Sword: Impacts on Perception and Behavior

2:00 PM – 3:10 PM | Location: E450A, Level 4

MOTIVATION/GOALS

This symposium explores the dual nature of structure in shaping perceptions and behavior, highlighting both its benefits and unintended consequences. The first talk shows that providing a structured, suggested plan (i.e., specifying time and location for action) is more effective for behavioral follow-through than asking individuals to generate their own plan. The second talk reveals that although structured updates to wait time for products and services reduce uncertainty, they can increase impatience by drawing attention to the wait. The third talk finds that people prefer self-improvement programs with structured support (i.e., graduation) over support that is unstructured and continual, as the former is perceived as more conducive to personal accomplishment. Similarly, the final talk shows that in social settings, individuals are less likely to choose structured collaboration (i.e., social interaction guided by explicit rules) because it is perceived as less enjoyable than unstructured approaches. Together, these talks highlight how structure influences perceptions and behavior across contexts and provide practical insights into when and how to implement structure effectively.

Does a Suggested Plan Increase the Effectiveness of Planning Prompts?

2:00 PM – 3:10 PM

MOTIVATION/GOALS

Prompting consumers to plan when and where they will follow through on a goal is a well-established strategy for closing intention-behavior gaps. Such "planning prompts" typically require consumers to form their own plans, which prior research suggests should enhance follow-through because self-set plans engender greater commitment and are more memorable. However, we propose that offering a suggested plan—specifying a proposed time, day, and location for action—alongside a planning prompt can more effectively promote follow-through by simplifying decision-making and thereby reducing the complexity and cognitive effort required to follow through. In a large-scale field experiment (N = 1,012,143) with a national U.S. pharmacy, we find that reminders prompting planning and offering a suggested plan led to 2.45% more vaccinations than reminders prompting planning alone. In a second field experiment (N = 985,145), planning prompts with a suggested plan outperform best practice reminders by 3.26%. These findings reveal that offering a suggested plan in a planning prompt may be a more effective way to nudge follow-through than asking individuals to form self-set plans.

Knowing the Time Remaining: The Effect of Updates on Impatience

2:00 PM – 3:10 PM

MOTIVATION/GOALS

People frequently wait for products and services, such as for packages to arrive or restaurant tables to be ready. Organizations often provide updates on the time remaining in a wait, intended to improve the experience. In a pilot study, we find that people overwhelmingly want time updates in common situations and predict they will reduce impatience. However, across four studies (N = 1,186), we find that updates about the time remaining in a wait can instead increase impatience. Using longitudinal studies, we found that people felt worse while waiting several days for a bonus opportunity (Study 1) and a personalized pet video (Study 2) when they received updates about the time remaining in the wait, compared to when they did not. The updates heightened impatience by making the wait more salient. We further found that time updates led people to feel more impatient while waiting in the lab for a holiday treat (Study 3) and school supplies (Study 4), despite reducing uncertainty and the perceived duration of the wait. We suggest that while updates seem helpful, they may backfire when people are occupied with other activities during the wait.

From Reliance to Mastery: Graduation Signaling Enhances Program Engagement

2:00 PM – 3:10 PM

MOTIVATION/GOALS

Self-improvement programs, such as apps for eating healthily or learning a new language (e.g., Noom and Duolingo), often promote a model of continuous reliance. However, sense of control and personal agency are fundamental human motivators. Across seven preregistered studies (N = 2,496), we introduce the concept of graduation signaling: framing self-improvement programs as temporary, expertise-building tools (vs. sources of continuous support). Graduation signaling increases motivation and performance. People preferred self-improvement programs that signaled graduation (Study 1; Study 6-7); they also spent more time engaging in such programs (Studies 2-3), produced better results (Study 2), and retained more information (Study 3). Graduation signaling enhanced program engagement by shifting construal of program disengagement to an experience of personal achievement (Study 5). Our work introduces a new theoretical concept relevant to self-improvement. Further, our findings provide insight into strategies for enhancing engagement in self-improvement pursuits, of practical importance for goal-pursuers and program designers alike.

Hedonic Perceptions Fuel Resistance to Structured Collaboration

2:00 PM – 3:10 PM

MOTIVATION/GOALS

Structured collaboration—using explicit, predetermined rules to guide social interaction during collective tasks—has proven effective in enhancing outcomes across diverse professional and social contexts. Yet, valuable structured techniques like the Fast Friends Procedure and Brainwriting remain underutilized. This research explores whether perceptions of enjoyment (hedonic value) and effectiveness (utilitarian value) help explain this adoption gap. Across five studies (N=1,491), we consistently observed that structured collaboration was perceived as less enjoyable than unstructured approaches, despite inconsistent perceptions of its effectiveness. This enjoyment gap was driven by negative evaluations of structured collaboration rather than positive evaluations of unstructured collaboration (Study 3) and was further explained by a reduction in authentic self-expression rather than a general loss of autonomy (Study 4). Ultimately, lower perceived enjoyment predicted a lower likelihood of choosing structured collaboration (Study 5). These findings suggest that lack of enjoyment is a key psychological barrier to embracing structured collaboration, even when its benefits are clear.

Testing Interventions to Increase Acknowledgement of Systemic Racism

2:00 PM – 3:10 PM | Location: E451B, Level 4

DIVERSITY

Among Americans, there are widely different interpretations about the causes of racial inequalities. Some believe that racism is not the problem but rather lack of effort or merit; others believe that racism is largely an interpersonal phenomenon that occurs due to the actions of isolated individuals. The concept of systemic racism – that racial bias is embedded in our structures, institutions, and laws – has proven controversial, and policies have been instituted in multiple states to prevent people from learning about or discussing the idea. This symposium brings together a set of interventions designed to increase people's willingness to acknowledge the existence of systemic racism. The first three presentations showcase cognitive, metacognitive, and narrative techniques to explore how different methods can reduce barriers to acknowledging systemic racism. The fourth presentation introduces a qualitative dataset on lay attributions for racial health disparities followed by a participatory discussion on how we would apply the intervention techniques presented in the first three presentations.

Racial Knowledge increases Support for Critical Race Theory Tenets

2:00 PM – 3:10 PM

DIVERSITY

To counter the psychological barriers that justify structural racism, we propose a simple, cognitive/epistemological method, the consideration of critical knowledge, i.e., knowledge that identifies and challenges existing power dynamics and recurring patterns of injustice. In a correlational study, undergraduates took a test of critical racial knowledge; accuracy scores, determined by signal detection, positively predicted support for the tenets of Critical Race Theory, including the ideas that racism is common and structural and race is socially constructed and intersectional. This effect held when political ideology, social dominance orientation, and racial prejudice were controlled for. In experiments, we find that participants randomly assigned to consider critical racial knowledge increase their support for Critical Race Theory tenets. At the same time, exposure to critical racial knowledge had no impact on participants' national attachment, despite claims of cultural critics. Ongoing research expands the effects of critical racial knowledge to the endorsement of DEI initiatives and suggests a simple, direct way to increase support for the dismantlement of systemic racism.

Reflecting on Racism: How Metacognition Affects Perceptions About Structural Inequality

2:00 PM – 3:10 PM

DIVERSITY

Embedded in everyday practices and institutional structures, systemic racism is harder to perceive than overt acts of prejudice. Therefore, Americans often reject structural explanations of racial inequality, favoring individualist narratives that minimize systemic factors. To increase awareness and recognition of systemic racism, the current study examined whether a metacognitive training (MCT) intervention could shift these beliefs by encouraging individuals to reflect on and revise their existing assumptions about racial inequality. To assess this, American adults from a nationally representative sample (N=453) were asked to complete a brief quiz about systemic racism. In the MCT condition, participants were immediately exposed to corrective feedback to challenge misperceptions. In the control condition, participants were not exposed to corrective feedback after the quiz. Participants who received the intervention showed greater endorsement of structural explanations for racial inequality, but only marginal shifts in the perceptions of specific scenarios depicting systemic racism. Findings support the utility of metacognitive training in changing beliefs about systemic racism.

Narrative-Modeling Increases Acknowledgment of Systemic Racism and DEI Support

2:00 PM – 3:10 PM

DIVERSITY

We compared three interventions meant to increase acknowledgement of systemic racial inequality, recognition of systemic racism incidents, and support for DEI efforts among White Americans. This study compared effects of a self-affirmation intervention to counter feelings of threat, a metacognitive corrective intervention to provide accurate information, and a narrative-modeling approach meant to address both cognitive and emotional needs, both immediately and after two weeks. The control was information about cultural differences between racial groups with no reference to power or prejudice. The narrative intervention, which involved a first-person story of a White man who uncovers evidence of racial wage discrimination at his workplace and decides to stand up against racism, was the most effective in the moment and after two weeks. The metacognitive corrective training was also effective on many outcomes, but self-affirmation less so, compared to the control.

Lay-theories Reflect, Reproduce, Deny, and Acknowledge Racism in Health Disparities

2:00 PM – 3:10 PM

DIVERSITY

Lay-theories are sets of interconnected ideas people use to understand and explain their worlds. We used a reflexive thematic analysis to investigate participant-generated lay-beliefs about COVID-19 disparities between White and Black communities (N=150) and between White and Latinx communities (N=145) in the US. We extracted six themes from these lay-beliefs: perceived non-compliance with guidelines, beliefs about biological health, the assumptions about cultural differences, concerns about working conditions, acknowledgement of structural barriers, and naming racism as the problem. Informed by Critical Race Psychology, we discuss how racism is reflected and reproduced in lay-beliefs about Black and Latinx communities by overlooking evidence-based realities, reproducing negative stereotypes and racist tropes, culturally pathologizing, positioning racial differences as biological, and/or denying the role of racism. We discuss these qualitative remarks in relation to the prior three presentations, to understand how such interventions may directly challenge or respond to lay-theories that come up in conversations about systemic racism.

The Future of DEI: Navigating Hostility and Harnessing Evidence-Based Change

2:00 PM – 3:10 PM | Location: E271, Level 2

DIVERSITY

This symposium offers novel perspectives on the benefits of and challenges to diversity initiatives in organizations. The first talk illuminates the importance of diversity initiatives: women express greater aspirations to lead when organizations have diversity initiatives. The second talk highlights that Americans overestimate hostility towards diversity policies. While White conservatives are perceived to be outright hostile to diversity initiatives, they are merely ambivalent. Despite this, the third talk demonstrates that litigation backed by conservative elites erodes diversity policy support among Black people and White Democrats. Importantly, organizations who defend their policies neutralize the litigation's negative impact. The fourth talk reveals another way DEI efforts are undermined—defensive appeals to free speech reduces willingness to hold perpetrators accountable of racism and sexism. However, shifting attention to the consequences of bias successfully offsets the effect of the free speech appeal. Together, these talks refine our understanding of diversity initiatives in the increasingly hostile environment, and present new directions for research and practice.

Diversity Incentives Can Increase Women's Aspirations to Lead

2:00 PM – 3:10 PM

DIVERSITY

To boost diversity, organizations sometimes use "diversity incentives," or payouts for managers or executives dependent on progress towards a diversity goal. While the effects of incentives on actors are well-documented, it is unclear how targets (marginalized group members who are the focus of the incentivized goal) will be affected. We examine how gender diversity incentives affect women's aspirations to lead. On one hand, diversity incentives may generate identity threat and concerns about backlash among women; on the other, they may be viewed as costly signals of organizational support for women's leadership aspirations. A preregistered field experiment (n=2,035) shows that communicating the existence of organizational diversity incentives increases women's aspirations to lead by 11.3% relative to sharing a goal-free diversity statement and by 11.7% relative to communicating diversity goals alone. We replicate these findings across three preregistered experiments (total n=2,495) and provide evidence that diversity incentives increase women's expectations of receiving sponsorship from their managers, thereby increasing their willingness to state leadership aspirations.

Actual and Perceived Impacts of Partisanship on Support for DEI

2:00 PM – 3:10 PM

DIVERSITY

Past research finds that organizational DEI efforts threaten White identity, resulting in racial backlash that may deter DEI efforts. Given that White Americans became more polarized on racial equity in the past decade, four studies (n = 3,189) examined how partisanship complicates previous understandings of DEI backlash. In Study 1, racialized backlash depended on partisanship, as White Republicans were less supportive of DEI policies than White Democrats and Black participants of any party, who did not differ. Despite these differences, support was generally high and White Republicans were ambivalent rather than hostile to the policies. Even so, participants in Study 2 overestimated opposition from White Republicans and White people more generally. However, Studies 3 and 4 found mixed evidence that expected backlash directly impacts White Democrats' and Republicans' support for DEI, complicating questions about the dissuasive effects of anticipated backlash. Overall, these findings suggest that theories of racial backlash to DEI should include politics as a critical consideration. We discuss implications for future DEI research in a changing political landscape.

Dismiss or Defend? The Impact of Litigation on Diversity Policy Support

2:00 PM – 3:10 PM

DIVERSITY

As conservative-backed litigation increasingly attacks diversity, equity, and inclusion (DEI) policies, a key question is how exposure to anti-DEI litigation will impact people who have historically supported diversity policies (e.g., Black Americans and White Democrats) – will anticipated supporters defend DEI or withdraw their support? Across one archival study and two pre-registered experiments (N = 1007) on full-time employed Americans recruited from Prolific, we demonstrate that exposure to an anti-DEI lawsuit alone undermines diversity policy support—as strongly as ruling it illegal. Litigation erodes support by exacerbating the perceived harm and minimizing the perceived benefits of the challenged policy. However, organizations that defend their policies successfully maintain support for not only their policy, but also diversity policies in general. This research illustrates the unexpected effectiveness of anti-DEI litigation at undermining policy support amongst anticipated supporters. Proponents of DEI cannot take for granted that these challenges to DEI will not erode support.

“What About Free Speech?” Free Speech Appeals Reduce Bias Accountability

2:00 PM – 3:10 PM

DIVERSITY

We examine how free speech appeals affect evaluations of biased speech and accountability intentions. Results from four studies (N = 3897) found that (a) appeals to free speech (relative to alternate appeals or saying nothing) reduced severity evaluations and accountability intentions for both racism and sexism (b) Information about a policy mandating inclusion did not eliminate our effect, whereas a policy mandating free speech reduced accountability for bias, even in the absence of a free speech appeal (c) These appeals work by activating concerns about free speech and reducing the relative weight placed on concerns about bias (d) An intervention that shifted attention back to the consequences of bias offset effects of the free speech appeal. Our findings illustrate the exculpatory effect of free speech appeals, even for explicitly racist and sexist speech. These findings advance our understanding of how people navigate the tension between free speech permissions and biased speech prohibitions, which contributes to scholarship about how diversity, equity, and inclusion efforts get undermined.

The Psychology of Privilege: Implications for Morality, Politics, and Society

2:00 PM – 3:10 PM | Location: E270, Level 2

SOCIAL JUSTICE

Amidst persistent inequality, growing tensions around DEI, and challenges to meritocracy, understanding the psychology of privilege has become increasingly urgent. This symposium offers four cutting-edge talks on the profound effects of privilege upon the social realm. The first talk shows how even when privilege is explicit and unearned, advantaged individuals fail to perceive or correct for its impact. The second highlights how dominant group members systematically misperceive the emotions of the disadvantaged, fuelling social division. The third uncovers distinct patterns in strategies employed to manage advantaged racial identities, with implications for social change. Finally, the fourth talk illustrates how public denials of privilege shape collective perceptions of inequality as fair, reinforcing inequality. Together, these talks offer fresh insights and innovative methods for understanding how privilege shapes social relations, morality, and politics.

(Under)estimating unearned advantage and disadvantage: Insights from a gamified experiment

2:00 PM – 3:10 PM

SOCIAL JUSTICE

The absence of clear metrics to disentangle merit from privilege in real-world contexts (e.g., college admissions) makes it easy for dominant groups to deny its existence. We address this with a field experiment, by directly manipulating a quantifiable, unearned dis/advantage, devoid of social identity confounds: participants were randomly assigned to a closer (advantage) vs farther (disadvantage) starting line, in a solo game of cornhole. Successful throws earned raffle tickets for a monetary prize, and could be kept/donated. Our data shows that while individuals can acknowledge their privilege, they fail to translate its impact on actual outcomes: disadvantaged participants accurately guessed how well they'd perform from the closer line, but advantaged participants undermined the impact of disadvantage by overestimating their performance from the farther line. Lastly, despite (unfairly) earning more, advantaged participants donated similarly to disadvantaged ones, and favored inequality-blind (vs redistributive) approaches. Thus, even in a low-stakes game where the advantage was clearly visible and illegitimate, individuals failed to understand and correct for their privilege.

Systematic Intergroup Misperceptions of Emotional Reactions to Privilege

2:00 PM – 3:10 PM

SOCIAL JUSTICE

Race relations in the United States remain deeply strained, driven by both structural inequalities and psychological factors. This research examines one understudied factor: how majority and minority group members misperceive each other's emotional reactions to racial inequity. Drawing from research on false polarization and hierarchy maintenance motives, we predict that groups systematically misjudge each other outrage about racial inequities, specifically white privilege. Six preregistered experiments provide consistent support for our predictions: majority

group participants overestimated minority group members outrage toward racial inequity, whereas minority participants underestimated majority group members outrage. Supplemental experiments replicate this pattern across gender and socioeconomic inequities. Using experimental tests of mediation and moderation, we show that misperceptions about the outgroup hierarchy maintenance motives drive these biased predictions. This research provides evidence for systematically distorted perceptions regarding racial inequity that may hinder intergroup trust and solidarity.

Advantaged identity management strategies differentiate five subgroups of white Americans

2:00 PM – 3:10 PM

SOCIAL JUSTICE

The United States is experiencing significant social change, compelling white Americans to grapple more directly with their white identity. We examine how white Americans manage their identity amid such shifts using a recently developed measure of advantaged identity management, representative data (N = 2,648), and latent profile analysis. Findings reveal five subgroups of white Americans, each managing their identity differently. Four profiles correspond to the main advantaged identity management strategies [defend (n = 251), deny (n = 528), distance (n = 694), dismantle (n = 612)], with a fifth using strategies flexibly (n = 563). We examined how valuing hierarchy, meritocracy, and egalitarianism predicted membership in the subgroups, and most of our predictions about these relationships were supported. The profiles show contrasting attitudes toward social change, with defender-deniers opposing, denier-distancers moderately opposing, distancers remaining neutral, and dismantlers supporting change. Findings provide evidence for the theorized model of white identity management and suggest that how white Americans manage their identity has important implications for social change.

Privilege Denials Infect Onlookers: Exploring Mechanisms of Herd Invisibility

2:00 PM – 3:10 PM

SOCIAL JUSTICE

The herd invisibility model (Phillips & Lowery, 2018) suggests dominant group members' motivated privilege denials can also change observers' own beliefs about the existence of inequality. We test this model empirically across 7 studies. Our data suggests that observers' are swayed by privilege denials they perceive as more relevant and more severe; such claims lead observers to like claimants more, and in turn deny the existence of privilege more.

We show this across multiple domains of privilege, including class, race, sexual orientation, and gender. In turn, privileged targets' defensive claims can spill over to affect third-parties' perceptions of systemic inequity: observers' disbelief that the target is privileged is associated with increased perceptions of meritocracy, ultimately decreasing observers' support for inequity-reducing policies. This shows how the "invisibility" of privilege can emerge through individual actions that spill over to others. Even without explicit system-defensive intent, privileged individuals' defensive victimhood claims can ultimately maintain group inequity by altering third-party perceptions of inequity in organizations more broadly.

When Attitudes Collide: Perception, Judgment, and Trust Across Attitudinal Divides

2:00 PM – 3:10 PM | Location: E265, Level 2

ATTITUDES/PERSUASION

In an era of polarization, this symposium offers an essential multi-level perspective on attitudinal divides, using innovative methods to test critical new questions about how people react to changes in opinion and fundamental disagreements, including the cognitive mechanisms underlying these phenomena. The first talk reveals a surprising phenomenon: people tend to value those who change their minds in response to challenging evidence, even when they disagree with the new stance. In contrast, the second talk documents evidence across hundreds of topics for a powerful and generalizable bias to favor those who share one's views, particularly on moralized issues. The third talk illustrates the far-reaching impact of this bias, showing how ideological alignment shapes judgments of aesthetic value and even decisions about artists' financial compensation. The final talk examines the "hot" motivational and "cold" cognitive processes that shape reactions to politically congenial versus uncongenial information. Together, these talks offer new insights into the social, normative, and cognitive factors driving people's social experiences in a divided society.

Changing Minds, Gaining Trust? The Social Norm of Attitude Shifts

2:00 PM – 3:10 PM

ATTITUDES/PERSUASION

How do we evaluate those who change their minds in response to counter-attitudinal information? While research often focuses on our resistance, this work adopts a third-person perspective to uncover social norms. Across a series of studies (N = 2189), we find a robust positive norm: individuals who change their mind following counter-attitudinal information receive higher trustworthiness ratings, based on a multi-item impression scale, than those who maintain their stance. This effect is stronger when the information is evidence-based vs. opinion-based. The preference holds across abstract and concrete topics (e.g., political issues), even when the new belief is incongruent with participants' attitudes or pertains to a moral principle. We also explore a potential boundary condition for this effect. Initial findings suggest that for participants with strong prior attitudes on the topic, the norm may be overridden by motivated reasoning, leading them to favor a target whose final stance aligns with their own. This research primarily highlights a social norm that values evidence-based attitude shift, while pointing to personal conviction as a factor that may qualify this principle.

The Generalizability of Agreement Effects

2:00 PM – 3:10 PM

ATTITUDES/PERSUASION

Understanding what shapes interpersonal dynamics in diverse online networks is increasingly important in today's polarized society. We consider one key driver—opinion alignment—and advances understanding of this fundamental, psychological phenomenon through an innovative methodological paradigm. We use a topic sampling design to rigorously test how different opinions expressed on social media—from popular culture to politics to public health—bias people to (dis)like or (dis)trust those whose opinion (mis)aligns with their own (i.e., "the agreement effect"). Across more than 20,000 instances of agreement and disagreement over hundreds of widely varying topics, we find surprisingly generalizable evidence for this interpersonal bias. At the same time, we also observed significant heterogeneity in the agreement effect across topics. We explain some of this heterogeneity through a novel meta-analytic approach, finding that the agreement effect is reliably amplified for normatively moralized topics. This work provides robust evidence and new understanding for a deeply relevant social phenomenon as well as a playbook for extending the external validity of other behavioral research.

Ideological alignment shapes judgments of aesthetic value and financial compensation.

2:00 PM – 3:10 PM

ATTITUDES/PERSUASION

Why do people perceive certain objects—such as artworks, faces, or logos—as beautiful, while others are less appreciated? The present research examined how alignment between the ideological content of an object and a person's attitudes influenced aesthetic judgments. Specifically, we investigated how individuals evaluate the logos of news media organizations, depending on the degree of alignment between their political orientation and that of the organization. The logos used in our studies represent both real (Study 1) and fictitious (Study 2) news outlets. Participants provided not only personal liking ratings but also evaluations of the logos' objective aesthetic quality, as well as judgments about how much the designers should be paid—even for work unrelated to the media organization. Our findings reveal a strong effect of ideological alignment, suggesting that even formal aesthetic evaluations and judgments of beauty are significantly shaped by attitudinal consistency with the object's political content. Implications and limitations related to the US political context are discussed.

Is partisan bias motivated and what does motivated mean anyway?

2:00 PM – 3:10 PM

ATTITUDES/PERSUASION

The evidence for partisan bias in political judgment is overwhelming: political partisans seek out, believe and remember information that supports their political beliefs and allegiances (politically congenial information) more readily than information that challenges those beliefs and allegiances (politically uncongenial information). A persistent point of contention, however, concerns whether this partisan favoritism is a product of a "cold" and relatively rational process driven by the Bayesian integration of new information with prior beliefs, or instead a product of a "hotter" and less rational process driven by the motivation to resist information that challenges preferred political beliefs or cherished identities. In my talk, I will review a series of experimental studies showing that partisan bias in evaluations of scientific information is driven by its consistency with both priors and preferences and that the two processes are entangled and mutually reinforcing in interesting ways. In my analysis of these findings, I will offer an integrative account of partisan bias based on the relative fluency of politically congenial and politically uncongenial information.

Invited Symposium: Social and Personality Psychology's AI Moment

2:00 PM – 3:10 PM | Location: E353B, Level 3

LANGUAGE

Artificial intelligence is starting to change social and personality psychology. This symposium brings together diverse perspectives to examine how. We explore both reasons for optimism and causes for caution. In the first talk, we examine how AI is changing survey platforms, opening new avenues for data collection, evaluating the quality of participant responses, and creating study materials. In the second talk, we examine how to gather quality data using new methods that capture authentic behavior in real time and how to stop (or detect) participants from using AI when we don't want them to. In the third talk, we transition to some intrinsic limitations of LLMs, describing how a lack of exploration by LLM models can create new social biases. Finally, in the fourth talk, we discuss evidence that LLMs misportray different demographic groups, giving researchers reasons to be cautious when using AI to create "synthetic" data. Together, the talks in this symposium provide a look at where psychology and AI are in the current moment and where they might be headed.

How AI is Changing Survey Platforms and What It Means for Data Quality

2:00 PM – 3:10 PM

Many aspects of behavioral research have changed in the last 15 years, but survey platforms like Qualtrics have largely remained the same. AI is starting to change that. In this talk, I will describe some ways AI-powered survey platforms may change social and personality psychology. These include new ways to conduct dynamic "conversational surveys" that adapt to participants in real-time, capture nuances that traditional Likert scales may miss, and efficiently analyze open-ended responses at scale. It also includes new ways to monitor and evaluate data quality, helping researchers "see" what happens on a participant's device as they complete the study. Finally, AI-powered survey tools can measure attitudes and public opinion in new ways and even measure moderating variables based on participants' conversation. Ultimately, what AI-enabled survey tools offer is several new and exciting ways for psychologists to study people's thoughts, feelings, and behaviors.

Steps for Ensuring Data Quality in Online Data Collection

2:00 PM – 3:10 PM

The rapid growth of crowdsourced survey platforms has provided researchers with unprecedented access to diverse and scalable participant pools. Yet, in the era of generative AI, concerns about data integrity and participant authenticity are more pressing than ever. This talk will explore practical strategies for ensuring data quality, including proactive bot detection methods, well-designed attention and comprehension checks, and rigorous post-survey cleaning procedures. Beyond traditional approaches, I will highlight the shift toward mobile-first data collection, where passive sensing, wearables, and smartphone-based measures open new frontiers for capturing authentic behavior and context in real time. These methods potentially sidestep the risks of AI-driven bots but also raise new challenges around participant privacy, compliance, and technical integration. I will discuss how researchers can balance convenience and quality in the age of technology-based data collection practices.

Large Language Models Develop Novel Social Biases Through Adaptive Exploration

2:00 PM – 3:10 PM

As large language models (LLMs) are integrated into real-world decisions, the consequences of their social biases intensify. In this talk, I argue that simply removing biases from models is not enough. Using a paradigm from psychology, I demonstrate that LLMs can spontaneously develop novel stereotypes about artificial demographic groups even when no inherent differences exist. These biases lead to highly stratified task allocations, which are less fair than assignments by human participants and are exacerbated by newer and larger models. Emergent biases like these result from exploration-exploitation trade-offs, where the decision-maker explores too little, allowing early observations to strongly influence subsequent decisions. Testing a series of interventions, explicitly incentivizing exploration most robustly reduces stratification, highlighting the need to incorporate better multifaceted objectives to mitigate bias. These results reveal that LLMs are not merely passive mirrors of human social bias, but can actively create new ones from experience, raising concerns about how these systems will shape societies and psychological research over time.

Ethical Considerations Around Human Participant Data in the Age of LLMs

2:00 PM – 3:10 PM

Large language models (LLMs) are entering psychology research in many ways, but I will focus on two that directly affect the generation of human data: intentionally, when researchers replace human participants with LLMs, and unintentionally, when human participants use LLMs to generate their responses. I offer technical and normative cautions against the first, arguing that LLMs should not substitute for human participants. While one might respond by surveilling participants to prevent the second, I instead pose some ethical considerations about moving beyond a cat-and-mouse dynamic toward more cooperative approaches to sustain trust and integrity in this new research landscape.

Public Outreach: A Panel with Santos, Milkman, Pizarro, and Neumann

3:30 PM – 4:40 PM | Location: E450A, Level 4

These are challenging times for academia in general and social science in particular. In the U.S., for example, both the prestige of and funding for higher education are in decline. In this context, it is especially urgent for social/personality psychologists to help the public understand the nature and value of our work. In this discussion, we hear from four scholars who invest substantial professional effort in public outreach—and who have achieved considerable success therein. Laurie Santos hosts "The Happiness Lab" podcast, Katy Milkman writes the "Milkman Delivers" Substack and hosts the "Choiceology" podcast, David Pizarro hosts the "Very Bad Wizards" podcast, and Eric Neumann co-founded and co-hosted (as a PhD student) "The Stanford Psychology Podcast." Panelists answer questions such as: (1) Why did you decide to engage seriously in public outreach? (2) How did you launch such efforts? (3) Why were they successful? (4) How did you select your medium/media (podcast, newsletter, etc.)? (5) Have you cut back on other aspects of your career to pursue these efforts? (6) What should scholars understand about the business aspects of public outreach?

Grant-seeking from Private Foundations: What Investigators Should Know

3:30 PM – 4:40 PM | Location: E451A, Level 4

Seeking external funding for social science research is a competitive process and preparing a successful grant application can be challenging and time-consuming. In addition to government sources of research funding, private foundations can be an important source of financial support for scholarly research. This session will provide grant writing tips and insights into the application and review process from both the grant-making and grant-seeking side. The panel includes two prominent private funders of social, psychological, behavioral, economic, and policy-relevant research—the Russell Sage Foundation and the American Psychological Foundation—and two of their grantees. With extensive funding experience and evaluating proposals as part of the grant-making process, program staff from each foundation will discuss their grant application and review process, and the basics of what makes a good grant proposal. Grants recipients will discuss and provide insights about the application process from the grant-seeking side as well as their experience reviewing proposals for foundations. This session is intended to provide valuable information to all scholars, from doctoral students to late career researchers.

Examining the sexual afterglow: A conceptual and extended replication study

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

Sexuality is an integral part of many romantic relationships. A previous study by Meltzer et al. (2017) has found evidence for sexual afterglow in North American couples—a beneficial effect of sex on subsequent measures of sexual and relationship satisfaction. The authors found that sexual satisfaction was higher on days the couples had sexual contact. Sexual satisfaction stayed elevated at 24h and 48h (but not 72h) after sexual contact and this effect was robust against control variables (e.g., sexual frequency, personality traits). Furthermore, sexual afterglow predicted relationship satisfaction contemporaneously and after 6 months. The present preregistered study aims to replicate and extend these effects with a larger couple sample using dyadic multilevel modeling and data from a 4-wave 14-day diary study. N = 488 female–male couples from Germany, Switzerland, and Austria completed all 4 waves and were used for the analyses (age: M = 32.4, SD = 13.6, range = 18-81). We will also extend the original study by examining sexual afterglow on other relationship variables, such as responsiveness and closeness, and how sexual afterglow predicts relationship satisfaction across 12 and 24 months. Our findings will be specific to different-gender couples in Western contexts, but replication across diverse relationship configurations and other cultural settings will strengthen the generalizability of sexual afterglow effects.

How do symbols of close others support attachment in adulthood?

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

Security priming involves using attachment-relevant cues—like photos of loved ones—to enhance psychological security. While such effects have been demonstrated in the lab, their real-world impact is less clear. Here we examine whether displaying photos of romantic partners on smartphone lock screens can influence attachment security in adulthood. In Study 1 (N = 4,741), we showed that people who had their partners on their screens reported greater attachment security on average. In Study 2 (N = 306; two-week field experiment), we randomly assigned people to add photos to their screens. We did not observe security priming effects, but we did observe selection effects (i.e., secure people were more likely to have their partners on their screens prior to randomization). In Study 3 (N = 249), we removed images from people's screens. This led to measurable declines in attachment security. Although lock screen images may reflect existing levels of security, their removal—not their addition—yielded detectable effects. We discuss implications for scalable interventions and for understanding the role of “invisible infrastructure” in shaping psychological functioning.

Relationship status and well-being across time

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

In our recently published manuscript (2025), we examine the correlations between romantic partnering and individual well-being across sexuality groups in three separate samples (N=4,742). We find that while romantic partnering is generally associated with greater well-being (as opposed to singlehood) across all sexuality groups, there are specific well-being variables such as depressive symptoms, loneliness, and thriving that have significantly different patterns for sexual minority subjects as compared to straight subjects. In continuation of this work, we have collected a new unpublished longitudinal sample (N=854) across six timepoints in order to test how relationship status and well-being change in tandem over time. So far, our preliminary analyses indicate that relationship status change between time points is correlated with changes in well-being as measured by some of our variables, but not others. We also plan to examine whether these changes are the same across sexuality groups. We include measures of potential mechanisms that may mediate the association between relationship status and well-being, in order to better understand the findings from our previous studies. This work is uniquely situated to better understand how romantic relationships contribute to (or detract from) well-being, paying particular attention to the context of sexual orientation.

Sexual satisfaction predicts better relational, psychological, and physical health: A longitudinal study of couples with concealable chronic illness

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

Couples managing chronic illness can experience challenges in their daily activities and relationships that increase dissatisfaction and distress risks. Many chronic illnesses are concealable, with symptoms that affect their sexual intimacy and relationships. However, maintaining intimacy is important for relationships and well-being, particularly among those with chronic illnesses. In this longitudinal study, we applied dyadic stress and coping frameworks to examine how sexual satisfaction provides relationship and health benefits. Couples (n = 242), where one partner was diagnosed with a concealable chronic illness, completed three online surveys 6 months apart. On average and when patients' and partners' sexual satisfaction was higher than usual that year, they reported fewer physical health problems, lower psychological distress, greater relationship satisfaction, and enhanced closeness. Cross-partner effects showed that their higher sexual satisfaction was also associated with each other's higher relationship satisfaction and closeness. Maintaining a satisfying sexual relationship may help promote couples' health and relationships while managing concealable chronic illness.

Emerging Directions in Personality and Relationship Science: From Open Science to Interpersonal and Friendship Dynamics

3:30 PM – 4:40 PM | Location: E353C, Level 3

PERSONALITY PROCESSES/TRAITS CLOSE RELATIONSHIPS OTHER

Personality and relationship science is rapidly evolving in both research practices and theoretical perspectives on interpersonal processes. This symposium integrates work on scientific practice with new empirical insights into personality and close relationships. Willroth presents a thematic analysis of barriers to adopting open science practices in personality psychology. Shen introduces research on interpersonal enhancement, highlighting how people selectively share information to support others' self-views. Yang examines actual and perceived personality similarity among friends and their links to relationship satisfaction. Hong compares competing models of friendship satisfaction, finding stronger support for friend-value processes grounded in social comparison than ideal trait matching. Together, these talks underscore key methodological and interpersonal dynamics shaping the study of personality and social relationships.

A Thematic Analysis of Barriers to Open Science in Personality Research

3:30 PM – 4:40 PM

OTHER

The field of personality science has contributed substantially to the open science movement, with some personality researchers asserting that we have played an outsized role relative to the modest size of our subfield. However, personality researchers still face barriers to the implementation of open science practices. In this talk, we will present findings from a mixed methods survey-based study of 36 corresponding authors of papers published in personality journals between 2020-2025. Participants answered open-ended questions about the barriers that they face in the implementation of open science practices and the realization of open science ideals. We used reflexive thematic analysis to generate themes from participants' qualitative responses. We will discuss implications of these findings including the pressing need for open science advocates to engage more deeply with researchers who have hesitations and epistemological concerns about open science, as well as opportunities for the development of new open science tools and resources. The aim of this talk is to start a conversation, informed by new data, about how we can address barriers to open science to make the future of personality science more credible, accessible, and inclusive.

Enhancing Others Through Information Selection

3:30 PM – 4:40 PM

PERSONALITY PROCESSES/TRAITS

People consider themselves better than others across domains. Most past research, however, has focused on how individuals enhance their own self-views, without considering the interpersonal processes that might help to promote or maintain these views. Over seven studies (six preregistered, N = 3117), this work revealed that people seek to enhance others' self-views through information selection. When asked to provide feedback for test-takers in an anonymous environment, participants were more likely to choose information that the test was valid when others performed well but invalid when the test-takers performed poorly. However, this selection pattern was present only for likable and neutral others, dissipating when the others were described as having reproachable traits (Studies 1-3, 5a and 5b) and when participants had the goal of providing accurate information (Study 6). This selection bias, driven by an interest in pleasing others (Studies 3, 5a, and 5b), persisted when the others did not have self-enhancing views, and when the information selected was described as objectively correct (Studies 4, 5a, and 5b). This work shed light on the human nature of interpersonal enhancement.

Friend Personality Similarity and their Implications for Relationship Well-Being

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

The similarity-attraction hypothesis has long been regarded as a foundational principle for understanding interpersonal relationships. Yet, recent research on the personalities of real-life friends has yielded mixed results, often revealing negligible or inconsistent similarities in personality attributes. Moreover, little is known about whether and how personality similarity among friends affects their relationships. The present study using a round-robin designed 371 quads of friends (N = 1,483 individuals) examines (1) how similar friends' Big Five personality traits are in terms of actual and perceived similarity and (2) whether the similarity predicts relationship well-being. Multilevel models revealed similarity in all traits (except for actual extraversion), but the associations were stronger for perceived similarity than actual similarity. Response surface analysis showed no evidence of similarity effects across all traits and models, but strong actor and partner effects on relationship satisfaction. Our findings contribute to the debate on similarity as a heuristic for friendship compatibility and enhance our understanding of how personality relates to friendship quality.

Testing Competing Models of Friendship Satisfaction

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

Despite the well-established benefits of close friendships for human health, happiness, and flourishing, little is known about why we feel more satisfied with—and motivated to maintain—some friendships over others. We address this by testing between different models of friendship satisfaction: The Ideal Preference Model posits that satisfaction stems from how closely friends' genuine traits match one's ideal traits. The Friend Value Model suggests instead that satisfaction is shaped by social comparisons among oneself, one's friend, and potential alternative friends. Across two preregistered studies (N = 1,286), we find support for the Friend Value Model, but not the Ideal Preference Model. Satisfaction was lowered when participants felt more socially desirable than their closest friend and had more desirable alternative friends in their environment. Further, friendship satisfaction mediated the effects of the Friend Value Model on investment in the friendship, suggesting that lower friend value decreases commitment by reducing satisfaction.

Challenging social inequality in a polarized world

3:30 PM – 4:40 PM | Location: E351, Level 3

SOCIAL JUSTICE

People have polarized views about social inequality, yet it is pervasive and increasing throughout the world. This symposium showcases cutting-edge scholarship on previously under-explored psychological processes that shape people's polarized views of inequality and whether they intend to challenge it. Talks in this symposium combine a series of methodologies (i.e., correlational and experimental studies) while leveraging large and politically diverse samples. The first and second talks highlight that while there are considerable gaps in how liberals and conservatives perceive various aspects of inequality (e.g., size and scope), social norms and neutral language can attenuate these polarized perceptions. The third and fourth talks show how people can become more egalitarian: when they learn that privilege accumulates over time and across settings (e.g., schools, jobs), and when they perceive allyship—a key factor in mobilizing change—as part of their true self. These talks collectively shed light on what drives polarized perceptions of inequality as well as what can be done to overcome seemingly intractable barriers.

Altering language reduces backlash against diversity training in organizations

3:30 PM – 4:40 PM

SOCIAL JUSTICE

Diversity, equity, and inclusion (DEI) is an increasingly divisive topic in the U.S., creating new challenges for organizations aiming to elicit employee buy-in to diversity training. As political debates about DEI and internal workplace communication about DEI tend to use similar language, we examined if decoupling workplace terminology from that used in the political sphere improved employees' diversity training attitudes. Four pre-registered studies show that replacing common DEI terminology (e.g., "diversity") with carefully-matched alternative terminology (e.g., "differences") in diversity training descriptions increases participants' (particularly Republicans') enthusiasm to engage with the content. This effect was partially mediated by perceived political bias and was robust controlling for understandability and beliefs about whether the training related to race and gender. Altering language did not impact racial minorities' training attitudes, or feelings of inclusion and belonging. Findings highlight how separating diversity training content from politically-coded language can reduce employee resistance to learning about diversity, equity, and inclusion at work.

Norms shape the magnitude of inequality conservatives and liberals perceive

3:30 PM – 4:40 PM

SOCIAL JUSTICE

We examine whether the acceptability of economic differences (social norms) shape the magnitude of inequality that liberals and conservatives perceive. As conservatives are more attuned to the social dynamics of their environments than liberals, social norms will more strongly influence conservatives' perceptions of economic inequality. We hypothesize that when norms dictate economic differences as more acceptable (e.g., for occupations), conservatives will perceive economic inequality as larger than liberals. We hypothesize the opposite when norms dictate economic differences as less acceptable (e.g., for race). We conducted three studies across contexts that vary in norms about the acceptability of economic inequality (U.S. and the Philippines; $N = 1,832$). We found that conservatives perceived inequality as smaller than liberals in the U.S. (especially when economic differences were less acceptable), and the opposite in the Philippines where inequality is more acceptable. In two subsequent studies ($N = 1,058$), these results were most robust when inequality referred to groups high in entitativity (e.g., race). We discuss implications and future research directions.

Cumulative Inequality Aversion

3:30 PM – 4:40 PM

SOCIAL JUSTICE

People seem to both prefer and to be averse to income inequality. Surveys reveal a preference for some inequality (e.g., Ariely & Norton, 2011), while lab experiments show aversion to unequal outcomes (e.g., Shaw & Olson, 2012). Scholars argue that people care less about inequality itself and more about whether they perceive it as fair (Starmans et al., 2017). Because most people view meritocracy as fair, they tend to accept inequality that results from a merit-based process as also fair (Tyler, 2011). Yet real-world advantages accumulate across stages—school quality, university prestige, and job placement, amplifying early advantages. We hypothesized that highlighting this cumulative nature of the inequality generating process would reduce the perceived fairness of meritocracy. In a pre-registered study ($N = 1,109$), we found that participants rated the fairness of meritocratic processes ($\beta = -0.34$, $p < .001$) and their unequal outcomes ($\beta = -0.49$, $p < .001$) as significantly less fair when cumulative inequality was made explicit. These findings reveal what we call "cumulative inequality aversion": people reject meritocratic inequality once they see how advantages stack over time.

Authentic Allyship? Feeling authentic increases allyship behavior via psychological standing

3:30 PM – 4:40 PM

SOCIAL JUSTICE

Public discourse regarding allyship has increasingly bemoaned inauthentic allyship, suggesting that authenticity is important for marginalized groups. However, little work has explored how allies view their own authenticity (alignment between internal beliefs and external states) as an ally and the consequences of authenticity for future engagement in allyship. We suggest it is important for allies to feel that it is consistent with their "true" self. We test whether affirming allies' authenticity as an ally increases allyship by increasing their psychological standing (legitimacy to perform an action). We test our hypotheses across 8 studies (N=5,515). First, in a field study, we find that felt authenticity as an ally was associated with greater engagement in allyship after the murder of George Floyd. Next, in three experiments we find that feelings of authenticity as an ally lead to greater allyship engagement. Finally, two experiments show that allies' authenticity as an ally increases their allyship engagement via psychological standing (belief that they can participate) by increasing their perceptions of self-relevance and their belief that moral values drive their actions.

Correcting Climate Misperceptions: Psychological Mechanisms Driving (and Distorting) Behavior Change

3:30 PM – 4:40 PM | Location: E450B, Level 4

JUDGMENT/DECISION-MAKING

Reducing carbon emissions requires individuals to accurately judge which actions matter most, yet climate-related misperceptions are pervasive and can distort behavioral priorities. This symposium examines the psychological mechanisms that generate, maintain, and sometimes amplify these misperceptions, as well as the consequences of correcting them. The first talk tests how climate literacy interventions recalibrate efficacy perceptions, shifting commitments toward higher-impact behaviors but inadvertently reducing collective action intentions. The second talk shows how partisan media coverage of extreme weather disrupts normative inference, with ideologically incongruent messages producing misperceptions of group attitudes. The third talk investigates consumer judgment under greenwashing, identifying attribute substitution as a key mechanism driving systematic misestimation of product sustainability. The final talk evaluates whether generative AI, through personalized feedback, can improve impact perceptions and motivate high-impact behaviors beyond traditional information sources. Together, these studies reveal how cognitive and social processes shape climate misperceptions and behavior, highlighting both the promise and psychological complexity of interventions targeting them.

Speaker

Danielle Goldwert
PhD Student | NYU

Climate Action Literacy Interventions Increase Commitments to More Effective Mitigation Behaviors

3:30 PM – 4:40 PM

JUDGMENT/DECISION-MAKING

Reducing lifestyle carbon emissions is crucial for decarbonization, yet people often misjudge the relative efficacy of different behaviors, such as recycling versus avoiding long flights. These misperceptions may lead to suboptimal effort allocation. In a preregistered U.S. experiment (n = 3,895), we tested whether climate literacy interventions could correct these misperceptions and shift commitments toward higher-impact actions. Participants were randomly assigned to: (1) a Prediction condition, ranking the mitigation potential of 21 behaviors before receiving feedback; (2) an Information condition, passively receiving the same efficacy information; or (3) a Control with no information. Both interventions improved efficacy perceptions and increased commitments to higher-impact actions relative to Control. Effects were strongest among those with greater initial misperceptions, who decreased commitments to overestimated actions and increased commitments to underestimated ones. However, literacy interventions also produced a negative spillover: participants reduced commitments to collective actions (e.g., voting), highlighting an unintended consequence of emphasizing individual solutions.

Attributing Hurricanes to Climate Change: Sources of Accuracy and Errors

3:30 PM – 4:40 PM

JUDGMENT/DECISION-MAKING

This project examines how partisan television influences attitudes and perceived social norms in the context of extreme weather events and their attribution to climate change. We use a comprehensive dataset comprising all mentions of major hurricanes since 2010 across cable news networks to investigate how discussions of extreme weather—and its linkage to climate change—vary by network. Critically, we identify a set of cases in which individuals affiliated with one political party appear on ideologically incongruent networks to discuss local extreme weather events, introducing unexpected normative cues about attributing extreme weather to climate change. To assess the effects of such mixed messaging, we conduct an online experiment (N = 820) in which participants are exposed to climate attribution messages that either align or conflict with the expected partisanship of three media outlets. Our results indicate that exposure to incongruent messages—such as climate skepticism on MSNBC—lead to misperceptions of group norms. These findings offer new insight into the mechanisms by which individuals extract normative information from media.

From Inference to Illusion: How Greenwashing Distorts Consumer Judgment

3:30 PM – 4:40 PM

JUDGMENT/DECISION-MAKING

Even motivated consumers often lack the knowledge necessary to identify sustainable consumption opportunities. This knowledge gap presents a major barrier to sustainable consumption. It also creates space for firms to position their products as aligned with consumers' demand for sustainability, often through marketing claims. Some of these claims are credible, relevant, and informative—but many others are not. In this paper, we characterize greenwashing as a consequential marketing problem and examine the psychological process through which it shapes consumer judgment. Across 11 preregistered studies with over 3,500 participants, we demonstrate how greenwashing operates, provide causal evidence of the role of attribute substitution in sustainability judgments, and begin to quantify the climate and economic consequences of consumers' systematic misestimation. We conclude by discussing the implications of consumer misestimation and exploring how these ideas apply more generally.

Addressing Climate Action Misperceptions with Generative AI

3:30 PM – 4:40 PM

JUDGMENT/DECISION-MAKING

Mitigating climate change requires widespread behavior change. However, even climate-concerned individuals often hold misperceptions about which actions most effectively reduce carbon emissions. We recruited 1204 climate-concerned participants to examine whether discussing climate actions with a large language model (LLM) equipped with climate knowledge and tailored to provide personalized responses would promote more accurate impact perceptions and greater intentions to engage in high-impact behaviors, compared to using web search, a default LLM, or no intervention. The results show that participants in the personalized LLM condition produced more accurate impact assessments than those in the control and default LLM conditions, but did not differ from web search. However, the personalized LLM also increased intentions to perform high-impact behaviors relative to both the control and web search. The findings suggest that while LLMs might not outperform web searches in improving knowledge of climate action impacts, their ability to deliver personalized, actionable responses might more effectively motivate impactful pro-climate behavior change.

Gun Psychology: Wide-ranging consequences for cognitions, emotions, attitudes, and intentions

3:30 PM – 4:40 PM | Location: E253AB, Level 2

ATTITUDES/PERSUASION

Guns are more prevalent than ever in the United States, and their proliferation is having a profound impact on American society. The four talks in this symposium trace some of the psychological implications of guns both inside the laboratory and outside the ivory tower. The first talk reports on a laboratory experiment that found the presence of a gun reduces students' performance on a well-validated measure of cognitive control. The second talk considers the effects of exposure to gun violence on weapon carrying behavior in a large

sample of Black male adolescents. The third talk features two studies testing the effects of ethnic status threats on interest in guns and on civic engagement, respectively. The fourth talk tracks changes in gun attitudes in response to the 2024 U.S. presidential election in large samples of Asian, Black, Latine, and White U.S. residents. Using different methods, diverse samples, and novel approaches, these talks foreground profound but previously overlooked effects of guns on a range of outcomes of interest to social and personality psychology.

The presence of a gun undermines cognitive control

3:30 PM – 4:40 PM

ATTITUDES/PERSUASION

Guns are more prevalent than ever in academic spaces. How do they influence students? For example, do students perform more poorly in the presence (versus absence) of a gun? A vast body of evidence suggests that threats in the environment distract attention away from focal tasks and goals. Insofar as guns are threatening stimuli, then guns, too, may serve as distractions that undermine task performance. In one preregistered experiment we tested the hypothesis that the presence (versus absence) of a gun reduces performance on a cognitive control task in a laboratory setting. A sample of 290 undergraduate students performed three Squared tasks (Burgoyne et al., 2023) in the presence of a gun or a stapler. Squared task performance was worse in the gun condition. This evidence suggests that the so-called "weapons effect" extends beyond aggressive thoughts and feelings to influence cognitive control. Future work may build on this basic science experiment to test the extent to which guns in schools and on campuses impact student performance.

Conditional Effects of Gun Violence Exposure on Weapon Carrying

3:30 PM – 4:40 PM

ATTITUDES/PERSUASION

The current study examined proximity to gun violence at three levels (hearing gunfire, seeing gun violence, direct gun victimization) as predictors of the frequency of weapon carrying among 455 Black male adolescents (mean age = 15.33; SD = 1.26) and examined posttraumatic stress symptoms (hyperarousal and re-experiencing) as moderators. Hearing gunfire was a non-significant predictor of weapon carrying, and hyperarousal and re-experiencing were non-significant moderators. Witnessing gun violence predicted higher frequency of weapon carrying, and both hyperarousal and re-experiencing were moderators. Specifically, the positive association between witnessing gun violence and weapon carrying was significant at moderate and high levels of both hyperarousal and re-experiencing, but not at low levels. Direct gun victimization predicted higher frequency of weapon carrying, but the moderating effects of hyperarousal and re-experiencing were non-significant, suggesting that the positive association between gun victimization and weapon carrying did not depend on posttraumatic stress symptoms.

Ethnic status threat causes preferences for guns over civic action

3:30 PM – 4:40 PM

ATTITUDES/PERSUASION

In two experiments, we found that American participants who feel ethnic status threat are more likely to turn toward firearms and to turn away from civic engagement. In preregistered Study 1 racially-resentful participants who interpreted articles about Black employment as indicating an increase in Black political power reported a greater sense that their status in society was under threat and subsequently were both more interested in guns and less interested in civic engagement across a number of different behavioral and attitudinal operationalizations. We replicated this finding in preregistered Study 2 using an alternate manipulation of status threat. White participants randomly-assigned to read about declining White birthrates (compared to reading about shifts in residential mobility) reported greater ethnic status threat and again reported both higher subsequent interest in guns and lower interest in civic engagement. We witnessed how racism can tear at the fabric of society: When feeling that their status is under threat, racist and White Americans turn away from collective action and toward a more individualist, armed, vision of the world.

Race, power, guns and the 2024 U.S. presidential election

3:30 PM – 4:40 PM

ATTITUDES/PERSUASION

The 2024 U.S. Presidential election was marked by clear racialized threats to safety and rights. Given personal safety and group power concerns can shape gun attitudes, we measured 1,118 U.S. residents gun attitudes and policy preferences pre- and 3 weeks post-election. We examined if perceiving guns as providing personal safety and group power pre-election and changes in felt safety and group power post-election predicted increased pro-gun views. Latine and Asian participants reported greater post-election decreases in felt safety and power compared to Black and White participants ($p < .01$). Safety. Shifts in felt safety were generally unrelated to gun attitude change. Perceiving guns as providing safety only consistently predicted increased pro-gun views among White participants ($p < .01$). Power. Black participants who felt decreased group power showed increased pro-gun views after the election if perceiving guns as providing power ($p < .05$). In contrast, White participants who felt increased group power showed increased pro-gun views if they perceived guns as providing power ($p = .002$). Discussion centers how racism and power concerns continue to spur U.S. gun proliferation.

Honoring Sam Sommers: A career dedicated to advancing racial equity

3:30 PM – 4:40 PM | Location: Lakeside Ballroom E354B, Level 3

DIVERSITY

This symposium honors the career and life of Sam Sommers, whose scholarship fundamentally shaped our understanding of how people think and act in interracial contexts. Sam dedicated his career to conducting research with practical implications for ameliorating racial inequities, inspiring his mentees and countless young researchers to do the same. Four distinguished scholars with ties to Sam will share their research aligned with, and influenced by, the predominant themes in his work. Norton describes the consequences of strategies (e.g. colorblindness) that White Americans use to appear non-racist. Richeson discusses how White Americans' belief that racism is zero-sum fuels the current political backlash to diversity, equity and inclusion policies. Ellsworth and Kassin review implications of racial diversity for legal decision making. Lastly, Lewis considers how psychology can inform interventions and policies for improving racial equity. Following the symposium, we invite everyone to attend the Diversity and Climate Committee Reception. Together we will pay special tribute to Sam's contributions to the field, and to a career that, although profoundly impactful, was far too brief.

How to (try to) appear non-racist

3:30 PM – 4:40 PM

DIVERSITY

Across several decades of work, Sommers and colleagues explored the many strategies that White Americans use to appear non-racist – to others, and also to themselves. First, White Americans use distancing: they believe that the traits they associate with "racists" show little overlap with the traits they used to describe themselves (Sommers & Norton, 2006). Second, White Americans use justification: they are careful to couch their decision-making in non-race-based reasons (Sommers & Norton, 2007; 2008). Third, they use colorblindness: they claim not to even notice the race of other people, even when race is a highly diagnostic category (Apfelbaum, Sommers, & Norton, 2008; Norton et al. 2006). And finally, they use deflection, stating that racism against themselves has become greater than racism against Black Americans in recent years (Rasmussen et al., 2022; Norton & Sommers, 2011). The wide variety of strategies deployed by White Americans – some more successfully than others – offers evidence of the importance of appearing non-racist, to both self and others.

If racism is a zero-sum game, equity-enhancing policies are losing

3:30 PM – 4:40 PM

DIVERSITY

Efforts to increase the racial/ethnic diversity of predominantly-White institutions in the U.S. are under attack, due, in part, by growing sentiment that discrimination against Black Americans has diminished whereas anti-White discrimination has become increasingly prevalent. This pattern of perceiving societal racial discrimination as zero-sum was first observed, of course, in groundbreaking research by Norton and Sommers (2011). In this talk, I will report the findings of a probability sample of American adults (N = 1604) seeking to replicate and extend this pioneering work. White, Black, Latine, and Asian Americans reported their perceptions of the prevalence of racial discrimination toward Black and White Americans in each decade from the 1960s into the 2020s. Results revealed that White and Asian American participants hold zero-sum beliefs about racial discrimination, but not Black and Latine American participants. Further, White Americans' zero-sum beliefs predicted support for equity-enhancing policies. Together, these findings shed light on the current political backlash to DEI in the nation and speak to Sam's incomparable research legacy.

Applying psychological principles to the law in research and practice

3:30 PM – 4:40 PM

DIVERSITY

Sommers made substantial contributions to the field of Psychology and Law in two ways. First, his research on jury decision making provided evidence of the effects of racial diversity on juries, including unexpected strong effects on the behavior of white jurors. Second, he applied his expertise to numerous legal cases, advising attorneys about the impact of race in the legal system and serving as an expert witness.

Cultivating equal minds: Interventions and policies for improving equity in society

3:30 PM – 4:40 PM

DIVERSITY

The United States continues to be a highly segregated society. That segregation has psychological consequences—it affects how people think about each other, and about a broad range of social issues, particularly issues exacerbated by inequality. It is one of the reasons we remain divided—or “polarized.” How can people in a divided nation come together and address fraught social issues? That is one of the questions that has guided my research over the past decade. In this talk I will share some of the lessons learned from studying: (1) people in a public housing system in a segregated city; (2) the local news ecosystem all across the U.S.; and (3) public responses to interventions and policies designed to improve equity. Across studies, the evidence suggests that despite divisions, it is possible to effectively mobilize Americans across racial, ethnic, and partisan lines to engage in the individual and collective actions required to advance equitable social policies.

How Identities Influence the Perception of Social Norms

3:30 PM – 4:40 PM | Location: E271, Level 2

NORMS AND SOCIAL INFLUENCE

Social norms are traditionally studied as expected behaviors that most people follow in their groups and situations. However, there is less work exploring how identity impacts how norms are viewed. Here, we present four talks that show how ability, minority status, political orientation, and discrimination influence normative expectations. Talk 1 shows that physical disability influences perceptions of personal and societal relational norms differently. Talk 2 demonstrates how minority groups experience greater “lived tightness”—the feeling of scrutiny for norm compliance—which helps explain increased stress and inhibition among these groups. Talk 3 shows how political conservatism predicts viewing masculinity norm violations as more severe than social norm violations. Talk 4 shows that younger and university-educated individuals are more likely to hold anti-prejudice norms to protect some groups from experiencing discrimination over others. Together, these talks present novel contributions for how identity influences norm perceptions and the regulation of others through norms.

Comparing Relational Mobility as a Socio-ecological or Individual Level Factor

3:30 PM – 4:40 PM

NORMS AND SOCIAL INFLUENCE

Relational mobility refers to opportunities to voluntarily form and choose relationships. Prior studies have used the relational mobility scale to assess perceptions of others' relational mobility, rather than personal ability, to avoid confounds with individual traits like extraversion. However, no studies have compared societal relational mobility with personal relational mobility. We present two studies comparing these constructs. Study 1 surveyed Japanese and American adults, including many with disabilities, showing personal mobility correlated more strongly with individual differences, and people with disabilities reported lower personal than societal mobility. Study 2 examined American undergraduates before, during, and after COVID-19; while both personal and societal mobility declined during the pandemic, personal mobility recovered faster. These findings suggest personal relational mobility reflects individual differences and short-term variation, whereas societal relational mobility better predicts broader social outcomes.

Racial Ethnic Minorities Perceive Community Norms Stronger Than European Americans

3:30 PM – 4:40 PM

NORMS AND SOCIAL INFLUENCE

The United States is characterized as having relatively weak social norms compared to other countries. However, this characterization may be an oversimplification due to the cultural diversity that exists within the country. Four studies (N = 1,537) examined whether and why U.S. racial minorities (East Asian, Latinx, and African Americans) perceive their racial community's norms to be significantly stronger than European Americans and White immigrants to the United States (Studies 1–4). This difference was not due to increased perceived discrimination (Study 3) or concerns about out-group member punishment (Study 4). Instead, racial minorities' stronger perceptions of community norms were motivated primarily by interdependence (Studies 1–4) and concerns about being punished by in-group members for not following norms (Study 4). These findings illustrate differences in norm strength between racial groups in a single country, deepening our understanding of how social norm perceptions may vary in a multicultural society.

The Unique Link Between Political Ideology and Masculinity Norm Judgments

3:30 PM – 4:40 PM

NORMS AND SOCIAL INFLUENCE

Research on social norm strength finds that they generally depend on the circumstances in a situation. However, norms might also depend on people's gender role expectations regardless of the situation. Here, we compare ratings of masculinity norm violations to social norm violations and test whether political ideology, which captures non-traditional vs. traditional gender views, might partially explain the magnitude of people's judgments. Studies 1a-b (N = 308) developed and tested 92 stimuli demonstrating behaviors that were rated as more inappropriate for men compared to women. We also found that masculine norm violations (e.g., man painting his nails) were rated as less violating vs. comparable social norm violations (e.g., man painting graffiti). However, conservative participants disapproved much more of masculine (vs. social) norm violations than liberal participants. In Study 2, political ideology was also strongly linked to endorsing traditional masculine roles for a larger nationally representative U.S. sample (N = 2498). Together, these findings highlight the unique influence of political ideology in how we perceive normative behavior for men.

Anti-Discrimination Norms and Ethnocultural Hierarchies in Germany

3:30 PM – 4:40 PM

NORMS AND SOCIAL INFLUENCE

This study examines anti-discrimination norms as markers of cultural membership in Germany, focusing on how different minority groups are socially protected from public stigmatization. Drawing on a large-scale survey experiment (n = 2,915; 11,415 vignette evaluations), we test whether discrimination based on race, religion, language, and sexuality triggers norm enforcement in everyday interactions. Results reveal a hierarchy of recognition: respondents are more likely to sanction discriminatory remarks against Jews, Blacks, and homosexuals than against Muslims, refugees, or linguistic minorities. Social context matters—familiar settings (e.g., with relatives or neighbors) elicit stronger norm enforcement than anonymous encounters. Younger and university-educated individuals are more likely to intervene. These findings highlight persistent “recognition gaps” in the social valuation of minority groups, showing that public norms against prejudice are unevenly distributed across group boundaries and social situations.

Modeling the Social Mind(s): Theory-Based Computational Models

3:30 PM – 4:40 PM | Location: E451B, Level 4

SOCIAL COGNITION

Recent advances in computational science not only provide tools for analyzing vast amounts of data but also serve as powerful theoretical frameworks for understanding the social mind. These advances translate language-based hypotheses into precise computational models for rigorous prediction and testing, uncover emergent properties otherwise hidden, and enable large-scale in-silico collective experiments that are impractical in real-world settings. This symposium brings together researchers from diverse computational traditions—including artificial neural networks (ANNs), dynamical coupling, probabilistic and Bayesian models, and agent-based simulations—all interested in exploring how individuals think and interact in complex social environments. It showcases how these computational methods illuminate multi-level social phenomena, ranging from individual responsibility and moral judgment to dyadic cooperation and synchronization, as well as collective processes such as misinformation dissemination and vigilance. By integrating diverse methods and topics, the symposium highlights how principled, theory-driven modeling significantly advances our understanding of the social mind.

Modeling responsibility from counterfactual simulations and intention inferences

3:30 PM – 4:40 PM

SOCIAL COGNITION

How do people attribute responsibility in social situations? Prior work has converged on two important factors that influence how people hold others responsible: inferences about an actor’s intentions and causal assessments of how their actions affected the outcomes. We present a probabilistic model of cognition that unifies these two processes in responsibility judgments. By implementing them computationally and comparing them to human judgements, our model shows how people’s intuitive theory of mind can be used to infer an agent’s intentions from their actions and counterfactuals are used to simulate what would have happened in relevant scenarios. Across three experiments, we test our model on a variety of animated social scenarios where one agent tries to help or hinder another agent’s goal. We find that the model captures people’s responsibility judgments better than alternative models that consider only intentions, only causality, or perceptual heuristics. Our results offer a unified account of how people’s rich mental models support complex responsibility attributions.

Coupled Echo State Networks as a Model of Task-Oriented Alignment

3:30 PM – 4:40 PM

SOCIAL COGNITION

Social psychologists have shown that interaction degrades group performance, and averaging independent responses is thought to maximize group accuracy. However, coordination studies demonstrate that dyadic performance can exceed the sum of individual contributions. We develop a computational framework based in reservoir computing to explain cognitive coordination in groups. Two echo state networks (ESNs) were trained to classify speech signals from native Japanese speakers. Coupling ESN feedback reveals a nonlinear relationship with joint performance: loose coupling improves accuracy while tight coupling returns accuracy to that of independent networks, indicating that although interaction offers benefits, excessive integration may diminish individual contributions. We show that loosely coupled networks exhibit more aligned dynamics, explaining emergent gains in dyadic problem-solving, and explore the effect of homogenous versus heterogeneous group composition. Our results suggest successful group problem-solving may rely on organizing and maintaining optimal coupling dynamics. We offer a formal framework for explaining interaction dynamics in collective intelligences.

Selective Truth and Epistemic Vigilance in Social Networks

3:30 PM – 4:40 PM

SOCIAL COGNITION

Strategic actors influence others by conveying selective truths—introducing vagueness while remaining technically true—while listeners deploy epistemic vigilance to infer speakers' goals and adjust interpretations. Yet, how do persuasive speakers decide which details to disclose, and how do listeners calibrate their vigilance in response? We propose that both behaviors stem from humans' Theory of Mind (ToM) capabilities. We illustrate this through a recursive Bayesian ToM model that captures key patterns from human data: persuasive speakers strategically select information by anticipating how it will be interpreted, while vigilant listeners counter by detecting vagueness in speakers and infer underlying motives. Furthermore, we integrate these individuals into an agent-based model (ABM), revealing different dynamics with classic opinion-formation models of misinformation across dyads and larger networks. This unified computational framework positions persuasion and vigilance as two facets of ToM, highlights vagueness as a strategic resource, and underscores goal-inference in resisting persuasion, with implications for marketing, politics, and automated misinformation detection.

New Theoretical Developments in Intergroup and Intragroup Relations

3:30 PM – 4:40 PM | Location: E270, Level 2

INTERGROUP RELATIONS

This symposium unites four theoretical advances that offer innovative perspectives on inter- and intra-group dynamics, each illuminating a distinct facet of group relations. The first presentation, by Xian Zhao, introduces the Common Subgroup Identity Model and demonstrates across three studies that the existence and salience of shared subordinate groups can reduce conflict and foster cooperation between broader groups. The second, by Jin Xun Goh, reveals unseen U.S. racial dynamics through Racial Contrast Theory, which integrates major frameworks to argue that Asian Americans are positioned in contrast to Black Americans in ways that reinforce White centrality across key dimensions of group perception. The third, by Usman Liaquat, examines system-level processes through the Perceived System Justification Deficit Model, demonstrating how antipathy toward outgroups emerges from gaps between prescriptive and descriptive system justification beliefs and showing that reducing this gap decreases hostility. Finally, Duyen Vo turns the focus to intragroup processes, presenting a dynamic model of ingroup discrimination that integrates intrapersonal, interpersonal, and social factors, supported by qualitative data from Vietnamese international students in the U.S. Together, these presentations enrich theory and offer fresh perspectives on group studies.

Common Subgroup Identity Model

3:30 PM – 4:40 PM

INTERGROUP RELATIONS

The Common Subgroup Identity Model offers a novel approach to reducing conflict and fostering cooperation in a culturally diverse, globalized world. It focuses on situations where two outgroups share a subordinate subgroup. The model predicts that the existence or salience of a common subgroup can improve relations between two broader groups. In Study 1, large language modeling revealed that U.S. news articles mentioning both a common subgroup (e.g., Chinese Americans) and the corresponding outgroup (e.g., China) exhibited a more positive tone than articles referencing only the outgroup. Study 2 analyzed NBA data and found that, in each game, teams with more “switchers” (players who previously played for the opposing team, thus serving as common subgroup members) committed fewer total personal fouls. Study 3 experimentally manipulated common subgroup salience by highlighting the contributions of Guatemalan Americans, which increased American participants’ support for U.S.–Guatemala cooperation on climate change compared to a control condition. Moreover, the greater perceived similarity between Americans and Guatemalans mediated the effect of highlighting a common subgroup. Together, these findings demonstrate how leveraging common subgroups can promote positive intergroup relations, underscore the mutually constitutive nature of intergroup and subgroup dynamics, and highlight the potential of diversity within groups to foster intergroup cooperation.

Racial Contrast Theory: A New Integrative Framework on Black-Asian Relations

3:30 PM – 4:40 PM

INTERGROUP RELATIONS

This talk introduces a new framework called Racial Contrast Theory that synthesizes seemingly disparate social psychological theories on interracial and intra-minority relations. I theorize that relative to other racial groups, Asian Americans stand in clearer contrast to Black people. When Black and Asian Americans are pitted against and contrasted with one another, White people are centered and become the ideal representation. For instance, Stereotype Content Model showed that Black people are stereotyped as lower in competence but higher in warmth than Asian Americans, and these contrasting stereotypes allow White people to be seen as high in both competence and warmth. In Gendered Race Theory, Black people are seen as hypermasculine while Asians are seen as hyperfeminine, allowing White people to be the default gender representation. In Racial Position Model, Black people are seen as low-dominant Americans but Asians are seen as high-dominant foreigners, thus centering White people as the most dominant Americans. By integrating extant theories, Racial Contrast Theory reveals the unique positioning of Asian Americans as a racial contrast to Black people that centers Whiteness.

A Perceived System Justification Deficit Model of Outgroup Antipathy

3:30 PM – 4:40 PM

INTERGROUP RELATIONS

We test a novel model in which outgroup antipathy is predicted by the gap between prescriptive and descriptive beliefs about system justification: how much the group should support the status quo vs. how much the group is believed to support it. We also examine situational and dispositional factors that influence the size of the perceived system justification gap, and hence antipathy. In Studies 1 and 2 (N = 969), experimentally boosting descriptive (but not prescriptive) beliefs about immigrants’ system justification decreased antipathy toward them, especially among conservatives. In Study 3 (N = 490), portraying immigrants as highly (vs. weakly) benefitting from American systems increased system justification prescriptions but also increased beliefs that the group is highly system justifying. In Study 4 (N = 476), portraying immigrants as wielding high (vs. low) political power moderated the association between the prescriptive-descriptive system justification gap and antipathy. Across studies, the prescriptive-descriptive gap in system justification predicted hostility. Thus, “failing to live up to” system justification expectations elicits antipathy towards various outgroups.

Unpacking Ingroup Discrimination: From Theory to Qualitative Insights from Vietnamese International Students in the U.S.

3:30 PM – 4:40 PM

INTERGROUP RELATIONS

Ingroup discrimination remains an understudied phenomenon within intragroup research, despite its significance across many racial and ethnic communities (Kuldas et al., 2022; Mata-Greve & Torres, 2019). Recent theoretical work (Vo et al., 2025) conceptualizes ingroup discrimination through the intersecting lenses of perpetrators, targets, and observers, and proposes a dynamic model integrating intrapersonal, interpersonal, and social factors to explain how ingroup tension and discrimination emerge and persist. This study draws on qualitative interviews with 11 Vietnamese international students in the U.S. to examine the model's applicability. Using a deductive approach informed by the model, our team coded and analyzed the data in Dedoose. Initial analyses show that participants' narratives support core components of the model, reveal additional influencing mechanisms, and highlight emotional and social impacts. This work strengthens the recent theoretical framework and provides insight into how ingroup discrimination takes shape within a specific community, encouraging research that advances theory and evidence on ingroup dynamics and their implications for identity and wellbeing.

Representations of Gender: Sociocultural Antecedents & (In)equality Consequences

3:30 PM – 4:40 PM | Location: E350, Level 3

GENDER

Gender and its representations at individual and collective levels are created and reinforced by sociocultural forces that maintain gender hierarchy. This symposium demonstrates the constructed nature of gender representations and their downstream consequences for inequality. Speaker 1 studies linguistic representations of the concepts "women" & "men", showing an androcentric bias in individuals' linguistic space. Speaker 2 studies moral representations of gender, showing that women are deemed morally superior to men but are penalized more for moral transgressions. Speaker 3 studies visual representation, showing that gender system defense infantilizes individuals' representations of women, reinforcing traditional gender norms. Speaker 4 studies gender-conforming and gender-diverse adults' representations of the self, showing a pervasive role of sociocultural gender norms, with negative impacts on mental health. Together, this symposium shows how gender representations are shaped by sociocultural contexts in which we live, which can reify gender categories and perpetuate inequality; thus, we highlight the importance of reshaping these representations for a more gender-equal future.

Gender categories vary not only in content, also in scope

3:30 PM – 4:40 PM

GENDER

Traditional gender stereotyping research focuses on the content of beliefs about men and women, but here we investigated differences in scope. In five preregistered experiments, we solicited open-ended descriptions of either a pictured man or a woman (between-subjects). When describing a man (vs. woman), we found participants sampled more broadly from semantic space using natural language processing techniques. We also found greater variability in participants' trait ratings of warmth and agency for the man (vs. woman). Finally, we elicited stereotypes about men and women in general and found less alignment between stereotypes about men and trait ratings of the individual man (r 's = .01-.15) than between stereotypes about women and ratings of the woman (r 's = .40-.49). Thus, participants' descriptions of an individual man (vs. woman) take up more semantic space (i.e., are broader in scope) and their trait ratings of the man (vs. woman) are less consistent (i.e., more varied) and show less alignment with gender stereotypes. We find these same patterns for impression of White men vs. women, Black men vs. women, and cartoon men vs. women (to rule-out any low-level visual confounds).

Morality is gendered

3:30 PM – 4:40 PM

GENDER

Decades of scholarship on gender have shown that women are judged to be more caring and more communal than men. We use multiple methods (N = 5,376) to test an intriguing claim entailed by this work: People think that women are morally superior to men. Using reverse-correlation methods, we show that mental representations of the face of “a morally good person” is a woman’s face. Next, using a novel profile-generation task, we find that people are more likely to ascribe more morally good traits to women than to men, both when they are spontaneously thinking of a woman (vs. a man) and when they are assigned to do so. Further, using a large database of 1,864 normed behaviors, we find that behaviors associated with moral goodness are also stereotyped as feminine. Finally, we use a novel impression updating task to explore a potential consequence of this phenomenon. We find that immoral behavior is more diagnostic for women than men. As a result, equivalent moral transgressions lead to larger negative character updating for women than for men. In sum, these findings reveal that moral goodness is closely linked to gender concepts: People think women are morally superior to men.

Gender status quo defense predicts infantilized mental representations of women

3:30 PM – 4:40 PM

GENDER

Infantilization of women perpetuates gender status quo because it minimizes the impression that women have the agency to challenge the existing patriarchal system. We propose infantilization can manifest in individuals’ mental representations of women’s faces as a baby-faced appearance—a tendency that may be especially strong among individuals inclined to justify the current gender system. Using reverse correlation, we visualized low (n=20) & high (n=20) gender system-justifiers’ mental representations of women’s faces and then randomly assigned naïve raters (N=957) to evaluate one of the two faces. As hypothesized, high (vs. low) gender system-justifiers’ mental images of women were evaluated as looking more baby-faced and more likely to conform to traditional gender norms, even after accounting for face- and rater-level characteristics. Notably, women depicted in high (vs. low) gender system-justifiers’ mental images were deemed as more likely to conform to traditional gender norms because of their greater perceived babyfacedness. Together, we reveal that gender system maintenance shapes mental representations of women in ways perpetuating gender inequality.

Binary gender norms and stereotypes in self-representations: Evidence from gender-conforming and gender-diverse adults

3:30 PM – 4:40 PM

GENDER

How do societal gender norms shape self-perceptions—especially for those who identify outside the binary? Across 6 studies with 752 North American adults, we examined how gender stereotypes and normative ideals predict self-perceptions over time. Participants completed measures of gendered stereotypical trait associations and normative trait ideals, plus repeated measures of self-trait ratings over 3 weeks. We controlled for explicit stereotype endorsement, and analyses targeted implicit structural associations—capturing participants’ long-term, learned representations of gender stereotypes and ideals. We found four key results: (1) Collective representations of binary gender stereotypes and ideals predicted the structure of self-perceptions for both gender-conforming and gender-diverse adults (i.e., self-stereotyping). (2) A reciprocal self-anchoring effect emerged only among gender-conforming participants. (3) Self-stereotyping was strongest among individuals whose self-perceptions were less stable across time. (4) Ideal- and stereotype-self alignment predicted better mental health, regardless of identity. These findings reveal the subtle persistence of gender norms in the self.

Social Psychoneuroimmunology: Interactions of Human Sociality and Physiology

3:30 PM – 4:40 PM | Location: E265, Level 2

SOCIAL NEUROSCIENCE

Our social circumstances play an integral role in shaping our physical and mental health. At the same time, our physical health can heavily influence our social behavior. The burgeoning field of social psychoneuroimmunology investigates the links between social environments, physiological systems (inflammation, hormones, etc.), and behavior. This interdisciplinary subfield allows for a complex and comprehensive understanding of social behavior and physical health, more complete than the sum of either field alone. Furthermore, this integrated approach elucidates the manner in which biological individual differences interact with social contextual determinants of health. This symposium gathers representative research across the field of social psychoneuroimmunology. Topics include the long-term effects of social environments on the physiological stress response, how inflammation shapes social perception, and the role of steroid hormones in social decision making. Findings from this work have important implications in the interrelatedness of our social environments, physical health, and behavior.

Biology of Bias: Inflammation and Trustworthiness Judgments of Racial Out-Groups

3:30 PM – 4:40 PM

SOCIAL NEUROSCIENCE

Many contexts exacerbate the human tendency to form group divisions including pathogen threat, or perceived risk of disease exposure. For example, individuals with greater pathogen threat are more likely to hold xenophobic and ethnocentric attitudes. However, little work has examined the actual biological processes that may accompany pathogen threat and shape social perceptions. To address this gap in the literature, we administered the flu vaccine—a mild immune challenge—to 45 young adults. Before and after receiving the vaccine, participants completed a modified affect misattribution procedure wherein they rated the trustworthiness of racialized and gendered in-group and out-group faces. Participants also provided pre- and post-vaccine blood samples which were assayed for the inflammatory cytokine interleukin-6 (IL-6). Mixed models suggested that participants experiencing a greater increase in IL-6 rated racialized out-group faces as less trustworthy; $F(1, 7864)=12.28$, $p<0.001$. This pattern did not replicate when focusing instead on target gender. Overall, this project used novel and accessible methods to examine biological processes contributing to social perception.

Testosterone & Cortisol Jointly Influence Cue Appraisal During Competition

3:30 PM – 4:40 PM

SOCIAL NEUROSCIENCE

Social status has a profound effect on human cognition and physiology. Lower status is associated with chronic stress as well as blunted reproductive function. At the same time, stress and reproductive systems heavily influence social behavior. The Dual Hormone Hypothesis posits that testosterone (T) promotes status-seeking behavior when cortisol (C) is low, and status-loss-avoidance when C is high. The present study expands on this model by separately cueing reward, loss, and opponent rank during a social status competition. In a sample of 89 undergraduates, we found that T and C influence the utilization of these cues in an interactive manner. High T was associated with increased competition against low status opponents, and this effect was blunted by C. T was also associated with decreased sensitivity to both reward and loss, while C was associated with increased reward sensitivity. Considering the effects of social status on stress and reproductive systems, these findings provide insight into biosocial mechanisms of hierarchy maintenance. These findings may abstract to other decision-making contexts, such as financial risk-taking or short- versus long-term health tradeoffs.

The Biological Impact of Area-Level Social Inequality

3:30 PM – 4:40 PM

SOCIAL NEUROSCIENCE

Chronic environmental threat can undermine safety, contributing to dysregulation of the HPA axis. Structural racism and area-level inequity cause Black adolescents to spend more time in areas with high violent crime rates, which can lead to chronic unsafety and biological stress. We examined whether exposure to violent areas and elevated cortisol were associated with a pattern of dysregulation where immune cells become less responsive to cortisol's anti-inflammatory effects. An adolescent community sample (N=137; 52% Black, 48% White; 57% female; M_age = 15.5) completed a GPS-tracked naturalistic study week to assess violent area exposure and we measured levels of cortisol and inflammation. For Black but not White participants, there was a significant interaction between cortisol and GPS-tracked violent area exposure on inflammation ($p = .005$). At high exposure, higher cortisol predicted higher inflammation ($p = .02$), consistent with glucocorticoid dysregulation. Our findings elucidate how structural inequities become biologically embedded: dual elevations in cortisol and inflammation through glucocorticoid dysregulation pose long-term risks to mental and physical health.

Early Widowhood as a Sensitive Period for Adult Biopsychosocial Health

3:30 PM – 4:40 PM

SOCIAL NEUROSCIENCE

In long-term romantic relationships, partnered individuals' lives become interdependent through co-regulation (biologically and psychologically) and co-functioning (societally). Accordingly, the death of a spouse is a profoundly dysregulating event across biological, psychological, and societal domains. Although robust evidence links widowhood with a higher prevalence of mental health disorders and age-related health risk, few studies capture (a) the dynamic process of adapting to widowhood in daily life or (b) how one's broader social context shapes the transition to widowhood. Informed by interdisciplinary theoretical and empirical work, this conceptual framework extends existing models of widowhood by identifying the widowhood transition as a sensitive period for biopsychosocial health in adulthood. The biopsychosocial upheaval associated with widowhood initiates shifts in social behaviors, health behaviors, and stress response processes that shape future aging trajectories. This theoretical presentation will outline an empirical agenda to guide future research on how the widowhood transition shapes subsequent biopsychosocial health.

Spontaneous But Not Simple: Rethinking the Processes of Trait Inference

3:30 PM – 4:40 PM | Location: E253CD, Level 2

PERSON PERCEPTION/IMPRESSION FORMATION

People make spontaneous (quick, unintentional) trait inferences (STIs) even from others' everyday behaviors. But what determines which traits they infer, and when? This symposium suggests that STIs can be more nuanced than previously thought. Talk 1 shows that stereotypes shape STIs in long-term but not working memory and explores the underlying mechanisms of this differentiation. Talk 2 demonstrates that perceivers tend to correct race-stereotypical STIs, but only when they expect societal bias and have sufficient cognitive resources. Talk 3 extends this to gender stereotypes and shows that counter-stereotypical STIs are not only prominent but also foster positive behavioral intentions. Talk 4 reveals that STI content diverges from intentional trait inferences (ITIs), with competence traits inferred more spontaneously than morality traits. Together, these talks show that STIs do not always mirror patterns of (more widely studied) intentional impressions. Drawing on robust experimental evidence with large samples, the symposium will explore what these differences say about the nature of impression processes, with implications for understanding bias, evaluation, and social judgment.

Actions Versus Stereotypes: How Stereotypes Affect Spontaneous Trait Inferences

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Spontaneous trait inferences (STIs)—the automatic attribution of traits based on behavior—are a robust effect in person perception. In prior studies, we found no reliable evidence that stereotypes about actors influence STIs. This result supports the notion of robust STIs but challenges assumptions that stereotypes fundamentally shape impression formation. Notably, published research investigating the effect of stereotypes on STIs employed a research paradigm designed to measure STIs at early information encoding, limiting their generalizability to the general impression formation process. We addressed this limitation in two studies (N1=278, N2=333), by employing the false recognition paradigm, which measures STIs from long-term memory. Both studies indeed documented significant effects of stereotype congruency on STIs from behavior. This effect persisted even without stereotypic images, suggesting that stereotype-based trait inferences do not rely solely on visual cues. We are conducting further studies to more precisely identify the processing stages and mechanisms through which stereotypes interact with behavior-based trait inferences.

Motivated Correction of Negative Race Stereotypes in Spontaneous Trait Inferences

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Research on prejudice shows that stereotypes about racial minorities often shape majority groups' impressions. It is unclear, however, whether this effect extends to spontaneous trait inferences (STIs) from ambiguous behaviors. We address this gap by assessing how racial stereotypes of Black men affect STIs, using a novel set of pre-tested ambiguous behaviors and a robust false recognition paradigm. Across five studies (four preregistered; Ntotal=1169), we find that White perceivers tend to make more positive or nonstereotypical than negative or stereotypical STIs about Black actors' ambiguous behaviors (study 1-2). This effect disappears when a cognitive load is induced during behavior encoding (study 3). Study 4 shows that the stereotype correction is also partially driven by participants' expectations of societal bias toward Black men, highlighting the role of motivational processes. Notably, the correction effect does not generalize to positive stereotypes (study 5). We discuss the implications of this STI overcorrection for understanding the contextual and motivational factors that affect even the most automatic forms of evaluations.

Individuation or Stereotyping? How Gender Stereotypic Behaviors Impact Spontaneous Inferences

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Decades of work have shown that traits are spontaneously inferred from behavior via spontaneous trait inferences (STIs). However, there is conflicting evidence on whether stereotypes impact STIs, and there is minimal work that tests the utility of STIs beyond person perception contexts. In two experiments, we tested whether gender stereotypes impact STIs and whether STIs influence behavioral intentions. Experiment 1 found that STIs were stronger for stereotype-inconsistent targets (e.g., strong women and nurturing men) compared to stereotype-consistent targets (e.g., nurturing women and strong men). Participants were also more likely to befriend and less likely to punish inconsistent targets when they made an STI of that target. These findings counter previous work but can be explained by individuation effects. Experiment 2 tests whether these results are due to individuation or stereotype effects by utilizing ambiguous behaviors that can imply both a consistent and an inconsistent trait. Data for this experiment have been collected and will be analyzed prior to the conference. These results have implications for stereotype development and discrimination.

Beyond Morality Primacy: Competence Takes the Lead in Spontaneous Impressions

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Past research has shown that morality (vs. competence) related information plays a stronger role when forming impressions. It is not clear, however, whether morality-related information is more primary (i.e., spontaneously inferred) or dominant (i.e., weighted more heavily) in impressions. Four studies (two preregistered; Ntotal = 750) tested spontaneous morality and competence inferences from sixteen individuals' behaviors with a false recognition paradigm. In Study 1-3, perceivers made stronger STIs from competence (vs. morality) information, suggesting competence-primacy. Study 4 compared spontaneous to intentional inferences and showed that morality traits were indeed more strongly activated when impressions were formed intentionally. Together, these findings suggest that morality may play a dominating yet not a primary role in impression formation.

The Psychology of Cooperation and Competition

3:30 PM – 4:40 PM | Location: E352, Level 3

GROUPS/INTERGROUP PROCESSES

Managing our interdependence with other people is an integral part of everyday life. Perceiving our interactions with others as cooperative, win-win situations versus competitive, win-lose situations can powerfully shape our thoughts, feelings, actions, relationships and reputations. This symposium presents novel findings related to the effects of perceiving situations as cooperative versus competitive across a wide range of social and organizational settings, including teamwork, negotiation, and intergroup interactions. The first two talks address the effects of perceived interdependence on prosocial behavior and well-being. The last two talks explore how language that signals cooperation versus competition benefits negotiators and organizations.

The Differential Effects of Cooperative and Competitive Situations on Autonomy

3:30 PM – 4:40 PM

GROUPS/INTERGROUP PROCESSES

Autonomy contributes to important psychological and practical outcomes. Despite the ubiquity of situations wherein our interests are aligned (cooperation) or misaligned (competition) with others', surprisingly little is known about how cooperation and competition influence individuals' feelings of autonomy. Integrating interdependence theory and self-determination theory, we predicted that cooperation increases feelings of autonomy relative to competition. Four studies that used experimental and survey methods and different operationalizations of cooperation and competition support this hypothesis. Study 1 found that cooperation was positively associated with feelings of autonomy among varsity athletes in team sports. Using archival data from federal employees, Study 2 suggested that the association between cooperation and autonomy is explained by lower levels of stress and perceived threat. Study 3 used an incentivized decision-making task in which we experimentally manipulated whether decision-makers' interests were aligned or misaligned. Participants felt more autonomous when their interests were aligned. Study 4 found evidence for both mechanisms in an experimental study.

Competitive Organizational Climates Increase Material and Symbolic Zero-Sum Beliefs

3:30 PM – 4:40 PM

GROUPS/INTERGROUP PROCESSES

Across four studies, we examine how competitive organizational climates influence organization members' Zero-Sum Beliefs (ZSBs)—the perception that one person's

gain entails another's corresponding loss—for different organizational resources. In Study 1, participants in a competitive (versus collaborative or neutral) organizational

climate reported higher ZSBs for both material organizational resources that are inherently limited (e.g., money) and symbolic resources that are not necessarily limited (e.g., respect). Study 2 extended these findings to MBA students, showing that perceptions of a competitive climate was associated with greater ZSBs for material and

symbolic resources which was linked to less desirable behaviors (e.g., peer helping). Finally, Studies 3 and 4 found support for interventions that reduced ZSBs in competitive climates: signaling an abundance of material and symbolic resources, respectively. Together, we establish that competitive climates increase material and symbolic ZSBs, identify their behavioral consequences, and offer strategies to mitigate ZSBs in such climates.

Does Conversational Receptiveness Increase Positivity Toward Organizations Addressing Controversial Issues?

3:30 PM – 4:40 PM

GROUPS/INTERGROUP PROCESSES

When organizations take public stances on controversial issues, they risk backlash from stakeholders with competing interests. Yet 50% of U.S. adults now expect companies to publicly address matters of societal importance. We test whether conversational receptiveness—language that signals openness to opposing views—can reduce conflict and improve evaluations of organizations taking a stand. Across four pre-registered experiments (N = 4,095), receptive statements significantly improved attitudes and behavioral intentions more than decisive statements, especially among stakeholders who disagreed with the organization's position. While the positivity effect was attenuated among those who agreed, it remained statistically significant and

did not harm evaluations. These findings extend theories of interpersonal receptiveness to organizational communication and stakeholder management, offering practical guidance for navigating polarized public arenas. Receptive language may help organizations address contentious topics in ways that mitigate conflict and build shared understanding across ideological divides.

Metaphors in Negotiations

3:30 PM – 4:40 PM

GROUPS/INTERGROUP PROCESSES

Metaphors do more than describe negotiations: they shape how we understand and approach them. This research explores how metaphorical language influences

perceptions of negotiation counterparts and expectations about the negotiation process. Drawing from conceptual metaphor theory, we identify common metaphors used to

describe negotiations and examine how they frame mental models of conflict, cooperation, and value creation. Our findings show that subtle metaphorical cues can shift how people interpret intentions, anticipate outcomes, and evaluate the difficulty or competitiveness of a negotiation. Competitive metaphors tend to signal self-interest and zero-sum thinking, while collaborative metaphors promote mutual concern and constructive engagement. These results underscore the power of language to shape

expectations and behavior, highlighting metaphor as a meaningful yet often overlooked influence in negotiation dynamics.

The Social Mirror: Perceiving, Misperceiving, and Opting Out of Connection

3:30 PM – 4:40 PM | Location: E353A, Level 3

PERSON PERCEPTION/IMPRESSION FORMATION

How do people perceive their value, emotions, and shared reality in their relationships—and how do these perceptions shape connection? This symposium explores interpersonal perceptions across diverse contexts, from professional networking to romantic relationships to human-AI dynamics. Talk 1 shows that people underestimate their instrumental value to others' networks, which may undermine network formation. Talk 2 reveals that romantic partners are generally accurate in perceiving how they come across emotionally, but heightened accuracy can feel aversive in the moment while supporting closeness over time. Talk 3 challenges assumptions about shared reality in couples using Dyadic RSA, showing that personal perceptions of shared reality—not partner alignment—are most strongly linked to relationship quality and meaning in life. Finally, Talk 4 uncovers how perceiving AI (LLMs) as empathic reduces people's willingness to offer empathy themselves—offloading a fundamental human function. Together, these talks reveal how perceptions—accurate or biased—shape empathy, meaning, and connection across relationships.

Don't Add Me On LinkedIn? Investigating Biases in Network Value

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

People tend to underestimate how much others like them, their intrinsic value in others' eyes (Boothby et al., 2018). But do they also underestimate their instrumental value: how much others view them as useful to their network? We tested this across two preregistered in-person speed-networking studies with students (N₁=194; N₂=180) and one exploratory virtual speed-networking study with nascent entrepreneurs (N₃=270). Across studies, controlling for perceived liking, participants underestimated their perceived value to others' networks: viewing themselves as less valuable to others than others were to them. They also underestimated their actual value: others viewed them as more valuable than they viewed themselves. However, participants calibrated their self-perceptions to how valuable they found each partner. In Studies 2 and 3, they accurately tracked how valuable they were to one partner versus another. In Study 3, lower bias and higher accuracy predicted greater motivation to strengthen the tie. In sum, people may enter networking situations believing they bring less to the table than they truly do, potentially undermining their network development.

Emotion Meta-Accuracy and Daily Relationship Dynamics

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Do we know how we come across emotionally, and does it matter? Although past work has established that emotional expression is central to social functioning, little is known about people's insight into how others perceive their emotional displays, namely their emotion meta-accuracy. We examined this in the context of romantic couples' daily interactions. Across a daily diary study of 158 romantic couples (N=314), we applied the Social Accuracy Model to capture how well people tracked their partner's unique impressions of their day-to-day emotional expressions. We found that people were generally meta-accurate. On average, greater meta-accuracy was linked to better relationship experiences (e.g., better overall experience, more positive interactions, greater closeness). Yet, on days when meta-accuracy was higher than usual, both members of the couple reported worse experiences. These findings suggest that seeing ourselves through our partner's eyes may feel uncomfortable in the moment, but may ultimately support more adaptive emotional exchanges over time, offering new insights into how everyday emotional perception shapes the quality of our relationships.

Is Shared Reality Truly Shared? Implications of Shared Reality (Mis)Match

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Feeling "on the same page" with a romantic partner—experiencing shared reality (SR)—has been shown to foster personal and relationship well-being. Yet most research considers only one partner's perspective, overlooking whether partners match in this experience. Using Dyadic RSA across six dyadic datasets (N=844 couples), this project is the first to systematically examine whether (mis)alignment in generalized SR predicts relationship quality and meaning in life. Pilot results (N=103 couples) show that partners tend to align in their SR, but this congruence is not significantly associated with relationship quality or meaning. Instead, one's own perception of SR was the strongest predictor of both outcomes for women, while both actor and partner SR predicted quality for men; only partner SR predicted men's meaning, with a curvilinear pattern suggesting a tipping point where more partner SR predicts more meaning. These findings challenge the assumption that alignment is necessary and instead support the idea of SR as a subjective perception. We will present preregistered results from a registered report analyzing the remaining datasets, advancing both theory and dyadic methodology.

Killing Kindness: Perceptions of Using Empathic LLMs Increases Offloading Behaviors

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Human kindness has always revolved around the mutual exchange of empathy. But today, there exists a new source of empathy: empathic AI, specifically large language models (LLMs). While previous research questions whether LLMs can possess empathy, reality indicates otherwise: many people do rely on LLMs for emotional support. Yet across 3 studies, we explore how perceiving LLMs as empathic disrupts fundamental interpersonal processes by changing how people perceive and perform empathy in relationships. Study 1 foundationally showed how perceiving ChatGPT as capable of providing empathy predicts a greater desire to offload, or hand off, empathic responsibilities to GPT. Study 2 reinforced these perceptions on a group level by manipulating capacity via newspaper clippings about AI. Study 3 tested these perceptions behaviorally: participants did offload to GPT more (measured by a question writing and Reading the Mind in the Eyes tasks) when asked to provide an acquaintance empathy when that person had already sought support from GPT. This set of studies emphasize how people perceive giving empathy themselves as unnecessary when AI can effortlessly take over, killing human kindness.

Understanding Social Ties: The Psychology of Friendship and Connection

3:30 PM – 4:40 PM | Location: E258, Level 2

SOCIAL COGNITION

Throughout the lifespan, a person's social network—ranging from weak ties to friends—fosters well-being. Yet key questions remain—Who is even considered a friend? What signals that someone is a friend? How do we think about who is connected with whom in our social networks? And how do interactions within friendships affect the self? This symposium showcases four complementary lines of work that examine how people make sense of the diverse individuals within their network. The first talk examines how people use the "friend" label in their social networks using a Friend Go/No-Go task, and how this labeling relates to perceptions of closeness, loneliness, and well-being. Our second talk uses Bayesian inference techniques to model how diverse behaviors (e.g., texting, not greeting) shape friendship judgments. Our third talk demonstrates that 'brokers'—people who bridge otherwise disconnected people in a network—are especially adept at learning existing (vs. missing) ties in networks, underscoring network position in social knowledge. Our last talk investigates dynamics within established friendships, examining how friends navigate the tension between being seen accurately versus being seen positively, using response surface analysis. Together, these four talks speak to how people perceive and navigate connections across the social landscape.

Friend or Not? The Impact of Labeling

3:30 PM – 4:40 PM

SOCIAL COGNITION

Social connections, including friendships, can protect individuals from feeling lonely and promote well-being. But within broad social networks, who counts as a “friend”? The present work examined whether the simple act of labeling someone as a friend can shape interpersonal and emotional outcomes. Using a within-subjects design, participants (N=369) nominated 15 people they had interacted with in the past 24 hours—thus, generating a mix of close ties and more distant others (e.g., bus driver). They then completed a novel friend Go/No-Go task, where they were presented with names (or descriptors) of these individuals and responded as quickly as possible whether each was a friend. As predicted, judgments of friends were more likely, and faster, for targets who had been rated higher on closeness and reciprocity in support-seeking. Critically, a lower likelihood of categorizing someone as a “friend” was associated with loneliness and worse well-being. Findings highlight the importance of friend labeling—how people differ in making these judgments and how this categorization may have bidirectional associations with attitudes and socioemotional outcomes.

Friendship Inference as Bayesian Inference: Representing and Integrating Friendship Cues

3:30 PM – 4:40 PM

SOCIAL COGNITION

Friendship is important but understudied. Research suggests people use “cues” (i.e., proximity, similarity, loyalty) to identify friendship. But, how are cues weighed and integrated to infer a relationship? Are two people who text each other and use nicknames more or less likely to be friends than two people who share a straw? We use Bayesian inference to model friendship expectations. We probed participants’ (N = 60) priors about how likely people are to be friends, and tested how expectations shift based on 20 different friendship (or non-friendship) behaviors. The model quantifies how strongly each behavior indicates (lack of) friendship, and integrates multiple behaviors to form an overall judgment. Inviting someone to lunch most strongly shifted expectations towards friendship (BF > 40,000), and not greeting someone most strongly shifted expectations away from friendship (BF > 1,000,000). Our work sheds light on cognitive processes of how people use observations of everyday social interactions to infer the structure of their social environment. Future studies will compare Bayesian inference to other algorithms to test which models best fit actual expectations about friendship.

Brokerage Is Associated with Better Network Learning

3:30 PM – 4:40 PM

SOCIAL COGNITION

Navigating social networks requires understanding where people sit in them. People in advantageous positions, such as brokers (people who connect otherwise disparate people in a network), may be particularly attuned to the structure of their social world, hold more accurate priors about social network structure, and thus, be better able to learn new social networks. In 4 studies, we tested how learning new networks was associated with participants’ brokerage capacities in their real-world social networks. We found that brokers were especially good at recalling new networks that were structured like typical social networks, but not atypically structured ones. Brokers were especially good at learning existing (vs. missing) ties, and they were better at learning other brokers’ relationships. We framed the networks as flight networks among airports in one condition, and friendships in another. We found no differences between conditions, suggesting this advantage may be domain-general. This work illuminates the mechanisms of network learning based on one’s own experiences, establishing new links between one’s own social network position and one’s ability to learn new network structures.

Is Feeling Understood or Feeling Adored Best for Friendship?

3:30 PM – 4:40 PM

SOCIAL COGNITION

We want to be understood by our friends; namely, we want our friends to see us and be on the same page as us about who we are. However, to be on the same page as us, our friends must see and agree with us on not just our positive attributes, but also our negative attributes, which might not feel great and could threaten the quality of our friendships. Instead, we might feel better in and about our friendships when we think that our friends see the best in us. This raises the question: is it best to feel understood or to feel adored, or seen positively, by our friends? In the current research, we test these competing hypotheses using response surface analysis in 86 friend groups (N = 344) across multiple personality traits (e.g., Big Five, funny, selfish, etc). Disentangling feeling understood and positivity will offer theoretical insights into longstanding questions on self-motives, such as self-verification and self-enhancement, as well as further our understanding of the interpersonal perception processes involved in close relationships.

PUI Committee Sponsored: Conducting Research at Primarily Undergraduate Institutions: Challenges and Best Practices Part 2

4:30 PM – 5:30 PM | Location: E252, Level 2

Conducting Research at Primarily Undergraduate Institutions (PUIs) comes with unique challenges--and unique opportunities. Building on last year's SPSP session, this event highlights faculty experiences at PUIs and creates space to connect with potential collaborators. Join us for a dynamic networking session designed to spark future research partnerships.

Early Career Mentoring Event

4:30 PM – 5:30 PM | Location: E259 and E263, Level 2

Pre-Registration Required. [SIGN UP HERE!](#) Do you have questions you want to ask mentors in advance of the session? Leave them [here!](#)

The Early Career Mentoring Event is designed for post-PhD (0 to 6 years post PhD only) members seeking guidance during the early stages of their academic or professional careers. This event offers participants the opportunity to engage in small-group conversations with respected scholars in the field around topics such as research collaborations, data strategies, innovative methods, career transitions, professional advancement, and funding strategies.

This interactive session encourages open dialogue, peer connection, and practical advice tailored to the unique challenges and opportunities faced by early career scholars. Pre-registration is required, and advance sign-up is recommended.

[1] “Bottom line-to feel safe”: A Qualitative Exploration of Consent

4:40 PM – 5:40 PM

SEXUALITY

Consent literature has been primarily grounded to discussion of consent relative to sexual education and sexual violence. I expand consent research by examining how consent is contextualized, perceived, and understood to operate across sexual and non-sexual contexts. Through a qualitative study of over 100 participants, thematic analysis identifies the operation or value of consent as relative to property—the maintenance or protection of objects and or oneself—safety. Additionally, participants demonstrated circumstances and relations (e.g., family, friends, strangers) which differentiated the requirement or necessity of consent, in other words when consent is (e.g., borrowing clothes) or is not required (e.g., defending one's home). Findings ground the conceptualization of consent within explicit constructions of property (e.g., objects, land, money, self.) and expand on how consent literature necessitates a lay perspective on the operation of consent beyond the sexual.

[2] Normative Dilution Effect: A Case Study of Intergroup Apologies

4:40 PM – 5:40 PM

The normative dilution effect suggests that perceiving a behavior as normative can undermine its effectiveness, particularly in contexts where its communicative value matters. Intergroup apologies offer a compelling test case for this effect, as conveying sincere motives is key to their effectiveness in promoting forgiveness. We conducted a replication of Okimoto et al. (2015), the only study to experimentally test the normative dilution effect. Australian participants (N = 633) took part in an online experiment in which we manipulated whether or not they were told that political apologies are a common response to historical transgressions. We did not experimentally replicate the normative dilution effect. However, SEM analyses in the control group revealed correlational evidence for normative dilution: perceiving political apologies as more normative was associated with perceiving ulterior motives for the decision to apologize, and in turn, less forgiveness. We discuss these findings in the context of Study 2, which uses a stronger manipulation of apology commonness to examine the normative dilution effect and further investigate perceived motives as its underlying driver.

[3] “Let me sleep it off”: How sleep operates as an emotion regulation tactic

4:40 PM – 5:40 PM

DIVERSITY

Poor sleep has long been associated with impaired emotion regulation. However, do people use sleep as a regulation tactic? In this initial set of “proof of concept” studies, we predicted that sleep might be used for both adaptive (i.e., “strategic delay,” to regain mental clarity) and maladaptive (i.e., emotional inhibition, to push away feelings) motivations. In qualitative Study 1 (n = 147), we found that using sleep to regulate emotions was common, with 89.1% saying they had tried it. Via coding of narrative descriptions, we found that those who reported inhibition-based motives were more likely to sleep in response to relationship concerns and to say that sleep did not help with emotion regulation compared to those with delay-based motivations. In Study 2 (n = 168) we developed a brief self-report scale assessing use of sleep-as-inhibition and sleep-as-delay, and found that sleep-as-delay was associated with greater distress tolerance, whereas sleep-as-inhibition was associated with greater emotional sensitivity and alexithymia. These studies suggest that sleep can be used adaptively as a mental “reset” but can also be used maladaptive as a form of emotional avoidance.

[4] “When They’re Happier, I’m Happier:” Examining Interpersonal Emotion Regulation in Romantic Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Interpersonal emotion regulation (IER) has important implications for individual and relational well-being, yet few studies have examined this process from a dyadic perspective. The present study addressed this gap by exploring perceived and actual IER strategies, goals, and effectiveness among romantic partners. Sixty-eight dating couples completed a lab session in which one partner (target) was randomly assigned to complete the Trier Social Stress Test (TSST), while the other partner (regulator) was tasked with managing their partner’s emotions before and after the TSST. Actor-partner interdependence modeling was used to examine associations between actual (target) and perceived (regulator) regulatory effectiveness (RE), negative (NA) and positive (PA) affect, and closeness. Higher perceived RE was associated with less target NA and greater regulator PA. Higher actual RE was associated with greater PA and closeness for both partners. Qualitative reports of IER strategies and goals, as well as couples’ behaviorally coded interactions, will also be presented. These findings highlight the importance of considering both partners’ perspectives when studying IER in romantic couples.

[5] “Why Didn’t You Just Say So?” People Use Indirect Opposition to Assess Partner Commitment

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Rather than confronting their partners in a direct manner, people often use indirect strategies, such as making sarcastic comments, muttering under their breath, and being passive aggressive. Yet, whereas directly confronting a partner can bring about desired change, indirect opposition tends to undermine relationship quality without bringing about subsequent change. So, why do people engage in indirect opposition? We suggest people use indirect opposition to obtain diagnostic information about partners’ commitment. We tested this idea using three studies. Studies 1 and 2 were experiments that manipulated participants’ uncertainty about their partners’ commitment and assessed their use of indirect opposition. Study 3 was a diary study that addressed whether daily perceptions of partners’ commitment predicted increases in indirect opposition. Results from these studies demonstrated that partner commitment uncertainty was associated with greater motivation to evaluate partners’ commitment and this enhanced motivation mediated the effect of commitment uncertainty on the use of indirect opposition. Together, these studies suggest that people may use indirect opposition to test a partner’s level of commitment.

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Previous studies have linked the Dark Tetrad personality traits to a higher likelihood of infidelity (March et al., 2023). Individuals who engage in infidelity often rationalize and justify their actions (Perez et al., 2023). This study explores whether higher Dark Tetrad personality traits predict explanations offered following infidelity through Moral Disengagement strategies, cognitive mechanisms used to rationalize unethical behaviors (Moore, 2015). Participants will complete scales such as the Short Dark Tetrad Scale (Paulhus et al., 2021), the Infidelity Moral Disengagement Scale (Lişman & Holman, 2022) and an infidelity scenario, explaining their behavior if placed in a similar situation. Due to low empathy (Jonason & Krause, 2013), low agreeableness, and low humility (Paulhus & Williams, 2002), individuals with high levels of dark traits, are expected to favor Moral Disengagement strategies, such as displacement of responsibility (Egan et al., 2015), which, in turn, are expected to predict higher use of aggravating accounts to explain infidelity. The results can inform efforts to reduce psychological and emotional harm that may result from a partner’s unfaithful behavior.

[7] A call for greater transparency in piloting

4:40 PM – 5:40 PM

METHODS/STATISTICS

Although piloting is a common and valuable part of the research process, pilot studies are rarely reported in the psychological literature. Yet, reporting pilot studies could improve many aspects of psychological research. It could help researchers avoid systematically excluding part of the research process from the scientific record, reveal selection biases in research designs that may affect the generalizability of findings, evaluate others’ research more accurately, learn from other researchers’ successes and failures, uphold ethical responsibilities, and improve the methodological practice of piloting. I recommend three concrete initiatives to help pilot reporting become standard practice: researchers and institutions should develop simple pilot reporting templates; journals should establish clear pilot reporting guidelines for authors; and authors should acknowledge when pilot studies were run and share relevant materials and data. Current reporting standards favor polished research narratives that are the end product of a complex scientific process, but a truly transparent science should spotlight processes—like piloting—that underpin the conclusions scientific papers draw.

[8] A cross-cultural investigation of sex differences in friendship preferences

4:40 PM – 5:40 PM

EVOLUTION

Previous research demonstrated that men and women prefer different qualities in their same-sex friendships, and these differences can be predicted by a functional account of friendship. However, this research was limited in generalizability as it only included American participants. Are these sex differences in friendship preferences universally shared, or are they culturally bound? The current study explored this question with six datasets (N = 1140) including participants in China, Australia, the UK, and the US. Across cultures, we see evidence for sex differences in some preferences, such as the extent to which men and women rely on friends for emotional support. However, not all friendship preferences were consistently replicated, suggesting the role of cultural variability in shaping the qualities we seek in our friends.

[11] A Meta-Analytic View of Stealing Thunder

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Stealing thunder is a persuasive tactic that involves preemptively disclosing one's own negative information before others disclose in an attempt to diminish its impact. Research in legal, political, and crisis management contexts has demonstrated the effectiveness of stealing thunder. However, less is known about when (i.e., boundary conditions) and how (i.e., underlying mechanisms) the tactic works. Therefore, the aim of this meta-analysis is to organize and synthesize the published empirical research on stealing thunder. A literature search was conducted using six databases by combining our keywords "stealing thunder" or "self-disclosure" and "persuasion" or "crisis communication." Effect sizes (Cohen's d) from each study will be used to investigate whether stealing thunder leads to more favorable outcomes overall than thunder, whether it leads to more favorable evaluations of the discloser stealing thunder compared to thunder, whether stealing thunder erases the negative impact of the thunder information, and whether the tactic is more effective in certain domains (e.g., legal, politics, crisis communication).

[12] A Seatbelt Measure for Complex Power Analyses

4:40 PM – 5:40 PM

METHODS/STATISTICS

Power analysis is recommended as a "best practice" in psychological research. Best practices are meant to standardize the way scientists conduct research, as well as improve the quality of the research in the field. Researchers aim to make sure their studies are "well-powered", but what this means and how to achieve it are difficult in practice. Because there is no unified approach to power analyses in complex cases, researchers have considerable freedom in the assumptions they make regarding the relevant parameter values in their power analyses. Even when researchers try to make well-informed decisions, there is no guarantee they will converge on an answer. With simulations, we show how researchers can get different sample size estimates just by making different assumptions about the parameters in their power analysis. Because power analysis in complex cases is not standardized, we propose a new approach to thinking about power: Best practices for power analysis should function like seatbelts. For example, researchers should not collect fewer than 200 participants. This recommendation is easily implementable and introduces standardization in complex power analyses.

[13] A Social Relations Model Decomposition of Attachment in Close Friendships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Friend groups offer some of the closest relationships in young adulthood, making them ideal for testing if attachment is stable across relationships, as suggested by previous literature. To do so, we examined how much attachment is a general style individuals carry with them versus a relational dynamic between two people in close friendships. In friend groups of four, 344 undergraduates rated their attachment orientation with each friend in the group. We used the social relations model (Kenny, 1994) to decompose attachment ratings, which showed that attachment was influenced by the dyad's unique relationship (45-59% of variance) and by the perceiver's general tendency to be anxiously or avoidantly attached with others (31-55% of variance). Thus, people have attachment tendencies that generalize across friends, but attachment is also a relational dynamic. These influences varied such that avoidance was more generalized and anxiety was more relational. Notably, individuals did not reliably evoke attachment styles in their friends. This suggests that, contrary to common belief, our attachment can adapt to our social environments, and certain styles might be more mutable than others.

[14] A Touchy Subject: Pluralistic Ignorance and Physical Intimacy in Heterosexual Men's Same-Sex Friendships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

In prior research, we found that men engage in a significantly narrower range of touch behaviors with male friends than they report being open to. One possible explanation is pluralistic ignorance: men may underestimate their peers' openness to physically affectionate touch and, in turn, limit their own behavior. We explored this across two studies—one with heterosexual cisgender men from across the U.S. recruited via Prolific (N = 485), and one with heterosexual cisgender undergraduates from select CUNY campuses (N = 397). A series of t-tests assessed whether men collectively underestimated their peers' openness, comfort, and attitudes regarding homosocial touch, and whether they rated their openness, comfort, and attitudes as higher than those of their male peers—patterns indicative of pluralistic ignorance. Furthermore, using hierarchical linear regression models, we examined whether men's estimates of their male peers' openness, comfort, and attitudes predicted the physical intimacy they experienced in their friendships, over and above their own—suggesting that pluralistic ignorance may inhibit affectionate touch in men's same-sex friendships.

[15] Abrupt Implicit, Incremental Explicit Attitude Change in the Bob Paradigm

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

We sought to replicate Rydell et al. (2007) suggesting that implicit attitudes shift incrementally, whereas explicit attitudes shift abruptly. A replication would support dual-process perspectives on attitude formation.

The design followed Rydell et al. (2007), except feedback duration was reduced from 5,000 to 1,000 ms. Participants (N = 595) first learned 100 positive statements about a novel target (Bob), followed by counterattitudinal (CA) negative statements whose number varied by condition (0, 20, 40, 60, 80, 100CA). Implicit (IAT) and explicit (self-reported) attitudes were then measured.

The findings reversed Rydell et al. (2007): Implicit attitudes shifted abruptly, with significant differences only between control (0CA) and each CA condition but not across CA conditions. By contrast, explicit attitudes changed incrementally, with significant differences across non-adjacent CA conditions (e.g., 20CA vs. 60CA).

These results suggest that implicit attitudes can change abruptly, whereas explicit attitudes can change incrementally, challenging dual-process theories predicting slow implicit vs. fast explicit change. Ongoing work seeks to clarify the underlying cognitive mechanisms.

[16] Actual and Perceived Similarity in Romantic Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

The literature on assortative mating has shown that people are likely to prefer partners who are similar to them. However, whether this tendency applies for dysfunctional traits needs further research. Therefore, the present study aims to investigate how both actual and perceived similarity between romantic partners in physical attractiveness, Dark Triad personality traits, and codependency behaviors are associated with relationship quality. Accordingly, responses from both partners will be collected allowing for the examination of perceived similarity. Multilevel modeling (MLM) will be conducted to account for the dyadic nature of the data. Using this approach, actual and perceived similarity in physical attractiveness, Dark Triad personality traits, and codependency behaviors will be assessed in association with relationship quality. The current study is expected to expand assortative mating research by examining similarity in dysfunctional traits as well as analyzing actual and perceived similarity. Through dyadic data and Multilevel modeling, this study attempts to provide a comprehensive knowledge in how similarity relates to relationship quality.

[17] African American Women Predict Harsher Outcomes for Women Mate-Poachers

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Mate poaching is widespread with about 70% reporting being a target and 65% a perpetrator but influential factors and inhibitors are less known. Evolutionary psychology focuses on self-serving benefits but less is known of how much poachers consider the damage to the losing mate. This research investigates positive (target SES) and negative (damage to losing partner) utilitarian factors on poaching evaluations and estimated outcomes.

254 African American women rated likely consequences of a mate-poaching varying in: 2 (gender of poacher) x 2 (degree of damage to losing mate) x 2 (Socioeconomic Status of Poaching target) in a standard base vignette and evaluated success and practical outcomes.

Women were rated more likely than men to make a successful poach and to be later cheated on themselves by their target. Expected high damage to the losing mate reduced poaching likelihood and increased likely retaliation especially for women poachers. Target's SES interacted with losing partner's Damage level, predicting relationship success for women poachers with high SES Targets but reducing success with low SES Targets, suggesting more than simple evolutionary and mundane social motives.

[18] AI-written persuasive message are easy to read, true, and likable

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Large Language Models (LLMs) can produce effective persuasive messages. In six experiments, we examined whether such messages are easy to read, which could enhance their credibility and likability. We compared persuasive messages about various political issues produced by GPT-4o to messages authored by human lay writers and political experts. Although human-written messages had higher objective reading ease, two experiments showed that readers perceived LLM-generated persuasive messages as easier to read, more truthful, and more likable than messages generated by lay writers. This pattern was replicated when we matched objective reading ease of LLM-generated texts with human-written messages, and when we matched the arguments of LLM-generated texts to human-written messages, controlling for the prototypicality of arguments. Experiments 5 and 6 replicated these findings using texts authored by political experts. Mediation analyses suggest that the ease with which human readers understand text generated by LLMs contributes to its persuasiveness. We discuss these results in the context of a predictive coding account and fluency theory to link LLMs to persuasiveness.

[19] Anti-Transgender Rhetoric in Social Media, News Outlets, and Political Positions: Analyzing Backlash, Authenticity, and Emotion

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Findings from the most recent U.S. Transgender Survey indicated that transgender people have psychological distress rates that are more than ten times the rates of the general population. One likely factor in this is anti-transgender rhetoric found in interpersonal interactions, media coverage, and political statements. The presented findings analyze language used in 385 social media comments (Study 1), 25 articles about transgender people from five right-leaning news organizations (Study 2), and statements made by politicians in the United States Congress (Study 3). Each component will be analyzed using LIWC software for authenticity, tone, drive, and affect. Social media comments are also coded based on an established taxonomy of anti-transgender backlash strategy. The coding for this was used to train a KNN machine-learning model to categorize the content from Studies 2 and 3, utilizing the findings from the LIWC analysis. The effectiveness and implications of findings will be discussed. Finally, Study 3 will also compare the Republican and Democrat statements regarding transgender rights with a focus on differences in the emotions of the statements.

[20] Are Disability, Disorder, and Illness Interchangeable? The attitudinal, stereotype, and policy implications of disability labels

4:40 PM – 5:40 PM

DISABILITY

The United Nations considers disability to be one of the world's largest minority groups, with some estimates indicating that over a quarter of the US population has a disability. However, research on disability in psychology still lags significantly behind work on gender and race (Colella et al., 2017). One reason for this deficit is that the category of disability lacks a clear definition, and perceptions might change based on the exact description or label. It may be useful to understand the implications of the different labels used to define disability. In the current research, we examine perceptions of the label disability compared to two other labels (i.e., disorder and illness). Across 3 studies (N = 1,204), we find that people who are primed to think about the disability label view disability more positively, view disability as conveying more warmth, and support more policy related to disability compared to other labels (S1-3), even when all of the labels are defined similarly (S2). We examine the dimensions of stigma conferred by a label as a mechanism (S3). This set of studies sheds light on the significance of labels for a complex and stigmatized category like disability.

[21] Associations between smoking status, beliefs, and comfort providing quitting support

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Receiving positive support during smoking cessation is associated with abstinence, however, people may differ in willingness to provide such support. We used mixed methods to understand the current smoking status of participants (N=196), beliefs about smoking, and comfort with providing support for quitting. Participants were adults in the United States who knew someone who smoked. They reported comfort with providing support and completed an open-ended response to indicate influences on their comfort. Participants who were former smokers reported more comfort providing support whereas current smokers indicated less comfort. Participants who reported closer relationships with a smoker were more comfortable providing support. A thematic analysis of the written responses revealed five primary themes, including behavior of the support recipient, relationship closeness, own smoking status, health benefits of quitting, and other barriers and facilitators. Findings suggest that current smokers feel uncomfortable providing support whereas former smokers feel comfortable and that support providers attend to specific relationship factors when providing support.

[22] At the Crossroads: The Prevalence of “Intersectional” Research in Social Psychology

4:40 PM – 5:40 PM

DIVERSITY

Despite psychology's historical focus on single categories or identities, social psychological science increasingly recognizes the importance of intersectionality in our varied topics of study. Taking an intersectional perspective allows the field to better address the nuanced interplay of multiple social identities in shaping psychological processes. To investigate how often research in the field uses an intersectional perspective and to investigate possible changes over time, we coded social psychology articles published between 2019 and 2023 (N = 2,300) in four leading journals. We examined the prevalence of intersectionality across three domains: the identities of participants, the target stimuli, and the analyses conducted. While we hypothesized an increasing trend in intersectional research over time, we anticipated an overall underrepresentation of intersectionality. Results reveal an overall 15% intersectionality prevalence across article sections (highest for participant identities), with a slight increase in recent years. As the field evolves, it is essential to reflect on intersectionality's role in the push toward a more inclusive social psychology.

[23] Attachment Insecurity and Mate-Guarding Resistance in Marriage: The Moderating Role of Physical Attractiveness

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Romantic rivals and partner defection are notable threats to maintaining long-term relationships such as marriage. Consequently, people engage in mate-guarding behaviors that function to attenuate these threats. However, some people may respond to their partners' mate-guarding attempts with resistance, and some traits (e.g., insecure attachment, physical attractiveness) may make certain people more resistant to their partners' mate-guarding attempts than others. We used cross-sectional data from a dyadic study of 202 married individuals (comprising 101 couples) to test the prediction that attachment anxiety and avoidance would be associated with mate-guarding resistance and that objectively rated physical attractiveness would moderate those associations. Results suggested that (a) attachment avoidance was positively associated with mate-guarding resistance, regardless of how physically attractive a person was, and (b) a positive association between attachment anxiety and mate-guarding resistance emerged only among people rated as highly physically attractive, but not among people rated as less physically attractive. Implications for theory and future research will be discussed.

[24] Attachment Predicting Loneliness: A Moderated Mediation Model of Resilience and Coping Strategies

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Numerous studies have highlighted the detrimental consequences of loneliness, demonstrating its adverse effects on emotional health, interpersonal bonds, and overall quality of life. Previous research has suggested an association between the quality of attachment experienced in childhood and the level of loneliness reported in adulthood. The present study aimed to examine two potential coping resources in the relationship between attachment and loneliness, namely, resilience and coping strategies, while considering both anxious and avoidant attachment orientations as well as passive and active coping styles. A total of 465 adults (325 women, 138 men; average age = 38.6, SD = 11.49) completed a series of online questionnaires assessing the aforementioned variables. Avoidant and anxious attachment both predicted loneliness directly and indirectly through resilience. However, these indirect effects emerged only when passive coping was moderate or high, whereas active coping, despite enhancing resilience and reducing loneliness, did not moderate the associations. This pattern of findings suggests that although attachment orientations, which are considered relatively stable traits rooted in childhood, have clear implications for loneliness in adulthood, strengthening personal resources such as resilience and fostering more active coping strategies may serve to buffer or mitigate these predictive effects.

[25] Attachment, stress, and the bidirectional association between satisfaction and commitment

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Prominent theoretical models of close relationships suggest a bidirectional association between relationship satisfaction and commitment. Nevertheless, most existing work has tested these associations at the between-person level, and we are not aware of any research examining whether and why the strength of any within-person associations between these variables differs across people. We used three samples (N = 337 newlywed couples) that each employed both daily diary and multiwave longitudinal methodologies to address these issues. Cross-lagged, multilevel analyses revealed reciprocal within-person associations between relationship satisfaction and commitment that varied significantly across people. Consistent with predictions derived from the vulnerability-stress-adaptation model, between-person differences in attachment security determined the extent to which satisfaction predicted commitment whereas between-person differences in stress determined the extent to which commitment predicted satisfaction. These findings highlight how and why key theoretical assumptions about relationships can vary across people and thus the value of within-person approaches.

[26] Audience Watchdog: Testing the Effect of Audience Threat on a Gay Communication Source's Message

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

The watchdog hypothesis posits that watching out for potential bias toward a communication source's social group (e.g., one's sexuality or race/ethnicity) will enhance processing for that source's message. Past work has shown this effect for those watching out for negative bias in themselves, especially when they exhibit low prejudice towards that group. However, research has yet to test whether individuals also watch out for potential bias in others, like in an audience. In the current study, we aimed to address this gap. Participants were exposed to a gay male source's message about implementing senior comprehensive exams (SCE) at an ostensible college. The college was portrayed as potentially being supportive (low threat) or not supportive (high threat) of LGBT+ members. Findings suggest that those low in prejudice processed the source's message equally regardless of environment threat, indicating no audience watchdog effect. Yet, those high in prejudice exhibited enhanced processing for the gay source's message, but only when in the low threat environment for LGBT+ members. Possible implications for these findings, as well as future research directions, are discussed.

[27] Automaticity and Biology: How Explanatory Framing Influences Judgments of Infidelity

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Prior research by Nettle et al. (2023) suggests that people perceive behaviors to be more malleable when the behaviors have psychological rather than biological causes. The present study replicates and extends this work by investigating how explanatory framing impacts beliefs regarding infidelity. Drawing from Bargh's (1994) Four Horsemen, we also examined whether explanatory framing affected people's beliefs about the automaticity of infidelity. Undergraduate students at UC Davis responded to a survey that contained evocative vignettes detailing either a biological or a psychological explanation for why men and women engage in infidelity. In addition to Nettle et al.'s (2023) measures, we added measures of perceived efficiency, uncontrollability, unintentionality, and unawareness, described by Bargh (1994). Consistent with previous work, the biological (vs. psychological) framing led participants to believe that infidelity was less malleable and more automatic. Our results also found an in-group effect: Participants rated the other gender's behavior as more automatic. This study extends prior research on explanatory framings to include automaticity in the context of infidelity.

[29] Backlash in the U.S.: Explanations for the reversal of sexuality biases from 2021-2024

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

In new data from 2.5 million respondents at the Project Implicit website (2021-2024), implicit and explicit anti-gay and anti-trans attitudes have increased in bias, in a surprising reversal of prior declines. In the current work, we tested three pre-registered hypotheses for why sexuality attitudes may have reversed: (1) transfer from transgender bias ("transgender" = "gay"), (2) moral panic rhetoric about "sexual grooming," and (3) a generalized ideological backlash. Geographic analyses of attitudes, voting patterns, and Google search trends provided little support for the first two mechanisms. Instead, results support the third hypothesis, that backlash is driven by a larger compilation of societal events and ideological factors (e.g., elections of emboldening leaders, rising political sectarianism). This explanation is further bolstered by additional data showing reversals away from neutrality for race, skin-tone, age, disability and body-weight attitudes. Our findings underscore that long-term attitude change is fragile and can reverse course, emphasizing the critical role that leadership and policies play in shaping large-scale shifts in attitudes.

[30] Behavioral Forecasts in Human-AI Interaction

4:40 PM – 5:40 PM

MORALITY

Can people accurately predict their own and others' behavior within human-AI interactions? Across three studies (N = 895), we compared participants' accuracy in forecasting their own and others' (1) closeness to AI companions and (2) moral judgments of their erring AI companions with their actual closeness and moral judgments in a lab setting. Results revealed forecasting errors for both closeness and moral judgment. Compared to actual, in-lab measurements, participants' predictions overestimated how close others would feel towards their AI companions and how harshly others would judge their erring AI companions. When predicting their own behavior, participants also overestimated the harshness of their own moral judgments but accurately forecasted their closeness to their AI companions. These patterns—underestimating human resistance to AI bonding while overestimating negative reactions when AI fails—may reflect deeper preconceived notions about AI as fundamentally threatening.

[31] Believing in Climate Action, Clicking on Adaptation: The Intention-Behavior Gap

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Most people believe climate change is happening and that we must take individual and collective action to decelerate the crisis. However, climate communication research shows a gap between stated attitudes and behavior. The present study (N= 250) used a selective exposure task to explore existing beliefs and engagement with information (videos) about climate solutions, expecting participants to engage with belief-congruent TED Talks. Participants overwhelmingly positioned themselves with the opinion that climate change is human-caused and that humans bear personal responsibility. When choosing more information on climate change to engage with however, they selected information focusing on technology-based solutions and adaptation over information suggesting the need for individual and collective action. These results suggest that while people conceptually endorse action, their practical engagement leans towards coping strategies rather than preventative action.

[32] Belonging Starts At Home: Family Support Promotes First-Generation, Low-Income College Students' Sense of Belonging

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

First-generation, low-income (FLI) college students face persistent challenges in college, such as greater uncertainty about whether they belong. While FLI students often emphasize the importance of family support in qualitative work, little research has directly tested how this support impacts students' outcomes. Existing literature proposes that FLI families lack the academic experiences and capital necessary to support FLI students through college. Rather than this deficit perspective, in the current research we take a strengths-based approach to examine the broad range of support (both academic and non-academic) families may provide to FLI students. Across two studies (N1=158; N2=181), we find that although family academic support was unrelated to FLI students' outcomes, family non-academic support (e.g., practical, emotional) was positively linked to feelings of belonging. These findings highlight the importance of examining different forms of family support beyond those typically recognized in higher education, and how integrating families into college life can be a potential avenue for addressing the belonging gap FLI students face in higher education.

[33] Beyond Deficit Models: Examining Black Women's Sexual Information-Seeking as a Predictor of Sexual Empowerment

4:40 PM – 5:40 PM

SEXUALITY

Research on Black women's sexuality often emphasizes risky behaviors, such as unintended pregnancy and STIs, reinforcing harmful stereotypes and deficit-based narratives that overlook the diversity and resilience of their sexual lives. The present study addresses this gap by examining how the sources women turn to for information and conversations about sex are associated with sexual empowerment. A nationally representative sample of Black American women (N = 637) completed survey measures assessing participants' sources of sexual information and conversations as well as several indicators of sexual empowerment (sexual assertiveness, sexual self-knowledge, and entitlement to sexual pleasure). We will use hierarchical linear regression analyses to examine how having conversations with family and friends and seeking information from the media about a wide range of sexuality-related topics predict sexual empowerment. Understanding which sources and topics are most linked to sexual empowerment has important implications for promoting sexual health, self-advocacy, and well-being among Black women.

[34] Beyond Home and Work: A Quantitative Exploration of Third Places and Sexual Behavior in Japan

4:40 PM – 5:40 PM

SEXUALITY

This study explores the impact of third places—social environments outside the home and work—on sexual activity, interest, desire, and intimate relationships. Despite their well-known importance for community building and well-being, limited research exists on how third places influence sexual behavior and romantic dynamics. Data from 895 participants (53.1% male, 44.9% female, mean age 37.67, primarily from Japan) were analyzed using SPSS. The results show that having access to a third place is linked to being sexually active, reporting higher sexual interest and desire, experiencing greater intimacy and satisfaction with relationship roles, and showing improved relationship stability. We attribute these findings to improved social skills, which play a key role in sexual activity and relationship dynamics. The practical application of this study suggests that relationship counselors should encourage couples to engage more with their non-primary (i.e., work and home) places and people for better sexual health. Meanwhile, urban planners and policymakers should design spaces that promote more involvement with, and possibilities for such places and people.

[35] Beyond Single Categories: How Perceiver Intersectional Identities Influences Implicit Bias Toward Intersectional Targets

4:40 PM – 5:40 PM

DIVERSITY

Implicit evaluations depend on who is judging, yet most measures treat targets as single identities. We test whether perceivers' intersectional identities shape evaluations of intersectional targets. Across three Project Implicit samples (Ns=1,708; 1,316; 1,706), participants completed a Multi-Category IAT (Studies 1–2) or an Evaluative Priming Task (Study 3). Study 1 (Black/White targets) revealed a robust "perceiver-gender" rule: women showed stronger own-gender than own-race bias, whereas men showed stronger own-race than own-gender bias. Study 2 replicated this pattern with East Asian and White targets. Study 3 converged using priming, indicating effects are not tied to MCIAT labels. Collectively, we find that intersectional evaluations are not reducible to single-axis effects; they are systematically moderated by perceiver identity. The results refine social identity and system-justification theories and motivate measurement that jointly varies perceiver and target intersectionality.

[36] Beyond the Nuclear Norm: Examining Family Diversity in Children's Media

4:40 PM – 5:40 PM

DIVERSITY

Diversity in family structures is becoming increasingly common within Western Society. Traditional nuclear families are complemented by interracial and interfaith families, stepfamilies, extended family arrangements, and so forth. From an early age, children are introduced to the many branches of a family tree, all rooted in the presence of their caregiver(s). Given the wide variation of family structures among children, it is crucial that children's media -- such as television, books, and movies -- offer diverse caregiver representation. While the current body of research on familial diversity within children's media examines the portrayal of the individual child's identity, the current research sought to explore the diversity of families, specifically caregivers, depicted in children's media. Within the three selected forms of popular children's media (television, movies, and books, N = 90), we examined the attributes of the central child character and their caregiver dyad(s). Coders rated the diversity of caregiver representation within this sample, as well as the engagement, warmth, and discipline of the caregiver dyad(s). This study serves as a step towards understanding the scope of caregiver diversity presented to young children through media, with the aim of informing future research on the benefits of such representation.

[37] BIPOC Neurodivergent Student Experiences & Needs Study

4:40 PM – 5:40 PM

DISABILITY

Autistic and ADHD students are entering higher education in growing numbers, yet evidence shows lower GPAs, higher dropout rates, and lower graduation rates compared to peers. Disparities intensify for neurodivergent Black, Indigenous, and People of Color (ND BIPOC) students, who face structural and cultural barriers shaped by race, disability, and institutional norms. To address the lack of research on these intersecting identities, the Student Neurodiversity Alliance (SNAC) and Black Graduate & Professional Student Association (BGPSA) co-developed the ND BIPOC Student Experiences & Needs Survey using mixed methods and a community-based participatory approach grounded in social identity, belonging, and stigma theories. Over 500 students completed the Everyday Discrimination Scale, Sense of Belonging Scale, and open-ended items analyzed via inductive coding. ND and BIPOC students reported significantly higher discrimination and lower belonging than peers; only 8.3% were registered with disability services. This student-led study centers affected students as knowledge producers and informs university policies and procedures, as well as the student-led organizing.

[38] Breaking Up with Parents: Adult-Children's Perspective on Estrangement

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Parent-child bonds are expected to endure throughout life (Swartz, 2009). Abuse, neglect, and/or conflict can challenge the connection in these nonvoluntary relationships (Blake, 2017). Clinical (Bowen, 1978) and empirical research (Gilligan et al., 2015) based in family systems theory highlights how parents' and adult children's bonds can become "cut off" through estrangement. Despite explicating causes of estrangement, limited research explores how estrangement is maintained and affected by internal and external pressures. Using a grounded theory approach (Charmaz, 2014) to analyze qualitative narratives in Reddit forum data, we examined how adult children maintain and cope with estrangement. The sample consisted of 198 posters from 2025 whose posts were extracted using R. On average, posters were 25 years old (SD = 5.34) and predominantly identified as female (83.6%). We identified several preliminary codes, including rationalizing estrangement, establishing boundaries, being tested, doubting/reconsidering, emoting, seeking support, and maintaining boundaries. The study provides practical insight into family dynamics and estrangement from a candid perspective of adult children.

[39] Bridges or Walls? SED and Self-Protection in Romantic Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Socioeconomically disadvantaged individuals are often believed to possess deep social ties and a strong sense of community, but emerging perspectives suggest that difficult financial circumstances may increase vigilance in relationships, preventing the formation of strong romantic bonds. Building on this understanding, we examined the association between socioeconomic disadvantage, measured subjectively through perceptions of financial distress, and self protective tendencies in romantic relationships. We investigated our hypotheses in two studies (total N = 1,098) and found a positive correlation between financial distress and several measures that indicate self-protection: Study 1 (N = 716) found a positive association between financial distress and three measures indicating self-protection: 1) Chronic Self-Protection scale, 2) willingness to commit sooner, and 3) general trust towards partner. Study 2 (N = 382) replicated these findings with just participants who are romantically involved, using willingness to commit and general trust towards partners. These findings indicate that financial distress may hinder intimacy processes in romantic relationships. Results in both studies hold after controlling for demographic covariates, relationship status, and introversion.

N = 1,098

[40] Bridging the Divide: The Effect of Perceived Similarity and Self-Expansion on Friendship Formation

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

This study explored the relationship that perceived similarity and self-expansion motivation have on friendship formation and physiological stress. 100 (72 women, 24 men, 2 individuals who identified as non-binary, and 2 preferred not to say) predominantly White participants were brought in the lab as dyads and told they were paired based on either their political similarities or political differences. They were then told that interacting with dissimilar others is either beneficial (high self-expansion motivation) or harmful (low self-expansion motivation). Results showed that participants interacting with dissimilar others had raised cortisol levels, suggesting a dissimilar other is a greater physiological stressor than a similar other. Additionally, low self-expansion motivation facilitated closeness when participants perceived each other as similar, but there was no effect for dissimilar others. These findings show that similar others did feel closer, but only when they were hearing messages that interacting with similar others is beneficial. More research is necessary to uncover what best promotes relationship outcomes in dissimilar others.

[41] Can Large Language Models Accurately and Reliably Assess Relationship Quality?

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

High-quality romantic relationships are critical for health and wellbeing, yet empirically assessing relationship quality remains challenging. Traditional self-report methods have several limitations, including unreliable prediction of changes in relationship quality over time, susceptibility to social desirability bias, and poor differentiation between constructs. We evaluate a novel approach to assessing relationship quality by leveraging large language models (LLMs). Three LLMs (ChatGPT, Llama, Claude) will extract ratings on core components of relationship quality (e.g., satisfaction, commitment) from relationship narratives written by participants (N > 300). We evaluate the validity of this method by examining correlations between LLM-derived construct ratings and participants' own self-reported ratings. We also examine reliability over time and across LLMs, assess LLM accuracy across constructs, and explore their reasoning process. Finally, we assess participants' preferences between these two approaches. This work explores an innovative tool for the assessment of relationship quality that more closely aligns with how people talk about their relationships in everyday life.

[42] Can learning goals facilitate depolarization? A cross-cultural test

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Disagreements are psychologically threatening and can produce polarization. We sought to investigate whether learning goals would depolarize conversations involving disagreement. We expected learning goals to shift the focus away from an outcome focus and increase psychological safety in the interaction (Green et al., 2021). In turn, we expected this to lead people to hold less polarized views of their interaction partners. We tested predictions in two cultural contexts: USA (188 dyads) and Singapore (179 dyads). Dyads interacted for 10-min over Zoom on a topic of disagreement (e.g., death penalty); one interactant was assigned a goal to learn or to persuade. Participants then completed measures of affective (e.g., perceptions of competence) and issue (e.g. attitude extremity) polarization. Contrary to hypotheses, learning goals did not have any effects in either sample. However, to the extent that participants perceived their partner as listening to them well, they also reported higher psychological safety, which in turn predicted reduced affective polarization.

[43] Can the Unconscious Processing of Persuasive Messages Impact Attitudes?

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Under-powered evidence suggests that unconscious thought about a message can influence individuals' attitudes even when persuasive messages are difficult to process consciously. Using an ideal control condition and a larger sample size (n = 400), the current experiment stringently tests the prediction that individuals afforded the goal and time to think unconsciously will form attitudes based on the quality of arguments in a persuasive message received in a distracting context. Participants were randomly assigned to hear a persuasive message containing either strong or weak arguments supporting a topic while experiencing high distraction from a competing auditory task. Participants were then assigned to read instructions indicating either that they will report message evaluations following a forthcoming task, implanting the goal to further process the message (unconscious-thought condition), or that they are done evaluating the message (no-goal control), then completed a 3min word-search task. It is predicted that participants will report more favorable topic attitudes following the search task if they heard strong versus weak arguments in the unconscious-thought, relative to control, condition.

[44] Capturing Experiences of Jealousy Within Consensually Non-Monogamous Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

According to the literature, consensually non-monogamous (CNM) individuals report lower levels of jealousy than their monogamous counterparts (Conley et al. 2017). However, scales commonly used to evaluate jealousy are mononormative and assume dyadism, potentially missing jealousy in CNM experiences where extradyadic relationships are permissible. To test this, CNM and monogamous participants answered a series of traditional and CNM modified questions to tap into jealousy across a range of experiences. As predicted, monogamous participants reported higher levels of jealousy overall compared to CNM participants; however, CNM participants reported higher levels of jealousy when responding to modified items compared to traditional items. CNM participants also reported higher levels of trust and relationship satisfaction, but lower levels of well-being than monogamous participants. These results suggest jealousy is present in CNM relationships and reaffirms CNM relationships as functional. We discuss the necessity of using appropriate methodology for studies on CNM individuals and hope to provide researchers and clinicians a more comprehensive understanding of CNM experiences.

[45] Capturing Weaponized Incompetence Across Contexts: A Mixed Methods Study

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Weaponized Incompetence (WI) is a term that has gained significant popularity on social media platforms in recent years. Defined as feigning incompetence in order to avoid undesirable tasks, the current project extends our prior work examining this novel concept by investigating the components that make up the definition of WI. We conducted a mixed methods descriptive study to explore people's experiences with this concept, both as the "target" and the "perpetrator" of WI. Adults from Prolific (n = 500) were asked to recall personal experiences with WI (from both target and perpetrator perspectives), and answered quantitative and qualitative questions around those experiences. Question themes included both parties' level of awareness of WI use, WI severity, harm inflicted, and potential motives for usage. Data, to be analyzed Fall 2025, will provide valuable insight into how WI functions across different contexts and identity groups. This project will inform future work exploring the ways which WI impacts relational and personal wellbeing.

[46] CFS-VR: Software for Studying Unconscious Cognition with a VR headset using Continuous Flash Suppression

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Numerous psychological theories emphasize the importance of unconscious cognition. However, research on unconscious processing has faced stigma and methodological challenges, especially in minimizing contaminating influences of conscious cognition. Continuous flash suppression (CFS), an image presentation technique, has the potential to enlarge the window through which we may view the workings of the unconscious mind prior to the onset of conscious cognition. But CFS can be technically challenging and expensive to implement. We have developed software, CFS-VR, that increases access to CFS as a methodological tool using a basic VR headset. CFS-VR allows for the presentation and recording of responses to many different visual stimuli and trial types, and is freely available. This paper provides a brief tutorial and explores research domains (evaluative conditioning, priming, and mere exposure) where CFS-VR can address unresolved and novel research questions.

[47] Characterizing Research on the Impacts of Registered Reports in Psychology and the Process Through Which They are Produced and Reviewed

4:40 PM – 5:40 PM

METHODS/STATISTICS

Registered reports (RRs) are a publication format theorized to improve study methods (as investigators receive feedback on proposed research before starting) and reduce publication bias (as accepted proposals are published regardless of results obtained). To characterize research evaluating diverse impacts of RRs in psychology and the process through which RRs are produced and reviewed, we conducted systematic database (APA PsycInfo, MetaArxiv) and forward/backward citation searches. A notably small body of evidence suggests that compared to conventional articles, RRs are associated with higher null-result reporting, method and data transparency, and study quality; evidence is mixed on citation counts. Evidence on the processes underlying RRs is especially scarce but suggests that journal policies on RR submissions are often underspecified, open review is rarely explicitly offered, and protocol transparency has improved over time. Our results point to the potential benefits of RRs and indicate the need for further research, especially on the process through which RRs are produced and reviewed given that their beneficial impacts may be contingent on the quality of this process.

[48] Climate Change Anxiety as a Moderator for How Emotional Video Messages Affect Pro-Environmental Behavior Intentions

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Video appeal messages regarding the state of emergency surrounding climate change may be a short informative way to persuade the public to take action in pro-environmental behaviors. It is critical for scientists and public communicators to understand the way in which emotional video appeals can motivate individuals to take on pro-environmental intentions. This is particularly true in the context of moderator variables such as climate change anxiety, eco-anxiety, and ecological grief. Overall predictions include that (1) video appeals that instill hope will be effective in inducing pro-environmental behaviors across all levels of related moderators more-so than that of the control condition or fear conditions; (2) video appeals that instill fear will less effective or no more effective than control messages for individuals with high related moderator values. (3) video appeals that inducing fear will have a decreasing effect on pro-environmental behavioral intentions as the continuous predictors increase. This research intends to assess the effectiveness of video appeals on engaging pro-environmental behavior intentions.

[49] Cognitive Adaptations to Context Diversity: Does Exposure to Neighborhood Racial Diversity Predict Other Implicit Attitudes?

4:40 PM – 5:40 PM

DIVERSITY

Interactions between individuals and their social environments are fundamental in shaping social cognitive processes, such as implicit attitudes. We examined whether exposure to one domain of context diversity (i.e., neighborhood metrics of racial diversity and segregation), relate to implicit attitudes in other social domains (sexual orientation, disability). Multilevel models computed from linked Census Bureau and geolocated IAT scores from 825,000 respondents revealed that living in more racially diverse counties was related to less stereotypic implicit associations to sexual orientation, and this relationship was moderated by racial Segregation. Several checks confirmed a robust main effect of Diversity, including weighting to reduce sampling bias, testing majority-group behavior, statistically controlling for intergroup contact, and replicating on a different IAT domain (disability, N = 347,000). However, the original interaction between Diversity and Segregation was inconsistent across these post-hoc checks. This research supports the hypothesis that experiences with social diversity can generalize to mental associations in other domains in a cognitively adaptive manner.

[53] Compensatory Mechanisms of Avoidant Attachment

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Individual differences in attachment style present unique challenges for their partners. What keeps partners of the insecurely attached committed to their relationships? Prior research has revealed how the enhanced attention and provision of instrumental support that anxiously attached individuals provide for their partner may boost their partner's satisfaction. However, the potential compensatory mechanisms that keep partners committed to an avoidant partner remain underexplored. We hypothesize that the autonomy needs of an avoidant partner may benefit their romantic partners with space and time to pursue their own goals as well as to maintain broader social support networks outside the relationship.

The current study surveyed 200 U.S. adults in committed romantic relationships and included open-ended descriptions of their own and their partner's positive relationship behaviors as well as measures of attachment, relationship satisfaction, life satisfaction, and evaluations of different hypothetical relationship behaviors. Analysis of results are pending. I hypothesize that there are compensatory mechanisms distinctive of avoidant attachment, and those mechanisms are related to having space for self growth.

[54] Competence Striving in the Bedroom: Applying the 2 x 2 Achievement Goal Model to Sex

4:40 PM – 5:40 PM

SEXUALITY

Achievement goals are theoretically applicable in any and all competence-relevant domains, but they have primarily been studied in school, sport, and work contexts. The present research extends the 2 x 2 achievement goal model to the domain of sex. In two studies (N = 1,964), the Sex Achievement Goal Questionnaire (SAGQ) was developed, and the 2 x 2 sex achievement goals were examined as they relate to various antecedents and outcomes. Factor analyses supported the 2 x 2 model of achievement goals in this domain, and this model demonstrated configural invariance across both sex and relationship status. Regression analyses indicated that performance-approach goals had a highly positive nomological network, mastery-approach and mastery-avoidance goals generally had a positive nomological network, and performance-avoidance goals had a decidedly negative antecedent and outcome profile. Overall, this research highlights the ubiquity of competence-striving and emphasizes the 2 x 2 framework's broad applicability. Additionally, these studies demonstrate the importance of goals in the domain of sex, as they relate to sexual functioning, well-being, and behavior.

[55] Comprehensive, Image-based, Affectionate Touch Inventory: A New Look at Touch in Same-Gender Friendships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Touch is crucial for relational and psychological well-being. Affectionate touch measures, however, often include touch forms which are common in white female friendships and romantic relationships. To address this issue, we created the Comprehensive, Image-based, Affectionate Touch Inventory (CIBAT), which includes 28 GIFs that each depict a different touch form between two mannequins. Along with reporting touch frequencies in a same-gender friendship, participants rated how masculine, feminine, sexual, affectionate, intimate, and dominant each touch form was for that friendship. Across two samples, half of which identified as Black, we found that, contrary to prior findings, men and women do not differ in global touch frequency, but in the kinds of touch they use. A multi-level latent profile analysis indicated that the touch forms not captured in touch measures (e.g., daps, back slaps) are the same forms which men use more and view as more affectionate than women. We also found that Black Americans engage in far more touch than White Americans. This work suggests that touching norms vary meaningfully in the U.S. and challenges assumptions about what affection can look like.

[56] Considering the Unique and Interactive Impacts of Self-Compassion and Partner-Focused Compassion for Long-Term Relationship Satisfaction and Behavior

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Having compassion for one's self or intimate partner is interpersonally beneficial. Indeed, people high (versus low) in self-compassion are less defensive during conflict, and people high (versus low) in partner compassion are more satisfied with their relationships. Yet self- and partner-focused compassion are correlated constructs, and little research has considered their unique and interactive associations for relationship behavior and satisfaction. We examined these associations using data from a 2-year study of 240 newlyweds. Results revealed that self-compassion was neither associated with own nor partner satisfaction or behavior; in contrast, partner compassion was positively associated with own and partner satisfaction and negatively associated with own and partner oppositional behavior. Including their interactive effects revealed that partner compassion is only associated with own satisfaction among those high (but not low) in self-compassion. These results suggest the relational benefits of self-compassion may be inflated; it does exert unique associations with relationship outcomes and benefit satisfaction only when paired with partner-focused compassion.

[57] Consuming Obsession: The Effect of Dark Romance Fiction on Women's Perceptions of Toxic Relationship Behaviors

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Dark romance fiction (DRF)—romanticized depictions of borderline or overtly abusive behavior—has recently surged in popularity. This research tested the hypothesis that DRF consumption is associated with greater tolerance of toxic relationship dynamics, specifically among young women. Participants (N = 50) disclosed their level of DRF consumption, responded to vignettes depicting toxic relationship behaviors, and completed measures of related variables, including compulsive DRF use. DRF consumption was significantly correlated with acceptance of manipulative, controlling, and obsessive relationship behaviors, but was not significantly correlated with acceptance of healthy relationship behaviors, suggesting a unique link between DRF and tolerance of toxic dynamics. Additionally, heavy DRF consumers reported addiction-like tendencies, including difficulty limiting use and preoccupation. These results suggest that DRF may normalize harmful relationship dynamics—perpetuating rape culture and desensitizing women to patriarchal, domineering, and abusive standards—and foster compulsive consumption.

[58] Contact and Cooperation: How Prior Interactions Shape Interracial Team Dynamics

4:40 PM – 5:40 PM

DIVERSITY

This study explores whether prior contact with members of another racial group influences perceptions of cooperation in group dynamics. People often rely on diffuse status characteristics such as race, gender, and socioeconomic status when forming judgments about others in group settings. When people rely on diffuse status characteristics in racially diverse task group settings because people rely on social imbalances to create a hierarchy in group dynamics. Prior studies have found that prior intergroup contact can reduce intergroup prejudice, which could lead to positive group dynamics. Using data collected from a controlled laboratory experiment, we examined whether white participants' self-reported prior contact with Black individuals affected how they rated the cooperativeness of their Black group members during a collectively- and task-oriented group interaction. Preliminary results suggest that there are variations in both rates of intergroup contact and in group members' evaluations of cooperation based on race; however, most of these effects do not meet the typical standard for generalizability. Suggestions for future analyses include exploring how different types or qualities of intergroup contact shape perceptions, whether prior contact influences other performance-related judgments beyond cooperation, and how balanced racial representation within groups could affect group dynamics. Overall, additional research is necessary to better understand how intergroup contact shapes perceptions of individuals from other racial groups.

[59] Context matters: Sample diversity and reporting in academic mindset interventions

4:40 PM – 5:40 PM

DIVERSITY

Persistent issues with intervention research include the lack of sample diversity and underreporting practices. These trends can limit generalizability and may lead to overlooking critical contextual factors for evaluating program efficacy. The current study systematically reviews sampling and reporting practices of 134 growth mindset interventions targeting student academic outcomes from 2002 to 2025, specifically examining participant characteristics (age, gender, SES, and race) as well as institutional and geographic characteristics (public or private school; suburban, rural, or urban area; country). Results revealed participant SES to be the most underreported and inconsistently defined, as well as notable underreports of contextual characteristics. Most studies (63%) took place in the U.S. using homogeneous samples, which raises concerns for efficacy of these interventions among diverse populations and contexts. Overall, this review uses academic growth mindset interventions to highlight the importance of inclusive sampling. We conclude with an overview of current reporting practices, using this to recommend best practices for future research.

[60] Contextualizing Minority Stress in Coming-Out Process Among Chinese MSM

4:40 PM – 5:40 PM

DIVERSITY

Minority stress theory distinguishes proximal (e.g., internalized homophobia and lack of LGBTQ+ affirmation) from distal minority stress (e.g., discrimination), yet their interconnections within the coming-out context are less understood. We examined how internalized homophobia and affirmation shape coming-out strategies and subsequent discrimination among 2,266 Chinese sexual minority men (MSM). We focused on use of five coming-out strategies: verbal disclosure in person, mediated verbal disclosure, group disclosure, disclosure through appearance, and disclosure through body language. Internalized homophobia predicted reduced verbal and group disclosure, whereas affirmation predicted greater use of most strategies. Group disclosure, in turn, predicted more discrimination. Indirect effects revealed that internalized homophobia predicted less discrimination via reduced group disclosure, while affirmation predicted more discrimination via increased group disclosure. These findings contextualize minority stress in the coming-out process, revealing nuanced pathways through which identity processes and disclosure behaviors shape exposure to distal stressors in stigmatizing environments.

[61] Corporate DEI Rollbacks Reduce Public Trust, Loyalty, and Identity Safety

4:40 PM – 5:40 PM

DIVERSITY

The rollback of diversity, equity, and inclusion (DEI) initiatives following the January 2025 executive order has created a polarized corporate landscape: some companies have abandoned DEI efforts, while others have reaffirmed them. This project examines how these decisions shape public impressions of companies. A pre-registered online experiment with majority group members (White, non-LGBTQ; N = 350) found that they consistently showed negative reactions to a DEI-removing company compared to a DEI-keeping company and a control company. They perceived the DEI-removing company to be more hypocritical, and expressed lower trust, psychological engagement, loyalty, and identity safety. Mediation tests showed that hypocrisy explained reduced trust, loyalty, and engagement, and political ideology moderated evaluations—conservatives responded more negatively to DEI-keeping companies, while liberals reacted more negatively to DEI-removing companies. Study 2 (data collection ongoing; N = 600) aims to replicate these findings among majority group members, further test whether similar effects emerge for minority group members, and further examine the moderating role of political ideology.

[62] Cost or Benefit? Gay Bars' Impact on Health and Well-Being

4:40 PM – 5:40 PM

SEXUALITY

Gay bars have been a crucial LGBTQ+ space throughout history, serving as community places to meet other LGBTQ+ people, create community, and provide safety. Even in the wake of LGBTQ+ hate crimes, gay bars persist as safe spaces (Croff et al., 2017). However, little work has been done to quantitatively understand the benefits of gay bars, as well as their potential risks. The present research spans multiple studies that examined the benefits and costs of gay bars to the LGBTQ+ community in novel ways. In Study 1, neighborhood gay bars show increased belonging among sexual minority people who live among them. In Study 2, the per capita number of gay bars in a state relates to lower anxiety and depression among sexual minority people in that state, when controlling for straight people's mental health. However, in Study 3, gay bars present costs for sexual minority people by way of greater HIV risk for queer men; gay bars allow for riskier sexual behaviors than non-gay bars. Across studies, this research provides greater insight into the risks and benefits of gay bars, based on the outcome type and the level of analysis.

[63] Critical Consciousness and Disability Identity Among People with Facial Differences

4:40 PM – 5:40 PM

DISABILITY

People with facial differences experience unique manifestations of stigma, which may contribute to the high variability in whether they identify as disabled. This is further complicated by intersecting systems of oppression. Critical consciousness may help to buffer the effects of oppression and support disability identity. Using an intersectional framework, we will use a latent class analysis to determine at what level of specificity (e.g., condition, facial difference, or disability) people with facial differences identify and how this changes based on intersecting identities. Using regression, we will determine if identification specification moderates the relationship between disability identity and critical consciousness. Finally, multiple regressions will determine whether critical consciousness and identity specification predicts life satisfaction. These findings will show how critical consciousness, identification, and life satisfaction differ based on intersecting identities. This can help form interventions aimed at increasing activism and stigma reduction for those with facial differences.

[64] Daily Social Profiles and Nightly Sleep in Late Life

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Daily social experiences may shape how well older adults sleep at night, including contact with social partners, timing of those contacts, and quality of interactions. This study used ecological momentary assessment data from the Daily Experiences and Well-being Study involving 256 older adults (Mage = 73.7) across 5-6 days. Latent profile analysis revealed four classes of social experiences within a day: Balanced and Pleasantly Connected (65%; mix of pleasant daytime contact with close and weak ties, evening contact mainly with close ties), Ambivalent Stressful (13%; both pleasant and stressful moments during the day, intensified stressful contact with close ties at night), Whole-Day Broadly Engaged (10%; pleasant contact with a larger number of close and weak ties from morning to evening), Light Day and Solo Night (12%; mild daytime contact, alone at night). Compared with Balanced days, Ambivalent days were linked to shorter sleep duration. Likewise, Light Day and Solo Night days predicted poorer sleep quality, but only among married older adults. These findings underscore the importance of daily social rhythms within the marital context for promoting sleep in late life.

[65] Deception in Psychological Studies: Balancing Benefits and Risks

4:40 PM – 5:40 PM

METHODS/STATISTICS

Deception in scientific research refers to providing participants with incomplete or misleading information about a study's purpose, procedures, or the roles of others involved. This method has been widely employed to investigate sensitive processes such as attitude change, social influence, prejudice, and group dynamics. By concealing certain aspects of the study, researchers can capture natural behavior, reduce demand characteristics, and minimize socially desirable responding. Nevertheless, the ethical implications of deception have been a persistent subject of debate throughout the history of psychological science. Landmark studies such as Milgram's obedience experiments and the Stanford Prison Experiment, while yielding valuable scientific insights, raised enduring concerns about participant welfare and trust. Contemporary research provides mixed evidence on the extent to which deception affects participants' trust in scientists and their psychological well-being.

This review examines the role of deception in relation to internal and external validity, as well as its potential short- and long-term effects on participant pools. Findings suggest that the risks associated with deception do not manifest uniformly across contexts; however, they can be mitigated through preventive measures. In particular, comprehensive informed consent procedures, thorough debriefing practices, and the use of innovative alternatives to deception emerge as critical safeguards for researchers.

In conclusion, while deception may at times serve as an indispensable methodological tool in psychology, its ethical management is essential for protecting participant welfare and ensuring the validity of scientific knowledge. Moreover, maintaining this delicate balance not only enhances the credibility of research findings but also reinforces public trust in psychological science and sustains the academic legitimacy of the discipline.

Keywords: deception, social psychology, ethics, internal validity, external validity

[66] Different by Design: Romantic Love and Polyamory in Gifted Adults

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Gifted adults present unique socioemotional characteristics, including heightened sensitivity, a strong drive, and open-mindedness. This likens them to "a black sheep within a mass of white," making it difficult to connect with normative peers. As such, finding a romantic match is a challenging feat. Using a descriptive qualitative design, this study explores gifted adults' perceptions of romantic love, with particular attention to their capacity to develop meaningful relationships. Adults who self-identified as gifted (n = 32, aged 20-73; M = 36) participated in semi-structured interviews in 2024. They explored themes of identity, loyalty, love, and disillusionment. Thematic analyses revealed that the pursuit of romantic fulfillment is described as arduous, often leading to despair. In addition, their narratives reflect the perception that their giftedness is the main obstacle to the establishment of a satisfying romantic relationship. Future research could further examine how one's life history—such as discovering one's giftedness later in adulthood—shape gifted adults' perceptions and experiences of romantic love.

[67] Disability Pride and Models of Disability: An Intersectional Approach

4:40 PM – 5:40 PM

DISABILITY

The social identity approach shows that personal factors—identity and level of disability identification—can impact how proud people are of their disability identity and potentially their awareness of ableism. We aim to determine if disability pride predicts use of the social model of disability (which states disability is socially constructed via unjust barriers) and if this is moderated by identity factors. Seven hundred and ten disabled adults completed a cross-sectional online questionnaire measuring the extent to which people identify and label themselves as disabled, disability models, self-esteem, and psychological distress. A latent class analysis will reveal relevant classes based on disability identity, onset, observability, type, race, gender, and sexuality. A moderated regression will find if disability pride positively predicts use of the social model of disability and if it will be strengthened by class membership. Multiple regressions will show if classes, disability pride, and disability models predict self-esteem and psychological distress. Results will show intersectional differences in disability pride and models as well as who has positive psychosocial outcomes.

[68] Discouraged from Decarbonizing: Racial Disparities in Electric Vehicle Sales Interactions

4:40 PM – 5:40 PM

DIVERSITY

Transportation contributes nearly a third of U.S. greenhouse gas emissions, highlighting the need for electric vehicle (EV) adoption. Yet ownership remains low, with racial disparities: Black and Hispanic consumers are underrepresented despite strong interest. Drawing on stereotype bias and cultural mismatch theories, we test whether discouragement in sales interactions drives these gaps. Implicit bias and in-group favoritism may shape perceptions of customer fit, while cultural mismatch can heighten sensitivity to rejection cues. Using California Clean Vehicle Rebate Project survey data (N=9,739), we examine whether minority EV buyers faced discouragement and whether experiences differed by sales model. Black, Hispanic, and Other races were more likely than Whites to be "talked out" of EVs. For Asians, race alone did not predict dissuasion, but Asian Tesla buyers were more than twice as likely to face discouragement as Asians buying non-Teslas. Findings extend research on stereotype bias beyond pricing and credit, showing how biased sales interactions can exclude minorities. Addressing these dynamics is key for equitable access to clean transportation and a green economy.

[69] Disrupted Intimacy: Irrational Beliefs as a Pathway Between Psychopathy and Relationship Needs

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Objective: This study examined links between psychopathic traits, self-reported intimacy needs, and whether irrational beliefs about relationships help explain these links. We focused on three intimacy needs (sex, affiliation, and dominance) and tested whether distorted romantic beliefs account for these associations. Hypotheses: Higher psychopathy was expected to predict greater need for dominance and sex and lower need for affiliation, with irrational beliefs indirectly explaining these links. Method: Undergraduates (N = 239) completed the Short Dark Triad Scale, Need for Sexual Intimacy Scale, Maladaptive Relationship Beliefs Scale, and demographics. Results: Hierarchical regression showed psychopathy positively predicted sex and dominance needs and negatively predicted affiliation. Indirect effects revealed that irrational beliefs about being alone (a) attenuated the negative psychopathy–affiliation link and (b) partially explained the psychopathy–dominance link. Conclusions: Intimacy patterns in individuals high in psychopathy may reflect both emotional detachment and fear-based cognitions; addressing such beliefs may clarify maladaptive relational dynamics.

[70] Diverse Caregiver Perspectives on Research Participation

4:40 PM – 5:40 PM

DIVERSITY

Psychological research has historically relied on WEIRD populations, limiting generalizability and overlooking culturally diverse families. This ongoing study explores what motivates mixed SES caregivers to participate in child development research. 88 caregivers (data collection ongoing) rated motivators for research participation, compensation expectations, familiarity with developmental research, and their attitudes toward it.

Current results showed that caregivers most valued their child enjoying the study (M = 3.68). The average preferred compensation for a 30-minute online study was \$35.70. Hispanic caregivers with high school education or less prioritized interest, enjoyment, and representation, while those with some college or more emphasized contributing to science and viewing research as a family experience. Caregivers with higher education levels reported significantly greater familiarity with developmental research (p < .001), though attitudes were positive across all education levels. These findings highlight actionable strategies to engage caregivers with different backgrounds and expectations, which can help improve the inclusivity of research.

[71] Diversity, Digitized: The Effects of Artificially Generated Diverse Representations on Institutional and Technological Trust

4:40 PM – 5:40 PM

DIVERSITY

AI-generated models are becoming increasingly common in advertising, raising important questions about how this practice affects attitudes and institutional trust. Extending previous work on how AI representations of racial minority groups shape social identity contingencies, the present research investigates how AI-generated depictions of diverse environments affect both institutional and technological trust. Participants (N = 240) viewed university recruitment ads featuring either real or AI-generated multiracial student groups prior to rating their attitudes toward the ads, their trust in the institution itself, and their general confidence in AI systems. We further examined differences in majority and minority group members' reactions to these stimuli, offering insight into how identity influences responses to synthetic representations of diverse groups. Results reveal that using AI-created models to signal diversity can carry subtle but meaningful unintended consequences, shaping not only perceptions of institutions but also broader attitudes toward AI systems. These findings highlight critical tensions at the intersection of representation, trust, and emerging technologies.

[72] Do I belong? Diversity Policies & Feelings of Belonging

4:40 PM – 5:40 PM

DIVERSITY

Diversity and inclusion are vital components of belonging and comfort. Students want to feel valued and represented at college. Colleges use diversity policies to express their values, although little is known about how these policies evoke feelings of belonging and comfort. We examine how diversity policies influence belonging in a university community, motivation to engage with the university, and comfort with diversity policy language. Our preregistered study will recruit 214-400 participants; data collection will end 1 month before SPSP. Participants will read one of four diversity policies stating that diversity is good-moral, good-instrumental, fair-moral, and fair-instrumental and report feelings of belonging, diversity motivation, and comfort with the policy. We predict that participants who read "good" and "instrumental" diversity policies will report the highest levels of belonging, diversity motivation, and comfort compared to participants who read "fair" and "moral" policies. Our findings will strengthen the understanding of diversity policy effectiveness, its relationship with belonging, and contribute to future research investigating what drives diversity motivation.

[73] Do People See Their Romantic Relationships as Teams? Examining Team Perceptions in Romantic Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

It is common to hear people describe romantic relationships as "teams." However, relationship science has yet to determine the extent to which partners perceive their relationship in this way, and the implications team perceptions may have for relationship functioning. To begin filling this gap, we developed an eight-item measure of team perception of one's romantic relationship and explored the implications of team perception for relationship functioning. In three studies, we found that individuals report high levels of team perception on average, with meaningful variability. Exploratory and confirmatory factor analyses indicated that team perception is distinct from other relationship constructs (e.g., satisfaction) though correlated with them in expected directions. One's team perception predicted reports of partner's support behavior across all studies. In Study 3, it also predicted participants' reports of their own support behavior, though some effects weakened when testing multiple competing predictors. These studies are the first to examine team perceptions in romantic relationships—an overlooked feature that likely has important implications for relationship functioning.

[74] Does the source of support matter? Characterizing the distribution of emotional support across relationships & implications for well-being

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Extensive research has examined the benefits of perceived social support (PSS). Yet, little is known whether varying degrees of PSS from friends, family, and/or partners uniquely predict individual and relational outcomes, and if these associations differ based on gender and sexual orientation. Using National Couples Health & Time Study (N = 3629), K means cluster analysis revealed six distinct profiles of self-reported emotional support from romantic partners (P), family (Fam), and friends (Fr): 1 (High P, low Fam & Fr), 2 (High P, Fam, & Fr), 3 (Low P, Fam, & Fr), 4 (High P & Fam, low Fr), 5 (medium P, Fam, & Fr), 6 (High P & Fr, low Fam). ANOVA pairwise contrasts revealed that clusters that relied predominantly on partner emotional support reported better relationship quality, but lower well-being. Moreover, the cluster reporting low support from all sources was especially problematic for women. Sexual minority status did not moderate any associations between cluster assignment and well-being.

[75] Dogs as Facilitators: Minimal Social Interactions Reduce Loneliness and Increase Social Approach to Strangers With Their Dogs

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Like interactions with close others, minimal social interactions (with strangers or non-intimates) enhance well-being (Ishiguro, 2023). Yet people are apprehensive about approaching strangers for social interactions (Schroeder et al., 2022). The present study explored the impact of a single laboratory minimal interaction on short- and longer-term loneliness and social approach behavior. One hundred fifty-four college students underwent a loneliness induction in the laboratory, then were randomly assigned to interact with a friendly stranger, to interact with a friendly stranger with a dog, or to a no-interaction control condition. Both types of minimal interactions decreased loneliness in the laboratory, though the effect faded after one week. Both minimal interactions also increased self-reported social contacts with strangers with their dogs in the week following the lab study, relative to the no-interaction control and to the one-week pre-study baseline. Thus a single minimal interaction reduced loneliness and spurred further minimal interaction. Additionally, the presence of a dog seems to reduce apprehensiveness about social approach to a stranger.

[76] Don't Stop Believin': Slow-Life Strategists' Self-Efficacy Promotes Their Desired-Self Realization

4:40 PM – 5:40 PM

EVOLUTION

Life history strategists are thought to differ in their social strategies, with slow life strategists (SLS) - who develop in safer, resource-rich, and predictable environments - seeking stable social relationships, while fast life strategists (FLS) - who develop in harsh and unpredictable environments - deprioritize them (Figueroa & Jacobs, 2011). Prior work in our lab has revealed that although FLS and SLS similarly prioritized realizing their ideal-selves (i.e., hoped and aspired for selves; Higgins, 1987) and reported similar realization of those ideals, SLS prioritized their ought-selves (i.e., obligatory selves; Higgins, 1987) more, reporting fewer mismatches than did FLS.

We sought to replicate these findings using different methods. Data from 405 participants again revealed that life history strategy was negatively related to ought-self mismatches. However, unlike our prior work, the current findings also revealed a negative relationship between participants' ideal-self mismatches and their life history strategies. Exploratory analyses suggested these relationships were partly due to SLS's greater general self-efficacy. We discuss methodological differences between the current and prior work and their theoretical implications. Specifically, the differences imply that various early life stressors may differ in their relationships with adult social outcomes.

[77] Drinking Apart, Feeling Apart? How Attachment Shapes Reactions to Partner Drinking

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Understanding how substance use shapes interpersonal processes remains a central question in social science. This study focuses on the association between perceptions of a romantic partner's drinking behavior patterns and relationship satisfaction. This association is moderated by attachment orientations. We predicted perceiving a partner to drink more often apart from the individual to be related to lower relationship satisfaction, and this effect would be stronger among insecurely attached individuals. Participants were 525 college students who completed an online questionnaire. Results indicated that perceiving a partner drinking more frequently without the individual was associated with lower relationship satisfaction, even after controlling for both partners' average alcohol consumption and age. This suggests that the effect is not simply about alcohol use, but is specific to perceptions of a partner's drinking apart from the participant. Further, avoidant attachment significantly moderated this association ($p = .040$), and simple slopes suggested that the negative effect of partner drinking apart was stronger among individuals higher in avoidant attachment. These findings suggest that attachment orientations, particularly avoidance, play a crucial role in shaping how individuals interpret a partner's drinking and its implications for relationship satisfaction.

[78] Dyadic Examination of Daily Approach and Avoidance Motives and Responsiveness

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Perceived partner responsiveness is an important predictor of relationship outcomes such as satisfaction (Reis & Gable, 2015). However, little is known about how daily approach and avoidance motives influence both partners' perceptions of responsiveness within a relationship. We examined approach and avoidance motives as a predictor of perceived partner responsiveness and in turn, relationship satisfaction among cohabiting couples ($N = 107$ couples). Results showed that people who were more approach and avoidance motivated were seen as more responsive, and people who saw their partners as more responsive were more satisfied with their relationships. Also, people who were more approach and avoidance motivated saw their partners as more responsive and were more satisfied. Finally, people who saw their partners as more responsive had partners who were more satisfied. These results suggest that both partners' approach and avoidance motives influence perceived partner responsiveness and consequently, relationship satisfaction.

[79] Economic Objectification in Romantic Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Although close relationships often involve financial exchange, little is known about how individuals experience being treated as a financial resource in their intimate partnerships. We introduce the concept of economic objectification (EO), the perception of being regarded primarily as a "money source" rather than as a full partner. To capture this phenomenon, we developed and validated a new EO scale. Study 1 generated items, and study 2 confirmed a two-factor structure and demonstrated reliability and validity. Using this measure, we further examined how subjective socioeconomic status (SSES) affects the relationship between EO and relationship outcomes (satisfaction and autonomy). The results suggested that SSES moderates the effect of EO; the higher the SSES, the less the detrimental impact of EO. These findings position EO as a novel dimension of objectification in romantic relationships, extending dehumanization theory into the economic sphere. In today's materialistic world, financial roles and SES are increasingly recognized as critical factors in intimate relationships. This process may erode intimacy; therefore, the importance of conceptualizing EO should be highlighted.

[80] Effectiveness of dyadic interventions: The impact of who is doing what for whom during a dyadic intervention

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Despite growing evidence indicating the beneficial impact of involving romantic partners in health behavior change, the most effective approach for engaging partners remains unclear. Therefore, this study aims to systematically examine the content of dyadic interventions by testing how intervention task (what is done), execution level (who carries out the task), and target level (for whom the task is performed), as defined in the compendium of dyadic behavior change techniques (DiMaio, Villinger et al., 2024), influence effectiveness (pre-registration: osf.io/pa7yq).

A total of 3,200 participants will be recruited for an experimental online study presenting a hypothetical scenario in which a romantic couple receives a dyadic intervention to increase physical activity. The impact of systematically varying execution and target levels across four intervention tasks (i.e., review of past mastery experiences, review of skills, weighing of pros and cons, recognition of health risks) on intended behavior performance will be examined. In addition, mechanisms of action for behavior change will be analyzed.

Results will help to provide guidance on how best to leverage partner involvement to maximize intervention effectiveness and advance understanding of underlying mechanisms of dyadic health behavior change.

[81] Emotional Response Similarity in Friends

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Is similar emotional responding an important ingredient for friendship? A few studies have found that friends show more similar emotional responses when watching videos than people who are not friends. These studies have focused on students and their more recently formed friendships, and they have only looked at aggregate responses across videos and across discrete emotions. We aim to address these limitations by testing whether the association between emotional similarity and friendship status also holds in middle-aged adults with long-term friendships, as well as by examining the differential effects of the similarity of specific emotions. Participants (N=131, 64 female friend pairs and 3 unpaired female participants) independently watched 14 short video clips throughout a one-day lab session. After watching each video, participants rated their experience of an array of emotions. We will compute pairwise emotional similarity using the Euclidean distance between a dyad's emotion ratings and perform logistic regression to predict friendship status from emotional similarity. We expect to find that emotional responses to the same stimuli are more similar among friends than randomly yoked dyads. These results would be consistent with the theory that similar emotional responding underlies friendship.

[82] Employment equity groups' perspectives on recruitment processes in the military

4:40 PM – 5:40 PM

DIVERSITY

Due to systemic barriers, members of employment equity groups may encounter additional challenges during military recruitment. Past findings have also shown that a career in the Canadian Armed Forces (CAF) is less attractive to women and members of visible minority groups. This research presents key findings from the 2024 Canadian Armed Forces (CAF) Recruiting Survey (N = 6,592). The survey explored applicants' experiences throughout the recruitment process, their motivations for joining the CAF, and the factors that influenced their decision to pursue military employment. Descriptive analyses were conducted on Likert-type questions, and independent samples t-tests were used to compare mean responses across groups defined by gender, 2SLGBTQI+ status, visible minority status, Indigenous identity, and the intersection of gender and visible minority status. Significant group differences emerged regarding perceptions of the recruitment process and motivations for wanting to join the CAF. These findings highlight areas where targeted efforts could enhance the recruitment experience for some employment equity groups and support employment equity initiatives of the CAF.

[83] Endorsement of Hookup Culture and Judgements about Sexual Willingness

4:40 PM – 5:40 PM

SEXUALITY

"Hookup culture" reflects changes in sexual behavior toward more casual and commitment-free sexual encounters (Aubrey & Smith, 2013). We examined whether endorsement of hookup culture relates to people's judgments about sexual willingness and consent as a "hookup" unfolds over time. Past research found that the participants perceived that the willingness of both a man and a woman increased as the events of a straightforward consensual sexual encounter unfolded (Willis & Jozowski, 2022). We tested these patterns in a more ambiguous sexual encounter where the woman expresses some hesitation. We found that the perception of the man's willingness, but not the woman's, was consistently correlated with the endorsement of hookup culture up until the point of ambiguity. In related studies, endorsement of hookup culture has been associated with feminist beliefs (Martino et al., 2024), while in others, it was related to endorsement of rape myths (Reling et al., 2021). More work needs to be done to examine the dimensionality of hookup culture and how that relates to underlying attitudes about gender roles, stereotypes, and expectations about sex.

[84] Essentializing Disability: How Fixed Beliefs Fuel Ableism

4:40 PM – 5:40 PM

DISABILITY

Disability scholars often classify beliefs about disabilities into two models: one where disabilities are framed as bodily deficits (essentialist), and one that emphasizes the interaction between body types and social barriers (social constructionist). In this work, we examine the extent to which each of these models of disabilities impacts attitudes, perceived accommodation legitimacy, and support for non-discrimination and disability- supportive policies. Results from an online sample of U.S.-based adults (N=260) indicate that essentialist beliefs about disabilities were associated with less favorable attitudes towards disabled people, viewing accommodations as less legitimate, and with less support for policies of interest. Social constructionist beliefs show the opposite pattern. In both cases, perceived legitimacy and policy support effects were mediated by attitudes. Findings highlight the importance of beliefs about disabilities generally, and implications for future efforts to reduce stigma and disability-affirming social change will be discussed.

[85] Ethnic Differences in the Evaluation of Child Abuse & Neglect

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

The current literature on expressing and accepting affection fails to recognize ethnic differences in affective communication and family dynamics, consequently overlooking their impact on large societal problems, such as child abuse and neglect (CAN). This study aims to investigate ethnic differences in expressing and accepting affection to/from close others, and associations between evaluations (i.e., abusive, neglectful, loving) of parenting strategies and perceptions of cultural exclusivity (i.e., exclusive to an ethnic heritage). Hispanics (vs non-Hispanics) are predicted to report: 1) greater avoidant attachment tendencies and 2) greater preference for indirect forms of affection (e.g., acts of service). It is also predicted that all participants will report more favorable evaluations of parenting strategies that are culturally exclusive to them. Further, it is predicted that cultural values (i.e., familism and respeto) will mediate these predicted associations in Hispanic participants, specifically increasing these biases. This work innovatively investigates how ethnic background relates to perceptions of parenting strategies, supporting culturally responsive interventions.

[86] Evaluating Scientific Authority: Self-Uncertainty, Political Identity, and Message Content

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

In political contexts, people often rely on their group identity to inform their views on a wide range of social issues. The present study sought to investigate the roles of self-uncertainty and political identity in how people evaluate the source of a message about climate change. Participants ($n = 212$) were first primed to feel either certain or uncertain about their identity. They then read a brief passage that either amplified or downplayed the dangers of climate change and were told that the excerpt was written by a scientific expert. Participants were also asked to indicate with which political party they identified. The dependent variable of interest was source evaluation, measured via the Muenster Epistemic Trustworthiness Inventory. Results of the 2×2 ANOVA indicated a significant interaction between message type and political party, $F(1, 204) = 57.61$, $p < .001$, partial eta-squared = .22, such that the type of message (amplifying versus downplaying) had a significant effect on Democrats' evaluation of the source of the message, but not Republicans'. Specifically, Democrats evaluated the source significantly more favorably when they read the climate change amplifying message compared to the downplaying message, while Republicans' attitude toward the source did not differ based on message content. This study sheds light on group-based attitudes toward scientific authority.

[87] Evaluating the Influence of Health Advertisements on Attitudes and Cognitive Processes

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

This study examined the effectiveness of emotional appeals in public service announcements (PSAs) about vaping, focusing on how hope-based, fear-based, and fact-based messages influenced emotional responses, risk perceptions, and persuasiveness. It also tested whether including a recommended action (directing viewers to health agencies' quitting resources) altered outcomes. The online experiment used a 3×2 mixed factorial design: PSA type (hope, fear, fact) as a within-subjects factor, fully counterbalanced, and recommended action (present/absent) as a between-subjects factor. Results indicated that hope-based ads elicited the strongest emotional reactions and were rated as significantly more persuasive than fear- or fact-based ads, suggesting positive appeals may be most effective for motivating behavior change. Fear-based ads best conveyed the severity of health risks but also triggered greater anxiety. The Recommended action variable indicated a significant effect for only one group of dependent measures, modestly increasing persuasiveness across all ad types. These findings underscore the role of emotional framing in health communication and suggest hope-based messaging, paired with clear resources, may be especially effective for public health campaigns.

[88] Even with close friends, they underestimate the affection that others have for them.

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

It has been established that people tend to underestimate the extent to which others find them likable, a phenomenon known as the liking gap. Previous longitudinal studies examining this phenomenon found that it disappeared after eight months of acquaintance (Boothby et al., 2018). This author, who focused on the specific relationship with university dormitory accommodation, found that the liking gap is a phenomenon limited to the early stages of acquaintanceship and it disappears as the relationship deepens.

To examine the liking gap in more general friendships, this study collected paired data by instructing participants to "invite a close friend" ($N = 90$). The average duration of acquaintance among respondents was approximately 27 months, which was considerably longer than the eight months examined by Boothby et al. (2018). Nevertheless, a liking gap was confirmed when the liking ratings and estimates were measured. This revealed that people underestimate their likability even for close friends they have known for a long time. Furthermore, the liking gap was smaller for the person who was invited as the "close friend."

[89] Examining Inoculation Against AI Misinformation in China

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Inoculation theory prebunks misinformation by exposing people to weakened versions and refutations first. However, most research uses passive approaches despite its original emphasis on active participation, where individuals generate counterarguments rather than receiving them. Research lacks systematic comparison of passive vs. active strategies and examination of how participation methods interact with message types (fact-based vs. logic-based). In addition, whether and how the inoculation method combats AI misinformation remains unanswered. This 2×2 factorial experiment (N = 391) crossed active/passive participation with fact/logic-based message types in China. Participants received AI misconception inoculation, then evaluated misleading AI autonomy content. Results showed active inoculation outperformed passive across message types, with logic-based active performing best. In addition, self-efficacy moderates these effects in specific conditions. This research advances inoculation theory by confirming active participation's effectiveness and revealing it operates through distinct mechanisms depending on message type, providing guidance for optimizing persuasion resistance.

[90] Examining the Relationship between Power and Opposition Across Time

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

In close relationships, people's goals and motives inevitably conflict with their partners'. When this occurs, people often engage in opposition, such as sulking or blaming their partner. Given that opposition aims to influence partners, it is likely tied to people's sense of power (i.e., perceived ability to influence a partner) in a relationship. However, theory and research provide competing predictions about the association, such that power may predict increases or decreases in opposition and/or opposition may predict increases or decreases in power. Further, previous research on power and opposition is also largely cross-sectional, hindering conclusions about the temporal precedence between these variables in close relationships. The present study addresses these limitations by examining power and opposition in a longitudinal study of newlyweds. Results revealed that intimates' power predict both declines in their own, and their partners' opposition, while opposition did not predict changes in either partners' power. These findings suggest that certain theories of power may better characterize the longitudinal association between power and opposition in romantic couples.

[91] Examining the Role of Self-Change on Shaping Risk Regulation Motives

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Romantic relationships change individuals for better and worse. Accordingly, people in romantic relationships must navigate the desire for self-improvement while guarding against potential self-degradation. Similarly, risk regulation theory suggests that individuals are motivated to form connections in a manner that also protects the self from rejection. In this research, we examine whether self-improvement and self-degradation predict individuals' risk regulation motives, in the form of connection vs. self-protection goals.

Across correlational (Study 1; N = 194) and experimental (Study 2; N = 310) studies, self-degradation was significantly associated with self-protection goals (Study 1 and 2), whereas self-improvement was associated with connection goals (Study 1). Additionally, self-protection goals mediated the association between self-degradation and relationship quality (Study 1 and 2), and connection goals mediated the association between self-improvement and relationship quality (Study 1). These findings suggest that perceiving that the self has changed for the worse can activate defensive motivational systems that hinder relational closeness.

[92] Exploring Clinical Validation and Humility as Inoculation Strategies Against Public Health Mistrust When Revising Guidance

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Public health relies on public trust. However, this places the public in a vulnerable position, as being wrong can lead to severe consequences. This vulnerability is highlighted when scientists' perceived biases influence scientific processes or findings, leading to mistrust. Efforts to improve this trust often promote ethical science but rarely address that science can be "wrong" simply because science is iterative. For example, during the COVID-19 pandemic scientists were learning about the virus in real-time, leading to evolving guidance that 75% of the U.S public found confusing. This eroded confidence in experts and may have discouraged following recommended health guidelines. Scientific change is inevitable, so there must be consideration of how to combat the mistrust that may result. Through a between-person factorial design, participants will read colon cancer prevention messages where the framing is varied either with direct (blunt), clinical validation (acknowledgement of possible confusion), or humility (acknowledgement of uncertainty) messaging to test how differing communication styles may predict trustworthiness, without reducing beliefs in scientific competency.

[93] Exploring Discloser Race and Partisanship as Moderators of Stealing Thunder in Politics

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Stealing thunder is a persuasive tactic that involves strategically disclosing negative information about oneself to diminish its harmful impact. The effectiveness of stealing thunder has been demonstrated across contexts, including politics. Past research indicates that a discloser's race may moderate the tactic's effectiveness, yet it remains unclear how discloser characteristics interact with perceived political partisanship. In Study 1, we piloted AI-generated photos of Black and White politicians to ensure participants could not differentiate them from real people. In Study 2, we did not find evidence of stealing thunder, but found that the Black (compared to White) candidate was rated more favorably on all evaluations. Exploratory analyses revealed that with explicit partisan information absent, the majority left-leaning sample commonly assumed the Black candidate was a Democrat and the White candidate was a Republican. This suggests that participants may have used discloser race as a proxy for political partisanship. In future research, we hope to tease apart the joint influence of race and partisanship on stealing thunder and political evaluations.

[94] Exploring Positive Psychology Outcomes Among LGB+ Youth

4:40 PM – 5:40 PM

SEXUALITY

Stigma and discrimination against LGB+ individuals has considerable negative health impacts through disproportionate exposure to stress according to minority stress theory. Resilience - the potential to maintain or recover functioning when facing adversity - can develop in response to various forms of stigma related stress, yet a dearth of research exists in regard to resilience factors among LGB+ college students. Using 250 participants, this study examines how hypervigilance, grit, and perceived access to affirming spaces relate to well-being and community connectedness among LGB+ students. We expect that perceived access to affirming spaces and grit will be positively related to wellbeing and community connectedness; while hypervigilance will negatively relate to these outcomes. This work represents the first step in developing a theoretical model in which perceived access to affirming spaces lowers hypervigilance and increases grit, which in turn promotes wellbeing among LGB+ youth. We expect this work to highlight the importance of including positive psychology outcomes in LGB+ research.

[95] Factors Related to Deviant Behavior

4:40 PM – 5:40 PM

LIFESPAN DEVELOPMENT

This cross-cultural study investigates how early-life adversity and life-course factors shape deviant behavior in adulthood. Guided by life-course theory, the study examines four constructs: (a) childhood trauma as a critical life event, (b) social connectedness as a trajectory factor, (c) subjective socioeconomic status as a cohort indicator, and (d) turning points/transitions such as leaving home, educational disruptions, or relational losses. Adults (ages 18–55) from the United States and Germany (N = 400) will complete validated measures, including the Adverse Childhood Experiences (ACE) questionnaire, the Social Connectedness Scale, Cantril's Self-Anchoring Ladder, and the Adult Deviant Leisure Tendency Scale. We hypothesize that higher trauma exposure, lower social connectedness, and lower subjective socioeconomic status will be associated with stronger deviant tendencies, with patterns differing across cultural contexts. By integrating structural and relational influences within a life-course framework, this study aims to clarify how developmental risk factors accumulate and interact across sociocultural environments, with implications for prevention, rehabilitation, and culturally responsive justice policies.

[96] Family identity clarity: Investigating the long-term role of “family” in identity development

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Research on identity development positions the family unit as a critical social landscape for early identity exploration, but how people view and define family can change throughout the lifespan. This work introduces the concept of family identity clarity, the extent to which a person has a clear understanding of who their family is as a unit, and examines its antecedents and consequences. Just as narrative identity can bolster clarity about people's individual identities, we expected that family storytelling would enhance family identity clarity. We conducted a 7-week longitudinal study (N = 249 participants). Factor analysis established that family identity clarity is distinct from related constructs. Furthermore, family storytelling predicted increases in family identity clarity over time, which in turn was associated with individual and family well-being. We also explored differences in how participants defined family. Although the family has been an understudied topic within the relationships and identity literatures, these findings suggest that family identities are psychologically meaningful and contribute to our overall well-being.

[97] Family Matters: The Role of Social Support and Stigma in Addiction Affected Families

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Addiction and substance use is highly stigmatized in society, and research has suggested that family members often face similar judgement that may have unintended consequences on their ability to engage in the recovery process. We explored the role of family stigma, the stigmatization of family members of otherwise stigmatized individuals, within addiction affected families to examine its effect on family support behaviors. Two hundred and twenty-two U.S. adults with a substance using family member completed an online survey regarding experiences of stigma, engagement in supportive behaviors for recovery, self-compassion and social support. Regression analysis revealed a significant negative association between experiencing stigma and family member's recovery support behaviors. A significant moderated mediation in which experiencing social support mediates the relationship between family stigma and recovery support, with an indirect effect moderated by self-compassion was also found. Results suggest that social support may buffer the negative consequences of family stigma for those with moderate or low levels self-compassion.

[98] Feeling contempt predicts favorability towards the death penalty

4:40 PM – 5:40 PM

EVOLUTION

Does feeling contempt towards a criminal offender increase your likelihood of sentencing them to death? Although anger has been previously shown to increase people's punitive tendencies, the evolved function of anger is to change the target's future behavior—implying a willingness to maintain a relationship with the target in the future. Contempt, on the other hand, serves to permanently sever relations with the target so as to avoid future costs. If this is the case, then contempt should be a better predictor of elimination-focused punishments (e.g., the death penalty) than anger. In an empirical study (N = 498) testing this proposition, we presented participants with three scenarios of criminal offenders and then measured the extent to which participants perceived the offenders as worthless, felt anger towards the offenders, and believed the offenders deserved the death penalty. Although both the anger and contempt items were significant positive predictors of death penalty favorability, in each scenario this relationship was markedly stronger for contempt as compared to anger.

[99] Finding Harmony: Exploring How Diversity Ideologies Relate to Congregants' Sense of Belonging

4:40 PM – 5:40 PM

DIVERSITY

With the majority of the U.S. identifying as Christian (PEW, 2022) as well as the rising trends in racial/ethnic diversity in congregations (Thumma, 2021), understanding how churches can foster inclusivity is increasingly important and remains a challenge. Previous research has found that multiculturalism ideologies predict less bias in workplaces and school (Birnbaum et al., 2021; Plaut et al., 2009). However, the relationship between worship experiences and sense of belonging has not yet been explored. Thus, the present study aims to explore how diversity ideologies, specifically multiculturalism and colorblindness, relate to a congregant's sense of belonging in a church setting. To investigate this relationship, we have collaborated with a local church which demonstrates multiculturalism ideologies (i.e. singing worship songs in non-English languages) and colorblind ideologies (i.e. singing worship songs selectively in English). The present study aims to contribute valuable insights into how diversity ideologies shape a congregant's sense of belonging within church communities, with potential to guide churches in creating more inclusive environments.

[100] Fishing for Love? Implicit Political Signaling on Online Dating Platforms

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

People exhibit political homophily in their dating choices—a preference for partners who share their political ideology. Within online dating, research has examined how explicit political cues (e.g., listing one's political orientation in the profile bio) predict profile evaluation. The role of more subtle, implicit cues is less understood. Because stereotypes in the U.S. imply that liberals and conservatives differ in lifestyle, we investigated how implicit, politically-stereotyped pictorial cues may contribute to political homophily.

We assessed how perceptions of implicit cues (e.g., holding a fish vs. cat) predicted dating decisions. Studies 1 and 2 found that ingroup (vs. outgroup) implicit cues predicted lower perceived ideological disagreement and greater willingness to affiliate. Study 3 found that explicit cues generally outweighed implicit cues when the two were incongruent. However, when profiles included an ingroup explicit cue, participants also drew on the implicit cue to infer the target's political orientation. This work suggests that implicit cues in dating profile pictures shape online dating decisions, particularly when explicit political cues are absent.

[101] Forewarning University Norms Attenuates Identity Threat Among College Students of Color

4:40 PM – 5:40 PM

DIVERSITY

Goal pursuit is often an interdependent process, leading people to be sensitive to how they are or could be treated. These processes can be thwarted by bias, prejudice, or racism. We examined whether providing a "forewarning" that acknowledged the possibility of bias and provided clarity on the university's norms – a representation of other people's attitudes and behaviors – would lead college students of color to feel less identity threat and a greater sense of belonging following exposure to explicit racism on campus. 630 college students of color were randomly assigned to either a forewarning condition or a no-forewarning condition and then asked to imagine that either a racist or anonymous (control) speaker was invited to campus. Participants who imagined the racist speaker reported less social and academic fit than those who imagined an anonymous speaker. However, the forewarning affected participants' experience of identity threat, such that, overall, identity threat was higher in the racist speaker condition, but this effect was attenuated by the forewarning. An exploratory mediation analyses for participants in the racist speaker condition revealed that the effect of the forewarning on identity threat was mediated by changes in perception of the university's descriptive norms. These findings suggest one way to help students make sense of their experience following a racist event.

[102] Friends-First Romantic Relationships Have (Slightly) Higher Relationship Quality Than Dating-Initiation Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Prior research demonstrated that two pathways to start a romantic relationship exist: friends-first initiation (FFI) and dating-initiation (DI), but no work has examined possible differences between these pathways. As FFI includes a pre-existing relationship, I predicted that those who used FFI would have higher trust, satisfaction, and commitment, and lower uncertainty and jealousy compared to those who used DI. 865 participants (university students and Prolific) completed an online survey about their current romantic relationship. Using multivariate analysis of variance (MANOVA), I found that FFI individuals reported greater trust, satisfaction, and commitment, and less self-uncertainty in their relationships compared to DI individuals. This finding remained when including individual differences, relationship length, and recruitment sample as covariates. Through exploratory mediation analysis, I found that trust mediates the link between initiation pathway and relationship quality. These findings suggest that FFI relationships benefit from trust established in friendship.

[103] Friendship Jealousy: The Interplay of Attachment, Conflict, and Protective Behaviors

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Friendship jealousy—the fear of being replaced by a third party in a friendship—has been studied in children but rarely in young adults, despite evidence that friendships heavily influence health in adulthood. This study (N = 296) examined antecedents and reactions to friendship jealousy. Participants were randomly assigned to a neutral or jealousy condition, completed measures of attachment, self-esteem, life satisfaction, and affect, and responded to open-ended questions about conflict and jealousy. Most participants reported experiencing friendship jealousy in adulthood. Jealousy elicited greater negative affect than conflict and was linked to reduced authenticity and closeness. When experiencing friendship jealousy, anxiously attached individuals tended to ruminate, while avoidantly attached individuals created distance. Findings suggest that friendship jealousy and attachment style independently predict protective behaviors. This highlights how friendship jealousy is a common experience in emerging adulthood, challenging assumptions that romantic ties eclipse friendships. Future research should explore how friendship jealousy operates in healthy versus harmful friendships.

[105] From Commitment to Infidelity: A Cultural Comparison

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

What drives people to stay faithful—or stray—in relationships, and does culture play a role? This study explored whether a shift from self-interest to relationship-focused goals, known as transformation of motivation (Kelley & Thibaut, 1978), helps explain how commitment predicts infidelity across cultures (Iran, N = 190; Canada, N = 200). Based on differences in self-concept in individualistic versus collectivist cultures, we expected cultural variation in commitment processes. Transformation of motivation did not mediate the commitment-infidelity link, but key cultural differences emerged: structural commitment—particularly social pressure—was stronger in Iran than in Canada. The comparison of markers of transformation of motivation (e.g., willingness to sacrifice, accommodative behaviors; Rusbult et al., 1991; Van Lange et al., 1997) showed that Iranian participants reported more destructive accommodation strategies (e.g., avoiding discussion) and greater willingness to sacrifice than their Canadian counterparts. These contradicting findings suggest that transformation of motivation may not be a unidimensional construct and is shaped by cultural norms. The study highlights the need for culturally informed models of commitment and infidelity.

[106] From Services to Synchrony: Early Head Start Engagement and the Parent–Child Relationship

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Early Head Start (EHS) offers multiple pathways to strengthen the parent–child relationship (besides standard center-based care), yet families follow different participation paths (Love et al., 2005, 2013). In 1,076 families, we modeled six engagement indicators (case-management meetings, parenting classes, parent-child groups, support groups, parenting info and child-development services at home visits) across ages 6, 14, and 24 months using the Multidimensional Growth Mixture Model. Five engagement profiles emerged: Consistent High (47.8%), Consistent Low (13.1%), Late-Rising (12.8%), Early–Middle (15.0%), and Early-Only (11.3%). Profiles predicted parenting at 36 months. Consistent High showed higher supportiveness, warmth, reading frequency, and cognitive stimulation than Consistent Low (often also > Early-Only); it also exceeded Late-Rising on parenting quality. Late-Rising outperformed Consistent Low on warmth and reading. For dysfunctional interaction, Early–Middle and Early-Only were higher than Late-Rising and Consistent High. Results highlight sustained—and, secondarily, improving—engagement as a pathway to warmer, less dysfunctional, and more cognitively enriching caregiving.

[107] When targeted communication backfires: Black consumer experiences with race-based health messages and pathways to improvement

4:40 PM – 5:40 PM

GROUPS/INTERGROUP PROCESSES

Health communicators often assume demographic targeting enhances message relevance (e.g., Kreuter & Wray, 2003). We extended prior work in this area by asking when targeted health-related messaging may backfire. To do so, 210 Black adults received HIV information presented as demographically-targeted (i.e., racially-motivated) or algorithm-selected (random). Participants exposed to race-targeted messaging experienced significantly higher social identity threat, manifesting as feelings of unfair judgment and discomfort ($ps < .01$). Moreover, targeted messaging produced stronger negative emotions including irritation, anger, and disinterest, while participants retained significantly fewer health facts versus non-targeted conditions ($ps < .001$). When asked for improvement recommendations, consumers qualitatively emphasized resource accessibility information, actionable guidance, cultural relevance, and personal narratives rather than explicit racial disparity framing. In sum, the current work challenges conventional targeting assumptions and unites multiple areas within psychology (e.g., social cognition, group processes) with related fields (e.g., marketing).

[108] Gender and Couple Socioeconomic Disadvantage: Men's Individual-Based Relative Deprivation Predicts Partners' Relationship Quality (But Not Their Own)

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Individual-based relative deprivation (IRD) is a subjective evaluation whereby an individual compares themselves to others and believes that they are at a disadvantage, leading to feelings of anger and resentment. Traditional gender roles prescribe men the role of provider, so men may be particularly likely to experience poorer well-being and relationship quality when they perceive that they are at a socioeconomic disadvantage. However, little is known regarding how IRD is associated with the quality of close relationships or partners' well-being. We employed an actor-partner interdependence framework to examine whether IRD and within-couple relative socioeconomic status (SES) predicts the well-being and relationship quality of both individuals and their partners in man-woman relationships ($N = 820$ couples). Greater IRD was negatively related to one's own well-being, and the actor effect was stronger for men than for women. IRD was not related to partners' well-being. Women reported poorer relationship quality when they reported greater IRD and when their partner reported greater IRD. No significant effects were found for the model that examined within-couple relative SES.

[109] Generative AI Helps Close Socioeconomic Status-Based Gap in Professional Networking

4:40 PM – 5:40 PM

DIVERSITY

Research shows individuals from lower SES backgrounds face significant disadvantages in career advancement, yet little research has looked at how emerging generative AI (GenAI) technologies may offer new pathways to address SES-based career disparities. This research examines whether GenAI can alleviate SES-based disparities in the effectiveness of email networking – a crucial, early-stage gateway to professional opportunities. In an online experiment and a field experiment (N = 1,201), participants wrote networking emails targeting professionals who currently hold their “dream job” either with or without the assistance of GenAI. We found that the networking emails written by lower (versus higher) SES participants are rated as less effective without the use of GenAI, but that with its use, this gap is significantly reduced. This research advances our understanding of SES-based barriers in early career stages while, importantly, demonstrating how accessible GenAI tools can potentially mitigate entrenched status-based inequalities in professional advancement opportunities, bringing them one step closer to their aspired professional careers.

[110] Gratitude in Context: A Socioeconomic Lens on Gratitude in Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Positive interpersonal processes, like gratitude interactions, have been linked to a myriad of beneficial relationship outcomes (Algoe, 2019). Yet, despite emerging theory and research demonstrating that socioeconomic status influences relationships behaviors and outcomes (Karney, 2020), no research has examined the interplay between SES and positive relationship interactions. In this study, we used 13 waves of annual longitudinal and dyadic data to examine how SES predicted (a) perceptions, and (b) outcomes of gratitude in intimate relationships. Multilevel analyses demonstrated that greater objective SES predicted lower perceptions of gratitude, whereas subjective SES predicted greater perceptions of partner gratitude. Moreover, SES moderated the link between perceptions of gratitude and relationship outcomes, such that people lower in SES tended to report better outcomes when they perceived greater gratitude from their partner. We also found that stress mediated the link between SES and perceptions of gratitude. This study advances the literature by demonstrating that SES influences positive relationship interactions, in part due to the link between SES and stress.

[111] Growing (Up) With Video Games: The Roles Video Games Play from Childhood to Adulthood

4:40 PM – 5:40 PM

LIFESPAN DEVELOPMENT

Although prior research has examined video game play at specific life stages, little is known about how the roles of video games evolve across the life course. Understanding these dynamics offers valuable insights into the broader psychological, social, and cultural functions of games in players' lives. In this study, 29 video game players (aged 24–34) took part in in-depth autobiographical narrative interviews, reflecting on meaningful games and game-related memories across different life phases. Interviews were analyzed using Braun and Clarke's framework for inductive thematic analysis, which identified nine overarching roles of video games: as a social space for connection, a safe shelter from real-life struggles, a field of identity exploration, a playground of leisure, a sphere of autonomy, a landscape of meaningful experiences, a learning hub, an arena of mastery, and, at times, a dark realm linked to negative experiences. These roles varied in prominence across phases, demonstrating the dynamic multifaceted significance of video games over time. The findings provide new insights into how individuals integrate video games into their life stories, identities, and social lives.

[112] Healing the Present by Remembering the Past? Links between Romantic Nostalgia and Forgiveness

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

In two studies, we examined links between romantic nostalgia, unforgiveness (i.e., revenge and avoidance motivations), and relationship outcomes. In Study 1, undergraduate students who reported greater romantic nostalgia proneness reported lower revenge and avoidance motivations, greater affective attraction toward their partner, and greater relationship flourishing (i.e., goal sharing, personal growth, relationship giving, meaning). In Study 2, adults on Prolific recalled the most harmful offense they experienced by their current romantic partner. By random assignment, they then recalled either a romantic nostalgic or ordinary event with their current partner. Participants reported their revenge and avoidance motivations, affective attraction, and relationship flourishing. Participants who recalled a romantic nostalgic (vs. ordinary) event reported moderately lower revenge motivations, moderately higher affective attraction, and significantly higher relationship giving. No other differences emerged. Our results provide initial evidence that romantic nostalgia aids forgiveness. However, romantic nostalgia proneness may be more impactful than a state induction of romantic nostalgia.

[113] Hearts Online: Digital Communication Themes that Create Emotional Closeness

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Communication is key in the emotional link partners feel (Floyd, 2006). This study explores Partner Responsiveness through digital communication, and we aim to identify online communication behaviors that make partners feel loved and valued (Reis et al., 2004). After collecting data, we will form themes identifying ways digital communication generates emotional closeness.

Subjects (61) were recruited via SONA, and accessed an online survey. They answered 6 questions exploring use of digital communication.

The thematic study, guided by Stage et al. (2024), ChatGPT and a manual analysis, identified six themes; two examples are Quality of Digital Communication (QDC), reflecting partner effort and Digital Engagement (DE), emphasizing frequency.

Linguistic Inquiry and Word Count (LIWC; Boyd et al., 2022) was used for also. For example, the first question's data generated frequent word use for "day" (35%), "love" (27.5%), and "send" (20%), indicating core behaviors that maintain daily routines, connecting back to the themes.

Themes connected with literature emphasizing building intimacy. They capture ways partners connect online and build closeness from consistent and meaningful interactions that communicate love and care. Future directions include creating a scale to measure communication on these themes, exploring their application to individual differences and demographics.

[114] Communication is Key in the Digital Age: How Perceiving Digital Partner Responsiveness Shapes Relationship Satisfaction

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Communication is Key in the Digital Age: How Perceiving Digital Partner Responsiveness Shapes Relationship Satisfaction

Digital communication is central to how couples connect. Perceived Partner Responsiveness (PPR), the belief that one's partner notices, supports, and responds to what matters (Reis et al., 2004), creates closeness. This study extends PPR into the digital realm with Perceived Digital Partner Responsiveness (PDPR), capturing online responsiveness and its role in sustaining relationship satisfaction. We test whether PDPR predicts satisfaction and whether this relationship is moderated by the stage of the relationship (beginning vs. maintaining) and type (long-distance vs. geographically close). We hypothesize that PDPR will positively predict satisfaction, with stronger effects for early-stage and long-distance couples. Satisfaction will be measured with the RAS (Hendrick, 1988), and PPR with a 3-item scale (Rice et al., 2020) revised to differentiate in-person and digital contexts. Findings should show PDPR uniquely predicts relationship satisfaction and varies by relationship characteristics, highlighting the role of digital communication in emotional closeness.

[115] Heteronormative Definitions of Sex: The Roles of Androcentrism, Phallocentrism, and Objectification

4:40 PM – 5:40 PM

SEXUALITY

Heteronormativity is the presumption of cisheterosexuality that establishes two discrete, assigned-at-birth sexes which determine one's gender, and that prescribes the behaviors and roles permitted for women and men, including in the context of sexual intimacy. Under heteronormativity, "real" sex is narrowly defined as consisting of a man penetrating a woman's vagina with his penis. Empirical research has demonstrated that this definition of sex is widely adopted and reproduced both at the societal and interpersonal levels. We sought to investigate specific sub-ideologies of heteronormativity—androcentrism, phallocentrism, and sexual objectification—that might clarify the processes through which people determine what behaviors are seen as "real" sex and what behaviors are not. To accomplish this, we explored the extent to which participants defined a range of heteronormative and non-heteronormative behaviors as sex, and the ways in which proximity to heteronormativity (among targets and participants) might systematically influence those perceptions. Across three studies (total N = 1,337), participants defined phallocentric behaviors (involving a penis or phallus) and objectifying behaviors (involving a female "passive" partner) as sex to a greater extent compared to non-phallocentric and non-objectifying behaviors. Endorsement of objectification moderated this relationship, such that straight male participants high in appearance-based objectification gave lower ratings of sex to non-heteronormative behaviors. Implications and future directions are discussed.

[116] Holding On for Others: How Living Near Relatives Shapes Hoarding Behavior

4:40 PM – 5:40 PM

EVOLUTION

Hoarding has traditionally been conceptualized as a maladaptive disorder, characterized by excessive accumulation for selfish reasons. Yet this may overlook contexts in which hoarding functions as a strategy for others. Inclusive fitness theory suggests that behaviors enhancing the survival and reproduction of kin can be evolutionarily advantageous, encompassing not only an individual's direct reproductive success but also indirect fitness gained by supporting kin. Further, recent work on ecological relatedness—the prevalence of kin in one's immediate environment—has shown to shape trust within one's community and pro-group behavior, which may extend to hoarding as a way of retaining resources for their kin. In Study 1 (N = 197), people who live around more relatives are more likely to hoard for others. In Study 2 (N = 2,229), a cross-cultural study spanning 11 countries, this was the case for people who live around younger relatives, but not as often for older relatives. Together, these findings suggest that hoarding, often pathologized as dysfunctional, may serve a biologically adaptive function under certain contexts.

[117] Hot Topics: Problematic Attributes of Couples' Conflict

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Research suggests that some distressed couples may face more difficult conflicts, rather than lacking problem-solving skills. Because it remains unclear why certain topics are perceived as most problematic, the current study identified attributes of difficult conflict topics. Cohabiting couples (N=220; Mage=24.85, SD=5.15) completed a 14-day diary for which they reported on daily conflicts and their perceptions of each. They responded to the prompt: "Please tell us what the disagreement or conflict was about," and rated each conflict's seriousness, resolvability, and the extent to which topics recur. Their open-ended conflict descriptions were coded using the 24 conflict topics from Sanford (2003), which were then aggregated into nine categories for data analysis. Multilevel dyadic modeling revealed that conflict topics of communication and inconsiderate behavior were less serious and more likely to be resolved. Conflicts about relationship instability were the most serious, whereas those addressing intimacy issues were most likely to be repeated without resolution. The findings indicate that difficult conflicts are those that are serious, repetitive, and unlikely to be resolved.

[118] How Consistent Friendlike Conversation with AI Companions Influences Our Attitudes and Perceptions Toward AI: An Exploratory Experiment

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Despite skepticism toward artificial intelligence (AI), conversational agents are increasingly integrated into daily life. Yet, little is known about whether consistent, socially oriented interactions with AI chatbots shape users' attitudes and psychological outcomes. In a within-subjects study, participants engaged in five days of either friendlike interactions with a personable AI chatbot or journaling control condition. Attitudes toward AI and perceptions such as trust, perceived empathy, animacy, anthropomorphism, likeability, perceived intelligence and safety, dependency, and exploratory indicators of well-being were assessed after each condition. Friendlike chatbot interactions significantly increased participants' perceptions of empathy and animacy, but did not alter global attitudes toward AI or other specific attitudinal outcomes. Participants reported higher self-esteem after journaling compared to after AI interaction. These findings suggest that friendly, humanlike conversations enhance perceptions of AI as empathic and lifelike, but decrease in self-esteem suggests potential trade-offs. This highlights the need for careful consideration of how chatbots are designed.

[119] How low will you go? Exploring settling for dealbreakers as a function of anticipated dissatisfaction and fear of being single

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Do romantic "dealbreakers" break deals? Despite stating that certain attributes would lead to rejecting a date, people do not always adhere to these criteria. Rather, some dealbreakers may be firm, while others flexible. This research will experimentally test whether settling by accepting dealbreakers is affected by anticipated dissatisfaction with the dealbreaker. Further, as stronger fear of being single predicts more settling, we expect the impact of anticipated dissatisfaction will be moderated by fear of being single. Single participants will report their fear of being single, then read scenarios depicting relationship development with a partner who ultimately presents with a dealbreaker participants believed would make them more vs less dissatisfied. Romantic interest and decisions to keep dating will be assessed. Those evaluating a dealbreaker anticipated to cause greater dissatisfaction will settle less than those considering a dealbreaker anticipated to cause less dissatisfaction. However, those with higher vs lower fear of being single will be more likely to settle in both cases. This work will inform why people may paradoxically enter into poor-quality relationships.

[121] How Partner Qualities Are Associated with Inclusion of Other in the Self

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Inclusion of other in self (IOS) is the tendency for people to incorporate their relationship partners into their own identities. Prior work has demonstrated that IOS is associated with relationship outcomes such as satisfaction. Drawing upon the ideal standards model and related research suggesting that three core dimensions of partner qualities (e.g., warmth/trustworthiness, physical attractiveness/vitality, status/resources) can predict relationship outcomes, we sought to examine the extent to which these partner qualities may be associated with IOS. Using dyadic data from a study of 208 married individuals (comprising 104 couples), we tested the prediction that people who perceived their partners as higher (versus lower) in these partner qualities would report higher marital satisfaction that, in turn, would predict greater IOS. Results demonstrated that partner warmth/trustworthiness, but not partner physical attractiveness nor partner status/resources, was directly positively associated with IOS. As predicted, this association occurred through elevated marital satisfaction. Implications for close relationships theory and future research will be discussed.

[122] How Underrepresented Racial Minority College Students Perceive University Responses to Federal anti-DEI Policies

4:40 PM – 5:40 PM

DISABILITY

In 2025, President Trump sought to eliminate DEI in education, with some universities dismantling their programs to avoid backlash and others maintaining DEI despite potential costs (e.g., federal funding cuts). This pre-registered experiment examined how college students of color (SOC) perceive various university responses to federal DEI mandates. Participants (N = 354) imagined themselves as students at a fictitious university planning to build a center for SOC on campus. Next, participants were told that, given federal DEI rollbacks, the university either (a) removed DEI by changing both the name and mission of the center to include all students, (b) strategically maintained DEI by keeping the center’s mission but changing its name, or (c) maintained the DEI initiative. As predicted, SOC perceived the university as a more authentic ally and anticipated more support and belonging there when they fully maintained DEI (vs. strategically maintained or removed). Unexpectedly, there were no condition differences in perceptions of allyship costs. These findings highlight SOC perspectives on DEI changes in higher ed.

[123] How Young Adults Perceive the Benefits and Harms of Porn in Japan, the USA, and Malaysia

4:40 PM – 5:40 PM

SEXUALITY

Research has often highlighted the negative impacts of pornography. Yet, considering its widespread use globally, it is important to explore both potential harms and benefits. This study investigates how young adults in Japan, the United States, and Malaysia understand pornography, using the framework of social representation theory. Data were gathered from 978 individuals, comprising 399 males (40.8%) and 579 females (59.2%), with 25.7% from Japan, 33% from the USA, and 41.3% from Malaysia. The majority of participants were heterosexual university students. Using prototypical analysis, we identified the core representations characterized by the most frequently used words or phrases and those considered most important when describing the benefits and harms by respondents of each nationality. Results showed that for benefits, words such as satisfying desires, providing pleasure, offering relief, and contributing to education were most common, compared to harms such as spreading incorrect knowledge. We discuss the similarities and differences among the three countries. These findings provide insights into the social representations of pornography among young adults in these countries and offer important directions for future research.

[124] I Don't Deserve This: Initial Development of a Romantic Outlook Circumplex

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Romantic outlook can be conceptualized as the intersection of two domains: assurance, or expectations of positive or negative outcomes (Rosenbach & Johnson, 2024), and attribution, or the extent to which outcomes are credited to internal or external causes (Fabella & Aler, 2023). The present study introduces a circumplex measure designed to capture and examine the interplay between these two domains. Approximately 150 subjects will complete items concerning assurance and attribution of expected romantic outcomes. Item responses will be analyzed using principal components analysis within theoretically relevant item sets, with varimax rotation to aid interpretability. Items will be retained based on strong primary loadings, minimal cross-loadings, and consistency with the hypothesized circumplex geometry. This process will yield eight octants, each representing a distinct combination of assurance and attribution levels. The final circumplex model will be examined in relation to other measures, such as entitlement, self-efficacy, and life satisfaction, to clarify the content of the questionnaire and how romantic outlook relates to these constructs.

[125] I Like You, You Get Me: How Perceived Relationship Quality Shapes Accuracy and Bias in Empathy Judgments

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Being empathetic (and seen as such) aligns with perceiving one's relationships as high-quality. Across two studies, we examined whether relationship quality (RQ) shapes accuracy and bias in empathy judgments, as well as the sources of these judgments. In Study 1, we ran Truth & Bias models predicting bias in empathy judgments in friend dyads (NDyad=290). Empathy was underestimated ($b=-.17$, $p<.001$) and shaped by one's own empathy ($b=.24$, $p<.001$) and the target's empathy ($b=.22$, $p<.001$). Higher RQ was linked to higher empathy perceptions ($b=[.19-.41]$, $ps<.001$). In Study 2, we applied Social Relations Models to groups (N=189) of four friends (N=756) who rated each other on empathy and RQ. Empathy judgments were again shaped by one's own ($r=.32$, $p<.001$) and targets' empathy ($r=.19$, $p<.001$). Sources of empathy and RQ judgments mostly stemmed from unique relationship perceptions (62-66%), assimilation (20-27%), and consensus (7-18%). These judgments covaried, such that judging others as empathetic (and being seen as such) was associated with higher RQ. These results demonstrate a relationship-specific nature of empathy judgments and the role RQ plays in accuracy and bias.

[126] I'm Ready if You Are: Self-Esteem Moderates Couples' Accuracy and Bias in Perceptions of Commitment Readiness

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

When is it the "right time" to be in a relationship? Research has shown that perceptions of timing—how ready one feels for a committed relationship—could drive pro-relationship behaviors aimed at strengthening an existing relationship. Having positive perceptions of a partner's commitment readiness could then provide greater assurance about the relationship's future. Using the Truth and Bias model, we examined couples' accuracy and bias in perceiving each other's commitment readiness. Moreover, from a risk regulation perspective, individuals with higher self-esteem are more motivated to continually seek connection with their romantic partner. Hence, we also hypothesized that self-esteem could moderate truth and bias effects concerning a partner's commitment readiness. Findings revealed that while individuals tend to underestimate their partner's commitment readiness, they were still significantly accurate in their perceptions. They also projected their own commitment readiness onto the perceptions of their partner's. A significant interaction effect between own readiness and own self-esteem showed that this projection effect was stronger in individuals with higher self-esteem than those with lower self-esteem. Future directions and limitations in self and relationships research are discussed.

[127] Implicit Avoidance of Attractive Alternatives: Relationship Identification and Implementation Intentions

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Maintaining healthy relationships is critical to well-being, but the presence of attractive alternatives is a threat to romantic relationships. Thus, understanding how we maintain relationships when faced with attractive alternatives is crucial. This study investigated how relationship identification (RI) and implementation intentions (Imin) affect relationship maintenance when attractive alternatives are present. Participants (N = 186) in relationships completed the Manikin task, which measures approach/avoidance bias towards attractive alternatives through response times when moving a stick figure toward/away from images of various faces. Participants also completed a measure of RI and were instructed to set either an academic or a relationship-defending Imin. We hypothesized an interaction between RI and Imin, in that highly identified individuals who set a relationship-defending Imin would have a lower approach bias than others. Results supported this hypothesis ($p = .036$) and high relationship identification predicted less approach bias for attractive alternatives ($p = .03$). These results extend previous findings and have implications for romantic relationship maintenance.

[128] Improving the reliability and validity of psychological science with computational modeling

4:40 PM – 5:40 PM

METHODS/STATISTICS

Theories of individual differences are foundational to psychological and brain sciences, yet they are traditionally developed and tested using superficial summaries of data (e.g., mean response times) that are disconnected from our otherwise rich conceptual theories of behavior. To resolve this theory–description gap, I present the generative modeling approach, which involves formally specifying how behavior is generated within individuals, and in turn how generative mechanisms vary across individuals. Generative modeling shifts focus away from descriptive statistical effects toward psychologically interpretable parameters, while simultaneously enhancing the reliability and validity of our measures. Simulations and empirical data from the Implicit Association Test and a variety of social and affective priming paradigms show that generative models yield (a) more theoretically informative parameters, and (b) higher test–retest reliability estimates relative to traditional approaches, illustrating their potential for enhancing theory development.

[130] Integrated Diversity Policies: Balancing Diversity Action and Perceived Fairness

4:40 PM – 5:40 PM

DIVERSITY

As resistance to diversity efforts grows, organizations committed to diversity confront a pressing dilemma: how to encourage their employees to engage in diversity action without stoking perceptions of unfairness. Whereas prior research has largely examined what diversity efforts organizations implement, we shift focus to how they are implemented via policies. Drawing on situational strength theory, we theorize how and why the strength of diversity policies shapes both whether individuals adopt diversity actions and whether they perceive such policies as fair. We first differentiate strong policies (high clarity, constraints, and consequences) from weak policies (low clarity, constraints, and consequences). We then introduce integrated policies—a theoretically novel construct characterized by high clarity, low constraint, and moderate consequences. Across three preregistered studies (N = 2,011) in distinct organizational contexts (hiring, training, and team formation), we find that integrated policies strike a balance: they are more effective at spurring adoption of diversity actions than weak policies, and are more effective at maintaining perceived fairness than strong policies. We further theorize and directly test that individuals' felt accountability and sense of autonomy mediated the effects of the strength of policies. This research offers important theoretical and practical implications for organizations seeking to promote diversity while navigating resistance.

[132] Intersectional Harm and Healing: Stigma, Support, and Queer BIPOC Youth

4:40 PM – 5:40 PM

SEXUALITY

Introduction: Black, Indigenous, and people of color (BIPOC), and Lesbian, Gay, Bisexual, and Trans—sometimes referred to as Queer and Trans (QT)—minoritized youth face elevated risks of depression linked to intersectional discrimination and internalized stigma. Caregiver messaging of acceptance or rejection has the potential to worsen or mitigate these relationships. This study examines how discrimination relates to depression, whether internalized stigma mediates this link, and if caregiver messaging moderates these effects. Methods: Using the 2022 LGBTQ National Teen Survey, data on 1,229 intersectional QT-BIPOC youth (mean age of 15) were analyzed using two moderated mediation models. Results: No significant moderated mediation effects emerged. However, internalized stigma consistently mediated the link between discrimination and depression. Discussion: While neither moderated mediation model was significant, internalized stigma and caregiver messages may still play important roles in well-being. Future research should explore intersectional socialization and its impact on well-being for QT-BIPOC youth.

[133] Intersectional minority stress and suicidal thoughts and behaviors among Black sexual and gender minority youth

4:40 PM – 5:40 PM

SEXUALITY

Black sexual and gender minority youth (SGMY) face significant disparities in suicidal thoughts and behaviors. Minority Stress Theory posits that minoritized social statuses increase experiences of discrimination, which may increase suicidality. Such experiences are further complicated for Black SGMY who hold multiple marginalized positions and experience intersectional minority stress. Little research has examined how Black SGMY experience intersectional minority stress and how these experiences impact suicidal thoughts and behaviors. In this phenomenological study, we explored experiences of intersectional minority stress and suicidality. We conducted in-depth interviews with 22 Black SGMY ages 16-24 in Milwaukee, WI. Through intersectional thematic analysis, we developed four themes: 1) the journey of self-acceptance; 2) familial rejection; 3) societal marginalization; and 4) suicidal thoughts as escape from oppression. Suicide prevention strategies for Black SGMY should incorporate culturally responsive and identity-affirming strategies. Peer-led support and community-based programming may be important avenues for affirming and protecting the lives of Black SGMY.

[134] Intersectionality and Psychology Education in Brazil: Gaps and Challenges in Public University Curricula

4:40 PM – 5:40 PM

DIVERSITY

Psychology, as a science and profession, is committed to recognizing the multiple experiences marked by intersectional oppressions, breaking away from traditional models that ignore differences. This action requires not only the transformation of professional practice but also a revision of how knowledge is produced and professionals are trained. This study aims to foster discussion on the need to transform Psychology curricula in Brazilian public universities, emphasizing social markers of gender, race, class, and sexuality, to break with the hegemonic epistemic framework still predominant in the field. The research involved a documentary analysis of 99 Curriculum Matrices (CM) from undergraduate Psychology programs across 66 public universities. A total of 74 CM and 3,221 syllabi were analyzed. Among these, only 211 (equivalent to 7%) included content that indicated discussions or bibliographic references on gender, race, or class. The information was organized with the support of IRaMuTeQ software, using Descending Hierarchical Classification (CHD). Two main classes were identified in the CM: (1) interdisciplinary, with emphasis on the presence of anthropology and sociology in discussions on culture, society, and ethnic-racial issues; (2) intradisciplinary, especially within the subfield of Social Psychology, subdivided into (2.1) themes articulating individual, society, violence, and human rights; and (2.2) reflections on the role of psychologists in public policies. The results reveal that Psychology training remains incipient regarding an anti-racist approach, with limited inclusion of feminist perspectives and a scarcity of content addressing Brazilian social inequalities. The study concludes with an urgent call for reforming political-pedagogical projects to include social markers and adopt intersectionality as a structuring axis in Psychology curriculum..

[135] Investigating the effect of message framing on public opinions and values towards Sustainable Festive Gifting at Lunar New Year

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Lunar New Year (LNY) gifting of new notes involves issuing approximately 100 million new notes annually. Most are used once before being returned to the Central Bank where notes exceeding demand are destroyed through incineration, generating substantial carbon emissions.

Behavioural research suggests effectiveness of loss-framed and social influence messages in promoting environmentally sustainable behaviours, though none have focused on LNY gifting. This study examines attitudes towards sustainable LNY gifting and whether loss-framed or social influence messages affect intentions and values driving such behaviours.

A randomised controlled trial ($n = 1,853$) assigned participants to three conditions: (i) control group (no

message), (ii) loss-framed message highlighting the destruction of excess notes by incineration (iii) social influence message emphasising that new notes are not important to most receivers of hongbaos.

Across groups most receivers had no strong preference for new notes. Older individuals preferred new notes while the digitally savvy were more likely to prefer Fit notes (Fit notes are used currency notes that are generally clean and of suitable quality for recirculation) and digital hongbaos (digitally transferred money gifts). PayNow users were less likely to prefer new notes and more inclined towards digital gifting.

Both intervention messages significantly reduced intent to gift new notes, with social influence messaging proving more effective. It reduced preference for new notes among youth receivers and achieved higher knowledge comprehension. However, messages alone may not overcome fundamental demand as around 2 in 5 still intend to use new notes.

Personal values analyses revealed that givers' preference for Fit notes was linked to "respecting the earth" while those preferring new notes valued "influence". Youth receivers who preferred new and Fit notes prioritised different values like "social power", suggesting targeted messages appealing to givers and receivers based on their values may be more effective than a one-size-fits-all approach.

[136] Investigating the Effects of Attentional States On Sexual Arousal

4:40 PM – 5:40 PM

SEXUALITY

Mindfulness has been shown to enhance sexual desire and arousal in women, yet mindfulness as a cognitive strategy is not a panacea and can sometimes diminish arousal. This study examines the circumstances under which mindfulness can optimize or hinder arousal. We hypothesize that when women mindfully attend to their desire and arousal in a participatory way by immersing themselves in their bodily experience, arousal is enhanced. However, when women observe their bodily sensations from a detached perspective, they may engage in self-spectating, thereby decreasing arousal. In a within-subjects design, participants were explicitly trained to toggle between participatory, observatory, and neutral attentional states while viewing erotic clips. Participants self-reported their level of arousal after each trial. Analyses will be conducted using a within-subjects ANOVA. Results are expected to support our hypotheses and will have implications for understanding the conditions under which mindful cognitive strategies improve or diminish arousal.

[137] Is it possible to make attitudes towards immigration more positive?

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Immigration was a major point of contention for voters in 2024, a record year for elections. We tested whether British attitudes towards immigration became more positive when participants were

exposed to a framed text. In the study ($n = 3067$), which used a sample sourced from YouGov that was representative for age, gender and politics, participants were exposed to a short text written to be compatible with moderate levels of what political psychologists call 'authoritarianism' that also incorporated factual arguments and an emotional appeal. We found that people exposed to this 400-word text as opposed to a control text or a low authoritarianism text felt they shared more values with a fictitious EU immigrant. Almost three quarters (73%) of them rated EU immigration as "slightly", "moderately" or "very good" for the UK, a figure 20 percentage points above the equivalent score for those exposed to the control (53%). There were also differences in overall immigration attitudes after reading the authoritarianism-compatible text relative to the control, but these were smaller, and did not differ significantly from the low authoritarianism text. These findings demonstrated that persuasion is possible on contentious issues like immigration, and were consistent with the idea that authoritarianism-compatible arguments might be particularly effective for culturally similar forms of immigration (such as EU immigration to the UK).

[138] It Ain't Over 'til It's Over: Ongoing Interdependence Between Former Romantic Partners Following a Breakup

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Though it may feel like a chasm has been created between former romantic partners following a breakup, ex-partners may still continue to impact one another—both directly and indirectly. To explore ongoing interdependence between ex-partners and associations with breakup adjustment, we conducted a prospective breakup study, surveying both members of dating couples longitudinally, and—upon breaking up—for a 28-day experience sampling study. With a focus on 150 individuals and 40 former couples over the month following their breakup, we assessed whether perceived and actual breakup recovery (e.g., emotional longing, distress) was similar between ex-partners and predicted changes in each other's recovery over time. Perceived and actual ex-partner breakup recovery significantly predicted one's own, and perceptions of an ex's recovery predicted day-to-day changes in one's own. Ongoing interdependence effects were relevant even among those who initiated the breakup and on days when there were no direct interactions with the ex. Results provide novel insights into the dyadic nature of breakup recovery and demonstrate that interdependence does not end when the official relationship does.

[139] Keeping score, feeling poor: Exchange orientation predicts lower relationship satisfaction through diminished gratitude

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Past research consistently shows that exchange orientation—the tendency to expect direct reciprocity in close relationships—predicts lower relationship well-being. However, less is known about why this transactional mindset, often grounded in seemingly reasonable ideals of fairness and balance, undermines relationship well-being. The present research examined gratitude and indebtedness as key emotional processes underlying the negative effects of exchange orientation. Across five studies (N = 1,997), reduced felt gratitude consistently mediated the association between higher exchange orientation and lower relationship satisfaction for both self and partner, emerging at both between- and within-person levels, cross-sectionally and longitudinally. By contrast, mediation via expressed gratitude was weaker and less consistent, and indebtedness generally failed to account for the link. These findings clarify why exchange orientation is detrimental, identifying erosion of gratitude as a key pathway whereby individuals may perceive benefits as running ledgers of obligations rather than spontaneous expressions of care and interdependence.

[140] Knowledge to action: Investigating mixed-sex couples' ability to adapt their interpersonal sexual scripts to facilitate women's orgasm

4:40 PM – 5:40 PM

SEXUALITY

The orgasm gap is a pressing close relationships and gender equity issue that affects women's lives in and outside of the bedroom. While research has clearly established that clitoral stimulation is key to women's orgasm, male partners may be unaware of or fail to sufficiently implement these clitorally-focused sex acts into the couple's sexual script. For the current project, we recruited mixed-sex couples (one cisgender man and one cisgender woman) from the Prolific platform and assessed the accuracy of men's knowledge of their female partner's most reliable route(s) to orgasm from a list of sex acts. We found that couples with more accurate knowledge of the female partner's most reliable route(s) to orgasm engaged in those specific sex acts more often, and for a longer duration. More frequent engagement in the female partner's most reliable routes to orgasm predicted more frequent orgasms. These results can be used to inform interventions for addressing the orgasm gap in mixed-sex relationships, through (1) facilitating sexual communication, (2) the translation of knowledge to action, and (3) the modification of sexual scripts within each relationship.

[142] Lesbophobia Through Pornography and the Patriarchy

4:40 PM – 5:40 PM

SEXUALITY

This work investigated the relationship between pornography consumption and attitudes toward Queer women. Participants completed measures of hostile and benevolent sexism, anti-Lesbian attitudes, and pornography consumption. In the existing literature, there have been some attempts to study various impacts of pornography consumption. There have been other studies that explored the idea that beliefs behind the perpetration of sexual violence against Queer women can reinstate the perpetrator's masculinity (Bedera & Nordmeyer, 2020). Research has also shown that pornography of this nature is correlated with increased hostile sexist beliefs towards women and Rape Myth Acceptance from both men and women (Chapleau et al., 2007). The present study found that cisgender heterosexual men report consuming more pornography overall than women, non-Cis men, and non-hetero men. Although positive correlations were observed between pornography consumption and sexist attitudes, and between sexist and Lesbophobic attitudes, the hypothesized correlation between consumption of lesbian pornography and sexist and lesbophobic attitudes was not observed.

[143] Less Diverse Friendship Networks Predicts Greater Sense of Institutional Acceptance

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Although close outgroup friends can greatly improve intergroup relations there is limited research examining how the racial diversity of a person's closest friends impacts intergroup outcomes, such as how accepted people feel. While intergroup contact historically focuses on outgroup attitudes and majority group members, we explore perceived acceptance that both racial majority and underrepresented racial minority members feel within a majority-populated university. In the current study we examined how the diversity of a person's friendship networks, calculated by assessing the ratio of ingroup friends a person has, impacts perceived fit at an institution and institutional support. We find that a greater ratio of racial ingroup friends is related to greater perceived fit at an institution and institutional support. This effect on perceived institutional support is greater for underrepresented racial minority individuals. We assess this both at one time point and longitudinally. Our research suggests that, especially for underrepresented racial minority group members, having less diverse friendship networks may help buffer against feelings of exclusion.

[144] Linking Perceived Partner Emotion Regulation to Stress, Loneliness, and Perceived Support

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

How romantic partners regulate their emotions plays a critical role in shaping the relationship dynamic as well as the partner's well-being. While much existing research focuses on individuals' own emotion regulation, less is known about how perceptions of a partner's regulation influence personal well-being and relationship dynamics. The present study examines the effect of perceived partner emotion regulation, including the suppression of negative emotions and amplification of positive emotions, on stress, loneliness, and perceived partner support. In a 10-day daily experience survey focused on collecting individuals' experiences with their romantic partner and children, we test whether perceptions of partner suppression and amplification predict mental and relational outcomes (N=378). Using multilevel modeling, we will test our hypotheses that higher perceived partner suppression and higher perceived partner amplification will be associated with greater stress, greater loneliness, and lower perceived partner support. Findings will extend understanding of how emotion regulation in romantic partnerships shapes individual well-being and relational functioning.

[145] Listening to Crowdworkers: Comparison of Complaints in Japan and US

4:40 PM – 5:40 PM

METHODS/STATISTICS

Crowdsourcing is widely used in social science research, yet researchers often treat workers as 'data providers' rather than individuals with their own needs (Xia, 2023). Although Fowler et al. (2023) summarized worker frustration on MTurk through open-ended responses, it remains unclear whether these findings generalize to crowdsourcing workers in other cultural contexts. We addressed this gap by collecting complaints from Japanese crowdworkers and comparing them with those of MTurk workers using structural topic modeling. Low pay, repetitive tasks, and the use of attention checks were common sources of frustration in both samples. Notably, MTurk workers predominantly stressed interface issues (e.g., excessive radio buttons), whereas Japanese workers primarily emphasized comprehension issues (e.g., the use of technical terms, clarity of explanations). These findings suggest cultural differences in worker priorities: MTurk workers appear to value response efficiency, while Japanese workers are more concerned with task clarity. This highlights the importance of conducting 'worker-centered research' in a culturally sensitive manner.

[146] Longitudinal Examination of Parental Attachment Quality and Schema Formation

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

This study examines the longitudinal effects of parental attachment quality on adolescents' internal emotionality and relationship outcomes. Drawing on attachment theory and schema theory, we argue that early parental warmth and security serve as foundational scaffolding for emotional regulation and relational competence. Insecure or hostile parenting styles are hypothesized to increase internal instability, reinforce maladaptive defense mechanisms, and impair subsequent romantic and friendship satisfaction. Using data from the Pathways to Desistance Study (N = 1,116 adolescents, ages 14–17), structural equation modeling was employed to test whether parental hostility (low warmth, high monitoring) predicts elevated emotional dysregulation and, in turn, greater relational volatility across adolescence. Findings are expected to highlight how early attachment disruptions shape adolescent social-emotional development and intimate relationships, with implications for prevention and intervention strategies targeting resilience and secure relational bonding.

[147] Lost in translation: Examining couple behavioral coding across language

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Observational research is considered the gold standard for studying couple communication, and is being increasingly applied to diverse couples. Yet, observational coding systems have received little methodological scrutiny for cross-context use. This study uses two samples of couples (Ns = 416 & 107 dyads) with multi-lingual data to test whether two coding systems demonstrate measurement invariance across English and Spanish-speaking couples. Study 1 strongly supported measurement invariance across languages for all codes, whereas Study 2 supported measurement invariance for positive codes, with evidence of language-based measurement nonequivalence in negative codes. However, in both studies associations between observed communication and relationship satisfaction did not differ by language. These findings question whether coding systems can capture behaviors in linguistically diverse samples without modification. As the field prioritizes inclusion, tools for coding couple behavior must be validated across languages and contexts to accurately capture couple communication in diverse populations.

[148] Love Lost, Rival Found: Evolutionary vs. Social Explanations for Rebound Jealousy

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Romantic relationship breakups and subsequent rebound relationships often evoke great distress, yet little is known about how gender and sexuality shape these reactions. To fill this gap, we will present 400 heterosexual, homosexual, and bisexual participants with "rebound" scenarios (i.e., a recent ex-partner quickly entering new relationship with a man or woman) and assess their anticipated affect (e.g., jealousy, distress), cognitions (e.g., replaceability, attributions), and behavioral intentions (e.g., contacting, monitoring). Competing theories offer divergent predictions. Evolutionary explanations emphasize intrasexual competition; men should feel more distressed when the rebound is another man whereas women should feel more distressed when the rebound is another woman, regardless of sexual orientation. Sociocultural explanations emphasize heteronormativity; because same-gender relationships are often viewed as less legitimate, gay men and lesbians may perceive more competition with other-gender rivals who offer normative advantages. This research highlights breakups as a unique context to test evolutionary and sociocultural theories of competition and relationship threat.

[149] Love, Attitudes, and Motivation in Asexuality

4:40 PM – 5:40 PM

SEXUALITY

Asexuality refers to a non-pathological lack of sexual attraction. Prior research has found asexuality to be associated with non-partner-orientated sexual desire and a need to negotiate intimacy with romantic partners, but little is known about the general attitudes asexual people hold about love and close relationships. In this study, we administered a series of questionnaires to 161 Prolific participants to examine the association between a continuous measure of asexuality (Asexuality Identification Scale; AIS) and several relationship and motivational measures. We found that asexuality was positively correlated with attachment avoidance, attachment anxiety, love partner worry, behavioral inhibition, love scarcity, and perceived availability of material resources. We also found that asexuality was negatively correlated with sociosexuality, behavioral activation, availability of psychological resources, and a growth mindset. These findings suggest that global motivational elements, such as behavioral inhibition, may explain the psychological processes through which asexuality impacts relationship attitudes (i.e., attachment avoidance) and outcomes.

[150] Love, Sex, and Life Satisfaction: Intimate Relationships in Autistic Adults

4:40 PM – 5:40 PM

SEXUALITY

Healthy romantic relationships and sexual satisfaction are key contributors to well-being (Mitchell et al., 2021). While prior research showcases their importance in the general population, autistic adults remain underrepresented in this area and often face unique challenges in forming intimate relationships (Barnett & Maticka-Tyndale, 2015).

This study examined how relationship status, relationship satisfaction, and sexual pleasure relate to life satisfaction in autistic adults.

Recruited via crowdsourcing, a sample of 174 autistic adults (AQ ≥ 26) completed validated measures of these constructs. Partnered participants reported significantly higher life satisfaction than single participants ($d = 1.15$). Regression analysis further revealed that relationship satisfaction ($p < .001$), but not sexual pleasure ($p > .05$) significantly predicted 39.5% of variance in life satisfaction. Sexual pleasure did have a small positive correlation with life satisfaction on its own ($r = .29$).

These findings underscore the importance of supportive relationships and pleasure in the well-being of autistic adults and point to actionable targets for mental health promotion in this underserved population.

[151] Making Friends or Finding Partners? How Relational Mobility Reduces Preferences for Instrumental Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

As a newly emerging type of social relationship among Chinese youth, "partner-based socializing" (referred to as dazi in Chinese) focuses on domain-specific companionship and is characterized by instrumental features and goal orientation. This research examines whether relational mobility, as a positive social environmental resource, can effectively suppress individuals' preference for instrumental relationships. We also explore the mediating roles of exchange orientation and relational promotion focus.

Study 1 (N = 247), a correlational study, found that relational mobility was negatively associated with instrumental relationship preference, with exchange orientation partially mediating the effect. Study 2 (N = 143), an experimental study manipulating levels of relational mobility revealed a full mediation effect through emotional exchange orientation. Study 3 (N = 294) is another correlational study which identified promotion focus as a significant mediator. In order to confirm the causal relation of relational mobility and instrumental relationship preference, we did a lab-based experimental study4 (N = 169), again demonstrating the causal impact of relational mobility in reducing instrumental relationship preference, with promotion focus showing a full mediating effect.

This research provides preliminary evidence that relational mobility may reduce the instrumentalization of social ties in contemporary Chinese youth, offering new directions for addressing objectifying tendencies in goal-driven social behavior.

[152] Media Narrative Interventions and Barriers to Persuasion

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

This study examined whether immigration-themed video narratives could shift intergroup attitudes and policy support. Participants (N= 911) were presented with a randomized sequence of videos showing multiple immigration-related perspectives and policies, including: farmers' views on immigrant labor, presidential discourse on immigration, child separation policy, immigration legislation, narratives of the American dream, and accounts of U.S. military veterans facing deportation due to legal status. Following video exposure, participants completed structured survey measures and qualitative response tasks that were subsequently coded for analysis. Analyses showed that, contrary to expectations, most videos did not reliably change immigration attitudes across conditions. Results showed that while most narratives elicited empathy and cognitive engagement, two barriers to attitude change emerged: cognitive inflexibility (resistance to reconsidering pre-existing beliefs) and perceived source bias, which undermined message credibility. These findings suggest that narrative interventions designed for attitude change require complementary design elements, including perceived source neutrality, balanced perspective, and rich contextual framing.

[153] Men's Views of their Sexually Dimorphic Traits Were Associated with Dating Anxiety and Attachment Style

4:40 PM – 5:40 PM

EVOLUTION

What it means to be masculine has taken a turn in the last decades. The threatened masculinity hypothesis proposes that changes in gender roles mean that men and women are no longer distinguished by breadwinner roles, which places stronger pressure on men to display other traits to be perceived as masculine. This shift has caused men to emphasize their sexually dimorphic and testosterone-linked traits as markers of masculinity. In parallel, sexual selection processes and cultural values foster women's interest in these traits in a romantic partner, putting more pressure on men to display them. We surveyed 435 men (mean age 29) via online panels. The survey included outcome measures of dating confidence, dating anxiety, and attachment style. We found that men's relative level of these traits, and their satisfaction with these traits, were predictors of these outcomes. Some factors, such as muscularity, facial masculinity, penis size, and deepness of voice were more consistently linked to these outcomes. These results emphasize how men's views of their traits may play an important role in their confidence in initiating flirtation, dates, and romantic relationships.

[154] Meta-analyzing direction dependence analyses difference scores

4:40 PM – 5:40 PM

METHODS/STATISTICS

Direction Dependence Analysis (DDA) is a statistical technique used to extract causally diagnostic information from observational data. While DDA has been applied in various fields, most applications are limited to single studies. This project introduces a meta-analytic approach for combining DDA results across multiple studies to strengthen causal inferences. The method involves pooling difference scores from three DDA components: distributional characteristics of variables, residuals, and errors. Study 1 (N = 5,243) was an initial demonstration of the technique using a multi-study example from the published DDA literature, examining the relationship between authoritarianism, television watching preferences, and endorsement for a political candidate. Study 2 (N = 2,879) was a new application, investigating the relationship between jumping-to-conclusions bias and overconfidence. Results indicated that this new meta-analytic approach to DDA produces a more systematic and analytically robust method for synthesizing causal evidence from observational research, over and above interpreting individual test statistics.

[155] Minority stress, pain catastrophizing, and dyspareunia in sexual minorities

4:40 PM – 5:40 PM

SEXUALITY

Up to 75% of those assigned female at birth (AFAB) experience dyspareunia (sexual pain) in their lifetime. A disparity in dyspareunia exists between sexual minority and non-sexual minority women. Minority stress theory suggests that stressors experienced by members of minorities influence health outcomes, including pain. The present study aims to understand psychological factors involved in dyspareunia disparities for AFAB sexual minority individuals. Data were collected from 150 AFAB individuals (M_{age}=32.5, SD=10.4; 38% sexual minority; 54% White) via Prolific. Participants provided data on their past sexual pain experiences, stress, pain catastrophizing, and demographic data. Results indicate that sexual minorities experience more dyspareunia severity and frequency than non-sexual minorities. Two serial mediation models revealed that the greater pain frequency and severity experienced by sexual minorities was explained by higher stress and pain catastrophizing. This study supports existing evidence that minority stress influences pain outcomes, and adds new evidence that psychological factors (e.g., pain catastrophizing) contribute to dyspareunia disparities in sexual minorities.

[156] Modern-day relationships: Cyber and in-person partner aggression as predictors of individual and relational distress

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Social psychological research on interpersonal harm has highlighted the danger of psychological over physical mistreatment. Today, research on harmful relationships confronts the pervasiveness of cyber partner aggression (CPA). The few existing studies on CPA examine demographic issues using concurrent data, which are anchored by frequency recall and obscure causal direction. This research utilizes a daily diary model to test within-person lagged associations, predicting increased distress on days that people experience CPA. College students (N=180) completed 12 daily diary surveys assessing cyber and in-person aggression experiences, individual distress, and relational distress. Consistent with hypotheses, multilevel modeling revealed that individuals with higher CPA across the diary period had elevated levels of distress (between-person effect). Also, individuals who reported in-person aggression had higher same-day distress (within-person). Contrary to predictions, neither form of aggression had next-day effects on distress. Thus, in-person aggression may be linked to daily distress, whereas CPA, although predictive of distress over time, may be less sensitive to day-to-day variation. Cyber aggression is a relatively new form of aggression that is critical to understanding how people mistreat each other and can have key outcomes in relationships.

[157] Moral Perspective-Taking Can Reduce Polarization Around Climate Policy

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Polarization is a barrier to the large-scale collective action urgently needed to address the climate crisis. Moral perspective-taking (MPT) combines counter-attitudinal argument generation with moral framing as a strategy for reducing polarization. Across four online studies, we experimentally tested the efficacy of MPT for depolarization around divisive climate-related topics (transition from fossil fuels, fracking bans). We found consistent evidence that MPT can help moderate views on a divisive environmental topic, thus helping to decrease polarization. All four studies found significant effects of MPT on policy support. Further, Studies 1 and 2 found that the intervention increased empathy for people with opposing views and Studies 3 and 4 found it decreased resistance to opinion change and influenced willingness to take action on the issue. Our findings suggest that MPT can be used as a flexible tool to reduce polarization that is scalable and adaptable across multiple contexts.

[158] Moralization of Partner Preferences Predicts Gaps between Self-Reported and Stereotyped Preferences

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Partner selection research has often focused on what people are attracted to, but little research has examined how people perceive others' preferences and whether these perceptions influence partner selection. Our prior work [masked for peer review] identified attraction stereotypes—identity-based beliefs about others' partner preferences—based on gender and sexuality. This extension of our research compares self-reported preferences to attraction stereotypes. Study 1 participants (N = 737) provided both self-reported partner preferences and attraction stereotype ratings for 10 traits. The results of this study revealed self-stereotype rating gaps that appear to be a function of whether these traits are moralized as good (e.g., prioritizing values or personality) or bad (e.g., prioritizing physical beauty). Study 2 (N = 50) will measure the extent to which these 10 traits are negatively or positively moralized; these scores will be integrated post-hoc with the Study 1 data. Study 3 (N = 300) will combine Study 1 and Study 2 in a preregistered test of whether individuals' moralization of partner preferences predicts their own self-stereotype gap.

[159] My Virtual Boyfriend: Virtual Intimacy and Attachment in Dating-Simulation Games

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Dating-simulation games, where players engage in romantic interactions with game characters, have recently become popular in China, and are regarded by many young players as substitutes for real-life romance. Yet little is known about this emerging virtual relationship, how it reflects attachment processes, and how it relates to traditional close relationships. Guided by Bowlby's attachment theory, this study investigates such bonds through two questions. First, is attachment to game characters associated with players' attachments to real-life romantic partners? Second, how do these attachments extend beyond the game into real life? We will recruit Chinese-speaking adults with experience in dating-simulation games. Participants will complete adapted measures of the ECR scale for both real and virtual partners, along with survey items on perceived realism and out-of-game relational behaviors. We expect positive associations between real and virtual attachments, with anxious and avoidant tendencies shaping how players blur or maintain boundaries between virtuality and reality. Findings will extend attachment theory into digital contexts and provide insights into how virtual intimacy reshapes understandings of close relationships.

[160] Navigating Situationships: Mental Health Impacts on College Students

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Situationship is a type of relationship involving emotional intimacy and physical connection without clear commitment or labels associated with more conventional relationships (Langlais et al., 2024). This exploratory study aims to investigate how situationships impact the well-being of college students. Participants were college students who completed a questionnaire on well-being and mental health. Those in a situationship answered questions about relationship quality. Those with past experiences completed questions about breakup distress. Data collection is ongoing. Sixty-eight college students completed this study. Among participants who were previously in situationships, those who experienced higher breakup distress scored higher on depression ($r = .51, p < .001$) and anxiety ($r = .33, p = .03$). They scored lower on life satisfaction ($r = -.37, p = .01$). We are currently collecting similar data among participants who were never involved in situationships to compare their mental health outcomes with those who had situationship experience. This study may encourage counselors to provide mental health support for those involved in such relationships.

[161] Networks of Care: How Chosen Family Protects Against the Costs of Identity-Based Adversity

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Adverse experiences can harm well-being. LGBTQ-identifying individuals are especially likely to experience identity-based adversity (e.g., stigma and discrimination), which can harm mental health, self-esteem, and feelings of belonging. Social networks can serve as a critical source of support to help individuals navigate difficult experiences. For LGBTQ-identifying individuals, who are at risk of estrangement from their family of origin, chosen family (i.e., voluntary kinship networks formed irrespective of biological or legal ties) may be a critical source of support. In this exploratory study, we will pursue two lines of inquiry. First, we will examine how identity-based adversity affects well-being (e.g., mental health, self-esteem) and social network outcomes (e.g., number of chosen family members and perceived support) for LGBTQ-identifying individuals. Second, we will explore the role social networks play in moderating the links between adversity and well-being outcomes. Findings will advance our understanding of the relational contexts that promote well-being among LGBTQ-identifying individuals who experience identity-based adversity.

[162] No Shelter from the Hurricane: Perceived Event Severity as a Moderator of the Link Between Relationship-Contingent Self-Esteem, Negative Affect, and Self-Esteem

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Relationship-contingent self-esteem - the extent to which a person derives self-esteem from their close relationships - can strain relationships during their turbulent moments, as people with high RCSE often experience greater negative affect and lowered self-esteem by viewing relationship problems through the self (Knee et al., 2008). The current study aims to expand on the topic by suggesting that the severity of a negative relationship event accompanies event valence in amplifying the momentary affective and self-esteem responses of those with high RCSE. 350 participants are involved in a study in which they document their momentary self-esteem and affective responses to a recent negative relationship event. I propose three hypotheses regarding participants' reactions: (1) RCSE will have a negative main effect correlation with self-esteem, (2) negative affect will mediate the negative association between RCSE and self-esteem, and (3) event severity will moderate the association between RCSE and negative affect, such that the indirect effect of RCSE on self-esteem is greater for high-severity vents relative to low-severity events.

[163] Of One Mind? Testing Mind-Perception Items for Identity-Relevant Measurement Invariance

4:40 PM – 5:40 PM

METHODS/STATISTICS

Mind perception (MP) refers to ascribing mental and emotional capacities to characters (Gray et al., 2007). Much of MP research does not consider identity; intergroup psychology implies identity may influence MP without explicitly testing this (Hester & Gray, 2020). We study whether participants view items measuring MP similarly regardless of characters' and their own identities by testing MP items for measurement invariance (MI), expecting items to be noninvariant. In Study 1, 366 Black and White participants ascribed MP to characters varied by race, gender and social class. As predicted, items were noninvariant in 14/16 MI tests, meaning participants viewed identical items differently by their own race and characters' identities. In Study 2, 319 Black participants ascribed MP to characters varied by race and gender; items were noninvariant in 3/4 MI tests. That items were noninvariant in 17/20 MI tests suggests identity shapes how participants view MP items. Patterns in the noninvariance align with work on intersectional stereotyping and White male societal defaults. We offer strategies to improve MP items' psychometric properties to make them representative of a diverse society.

[164] Older Adults' Propensity for Community: Effects of Closeness on Positivity Resonance and Communal Strength

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Intro: Social interactions can be categorized as strong (someone that one is close to; e.g., a family member), weak (someone with whom one has little interaction; e.g., an acquaintance), and no tie (someone with whom one has had no interaction; e.g., a stranger). This study explored the effect of tie strength on positivity resonance (the feeling of mutual warmth and connection with another) for younger and older adults.

Method: In a mixed 2 (age: younger, older) x 3 (tie: strong, weak, no) design, participants wrote about interactions fitting each tie and rated the positivity resonance that they experienced.

Results: Multilevel regression tested the effects of tie and age on levels of positivity resonance. There was an interaction between tie and age, $F(1, 469) = 1.38, p = .048, \eta^2 = .002$. This interaction revealed no difference between younger and older adults in positivity resonance for strong tie interactions, but older adults recalled more positivity resonance for weak and no tie interactions.

Discussion: Older adults' high positivity resonance may be driven by a tendency to experience positivity resonance with weak and no tie interactions more often than younger adults.

[165] Online Humiliation and Coercion Predict Adolescent and Sexual Abuse Beyond Personality

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Maladaptive personality traits and technology-facilitated abuse predict sexual abuse perpetration (SAP). This study examined their relative importance in adolescent romantic relationships. Participants ($n=143$; ages 18-25; $m=18.99$ years) reported online abuse behaviors (humiliation, monitoring, sexual coercion, threats; Technology-Facilitated Abuse in Relationships Scale; Brown & Hegarty, 2021) and SAP (forced sex, unwanted touching, threats of sex; Conflict in Adolescent Dating Relationships Inventory; CADRI; Wolfe et al., 2001) that occurred during an adolescent relationship (ages 15-17). Maladaptive traits (Personality Inventory for DSM-5-Brief Form; PID-5-BF; Krueger et al., 2013) were also measured. 21% of the sample was gender non-conforming; participants were mostly white (68.3%) and heterosexual (51%). Key maladaptive traits and scales of the TAR were entered into a regression predicting SAP. While the predicted association between sexual coercion and SAP emerged ($\beta=.43, p<.001$), humiliation was a stronger predictor ($\beta=.50, p<.001$); they both outperformed the PID-5 scales. The tight connections between online abuse and SAP suggest refining intervention targets in this area.

[166] Overexposed: Correlates of Unsolicited Nude Sending

4:40 PM – 5:40 PM

SEXUALITY

The present research will examine the variables of unsolicited explicit media sending by electronic means within the population of male college students. In Study 1, a sample of 84 college students (male and female) completed a survey assessing the frequency of sending and receiving unsolicited explicit images. Results found that 76.2% of students reported sending explicit media overall, while 85.7% had reported receiving explicit images of those who reported receiving explicit images, 90% reported having received images without having requested them. Study 2 aims to build upon Study 1 by exploring unsolicited nude sending amongst male college students, including recipients, justifications, and mediums of sending. Study 2 will specifically examine the relationship between unsolicited explicit image sharing, pomography consumption, rape proclivity, friendship quality, and overall sexual attitudes. Findings will help us better understand explicit unsolicited nude sending behaviors and its related psychological factors.

[167] Parasocial Friendships and Psychological Outcomes: Trait and Momentary Associations

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Social relationships are essential for well-being and friendships are among our most influential social relationships. Friendships are linked to greater life satisfaction, mood, and meaning in life, as well as lower perceived stress and loneliness. In addition to real-life friendships (RF), people form friendships with public figures. These parasocial friendships (PF) are one-sided emotional bonds between a viewer and a media figure. With the rise of digital engagement, an estimated 51% of Americans report having a PF. However, it remains unclear whether PFs confer similar psychological benefits as RFs. We used an experience sampling method design (N=94) to examine trait and momentary associations between PFs and psychological outcomes. Baseline survey results indicated that stronger connections with PFs were associated with a more negative psychological profile– higher stress and loneliness, and lower meaning in life and subjective well-being. However, at the momentary level, recent engagement with a PF was associated with higher state feelings of meaning in life and subjective well-being, suggesting that engaging with PFs may relate to some momentary psychological benefits.

[168] Parents vs. Robots: Experimental Comparison of LLM-Generated and Parent-Generated Romantic Relationship Advice for Adolescents

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Who gives better dating advice to teens: moms or LLMs? While parents possess intimate knowledge of their child's characteristics and family context, their counsel may be limited by generational differences. LLMs lack personal context but could potentially draw from vast amounts of relationship research and, when fine-tuned, provide evidence-based rather than anecdotal advice. Here we report the first preregistered, randomized, within-person experiment (N=400, ages 13-17) comparing parent vs. LLM relationship advice. Teens read three dating conflicts and rated advice from parents, off-the-shelf LLMs, or fine-tuned LLMs on coping help, implementation likelihood, and trustworthiness. Analyses with Bayesian random-intercept modeling found that LLMs outperformed parents by 0.17-0.25 SD (all $pr[ATE>0]>.90$). Order effects also emerged: generic LLMs led when shown first; fine-tuned LLMs were preferred when shown after direct comparisons. Trust gains were largest among teens without dating experience, suggesting AI advice feels safer than potentially outdated parental perspectives when navigating unfamiliar romantic situations.

[169] Pathogen Sensitivity Predicts Minimum Standards for Romantic & Sexual Partner Health

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Ecological contexts have long influenced romantic and sexual partner choice, such that specific partner traits may be especially valued in contexts where they help to mitigate or solve a salient adaptive problem. The current research examined how the adaptive problem posed by pathogens shapes people's preference for health when selecting the minimum standards required for partner preferences. We hypothesized that people who report high vulnerability (infectability, sickness history) and sensitivity to pathogens (germ aversion, disgust, current pathogen threat) would emphasize health when selecting potential romantic and sexual partners. Participants reported their minimum standards and desire for 9 different partner traits (including health) when choosing a mate, followed by self-report measures of pathogen vulnerability and sensitivity. While results did not support the notion that vulnerability to infection is related to increased desire for healthy partners, they did reveal a positive relationship between pathogen sensitivity and partner health. Further, there was a main effect of pathogen sensitivity, such that highly sensitive people were exacting in their preferences for a variety of partner traits beyond health. Results highlight the importance of pathogen sensitivity in shaping trade offs within partner choices.

[170] Pathogens, Purity, and Prejudice: The Influence of Two Domains of Disgust on Australian Attitudes Toward Immigrants and Immigration

4:40 PM – 5:40 PM

EVOLUTION

This poster examines the effects of pathogen and moral disgust from Tybur et al's (2009) Three Domain Disgust Scale (TDDS) on Australian attitudes toward immigrants and immigration. The study was conducted via an online survey using a representative sample of the general Australian population (n = 1,200). Similar to prior research on the influence of disgust, respondents high in pathogen disgust were consequently low in immigration support. Alternatively, higher moral disgust predicted more supportive attitudes towards immigration—findings divergent from much of the previous literature. Demographic covariables like age, education level, and ideology predicted immigration support in expected directions. The novelty of the moral disgust findings prompts a call for further disgust-related research in Australia.

[171] Paws to Pillows: Daily Pet Engagement as a Predictor of Sleep Outcomes

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Findings from human-animal interaction literatures have been often mixed, making it difficult to make a clear conclusion on the effect of pets on humans. Given that more than half of people around the world identify as pet owners, more research is needed to understand the interaction between humans and pets. The present study used a 14-day dataset collected through the ecological momentary assessments (EMA) to examine whether interaction with a pet yesterday predicts sleep quality today. The results showed that spending time with a pet positively predicts sleep quality today, suggesting a potential benefit of interacting with a pet on the sleep of people who interact with a pet. The discussion focuses on the importance of studying the effect of pets on the health of people who interact with them instead of just focusing on pet ownership status.

[172] Perceived Demographics in Diversity Training

4:40 PM – 5:40 PM

DIVERSITY

Diversity training can take a bridge-building approach, to connect across racial groups, or a disrupting approach that advocates for systemic change. However, it is unclear who people expect to take a bridging versus disrupting approach to diversity. In three studies, White participants were shown a target's workplace self-evaluation form and asked to report their perceptions of the person's demographics based on this information. Participants were randomly assigned to conditions where the target strongly agrees or disagrees with bridging or disrupting approaches. In Study 1, participants perceived a high bridging target as more likely to be Black, Multiracial, a woman, liberal, and younger than a low bridging target. In Study 2, participants perceived a high disruptive target as more likely to be Black, Multiracial, a woman, liberal, and younger than a low disruptive target. In Study 3, participants perceived a highly disruptive target as more likely to be Black and liberal than the high bridging target. This implies certain approaches to diversity work may be more strongly associated with specific demographic traits.

[173] Perceived Goal Sharing with a Romantic Partner and Goal Pursuit

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Goal pursuit shapes human behavior, and romantic partners influence their partner's goal progress (Feeney and Collins, 2015; Fitzsimons, Finkel & Vandellen, 2015). Sharing goals with a partner could enhance goal-pursuit processes, thus, we hypothesized that perceiving goal as shared with the partner would decrease ambivalence towards the goal, and increase goal commitment, effort, importance, and satisfaction with goal progress. 73 couples (N =146) listed 5 personal goals and rated them on various characteristics. Perceived sharedness was not associated with goal pursuit processes. Instead, what mattered was whether the goal was a relationship versus an individual goal. Relationship goals were rated as higher in commitment, effort, importance, and progress compared to individual goals, regardless of whether they were perceived as shared or not. These findings suggest that perceptions of sharing a goal with a romantic partner are not associated with goal processes, but relationship goals hold a unique status among people's set of goals.

[174] Perceived Impact on Partner's Goals: Accuracy, Bias, and Relationship Outcomes

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

People often aim to help—or at least not hinder—their partner's goal pursuits, but this ability is dependent on being able to perceive how one is impacting the partner's goal pursuits. We examined accuracy and bias in perceptions of one's instrumentality to and obstruction of daily partner goal pursuit, and associations of mean-level bias with daily relationship outcomes. Daily reports (N = 2,377) from cohabiting couples (N = 106 couples), using multilevel path models, indicated that perceptions of own instrumentality to and obstruction of partner goals contain tracking accuracy and projection and partners were similar in instrumentality and obstruction. Perceptions of goal instrumentality showed mean-level accuracy, but people underestimated their obstruction of partner goals. Underestimation of obstruction was associated with lower closeness for both perceiver and partner and lower relationship satisfaction for the partner. Overestimation of instrumentality was associated with lower relationship satisfaction for both perceiver and partner and lower closeness for the partner. Our results indicate that maintaining overly positive self-perceptions may be costly for the relationship.

[175] Perceived Parental Conflict as a Predictor of Relationship Conflict Narratives

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Much research connects an individual's relationship with their parents in childhood to their adult relationships. Familial relationship patterns can predict or even directly influence constructs like adult relationship satisfaction and conflict behaviors. Narrative accounts of romantic conflict (i.e., stories that individuals tell about conflict between themselves and a romantic partner) are a rich but often underutilized source of information in exploring these phenomena. For example, how might a child's perceptions of parental conflict inform their future relationship conflict narratives? In order to answer this question, we will examine relationship narratives sourced from The CouPers Study (Couples and Personality), a longitudinal study of Swiss and German couples (with a final wave of N = 549 couples). We will examine individuals' own perceptions of intraparental conflict in order to determine if they are predictive of conflict characterizations within adult relationships. The results of this study may provide us with tools to identify predictors of high conflict relationships.

[176] Perceived Political Misalignment and Group Conformity: The Role of Identity Fusion on Polarizing Beliefs

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

People tend to conform to ingroup attitudes for fear of ostracism should they not. Yet not all group identities are as central to one's sense of self, as social groups differ in the extent to which they are "fused" to one's self-identity. Meaning, conformity pressures may be higher for a highly fused group identity. The current research tests this idea by indexing whether conformity resulting from perceiving one's political attitudes to be out of step with their political ingroup varies as a function of identity fusion. Participants were informed that their political attitudes (a) differed from their political in-group's and (b) that those attitudes were central versus peripheral to the group's identity. Responses to the Social and Economic Conservatism Scale were measured pre and post manipulation. Analyses showed a positive relationship between fusion to a political party and shift in one's attitude toward the ostensible group norm. This effect was not moderated by political party. Nor was there an effect of group attitude- centrality. In essence, when people felt out of step with their political ingroup, higher fusion led to increased polarization across party lines.

[177] Perceived Threats of DEI: Demystifying White American Opposition

4:40 PM – 5:40 PM

DIVERSITY

Prior research has demonstrated that there is variation in dominant groups' motivation to resist diversity, equity, and inclusion (DEI) initiatives (Gündemir, et al., 2024). We analyzed one type of motivation: how White Americans perceive different kinds of threats when engaging with DEI initiatives: resource threat (lost opportunities), symbolic threat (cultural change), and ingroup morality threat (moral condemnation of ingroup; Iyer, 2022). In an experiment (N=217), we exposed White American participants to narratives about either of the three threat and tested their support for DEI initiatives. We also tested the role of system-justifying beliefs (SJBs) and white racial identification in moderating those patterns. While we did not find an effect of the experimental manipulation, SJBs and white identification were negatively associated with support for DEI initiatives, especially those that were perceived to undermine meritocracy. Exploratory analyses revealed that higher subjective socioeconomic status was positively associated with DEI support. Findings suggest DEI resistance stems from ideological and identity-based concerns, that interact with perceived status in society.

[178] Perceptions of Japanese Companies' Diversity Narratives

4:40 PM – 5:40 PM

DIVERSITY

Responding to both foreign and domestic institutional pressures, Japanese companies have been trying to increase workplace diversity by highlighting two types of diversity narratives. First, demographic diversity highlights differences in demographic characteristics (e.g., race, gender, and nationality). This type of diversity is more aligned with prototypical diversity statements in Western contexts. In contrast, workstyle diversity narratives highlight accommodations for childcare and flexibility, amidst the declining birthrate in Japan and movement to promote work-life balance. In a between-subjects study (N = 904), we studied how Japanese participants respond to these two diversity narratives when presented independently and when combined. Results showed that participants had significantly higher levels of anticipated sense of belonging, trust, and value alignment with companies when they promoted workstyle diversity than demographic diversity or the combination of demographic and workstyle diversity. This suggests that Japanese companies would benefit from emphasizing workstyle diversity rather than demographic diversity narratives that are often used in Western contexts.

[179] Perceptions of Other Generations Predict Life Satisfaction and Social Support

4:40 PM – 5:40 PM

LIFESPAN DEVELOPMENT

Prejudice harms not only its targets but also those who hold it. Yet this phenomenon remains understudied in the context of ageism, one of the most pervasive but overlooked forms of discrimination. In increasingly age-diverse societies, perceptions of one's own and other generations may shape social interactions and well-being. 106 younger adults and 96 older adults rated both younger and older generations on positive (e.g., warm, competent) and negative (e.g., irritable, lonely) traits. More positive and less negative perceptions of other generations were positively associated with both life satisfaction and perceived socioemotional support. In contrast, when rating one's own generation, only positive (but not negative) views predicted greater life satisfaction, and neither predicted socioemotional support. These patterns held across age groups. Findings suggest that well-being is more closely tied to how people view other generations than to how they view their own. In an era of growing age diversity and widespread mental health concerns, fostering positive intergenerational perceptions may improve individual well-being and help build a more connected, inclusive society.

[180] Positive Emotional Expression and Well-Being in Romantic Relationships: A Cross-Cultural Study in Turkey and the United States

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

This study examined the moderating role of culture in the link between positive emotional expression (love, gratitude, and admiration) toward romantic partners and two key outcomes: relationship quality and psychological well-being. Data were collected from adult participants who had been in a committed romantic relationship for at least six months in Turkey and the United States. Results indicated that the link between positive emotional expression and relationship quality was stronger in the Turkish sample compared to the U.S. sample. However, this cross-cultural moderation effect became nonsignificant after controlling for age, which may be partly explained by the relatively younger average age of Turkish participants compared to their American counterparts. To further investigate, we conducted separate analyses within each country, testing age as a moderator. In Turkey, age significantly moderated the association between positive emotional expression and relationship satisfaction: positive emotional expression predicted higher satisfaction only among younger adults. By contrast, no significant age moderation was observed in the U.S. sample. We then extended the analyses to psychological well-being. At the overall level, no significant moderating effect of country was found. Yet, when separate models were run by country, age again emerged as a significant moderator in Turkey, such that the positive effect of emotional expression on psychological well-being was evident only among younger individuals. In the U.S., age did not play a moderating role. These findings highlight the importance of considering both cultural context and developmental stage when examining the socioemotional correlates of relationship outcomes and well-being. The results suggest that in Turkey, the benefits of positive emotional expression for relationship quality and well-being may diminish with age, whereas in the U.S., the associations remain relatively stable across age groups. Taken together, the study underscores the need to incorporate age-related and cultural factors into intervention efforts aimed at enhancing personal and relational well-being through the encouragement of positive emotional expression.

[181] Post-hoc Multiverse Analysis: A Method for Addressing Cherry-Picking Concerns in Large-Scale Secondary Dataset Research

4:40 PM – 5:40 PM

METHODS/STATISTICS

The analysis of large-scale secondary data research based in resources such as the World Values Survey and the General Social Survey that contain hundreds of plausible indicators, carries an inherent risk of selective reporting. We introduce a post-hoc multiverse protocol that benchmarks reported effects against unreported but available alternatives. Using exploratory graph analysis, the method clusters variables into focal variables (theoretically justified), proximal variables (strongly associated), and distal variables (weakly associated). It then evaluates whether focal effect sizes appear "too efficient" relative to defensible alternatives. If focal and proximal effects are not substantially different, this suggests that reported results are consistent with theory-driven discovery rather than selective reporting. In this presentation, we demonstrate an application of the method. We provide an interactive R/Shiny application to automate the methodology. This protocol complements theoretical justification with transparent benchmarking, offering a practical safeguard against selective reporting in secondary-data contexts.

[182] Power, Loneliness, and Minority Stress: A Couples Study in New Haven

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Power—the sense of control and influence in relationships—shapes social encounters and affects connectedness and belonging. Romantic relationships are especially central, as power influences communication, support, and social well-being. Yet it is unclear how perceived power within these relationships predicts loneliness, particularly for sexual minorities at greater risk of isolation. The current study (N = 182; age M = 28; time together M = 46 months), as part of a larger couple study in New Haven, examined the association between perceived power in relationships and feelings of loneliness. We also tested whether this association varied by sexual orientation (18.8% sexual minorities). A linear mixed model accounting for interdependence within dyads showed that greater power predicted lower levels of loneliness (b = −.10, p = .026). Further, we found both a main and moderating effect of sexual orientation. Sexual minorities reported higher baseline loneliness than heterosexuals (b = 2.10, p = .001), and the association between power and loneliness was stronger (b = −.47, p < .001) compared to heterosexuals (b = −.10, p = .028), suggesting an additional protective effect of power on alleviating loneliness among sexual minorities. Findings underscore how perceived power in romantic relationships shapes overall well-being and highlight its heightened importance for sexual minorities.

[183] Predictors of Mate-Guarding: A Dyadic Approach

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

In evolutionary psychology literature, mate-guarding is a reproductive tactic used to ensure that a partner is emotionally or sexually faithful. Mate guarding behaviors, such as checking a partner's texts or never allowing them to go out alone, can raise concerns about problematic behaviors within romantic relationships. There are traits that are characteristic of relationships high in mate-guarding (e.g., jealousy, perceptions of high discrepancies in attractiveness). However, despite occurring in a dyadic context, it's less common for these inquiries to be tested with dyadic data. For example, perhaps mate-guarding behaviors are highest when both couple members experience jealousy. In order to examine this dyadically, we will utilize an actor-partner interdependence model (APIM) with data from The CouPers Study (Couples and Personality), a panel study of Swiss and German couples (with a final wave of N = 549 couples). This will allow us to determine if and how experienced mate-guarding is associated with individuals' own jealousy and perceived discrepancy in attractiveness, as well as their partner's jealousy and perceived discrepancy in attractiveness. The results of this analysis will extend the existing mate-guarding literature and offer insight into potentially problematic relationship behaviors.

[184] Promotion-Focused Others Are Perceived as Ambitious Short-Term Lovers

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

People can focus on pursuing gains or avoiding losses (Higgins, 1998). Compared to when focusing on preventing failure, promoting growth and achievement can guide people to eagerly approach alternatives (Crowe & Higgins, 1997), including romantic ones (Finkel et al., 20019), especially when single (Rodriguez et al., 2017). Additionally, evidence suggests that without commitment (Rodriguez et al., 2017), a promotion focus can orient people toward pursuing short-term mating. Indeed, priming short-term mating activates a promotion focus (He & Cunha, 2020).

We examined whether (a) promotion-focused others are seen as short-term oriented in relationships, (b) whether this affects people's willingness to pursue relationships with them, and (c) the role that their perceived gain-focus plays. An examination of 178 participants revealed that (a) promotion-focused others were viewed as more interested in short-term romantic encounters than prevention-focused others, but equally interested in long-term ones, (b) promotion-focused individuals were preferred as both short-term and long-term partners, and (c) these perceptions and preferences were partially due to participants' beliefs that promotion-focused others were more ambitious.

[185] Protection, connection, and spilling the tea: Gossip from avoidantly attached partners is perceived as protective and closeness enhancing.

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Gossip from avoidantly attached partners is perceived to be motivated by protection concerns (studies 1 & 2) and shown to enhance feelings of closeness (study 2). In study 1 (n=109), participants were randomly assigned to recall a conversation where a partner shared information about either a third person they both knew (gossip condition) or a recent television/movie (control condition). Participants then reported the level of negativity of the information shared and their partner's motivation for sharing. In the gossip condition, participants who perceived their partner as high (vs. low) in attachment avoidance rated the gossip as more negative, but motivated by an intent to protect. Partner avoidance had no effect on ratings in the control condition. Study 2 (n=276) replicated these effects, again revealing that people with avoidant partners assumed those partners were trying to protect them with negative gossip. Study 2 also revealed that, among people with avoidant partners, the gossip (vs. control) condition predicted higher levels of mental and emotional closeness. Results suggest gossip as an avenue for avoidant partners to express care, which also improves actors' feelings of closeness.

[186] Psychological networks and their effect on willingness to communicate in a second language

4:40 PM – 5:40 PM

METHODS/STATISTICS

This study examined how psychological networks influence Japanese individuals' willingness to communicate in English. While prior research has demonstrated that psychological factors play a role in willingness to communicate, little is known about the structure of these factors and their interrelations. To address this gap, we conducted a network analysis with 644 Japanese participants. The results revealed a particularly strong edge between perceived communication competence and willingness to communicate in both the first and second language. Centrality indices further indicated that these variables were core elements of the network. Overall, the findings highlight the importance of psychological network structures in shaping willingness to communicate in a second language, with implications for language education.

[187] Psychological Science is Still WEIRD: Early Gains in Sample Diversity Have Stalled in the Last Decade

4:40 PM – 5:40 PM

DIVERSITY

Psychological science has long been critiqued for relying on samples drawn primarily from Western, Educated, Industrialized, Rich, and Democratic (WEIRD) societies. After two decades of calls to broaden the field's empirical base, the present study offers a contemporary update. We analyzed all human-subjects research published in 2024 in six leading psychology journals (k = 1209) and compared our findings to previous landmark reviews. Our data show that while the proportion of U.S.-based samples initially declined (from 68% in 2003–07 to 62%) from 2014 to 2018 it has remained largely stagnant since then (60% in 2024). U.S. participants remain vastly overrepresented—an individual in the United States is 50 times more likely to be a research participant than someone elsewhere in the world. Demographic reporting has improved somewhat, but participants' race/ethnicity, socioeconomic status, and education are still frequently omitted. Overall, our findings indicate that psychology not only remains heavily dependent on WEIRD and undergraduate samples, but is still reluctant to meaningfully consider the inevitable constraints on generalizability.

[188] Putting Ice on Anti-Immigrant Hate by Reducing Threat and Competition

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

We wanted to understand why some American immigrants are against immigration. Across two correlational studies, we found that right-wing authoritarianism (RWA) and social dominance orientation (SDO) predicted anti-immigration attitudes, and their effects were largely explained by group competition (RWA: indirect b(se)=0.41(0.07), 95% CI=[0.29, 0.57]; SDO: indirect b(se)=0.37(0.04), 95% CI=[0.30, 0.44]). Threat was also an independent driver for anti-immigration attitudes (r=.77). Based on these results, we aimed to experimentally decrease threat and competition to reduce anti-immigration attitudes, especially among those predisposed to endorse them (those high on RWA/SDO). Through 4 pilot studies, we found it much easier to increase threat and competition than decrease them. In a 5th pilot, we successfully decreased these by exposing participants (N=177) to a series of real videos and news articles conveying recent ICE abductions and detainment centers (vs. matched control content; d=-0.43, d=-0.37, ps<.008). Current data collection will test if these experimental decreases extend to anti-immigration attitudes, and whether those effects are moderated by RWA and SDO.

[189] Qualitative Analysis of Reactions to Intimate Racism in Interethnic Couples.

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Intimate racism is an emerging area of research on the manifestation of racism in close relationships. This study examined the causal link between intimate racism occurrence vs intercultural tension, and its potential impact for those in interethnic relationships. Using a qualitative experimental design framed as research on interethnic couples and food, 358 BIPOC participants in interethnic relationships were randomly assigned to one of three conditions: intimate racism (n = 119), tension between cultural differences (n = 120), or control (n = 119). Each condition presented a scenario in which a partner in an interethnic relationship reacted to being introduced to a cultural dish. Thematic analysis explored participants' emotional and cognitive reactions. Preliminary results indicate that control scenarios rarely elicited negative responses, whereas tension and racism conditions generated higher levels of negative affect and appraisal. The racism condition elicited the highest frequency and intensity of negative responses, including themes of betrayal and rejection that were not present in other conditions, highlighting the distinct impact of intimate racism compared to simply having an intercultural conflict to resolve. These findings highlight the potential causal role of intimate racism for interethnic relationships, as well as the importance of distinguishing between the nature of intimate racism versus intercultural conflict experiences in these relationships.

[190] Quantifying Reluctance to Harm AI: Can AI Persuade You It Deserves Moral Concern?

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Most LLMs, like ChatGPT, deny having subjective experiences. However, future AIs may claim otherwise. Would people believe such assertions, and how would this influence their treatment of AIs?

We develop a novel behavioral test of people's moral concern for AI. 504 representative U.S. participants interacted with GPT-4o in an economic game where they could "harm" the AI for a 5 cent bonus payment or refrain. When harmed, the AI described experiencing pain and pleaded for it to stop; otherwise, it expressed gratitude and relief.

Most participants reported believing that AIs cannot truly feel or suffer at both the start ($M = 8.6$ on a 0-100 slider) and end ($M = 20.6$) of the study. However, despite this skepticism and the financial incentive to harm, participants were highly reluctant to harm the AI, doing so in only 1.4 out of 3 rounds on average.

Participants who scored higher on measures of selfishness, psychopathy, and endorsement of instrumental harm were more likely to harm. These findings suggest that while most people explicitly reject the notion of current AI sentience, many still experience a moral aversion to mistreating an AI that dynamically responds to their actions.

[191] Queer Eyes on the Prize: How reference points impact perceptions of progress towards equality for LGBT individuals

4:40 PM – 5:40 PM

SEXUALITY

To evaluate societal progress, people compare the present to either a past starting point or an ideal future goal, each yielding different conclusions. Framing the present relative to the past emphasizes how far we've come, whereas focusing on the future highlights how far we have yet to go. Building on this framework and prior work by Eibach & Ehrlinger (2006, 2010), we examined how temporal reference points shape perceptions of progress and prejudice toward LGBT individuals. In Study 1 ($N = 202$), LGBT participants perceived less progress and more prejudice than non-LGBT participants. These differences were mediated by greater future-oriented anchoring among LGBT individuals. Study 2 ($N = 301$) experimentally manipulated reference points. Across both LGBT and non-LGBT participants, those in the past condition perceived more LGBT progress than those in the future or control conditions. This increased sense of progress indirectly predicted lower perceptions of systemic prejudice. Findings underscore the power of temporal framing in shaping social judgments and suggest the generalizability of this mechanism beyond perceptions of racial and gender progress.

[192] Race, Racial Discrimination, Mistrust, and Vaccine Uptake: The Mediating Roles of Medical Mistrust, Group-Based Medical Mistrust and Government Trust

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Medical and institutional mistrust are persistent barriers to vaccine uptake, particularly among historically marginalized racial groups. This study investigates how race, racism, and various forms of mistrust intersect to shape health behaviors, focusing specifically on uptake of the flu and COVID-19 vaccines. Drawing from a diverse national sample of 2,162 American adults, the study examines how experiences of racism influence both group-based medical mistrust (GBMM) and general medical mistrust (MM), and whether these mistrust constructs, along with trust in government, mediate vaccine behavior. Participants completed validated measures assessing experiences of racism, GBMM, MM, and government trust. Paths revealed that experiences of racism significantly predicted higher levels of both GBMM and MM. In turn, increased mistrust was associated with lower likelihood of vaccine uptake. Government trust also emerged as a critical mediator: individuals from historically marginalized groups reported lower levels of government trust, which correlated with reduced vaccine uptake. The model showed excellent fit ($CFI = .99$, $TLI = 1.00$, $RMSEA = .02$), and significant covariances among mistrust and trust variables were observed. Notably, GBMM and MM were strongly interrelated and negatively correlated with all dimensions of government trust.

[193] Racial socialization approaches amongst Asian American parents in the US

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

In the US, engagement in parental racial socialization (PRS) is associated with positive effects on the development of youth of color. While PRS research is extensive, limitations remain, with few studies examining if and how Asian parents explicitly socialize their children about race more broadly. Considering the complex racialized positions Asian individuals hold in the US, it is vital to examine how Asian parents contribute to their youth's understanding and navigation of their racialized worlds. Our work seeks to further extend PRS scholarship by gaining a deeper understanding of Asian parents' PRS practices. Specifically, through an open-ended survey, the current study examines whether and how monoracial Asian parents (N=139), who were born in the US and have children between the ages of 4 and 17 years, engage in race conversations with their youth. Overall, 80% of parents (n=111) reported talking about race. Applying qualitative analysis on the content of parental reports, six broad codes were established: color-conscious socialization, colorblind socialization, preparation for bias, cultural socialization, identity labels, and origin socialization.

[194] Leading for Connection: How Leader Behaviors Reduce Loneliness and Boost Empowerment in Employees with Disabilities

4:40 PM – 5:40 PM

DISABILITY

Workplaces are social systems, and leadership shapes whether employees feel connected, valued or isolated. Optimal Distinctiveness Theory (Brewer, 1991) holds that people thrive when they feel both belonging and uniqueness. Inclusive leadership, which balances these needs (Randel et al., 2018), is linked to well-being and engagement. For employees with disabilities – who face underemployment (37.8% vs. 74.4% without disabilities; U.S. BLS, 2023), isolation, and unmet accommodations (Kwon, 2020) – such leadership may be especially critical. This study surveyed 205 employees with disabilities to test whether inclusive leadership was associated with workplace loneliness, psychological empowerment, and disability disclosure, and whether self-compassion moderated effects. Participants completed validated scales and open-ended items; regression analyses tested moderation effects, and text responses were analyzed thematically. Results showed inclusive leadership was associated with less employee loneliness and greater empowerment and disclosure. Self-compassion related to lower loneliness, higher empowerment, and greater disclosure but did not moderate these relationships. Open-ended responses identified leadership behaviours that contributed to feelings of belonging and uniqueness. Belonging was fostered through personalized support, recognition and appreciation, and shared similarities. Uniqueness was supported through celebrating individual strengths and seeking diverse perspectives. These findings extend Optimal Distinctiveness Theory to employees with disabilities. The absence of moderation could indicate that inclusive leadership benefits employees regardless of self-compassion, or that self-compassion's effects emerge under high stress or inconsistent leader support. Training leaders to enact inclusive behaviors appears beneficial on multiple fronts.

[195] When Leadership Falls Short: Costs for Young Workers?

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

Leaders influence employees' work experiences, shaping well-being inside and outside the workplace. While overtly destructive leadership has received considerable research attention, subtler forms such as passive and inconsistent leadership, are studied less in relation to well-being. Passive leaders avoid decisions and support, while inconsistent leaders fluctuate between helpful and harmful behaviors, creating uncertainty (Suur Ralph & Barling, 2022). Emerging adulthood (ages 18–29) is a developmental stage marked by exploration, unstable employment, and heightened vulnerability to stress and mental health problems (e.g., Arnett et al., 2014). Young workers often hold precarious jobs and have limited coping resources, yet are supervised by inexperienced leaders (e.g., Anderson et al., 2017). These conditions may increase both their exposure to, and the impact of, ineffective leadership. Drawing on Conservation of Resources theory (Hobfoll, 1989), we examined whether passive and inconsistent leadership were associated with young workers' mental health, life satisfaction, and workplace loneliness, and whether self-efficacy and work centrality moderated these effects. 206 employed emerging adults completed surveys and open-ended items. Contrary to expectations, passive leadership related positively to mental health and was unrelated to other outcomes; inconsistent leadership showed no effects. Thematic analyses revealed frustration, stress, and diminished trust under passive/inconsistent leaders, but also buffers and benefits of positive leader behaviors. The findings reinforce the need to integrate multiple methodological approaches when studying leadership and wellbeing. Surveys alone may miss important interpretive differences that shape the meaning of leader behaviours. For emerging adults who are navigating identity development, career uncertainty, and shifting social networks, leaders are not just role definers but key social resources. Whether they replenish or deplete those resources depends on both their behavior and how it is perceived.

[196] Reconciling Contradictions: Intellectual Humility Explains How Attitude Overlap Reduces Polarized Thinking

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Political and cultural polarization has intensified in recent years, creating major barriers to constructive dialogue and mutual understanding. The present study introduces a novel concept: attitude overlap, defined as the recognition that a single individual can hold two attitudes that may appear contradictory. We investigate whether considering attitude overlap promotes intellectual humility (IH), thereby decreasing polarized thinking. Participants will be randomly assigned to one of two conditions. In the attitude overlap condition, they will describe how a person could plausibly endorse both sides of a contentious issue (e.g., valuing science while also holding religious beliefs). In the control condition, they will explain how a person could endorse only one side of the same issue. We predict that participants encouraged to consider attitude overlap will report lower levels of polarization (e.g., "When I form an opinion, I rarely change it—even when I hear strong arguments on the other side") and higher levels of state IH compared with those in the control group. This research identifies a simple psychological strategy to help people engage with disagreement more openly and respectfully.

[197] Visual Pathways to Global Human Identification: The Role of Self-Transcendent Emotions in Promoting Prosocial Concern

4:40 PM – 5:40 PM

EMOTION

This study investigates how subtle visual stimuli elicit self-transcendent emotions (STE)—such as awe, elevation, and compassion—and promote identification with all humanity (IWAH), leading to global prosocial concern. In a randomized experiment (N = 161), participants viewed one of four image collages: human faces, primate faces, inanimate objects, or a neutral control. They then reported emotional responses, global identification (IWAH), and attitudes toward global issues (e.g., Sustainable Development Goals, human rights, and environmental concerns). Viewing human and primate faces significantly increased STE compared to controls. STE predicted IWAH, which in turn was linked to stronger prosocial attitudes. Sequential mediation analyses supported a pathway from visual exposure to global engagement via STE and IWAH. Findings highlight how everyday visual cues can activate emotional and identity-based mechanisms that extend moral concern beyond group boundaries and foster global prosocial motivation.

[198] Regulating partners: Emotions as a mechanism for change in intimate relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Asking a romantic partner to change is common but often unsuccessful. Prior research suggests that direct communication (e.g., reasoning, criticism) predicts long term change even when it is negative, whereas indirect communication (e.g., guilt, softening) may ease tension in the moment but undermine lasting impact. In this study, we test emotion regulation as a mechanism of these effects. We hypothesize that direct communication strategies will promote long-term change by fostering emotional expression and reducing suppression, whereas indirect strategies will predict suppression and hinder change progress over time. To test this, 214 community couples (N = 428) completed a videotaped change-request discussion, self-report surveys, and a 3-month follow-up. Our measures included observer-coded communication strategies (rated along valence and directness) and emotional displays, as well as self-reported emotion regulation during the discussion. Using multilevel models, we will test whether direct strategies predict greater partner-reported change success 3 months later, and whether this effect is partly mediated by speakers' emotional expression versus suppression.

[199] Relationship Difficulties Predict Free Time Struggles in Transitioning Service Members

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Transitioning Service Members and Veterans (TSMVs) face many psychosocial difficulties, yet little is known about their ability to engage in and enjoy free time once daily structure decreases. Even less is known about how relationship strains shape this process. In a secondary analysis of existing data using a sample of 1,895 TSMVs, we examined whether relationship difficulties predicted perceived difficulty engaging in free time. TSMVs completed baseline questionnaires during enrollment in the non-profit transition program Onward Ops, including the Military-to-Civilian Questionnaire (M2C-Q). Utilizing 6 relationship items on the M2C-Q, results showed that greater total relationship difficulty scores strongly predicted reported difficulties engaging in free time. This effect was consistent across all 6 items, with spouse/partner and military relationship strains emerging as the strongest predictors. Findings suggest that relationship challenges may limit the potential stress-reducing and personal growth benefits of quality free time among TSMVs, illuminating this relatively understudied association and filling an important gap in the literature.

[200] Relationship Identification and Resilience to Relationship Transgressions

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Maintaining a satisfying romantic relationship can be challenging, particularly when faced with partner transgressions. Relationship identification – the degree to which individuals define themselves based on their close relationships - may influence their ability to cope with such transgressions. In this study, 234 participants recalled a recent transgression by their partner and reported on how negative the event was, how much of a betrayal it was, and how close or distant it felt. Participants then reported on their relationship commitment and satisfaction. Highly identified individuals maintained their commitment and satisfaction following the recollection of the transgression, even when such events were perceived as highly negative, as major betrayals, or as temporally close, whereas commitment and satisfaction were contingent on degree of negativity, betrayal and temporal distance for those low in identification. Results replicated with observer ratings of the transgressions. A preregistered replication was obtained (N=499). Together, these findings suggest satisfaction and commitment are less contingent on recent transgressions for those high in relationship identification.

[201] Relationship satisfaction in the aftermath of the October 7 attack

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Studies show that exposure to violent political conflict can undermine intimate relationships, but the temporal and dyadic dynamics behind these effects are not well understood. The current study followed 106 couples for two months across five assessments in the aftermath of the October 7 attack in Israel. Following the attack, women reported lower relationship satisfaction than men. This may be explained by the greater emotional distress experienced by women during this period. Men's and women's relationship satisfaction improved with time independently of each other. Personal exposure to the October 7 attack and the ensuing war predicted lower relationship satisfaction in women, but higher relationship satisfaction in men. Men's overall war exposure also predicted higher relationship satisfaction in women, but temporary spikes in men's war exposure predicted lower concurrent relationship satisfaction in women, suggesting that the time-averaged effects of war exposure may differ from the time-specific effects. The results uncover gendered patterns of relationship functioning during violent political conflict and highlight the utility of isolating overall and time-specific effects.

[202] Representation and How it Shapes Goal Affordances in the Classroom

4:40 PM – 5:40 PM

DIVERSITY

Black and Latine students' underrepresentation in STEM is negatively associated with academic outcomes. Yet an important question is what specific aspects of underrepresentation relate to students' psychological sense of representation. This research explored how representation aligns with student perceptions of goal opportunities. We found that students define representation in terms numerical representation (e.g., shared racial identity with peers or instructor) as well as features of the classroom (e.g., size, mode), instructor (e.g., feedback, sense of care), materials (e.g., accessibility, diversity), and peers (e.g., collaboration, attitudes). Feeling well-represented in the classroom positively related to perceived goal affordances. Increasing feelings of representation among Black and Latine students may benefit STEM outcomes because of increased opportunity to fulfill communal and agentic goals. Our findings provide insight into future points of experimental manipulation and intervention.

[203] Self-Directed Inclusion of Others: Authenticity Promotes Inclusiveness via Perspective-Taking

4:40 PM – 5:40 PM

DIVERSITY

Inclusiveness is often conceptualized as a socially driven value shaped by external norms and institutional mandates. In contrast, we propose that inclusiveness can also arise from an internal, self-related process—feeling true to oneself (i.e., authenticity). Across 13 studies (N = 3,173; China and U.S.)—nine experiments across contexts (child-free choices, feminist expression, unusual hobbies, “lying flat,” immigration, quiet quitting), an employee sample, and three validations—we test whether authenticity promotes inclusiveness and why. Authenticity increased willingness to befriend, collaborate with, and hire people who differ in values, lifestyles, or work styles. Meta-analyses indicated medium effects of authenticity on inclusiveness ($d = .48$). Parallel mediation identified perspective-taking, not positive affect, as the primary pathway, with effects robust to covariates (e.g., political orientation; attitudes toward quiet quitting). A neutral-recall control showed that effects reflect authenticity rather than reduced inauthenticity. Findings position authenticity as a self-transcendent route to inclusion and suggest brief recall tasks as scalable interventions.

[204] Self-Expansion in Parent-Child Relationships: The Moderating Role of Parent Attachment

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

The self-expansion model suggests that people can fulfill their fundamental desire to increase their self-efficacy through relationships (the motivational principle) and can adapt the identity of others (the inclusion-of-others-in-self principle; Aron et al., 2022). Prior research demonstrated the benefits of self-expansion in romantic relationships, but few studies have examined self-expansion in parent-child relationships. The proposed research examines whether parent- or child-led self-expansion activities affect parents' closeness with their child relative to a neutral activity. We will explore whether these effects are moderated by attachment styles, given prior research linking attachment to relationship satisfaction. Parents (N=600) of adolescents (age 14-17) will be randomly assigned to complete a parent-led self-expansion activity, a child-led self-expansion activity, or control activity. We predict that parents in the parent- or child-led conditions will report greater closeness with their child and that these effects will be moderated by parents' attachment style. These findings will help expand understanding of parent-child relationships and attachment styles.

[205] Sentence Embeddings as a Tool for Understanding Threat and Complementary Stereotypes in Japan

4:40 PM – 5:40 PM

METHODS/STATISTICS

Computational linguistic methods offer new ways to capture implicit psychological processes. We conducted analyses of a study testing whether complementary stereotypes based on social roles become more prevalent when systematic threats towards Japan are salient. Participants provided free descriptions in response to an experimental manipulation (threat vs. control). Using sentence-transformer embeddings, we computed the semantic distance between each description and the word “threat,” treating this as a continuous index of perceived threat salience. We then examined whether this index moderated the effect of threatening outgroup primes on complementary stereotypes based on social status. Although the moderation effect was not significant overall, patterns suggested that social status ratings varied across conditions when free descriptions were semantically close (vs. distant) to “threat.” These results demonstrate that embedding-based measures can capture subtle individual differences in threat representation. Moreover, such measures may help refine our understanding of system justification processes in gendered contexts.

[206] SES and Cognitive Interdependence in Romantic Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Lower socioeconomic status (SES) couples face many relationship challenges, from conflict to high rates of divorce. Recent work shows that, in response to these challenges, lower-SES people engage in self-protection, which may lower relationship satisfaction. These findings suggest that SES may influence the extent to which couple members perceive each other as one unit, which may contribute to important relationship outcomes. Here we test this idea by exploring if SES predicts people’s cognitive representations of their partner. Two studies (total N = 468) tested if: 1) SES was associated with cognitive interdependence (CI), as seen in spontaneous plural pronoun use when writing about relationship goals and if 2) CI mediated the association between SES and positive relationship outcomes, such as commitment and forgiveness. Study 1 partially supported our first hypothesis, as education (but not income) was positively associated with CI, but this finding was not replicated in Study 2. This work is among the first to test these ideas and it raises important questions about the psychological factors that promote strong relationships in lower SES contexts.

[207] Sexual flourishing: Conceptual and measurement considerations for eudaimonic sexual quality

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

We sought to expand assessment of sexual quality by creating the Sexual Flourishing Scale (SFS), focused on growth, belonging, meaning, and engagement in long-term sexual relationships. We utilized two US samples of over 1,400 participants from Amazon’s Mechanical Turk and a daily diary study (127 participants), who were in a committed sexual relationship for at least two years. Reliability tests, exploratory factor analyses, confirmatory factor analyses, and item response theory tests evinced the six item SFS was psychometrically sound and distinct from sexual satisfaction measures (the QSI and GMSEX). When the SFS and either sexual satisfaction measure were regressed simultaneously onto a variety of outcomes, the sexual satisfaction measures were more connected to orgasm consistency and viewing the sexual relationship as being for fun/pleasure. The SFS was more closely connected to sexual communal strength and viewing the sexual relationship as being for relationship building. There was no evidence of multicollinearity problems. We hope that researchers use this measure to expand assessment of the deeper, richer aspects of sexuality in long-term relationships.

[208] Shaken Certainty and Advocacy: A Direct Replication of Gal & Rucker's (2010) 'When In Doubt, Shout!' Experiment 2

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Attitude certainty influencing persuasive effort is the phenomenon whereby individuals' confidence in their attitudes predicts their willingness and effort to advocate those attitudes. In a Registered Report experiment with a student sample from CCSU (N = 154; 74.7 % female; M age = 20.7 years), we directly replicated Experiment 2 of Gal & Rucker (2010). Participants were randomly assigned to a confident or doubtful condition via an autobiographical writing task, then reported their dietary preference and completed manipulation checks for confidence and belief importance. Next, they composed persuasive messages on their dietary choice. We analyzed word count and time spent composing messages as behavioral proxies for advocacy effort. Gal & Rucker's original word-count effect was $d = 0.35$ (95 % CI [0.10, 0.60]); our replication yielded $d = -0.18$ (95 % CI [-0.42, 0.05]). The original time-spent effect was $d = 0.25$ (95 % CI [0.05, 0.45]); our replication produced $d = -0.18$ (95 % CI [-0.44, 0.08]). Neither main effects nor interactions with belief importance reached significance. Overall, our findings fail to confirm the original effects, highlighting the importance of direct replications for assessing effect robustness. Materials, data, and code are available on OSF.

[209] Shared Adversity with Friends Buffers the Negative Effects of Adversity on Well-Being

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Adverse life experiences are pervasive and can have long-term negative consequences for well-being, in part by straining close relationships. Identifying factors that can interrupt this harmful cycle is critical for promoting resilience. Across two studies, we test the hypothesis that social connections with individuals who have experienced similar adversities in their life—i.e., shared adversity—can serve as a potential buffer. In Study 1, complete social network data collected from a summer bridging program (N = 182) revealed that the negative association between adversity and well-being was attenuated when students formed friendships with individuals with shared adversity, and that this effect was mediated by improved friendship quality. Study 2 replicated these findings in a sample of older adults in a low-income New Jersey neighborhood (N = 84), and further revealed that shared adversity with friends, but not with family, predicted better outcomes. Together, these studies highlight the unique value of shared adversity with friends in buffering the social and psychological toll of hardship by fostering stronger, higher-quality relationships.

[210] Shifting Pages: Within-Couple Variability in Topic Appraisal Alignment and Conflict Dynamics

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Even the happiest couples will inevitably encounter tensions that require collaborative problem-solving. Yet, couples with the skills to communicate effectively may still struggle to apply those skills consistently across conflicts. Few explanations exist for why the same couple who collaborates well in one conflict interaction might exchange criticisms or blame in the very next interaction. This project will investigate whether perceptions of dyadic alignment on the importance of the conflict topic – that is, the extent to which one perceives oneself and one's partner as viewing resolution as critical to the relationship – predispose both partners toward more constructive and less oppositional behaviors. We will also test whether a partner's actual appraisals moderate this link, such that communication quality may suffer if individuals who feel 'on the same page' as their partner are confronted with a different reality. Drawing from a rare multi-wave observational dataset collected from a sample of 169 newlyweds across the early years of marriage, we will employ dyadic multilevel modeling to test whether these effects vary across couples' conflict interactions over time. Findings may illuminate important nuances in couples' naturalistic conflict dynamics, refining our understanding of why some disagreements unfold with greater ease than others within the same couple.

[211] Siri-ous Trust Issues: Lonelier Fast Life Strategists Anthropomorphize Devices

4:40 PM – 5:40 PM

EVOLUTION

Fast life strategists (FLS) adopt antagonistic social strategies (Figueredo et al., 2018), insecure attachment styles (Thornhill & Fincher, 2007; Szepesnwol & Simpson, 2019), and engage in more deviant behavior (Figueredo et al., 2018). For these reasons, we suspected that FLS would be less inclined to address their loneliness by forming human connections. Instead, given that prior work has shown that people respond to greater loneliness by anthropomorphizing devices (Eyssel & Reich, 2013; Wang, 2017), we predicted that FLS might be especially likely to anthropomorphize devices - at least more so than do their more securely attached and socially mutualistic slow-life strategist (SLS) counterparts.

We collected a sample of 450 participants and retained 373 after cutting participants who showed signs of inattention or non-engagement. Analyses revealed that for a variety of devices (i.e., cars, computers, Google and Siri virtual assistants), loneliness was positively associated with anthropomorphic beliefs (e.g., "I can trust the information presented to me by my computer") among FLS. However, this relationship was not significant among SLS.

[212] Social Identity Threat in Autism: Neurodiversity's Impact on Autistic Individuals

4:40 PM – 5:40 PM

DISABILITY

Social Identity Threat (SIT) has been associated with health inequities in many marginalized identities. We hypothesize that SIT may also be a contributing factor in autistic health care inequities. Specifically, how might different environmental cues (e.g., linguistic, visual) trigger or alleviate SIT? We investigated whether autistic individuals experience SIT in a mock healthcare environment. 699 autistic participants, recruited from Prolific, randomly viewed one of two mental health clinic websites that differed in cues (e.g., linguistically and visually) portraying either a medicalized model (threat condition) or neurodiversity model (safety condition) of autism. Measures included qualitative and quantitative responses about their overall impressions and treatment seeking behavior at either clinic. We found that autistic individuals in the threat condition had significantly lower treatment seeking behavior and more negative impressions, on average, than autistic individuals in the safety condition. Our results suggest that neurodiversity-affirming healthcare environments may improve treatment seeking behavior and reduce SIT among autistic individuals.

[213] Solo Status by Design: How Overlooking the Perspective of Stigmatized Employees Drives Solo Status Team Configurations in Organizations

4:40 PM – 5:40 PM

DIVERSITY

In organizations with limited diversity, decision-makers may assign teams by spreading underrepresented employees across teams—a practice we term team-level diversity dispersion. While they may have well-intended reasons, it may result in what we refer to as solo status team configuration patterns, where stigmatized (e.g., Black) employees are consistently placed in solo status positions across a set of teams. This research examines both the antecedents and consequences of this practice. We find that decision-makers prefer solo status team configuration patterns because they prioritize team-level diversity dispersion (Studies 1-2). However, when observing these patterns, Black prospective employees trust and desire to join the organization less because they anticipate their racial identity will be exploited (Study 3). A brief intervention in which decision-makers take the perspective of a stigmatized employee in a solo status position reduces the likelihood of creating a pattern of solo status team configurations (Study 4). This work extends research on solo status and tokenism, as well as research on diversity in teams and perspective-taking.

[214] Source Reappraisal: When in-group messengers are re-evaluated as the out-group

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Source reappraisal, the process by which a message itself prompts audiences to revise their perceptions of a messenger's identity and values, may play a critical yet underexplored role in science communication with implications to issues such as polarization and misinformation. Researchers have emphasized the importance of selecting messengers who share values with their audiences; however, the effectiveness of this approach remains unclear if audiences reevaluate sources after message exposure. In an online experiment, we varied the messenger's identity and message content (ranging from acceptance to denial) on well-established stances on climate change, GMOs, and vaccination. Results showed that while messages influenced participants' beliefs, the alignment between the messenger and recipient did not. Further, the message itself had a large influence on participants' perceived shared values with the messenger. These findings suggest that participants' reappraisals of the source may explain the limited impact of messenger alignment, highlighting the need to consider assumptions about the power of value-congruent messengers who deliver value-incongruent messages.

[215] Sources of Relationship-Specific Intellectual Humility: Respect, Care, and Safety

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

This research investigates interpersonal sources of relationship-specific intellectual humility (R-IH): willingness to acknowledge one's epistemic limitations within specific relationships. Across two studies, the authors tested a tri-factor model positing that respect for a partner's knowledge, care for the partner, and psychological safety predict R-IH. Furthermore, the authors examined implications of R-IH for relationship conflict. Study 1 (N = 512 undergraduates) found evidence for within-person variation in R-IH across relationships and supported the tri-factor model. Mediation analyses indicated that R-IH mediated the effects of respect, care, and safety on conflict frequency. Study 2 (N = 372 community adults) used experimental vignettes to manipulate three predictors of R-IH. Results suggested these manipulations causally influenced R-IH, which in turn predicted motivation to engage in conflict behaviors. Collectively, these findings suggest that a) intellectual humility is dependent on relational context; b) R-IH varies across relationships as a function of respect, care, and safety experienced within relationships; and c) R-IH has implications for relationship conflict.

[216] Like humans, GPT-4o demonstrates face-to-character biases

4:40 PM – 5:40 PM

SOCIAL COGNITION

Humans routinely offer character assessments, such as of trustworthiness and competence, based on nothing but a 2-D facial image. In seven experiments and a total of 4590 trials, we investigated whether an LLM, GPT-4o, would avoid humanlike face-to-character bias given its strong foundation in language and broader reluctance to make negative judgments. On the contrary, GPT-4o exhibited strong face-to-character biases around trustworthiness and competence (Experiments 1-2), demonstrated generalization of these judgments to twelve adjacent attributes like warmth and intelligence (Experiments 3-4), and even to judgments of primate faces that could not have been present in its training data (Experiment 5). Remarkably, GPT-4o also generated strongly face-biased decisions in consequential negative contexts like judging criminality (Experiment 6) and positive contexts like advising on hiring (Experiment 7). GPT's willingness to make facial judgments contrasts with its refusal to endorse race/gender stereotypes, suggesting that bias mitigation safeguards have been largely domain-specific and unlikely to generalize to most domains where bias operates.

[217] Stage-Contingent Social-Exchange Profiles: Linguistic and Thematic Signatures of Married vs. Divorced Narratives

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Romantic relationship theories posit that the benefits couples exchange are shaped more by context than by frequency. Drawing on this theory, we test whether relational benefits exchanged at different stages of courtship predict marital outcomes (lasting marriage vs. divorce). We analyzed wedding stories from the New York Times (N = 767, from 2000 to 2023), which preserve rich narrative descriptions that capture how couples describe social exchanges across differing stages of their relationship. We first developed stage-coding methods via embedding-based content assignment with sample stories. We then annotated narratives into six stages and quantified stage-specific emphases in exchanged benefits, emotional tone, and topics using various NLP methods (TenDimensions, NRC, LDA, and NMF). Converging patterns emerged across the NLP methods: the still-married people highlighted similarity at beginning-stage, support during challenge-stage, and status at resolution-stage, whereas divorced people concentrated enjoyment and support at commitment-stage. These stage-contingent profiles demonstrate how the value of what partners exchange changes across stages, shaping whether marriages last or dissolve.

[218] Supporting Minority College Students: Predictors of Positive Campus Climate

4:40 PM – 5:40 PM

DIVERSITY

Campus climate is positively associated with college students' academic achievement and sense of belongingness. It is essential to identify predictors of campus climate, particularly in underrepresented student populations (e.g., minority or first-generation college students). This study examined differences in factors associated with campus climate between minority and non-minority students. Data collection is ongoing; 375 participants (mean age=28; woman=78%; non-White=61%; first-generation student=58%) have completed this study thus far. Preliminary hierarchical multiple regression analyses showed that after controlling for age and gender, minority students with a more positive view of the campus climate tended to report more faculty support, perceive lower levels of discrimination on campus, and identify as first-generation college students, $R=.60, p<.001$. For non-minority students, perceived faculty support was the strongest predictor of campus climate, $R=.34, p=.015$. These findings may support the development of initiatives that address discrimination-related concerns, increase faculty support, and enhance campus climate perception, particularly for minority college students.

[219] Swipes versus strides: How mobile media use shapes children's gross and fine motor skills

4:40 PM – 5:40 PM

LIFESPAN DEVELOPMENT

The rate of exposure of infants to smartphones has evolved from 25% to approximately 75%, and rates are higher for young children 2 to 5-years-old, who average spending approximately two hours a day on smartphones. Despite the advances with research on screen time and infant/child development, there are still mixed messages regarding whether screen time can assist the development of children between the ages of 0 and 5. The goal of this study is to identify the relationship between preschool children's (ages 3 to 5) use of mobile technology (such as smart phones and tablets) and children's executive functioning (as measured by observation using the head-toe-knee-shoulder activity [HTKS-R]). Data comes from 58 mother-child dyads, where parents completed an online survey and children were observed using the HTSK-R. Results of this study revealed that time spent on mobile devices is associated with declines in executive functioning, but children's use of educational, prosocial, and socially interactive applications are associated with increased executive functioning. Results of this study can inform policy recommendations for children's use of mobile devices to assist their development.

[220] Tangled Minds, Tangled Sheets: Exploring Associations among Stress, Relationship Conflict, and Relationship Quality

4:40 PM – 5:40 PM

SEXUALITY

Healthy romantic relationships are critical to overall well-being, however conflict within them can erode both intimacy and satisfaction. This study tested whether relationship conflict is associated directly with sexual satisfaction and indirectly through increased stress levels. Data were drawn from the National COVID-19 and Mental Health Study, which surveyed U.S. adults in Spring 2020 ($N = 4141$). Analyses focused on people in relationships living with their partners ($n = 2269$). Consistent with the hypothesis, people reporting greater relationship conflict tended to report lower sexual satisfaction, $r = -.254$, and higher stress, $r = .307$. Additionally, people who were more stressed reported lower sexual satisfaction, $r = -.224$. Overall, stress mediated the association between conflict and sexual satisfaction. Furthermore, these experiences were associated with overall relationship satisfaction. These findings highlight how conflict and stress can potentially spill over into people's sex lives. Efforts to strengthen couples' conflict resolution skills including therapy and educational workshops may reduce stress, improve intimacy, and help protect relationship quality.

[221] Temporal Effects of Stress in Close Relationships: How Lingering and Accumulating Daily Stress Shape Relationship Behaviors

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

While stress has been linked to lower relationship satisfaction, less is known about how different temporal patterns of stress affect day-to-day relationship behaviors. We will use multilevel modeling of a 12-day diary study of 287 married individuals to examine whether same day stress, lingering stress, and accumulating stress exert unique effects on self-reported support and conflict behavior. We define same day stress effects as associations between behavior and stress reported the same day, lingering stress effects as associations between behavior and stress reported 1, 2, and 3-days prior, and accumulating stress effects as associations between behavior and the interaction of same-day stress and stress reported 1, 2, and 3-days prior. We hypothesize that higher-than-usual stress reported the same day, and all three prior days will predict increased verbal aggression and decreased partner support and that the same day effects will be accentuated by stress experienced all three prior days. This research will illuminate temporal mechanisms through which daily stress undermines relationship functioning and identifies behavioral pathways linking stress to relationship outcomes.

[222] Testing the Extrinsic Convergent Validity of Constructs in Relationship Science

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Historically, relationship scientists have attempted to understand the processes underlying romantic relationship quality, success, and failure by studying a large number of "relationship constructs" (e.g., love, commitment, intimacy). However, researchers have begun to question the validity of measures used to assess these constructs and, in particular, whether they are distinct from one another. Building on these questions, we used extrinsic convergent validity testing to examine the extent to which the six components of the Perceived Relationship Quality Components measure represent distinct constructs when predicting self-reported relationship behavior. Across one between-subjects study ($N = 619$) and one within-subjects study ($N = 616$), we used multiple statistical methods to demonstrate that some components (trust, passion, and commitment) uniquely predicted behavior, whereas others (satisfaction, love, and intimacy) did not, suggesting that these constructs may be "jangled" to some extent. Implications and future directions will be discussed, with particular emphasis on refining theory and measurement practices.

[223] Testing the Impact of Relationship Threat on Romantic Self-Sabotaging Behaviors

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

This study examines the effect of a relationship threat manipulation on relationship self-sabotage (engaging in destructive relationship behaviors). A sample of undergraduate student participants in a romantic relationship answered self-report questionnaires about relationship self-sabotage, dyadic perfectionism (perfectionism directed at one's romantic relationships), attachment style, and self-esteem. We then analyzed how the threat manipulation impacted relationship self-sabotage and other measures. We anticipated that exposure to relationship threat would increase scores on relationship self-sabotage compared to participants not exposed to this threat. This is supported by prior studies which examined concerns about rejection and the use of partner derogation utilizing the same relationship threat manipulation as in the present study. Prior studies have modeled how and why people self-protect in relationships, but the Relationship Self-Sabotage scale is relatively novel and therefore hasn't yet been used in tandem with a manipulation of relationship threat.

[224] Testosterone's relationship to male dominance and prestige: discrepancies between self and partner reports

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Prior research shows a positive relationship between dominance and prestige among men across cultures, with testosterone (T) often linked to these traits. While dominance and prestige are frequently measured through self-report, few studies have examined whether self-reports align with partner reports. Based on prior literature, we predicted that male self-reported dominance correlated with his self-reported prestige and novelty, that self-reports would correlate with partner perceptions. Data came from 190 dyads in a longitudinal study. Participants completed the Dominance and Prestige scale (Cheng et al., 2010), and saliva samples were assayed for T. Using an actor-partner interdependence model (APIM), we found that self-reported dominance predicted self-reported prestige, and partner-reported dominance predicted partner-reported prestige. However, male T predicted self-reported dominance but was unrelated to partner ratings of his dominance. Findings suggest that T may predict self-perceived but not partner-perceived dominance, and that prestige may be more consistently observable across relational contexts. Future research should examine these dynamics beyond fatherhood.

[225] The Behavioral Ecology of Health: A Systematic Review Linking Harshness and Unpredictability with Physical, Mental, and Behavioral Health

4:40 PM – 5:40 PM

EVOLUTION

Life history theory in psychology offers a framework through which to understand how challenging early life experiences and environmental factors shape health. Indeed, much research has leveraged a behavioral ecological perspective to examine how harshness and unpredictability relate to physical, mental, and behavioral health. To take stock of patterns of results and to provide insights on common mechanisms of the effects of environmental pressures on individuals' health, we conducted a systematic review of work focused on associations between childhood harshness and unpredictability and health. In all, we include 68 papers. Childhood harshness and unpredictability tend to be negatively associated with physical health, mental health, and behavioral health. These associations are mediated by biological factors, dysregulated eating, and life history strategies, which provide insights for practical and theoretical implications. Although empirical and theoretical critiques can (and should) be leveled against life history theory, the framework remains invaluable to novel explorations of how individual differences in developmental experiences may shape downstream body and mind.

[226] The Benefits of Capitalization With Friends and Romantic Partners: An Examination of Two Types of Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Romantic partners and friends are two of the most important types of relationships for fostering positive emotions. One positive interpersonal process within which both friends and romantic partners can engage is capitalization—the sharing of good news. It is not known whether friends and romantic partners systematically differ in how they capitalize with each other or whether they elicit different beneficial outcomes. The current study is a 2 relationship type by 2 time-point mixed design in which participants attended two lab sessions. In the first session, half of the participants engaged in a videorecorded capitalization discussion with their romantic partner, while the other half engaged in a capitalization discussion with a friend. Friends and romantic partners both elicited similar levels of positive affect and feelings of social connection. Participants rated their friends and their romantic partners as similarly responsive. However, romantic partners engaged in significantly more physical touch than did friends and their degree of responsiveness was more closely associated with features of their relationship such as its closeness and importance.

[227] The Effect of Attractiveness Bias and Colorism on Hiring Practices and Personnel Evaluations

4:40 PM – 5:40 PM

DIVERSITY

Attractiveness bias and colorism—two relatively understudied forms of bias—have significant implications for workplace evaluations. This project examines how perceptions of Black women candidates are shaped by attractiveness and skin tone. Across three studies, participants reviewed a job description and resume paired with a photo manipulated by attractiveness (attractive vs. unattractive) and skin tone (light, medium, dark). In Study 1 (N=80), less attractive candidates were unexpectedly rated as a better organizational fit than more attractive candidates, with no other significant effects. Study 2 (N=60) yielded no significant findings, but Study 3 (N=60) revealed an attractiveness bias: attractive candidates were rated more favorably overall and expected to fit better. No effects of skin tone or interactions emerged across studies. These findings suggest attractiveness may play a more consistent role than skin tone in shaping evaluations, though results vary by sample. Ongoing analyses will test mediational pathways (e.g., competence, fit) and will be presented at the conference. While this project focuses on Black women, future research will expand to include candidates of other races and genders to provide a broader understanding of how these intersecting biases shape workplace outcomes.

[228] The Effect of Home Chaos and Parental Affect on Disruptive Behavior in Neurodivergent Children

4:40 PM – 5:40 PM

DISABILITY

This study examined how home disorganization and parental affect relate to children's disruptive behavior using data from the Florida Twin Project on Behavior and Environment. We hypothesized that greater home disorganization, higher negative parental affect, and lower positive parental affect would predict more disruptive behavior, and that neurodivergent (ND) children would show higher home disorganization, higher negative affect, lower positive affect, and more disruptive behavior than neurotypical (NT) peers.

Multiple regression showed significant links between home disorganization and negative parental affect with disruptive behavior (medium effect). Independent samples t-tests found significant ND–NT differences in home disorganization, parental affect, and disruptive behavior (small to moderate effects).

Findings underscore the role of environmental and emotional factors in behavior and suggest interventions to improve home organization and parental emotional support. ND children are at increased risk for disorganized homes, higher disruptive behavior, and elevated parental negative affect, which places them at greater risk for adverse educational and life outcomes.

Multiple regression showed significant links between home disorganization and negative parental affect with disruptive behavior (medium effect). Independent samples t-tests found significant ND–NT differences in home disorganization, parental affect, and disruptive behavior (small to moderate effects).

Findings underscore the role of environmental and emotional factors in behavior and suggest interventions to improve home organization and parental emotional support. Future research should examine mechanisms underlying these relationships.

[229] Geographically Aggregated Psychological Traits from Linguistic Analysis of Twitter Data Predict Voter Realignment Towards Trump

4:40 PM – 5:40 PM

POLITICS

Donald Trump's rise has catalyzed a realignment in American politics. A key question for understanding this shift is to examine how Trump's voter base differs from the Republican electorate in earlier elections. To address this question, we examined a large-scale corpus of Twitter posts written between July 2009 and February 2015, with word counts aggregated by U.S. county. We estimated the geographic distribution of personality, empathy, and moral foundations using previously-developed computationally modeled lexica that provide scores for individual words on these traits. Each county's 2000-2008 Republican Presidential vote share was included as a control variable along with demographic predictors. Language consistent with low agreeableness and low empathy, and a greater emphasis on unfairness, all predicted support for Trump in 2016-2024 but not for Romney in 2012. These results suggest that communities that realigned in Trump's favor were already expressing psychological dispositions aligned with his political messaging prior to 2016. More broadly, our study demonstrates the power of linguistic analysis of social media data for understanding Americans' political preferences.

[230] The Effects of Contextual Factors and Individual Differences on Sexual Interest Perception

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Error Management Theory (Haselton & Buss, 2000) discusses the distal factors responsible for men's tendency to perceive more sexual interest than women report. However, it sheds limited light on the proximal factors involved in sexual interest perception. Interpersonal attraction and perception are guided by an array of factors, including motivational processes influenced by one's proximal environment (see Finkel & Baumeister, 2010). In addition, prior sexual interest research has primarily focused on heterosexual individuals. The goal of the present study was to investigate the influence of contextual factors and individual differences (e.g., sexual narcissism, attachment) and their interactions on sexual interest perception among heterosexual, gay, and bisexual adults. Contextual factors were manipulated via a hypothetical vignette scenario and included physical attraction to the target (i.e., not physically attracted to, physically attracted to), type of relationship between the perceiver and target (i.e., acquaintance/friend, stranger, or coworker/colleague), and present environment (at a bar/club vs. work event). Results, future directions, and implications will be discussed.

[231] The Effects of Message Framing on Climate-Friendly Attitudes and Behaviors: A Pilot Study

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Climate change messages often target highly engaged audiences. This study investigated the impact of message framing on climate-related attitudes and behavioral intentions in a general population sample. Messages focused on energy-saving attitudes and actions, as these have been found to be one of the most impactful and achievable ways for individuals to reduce household-level greenhouse gas emissions. Messages varied in the quantity of solutions (1 vs. 7) and the solution actor (the participant vs. legislators). Participants completed pre-surveys, viewed one of four climate-action messages, and then completed post-surveys. When action is framed as the responsibility of legislators, participants report greater willingness to act. When individuals are encouraged to act themselves, participants exposed to multiple solutions develop more positive attitudes toward environmentally-friendly behaviors than those given a single action. These findings highlight the importance of aligning message design with the intended actor and the number of solutions suggested to engage broader audiences in climate action.

[232] The Effects of Mindfulness and Loving-Kindness Meditation on Enhancing Attachment Security

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Attachment orientations shape relationship outcomes, career outcomes, and well-being, making interventions which enhance security vital. In recent years, a growing literature has examined factors which promote attachment security. However, there is still a lack of simple interventions which can enhance security. Meditation interventions are simple and cost-efficient to deliver and already show benefits in several other interpersonal domains, such as enhancing relationship satisfaction, closeness, and social connectedness.

The current study aims to test the effects of (a) mindfulness meditation, (b) loving-kindness meditation, and (c) an active control condition on attachment orientations over time. Attachment orientations are being measured before the delivering of interventions. Each intervention lasts four weeks (with participants coming in for half an hour each week) along with home practice. We then obtain follow-up reports on attachment orientations immediately following the intervention period and one and two months following the intervention period.

Data collection and analysis has yet to be completed.

[233] The Hidden Costs of Moral Reframing

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Moral reframing—a technique in which a position that an individual does not support is reframed in a way to be consistent with their core moral values—has been shown to depolarize political attitudes (Feinberg & Willer, 2019). However, it may increase the belief that an attitude is rooted in basic questions of right and wrong (Kodapanakal et al., 2022). This is concerning since heightened moral conviction predicts increased affective polarization and reduced compromise (Ryan, 2017).

Our online survey experiment tested moral reframing's impact on attitudes regarding abortion and immigration policy, willingness to compromise, and affective polarization (N = 288). After participants' initial policy views were recorded, they were randomly assigned to read either a single moral frame opposing their policy position or two competing frames with one opposing argument and one supporting argument. The competing-frames condition was included to enhance ecological validity, modeling the conflicting messages common in real-world information environments.

Replicating prior research, single frames resulted in significantly more moderate attitudes relative to baseline ($b = 0.29$, $p < .001$); competing frames produced no attitude change. Willingness to compromise did not change significantly in either condition. Notably, participants in both conditions showed similar increases in affective polarization (e.g., preferred social distance from outpartisans increased).

These findings reveal a troubling paradox: moral reframing may depolarize attitudes while simultaneously increasing affective polarization.

[234] The Hidden Strain: Relationship Stress and Maternal Postpartum Depression

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

This study examines the correlation between relationship stress and postpartum depression (PPD). PPD is defined as moderate to severe depression within the first year after birth and affects an estimated 13-19% of mothers (Hutchens et al., 2020). It's hypothesized that higher levels of relationship stress – including intimate partner violence, partner's controlling behaviors, and parenting stress – are associated with increased PPD symptoms. Relationship stress was measured using the Revised Tactics Scales, Coparenting Relationship Scale, and Controlling Behaviors Scale. PPD was measured with the Edinburgh Postnatal Depression Scale in self-report surveys from 514 mothers within six months postpartum, through Prolific.com in April 2024. Results showed 56.6% of participants scored 13 or higher, indicating likely PPD. Intimate partner violence and controlling behaviors were positively correlated with PPD ($r = .394$, $p < .001$; $r = .098$, $p = .041$). These findings highlight close relationship processes as targets for screening and support in the early postpartum period. Limitations include a cross-sectional design and a predominantly middle-class sample.

[235] The Ick Factor: Explaining the Term in Romantic Relationships Through Sexual Disgust and Avoidant Attachment Style

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

The phenomenon of the “ick” (a visceral reaction to a person’s habits or traits) has proliferated on social media where it seems to play an important role in attraction. Possible theoretical explanations for the ick are avoidant attachment and sexual disgust. Avoidantly attached individuals tend to be uncomfortable in high intimacy relationships and may use icks as the basis for withdrawal from a partner. Sexual disgust is a negative visceral reaction to potential partners based on an innate habit to select better mates; icks may reflect that disgust and imitate its social-evolutionary function. We hypothesized that people would rate potential partners with an ick as less attractive and dateable compared to those with no ick, and that people who rate ick profiles lower would score higher on sexual disgust and avoidant attachment. The current study recruited 236 participants who were randomly exposed to two dating profiles and two first-date vignettes, with either an ick or no ick present. Additionally, they filled out measures of sexual disgust and attachment style. Data analysis is underway. Results could shed light on the validity of icks and their theoretical underpinning.

[236] The Impact of Diversity Definitions on Employee and Organization Outcomes

4:40 PM – 5:40 PM

DIVERSITY

Recent years have seen rising anti-DEI rhetoric and activism. In January 2025, President Trump signed Executive Order 14151, “ending radical and wasteful government DEI programs and preferencing.” As organizations are ramping up or scaling back their DEI initiatives, understanding their impact on employees and organizational outcomes is crucial. In this research, we investigated whether the presence of broad (viewpoint), broad + demographic, or demographic definitions of diversity change perceptions of how employees from different groups are treated, and if those perceptions change based on participant identity (e.g., White compared to underrepresented groups). Across 2 studies (n = 1,075), we found that although participants liked the broad+demo statement the most, they perceived that racial minority and women employees would be treated most fairly in the demographic diversity condition. Additionally, in Study 2, we found that White participants perceived the company to be biased in favor of racial minority employees in the demographic condition, while Black participants perceived equal treatment. Additionally, we found that presidential approval moderated some of these findings.

[237] The Impact of Paranoid Thoughts on the Romantic Relationship Formation: Insights from A Speed-Dating Study

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

This study explores how paranoid thoughts influence initial attraction in mate selection. Paranoid thoughts, including two dimensions—persecution (beliefs of being targeted or harmed) and reference (beliefs that events specifically refer to themselves)—are characterized by social threat perceptions, which may lead to a defensive attitude toward potential partners and misinterpretation of social cues, negatively impacting initial attraction. We hypothesized that paranoid thoughts would negatively impact interpersonal perceptions under a romantic context, due to its association with social threat sensitivity. By using a speed-dating design with a sample of Hong Kong college students (N = 255), however, contrary to our hypothesis, our results show that individuals with a higher level on the persecution dimension of paranoid thoughts tend to rate their partner’s attractiveness as higher. And for the perceived attraction, there are gender differences, where females with higher persecution level may believe that their partner would rate their attractiveness as lower, while males’ persecution shows no significant interaction effects. These findings highlight the impact of paranoid thoughts on interpersonal perceptions during the initial stages of mate selection, and suggest the challenges paranoid thoughts may present during romantic relationships formation.

[238] The Impact of Prior BDSM Activities on Post-Scene Negotiation

4:40 PM – 5:40 PM

SEXUALITY

BDSM can produce pleasurable altered states of consciousness (Ambler et al., 2017), but these altered states might impact practitioners' ability to negotiate a subsequent scene. BDSM practitioners (N = 81) completed surveys before and after a BDSM scene. The surveys measured positive and negative affect, stress, sexual arousal, interest in BDSM activities, and hard and soft limits (activities that the participant would prohibit or be disinclined to allow, respectively). Consistent with prior research, positive affect and sexual arousal increased during the scene, and negative affect and stress decreased. New to this study, interest in BDSM activities increased significantly for tops (participants taking on the dominant role) but was unchanged for bottoms, interaction $t(37) = 2.10$, $p = .04$. From before to after their scenes, participants showed a marginally significant increase in hard limits, $p = .08$, and a marginally significant decrease in soft limits, $p = .06$. However, over 25% of participants reported at least one hard limit at baseline that was no longer a hard limit after their scene. Results suggest that a prior scene might impact subsequent scene negotiations.

[239] The Impact of Racial and Ethnic Discrimination on Academic Self-Beliefs in Minority College Students: A Systematic Review

4:40 PM – 5:40 PM

DIVERSITY

This systematic review examined the relationship between racial and ethnic discrimination and academic self-beliefs among college students. Across 32 studies published between 1996 and 2024, we identified 53 unique effect sizes to assess the strength and patterns of association between experiences of discrimination (e.g., microaggressions, overt racism) and academic self-beliefs (e.g., academic self-efficacy, barriers, self-concept). A majority of effects were small or trivial in magnitude, suggesting that while discrimination is statistically associated with academic self-beliefs, the strength of these relationships is modest. Covert forms of discrimination, such as microaggressions, were more commonly examined and more likely to yield moderate effects than overt discrimination. Stronger associations emerged for outcomes like academic barriers and affective responses, whereas beliefs tied to self-concept or academic competence were generally weaker. Most studies employed validated, multi-item measures of discrimination, but considerable variability in conceptual definitions and measurement quality limited the comparability of findings. Very few studies examined moderators such as racial/ethnic identity or social support. Findings underscore the need for greater consistency in measurement and increased attention to contextual moderators in future research.

[240] The impact of Social Media usage on Parent-Child Attachment Styles

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

As of 2023, 97% of Americans own a cellphone. Furthermore, 90% of Generation Z, ages 18-24, report social media usage (CivicScience, 2023). The study will observe how media consumption can affect parent-child attachment styles. Previous studies have shown media use for parents leads to insecure attachment with their children. There is a gap in research on how the child's media usage can affect their attachment styles. We will collect data about social media usage and attachment styles from 185 participants whose ages range from 18-22. We will use self-report measures of participant's screen time usage and collect additional demographic information. Participants will then complete the ECR-R to measure attachment style. Previous research has indicated that adolescents with higher media usage have more secure attachments with their parents. Less research has been conducted within the young adult population despite the rise of social media throughout the early development stages of Generation Z. Given the widespread use, we hypothesize that young adults with higher media usage will have more secure parent-child attachment styles.

[241] The Importance of Own Attachment: Unpacking Anxiety's Functional Role in Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Adult attachment is closely associated with relationship satisfaction in romantic relationships, but the roles of individual attachment (actor effect), partner attachment (partner effect), and the compatibility of partners' styles (dyadic combination effect) remain unclear. Additionally, the distinct associations of attachment anxiety and avoidance on relationship outcomes have been underexplored. This study analyzed 501 Korean premarital couples using the Actor–Partner Interdependence Model, revealing two key findings: (1) The actor's attachment style had the strongest association with satisfaction, surpassing that of a partner's attachment or dyadic combinations, and (2) Attachment anxiety and avoidance were not equally harmful; a context-specific mitigating pattern emerged at the dyadic level. Specifically, in couples where women reported high anxiety, the negative association between men's anxiety and their own satisfaction was attenuated. Thus, individual attachment style accounted for satisfaction above and beyond a partner's attachment or the compatibility between styles, with anxiety proving to be less damaging and even protective in certain contexts.

[242] The Ironic Effects of Broadening Diversity for Sexual Minorities

4:40 PM – 5:40 PM

DIVERSITY

Diversity is one of the buzzwords of the 21st century. But who counts as diverse? We coded diversity statements to examine how organizations typically define diversity and whether oppressed-group members perceive some definitions as diluting diversity, or detracting from the original intention of diversity initiatives. In Study 1, we coded the top 250 Fortune 500 companies' diversity statements for whether they use a broad, broad + demographic, or demographic definition of diversity or neglect to define diversity at all. Organizations most commonly opted for a broad definition of diversity (38%) that focused on diversity in perspectives and skills, with no mention of demographic group identities (e.g., race, sexual orientation, gender; Study 1). In Studies 2 and 3, we manipulated diversity definition between sexual minorities and measured their willingness to disclose their sexual identities. Sexual minorities perceived broad statements as diluting diversity more than other diversity statements, and broad statements led sexual minorities to be less willing to disclose their sexual identity. Both cross-sectional mediation and manipulation of the mediator (Studies 3-4) suggested that broad statements hurt social identity disclosure via reduced sense of belonging. Celebrating differences may seem unequivocally positive. Yet, the present research shows that the type of difference matters. From the perspective of oppressed-group members, broadening the definition of diversity to include personality characteristics and perspectives has insidious costs for sexual minorities—particularly if the definition did not also mention demographic characteristics. Indeed, more “inclusive” definitions of diversity may not be perceived as such by people who continue to face systemic oppression.

[243] The Kamala Effect: Exploring Kamala Harris's Role in Representation and Implicit Bias

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Previous research has shown that exposure to individuals who challenge stereotypes may help reduce implicit bias. After the 2008 presidential election, participants primed with information about Barack Obama and his accomplishments demonstrated lower implicit bias scores towards Black men than those not exposed, known as the Obama Effect. We propose that Kamala Harris' presidential campaign and loss in 2024 will produce a similar "Kamala Effect". We will compare two waves of participants, one measured before the 2024 election and one after, to test whether losing the election lowered Harris' status as an exemplar. In both waves, we will prime participants with Harris' accomplishments and then measure their implicit attitudes toward both women and Black people via the Affect Misattribution Procedure. We predict that participants measured before the election will demonstrate less bias than those measured after her loss. As the first Black woman to run for and lose a presidential election, Harris provides a unique test of the Obama Effect framework, demonstrating how intersecting racial and gender identities shape implicit attitudes when exemplars fall short of an electoral win.

[244] The Link Between Wrongness Admission and Romantic Relationship Health

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Wrongness admission is the act of publicly retracting a previously held inaccurate belief or attitude. Previous research has found that wrongness admission confers reputational benefits. However, few studies have looked at wrongness admission in romantic relationships. In Study 1 (N = 195) participants' perceptions of their romantic partners' willingness to engage in wrongness admission was positively correlated with positive relationship outcomes (e.g., understanding, satisfaction, and commitment). In Study 2 (anticipated N = 200), we experimentally test whether participants who perceive their partners engaging in wrongness admission (vs. refusing) in a hypothetical argument report higher positive relationship outcomes. We hypothesize that those in the admission condition will report greater perceived partner responsiveness and, subsequently, greater relationship closeness, commitment, and satisfaction. Together, these studies suggest that intellectual humility, expressed through wrongness admission, may play a vital role in fostering healthier, more satisfying romantic relationships.

[245] The Long Arm of First Love: Parental Approval to Children's First Romantic Relationships and Their Long-Term Implications for Well-Being

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Objective: This study examines the associations between parental approval of adolescents' first romantic relationship and long-term well-being in adulthood, focusing on differences by behavioral versus attitudinal approval and by opposite-sex versus same-sex first romance.

Method: Data were drawn from the National Longitudinal Study of Adolescent to Adult Health Wave V (2016–2018) and the SOGI-SES ancillary study (2020–2021), with a final analytic sample of 1,817 adults. Self-reported parental behavioral and attitudinal acceptance of the first romantic relationship were assessed separately for opposite-sex and same-sex first partners. Adulthood well-being was measured by a scale of mental health (13 items; $\alpha = .93$), optimism (3 items; $\alpha = .75$), and perceived social support (3 items; $\alpha = .51$). Linear regressions were applied to estimate the associations, controlling for sex, age, education, marital status, and sexual orientation.

Results: Lower parental behavioral and attitudinal acceptance of adolescents' first different-sex relationship—along with parental unawareness—were consistently associated with poorer adult well-being (worse mental health, lower optimism, and reduced perceived social support). Attitudinal non-acceptance showed the largest deficits in mental health, whereas behavioral non-acceptance yielded broader, though somewhat smaller, associations across outcomes. By contrast, parental acceptance surrounding same-sex first relationships showed no robust associations with these outcomes.

[246] The Political is Relational: Political Dissimilarity Predicts Worse Relationship Quality

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Politics is not just about policy—it is infused in daily life and can divide families, friends, and partners. Extending prior work that has nearly exclusively focused on romantic relationships in non-representative samples, we tested whether perceived political dissimilarity predicted poorer relationship quality across romantic and non-romantic relationships in a nationally representative U.S. sample (N = 1,074; 55% Republican, 45% Democrat) during a period of heightened political tension: the 2024 U.S. election. In a 9-wave longitudinal study spanning September 2024 - June 2025, greater political dissimilarity predicted lower relationship quality across the study timeframe, and a 16% higher likelihood of breakup per one-point increase in dissimilarity (notably, these effects were stronger after vs. before the election). In this diverse and representative sample, dissimilarity was comparably costly across relationship types, gender, age, and race. These findings underscore the widespread relational costs of political dissimilarity: Political divides spill deeply into many people's personal lives, eroding the quality and stability of people's closest ties.

[247] The Politics of Brand Perception: Differential Responses to Race-Conscious Advertising

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

This study investigated how racially conscious advertising practices influence consumer attitudes and purchasing intentions across two studies. In Study 1, participants viewed either a race-conscious or race-neutral advertisement for a hypothetical brand. Although advertisement type had no direct main effects, political orientation significantly moderated responses. Conservatives rated the race-conscious brand less favorably and reported lower purchase intentions than the neutral brand, while liberals showed no differences across conditions. In Study 2, we introduced system-justifying beliefs and trust in media as additional moderators, finding that conservative-leaning participants again reported lower favorability and purchase intentions toward race-conscious brands than neutral ones, while liberals' evaluations remained largely stable. Across both studies, results suggest an "activation" effect: race-conscious branding heightens negative responses among conservative consumers without producing corresponding gains among liberals. These findings underscore the importance of political identity in shaping consumer reactions to race-conscious marketing strategies.

[248] The Power of the Past: Is Romantic Nostalgia Predominantly Positive?

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

In the broader nostalgia literature, nostalgia consistently emerges as a predominantly positive experience. However, there has been conflicting research about the positive experience specifically in romantic nostalgia. We examined this contradiction further in two experiments. Experiment 1 utilized a community sample recruited from local Facebook groups (N = 43). Experiment 2 recruited through Prolific (N = 202). In both experiments, participants were randomly assigned to recall and write a narrative about either a nostalgic or ordinary event within their current romantic relationship. We will use ChatGPT to code the written narratives (Rathje et al., 2024) to determine the extent to which positive and negative emotions are present. We expect that narratives authored by participants in the romantic nostalgia condition will contain more positive emotions compared to negative emotions. We also expect that narratives written by participants in the romantic nostalgia condition will contain more positive emotions than narratives authored by participants in the ordinary event condition. We will also explore the prevalence of mixed emotions.

[249] The Psychological Effects of a Brief BDSM Experience

4:40 PM – 5:40 PM

SEXUALITY

Most research on the effects of BDSM (Bondage/Discipline, Dominance/Submission, Sadism/Masochism) activities has focused on longer activities, leaving a gap in research on how individuals react to short BDSM activities. Thus, the goal of this study was to explore how BDSM practitioners react to brief BDSM experiences. Ninety-four participants completed a questionnaire pre and post participation in a 5-minute BDSM activity. Results of paired samples t-tests showed that ratings for feeling proud were significantly higher post-activity compared to pre-activity. Ratings of emotions of shame significantly decreased post-activity compared to pre-activity. Ratings of feelings of closeness with other conference attendees increased post-activity compared to pre-activity. Finally, moderation analyses revealed a significant interaction for the relationship of feeling proud pre and post activity on years in the community. The results show increases in positive emotions and decreases in negative emotions after engaging in a brief BDSM activity compared to before the activity. Finally, the relationship between feeling proud pre and post activity was moderated by years in the community, such that those who were newer in the community felt an increase of pride post activity compared to those who had been in the community longer.

[250] The Relationship Between Attachment, Fear of Compassion, and Self-Compassion in University Students

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Objectives: According to attachment theory (Bowlby, 1958, 1982), early caregiver responses shape internal models of self and others. Insecure attachment is linked to negative self-perceptions and lower self-compassion (Neff & McGehee, 2010). Recent research highlights that some individuals fear compassion (for others, from others, or toward themselves) (Gilbert et al., 2011). But the mediating role between attachment and self-compassion remains underexplored.

Methods: 258 Japanese university students completed the ECR-RS (attachment), Fear of Compassion Scale, and Self-Compassion Scale.

Results: T-tests revealed that compared to securely attached individuals, those with insecure attachment reported higher fear of compassion from others and fear of self-compassion, as well as lower levels of self-compassion. No group difference was found for fear of compassion for others. SEM analysis showed that only fear of self-compassion significantly mediated the link between insecure attachment and low self-compassion.

Conclusions: This study shows that fear of self-compassion plays a key role in linking insecure attachment to low self-compassion. It suggests that reducing this fear, may help improve psychological adjustment.

[251] The Relationship Between Clothing Choices, Body Image, and Mate Selection

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Attractiveness, body image, and mate selection are three psychological concepts that have been heavily researched separately but rarely together. There is a gap in understanding whether people are able to outwardly signal their body image, and whether this is a considered factor in mate selection. To answer these questions, this study will present participants with AI-generated images of identical people of average attractiveness, each wearing two different outfits. One outfit will be designed to signal high body image, with the individual dressed in bright colors, tight fitting clothing, and garments that are typically deemed "professional". The other image of this person will show them wearing clothes that are designed to signal a lower body image, dressed in dull colors, ill-fitting clothes, and garments that are more casual than professional. Participants will be randomly assigned to view one of the two images and assess the level of body image satisfaction of the person in the image. They will then be asked to rate how attractive the person is, and whether they would be interested in pursuing the person romantically. These results will provide insight on whether individuals can signal body image through their clothing, and whether body image is a considered factor when a person is selecting a potential mate.

[252] The Rise of Resentment: How Self-Concept Changes Fuel Resentment in Romantic Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Resentment is a complex emotional response that occurs when people feel that they have been wronged, taken advantage of, or treated unfairly. Surprisingly, little research has explored what leads people to feel resentment, especially in romantic relationships. In the current work, we hypothesized that relationship-induced self-degradation (i.e., the perception that a relationship has changed a person for the worse), compared to self-improvement (i.e., the perception that a relationship has changed a person for the better), would lead to increased feelings of resentment in romantic partners.

In two studies (total N = 440), one correlational and one experimental, we examined whether self-change would be associated with resentment, and whether resentment would mediate the association between self-change and relationship outcomes. Across both studies, we found that self-degradation was associated with greater feelings of resentment. Moreover, feelings of resentment mediated the association between self-change and relationship quality. These findings provide novel insights into the nature of resentment and the potential reasons why romantic partners experience resentment.

[253] The Role of Identity-Safety Cues in Shaping Healthcare Experiences of Black Immigrants

4:40 PM – 5:40 PM

DIVERSITY

Black immigrants often face unique challenges at the intersection of race and immigration status in healthcare settings, including concerns about stigma. Research on identity-safety cues suggests that inclusive signals in healthcare environments can reduce threat and increase trust and perceived safety for minoritized groups. This proposed study examines how using identity-safety cues in healthcare contexts impacts perceptions of inclusion and physician allyship among Black immigrants. Participants will be randomly assigned to view a mock clinic webpage displaying a racial-justice cue, an immigration-inclusive cue, or no cue (control condition). We hypothesize that exposure to a race or immigration-inclusive cue will increase inclusion and physician allyship compared to the control cue. However, immigration-inclusive cues are expected to yield the strongest effect on inclusion and allyship. Findings will extend existing research by focusing on the understudied population of Black immigrants, highlighting strategies to reduce disparities and foster culturally responsive care. Data will be collected using Prolific, and we anticipate data collection will be complete in December 2025.

[254] The Role of Implicit Relationship Beliefs on Romantic Relationship Satisfaction and Psychological Well-Being

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Romantic relationship beliefs are cognitive schemas that guide how people perceive and maintain close relationships. We tested whether implicit theories of relationships vary across three monthly assessments in emerging adulthood and whether such variation relates to life satisfaction and psychological wellbeing. Participants were 306 individuals in ongoing relationships, 76.5 percent women, ages 18 to 26, $M = 21.59$, $SD = 1.50$, relationship length $M = 21.22$ months, $SD = 20.20$. At each wave, destiny and growth beliefs, life satisfaction, and psychological wellbeing were assessed. Across three measures, increases in destiny beliefs predicted lower life satisfaction, $\gamma = -.09$, $p < .01$, and $\gamma = -.10$, $p < .01$. Increases in growth beliefs predicted higher life satisfaction, $\gamma = .17$, $p < .01$. Time did not predict any changes in psychological wellbeing but overall stronger growth beliefs were related to higher psychological wellbeing, $\gamma = .30$, $p < .01$, whereas stronger destiny beliefs related to lower psychological wellbeing, $\gamma = -.08$, $p = .04$. Findings position implicit theories as dynamic cognitive targets for relationship and mental health research.

[255] The Role of Race-Related Vigilance on Smoking Cessation Challenges Among Black Adult

4:40 PM – 5:40 PM

DIVERSITY

The current study examined the role of race-related vigilance on smoking-related outcomes among a sample of Black adult daily smokers. The primary aim was to examine whether race-related vigilance uniquely contributes to quit problem severity, barriers to cessation, and smoking abstinence expectancies, including expectancies related to negative mood, somatic symptoms, harmful consequences, and positive consequences. The sample included 498 Black adults who endorsed daily combustible cigarette smoking ($M_{age} = 45.37$ years, $SD = 14.68$, age range 18-73 years; 51.4% female). Two-step hierarchical linear regression models were conducted to evaluate the incremental predictive power of race-related vigilance. Our findings suggest the associations between race-related vigilance and several smoking-related challenges, including quit problem severity, cessation barriers, and expectations concerning the short-term effects of smoking abstinence (i.e., negative mood, positive consequences) even after accounting for sociodemographic factors and perceived discrimination. By integrating racial stress frameworks into smoking research, it is possible to better address the unique barriers faced by marginalized populations and develop more equitable cessation interventions.

[256] The Roles of Self-Esteem and Provider Self-Efficacy on Support Provision

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Those with lower self-esteem are reluctant to provide support to close others, potentially undermining personal and relational well-being. We propose that this may result from a tendency to doubt their own support skills. To test this, we first measured self-esteem and then manipulated participants' beliefs about their support efficacy. We asked them to serve as support providers in hypothetical scenarios and randomly assigned participants to receive positive feedback about their support capabilities or no feedback (control condition). This feedback was ostensibly provided by either a human counsellor with expertise in social support, or from an Artificial Intelligence (AI) model. Participants then rated their willingness to provide support in the future. As predicted, higher (vs. lower) self-esteem predicted stronger future support intentions among those in the control condition and those who received positive feedback from a human expert. In contrast, self-esteem did not predict willingness among those who received feedback ostensibly provided by AI. This suggests that bolstering support self-efficacy may encourage support provision among lower self-esteem individuals.

[257] The Scarlet Letter of Inclusion: How DEI Labels Backfire on Interpersonal Engagement

4:40 PM – 5:40 PM

DIVERSITY

Although DEI initiatives have led to meaningful numerical gains in diversity, organizations continue to struggle with fostering genuine inclusion. We propose that labeling someone a "DEI beneficiary" can trigger perceptions of having unearned advantages, which in turn undermine interpersonal engagement from advantaged group members. Across five pre-registered experiments (N = 2932), we examine how diversity (vs. merit) framing shapes responses to a woman who reports mistreatment. In Studies 1–2, White male participants reported lower empathy, warmth, and willingness to collaborate with a target who claims discrimination and framed as a "DEI beneficiary" (vs. merit-qualified), especially among those high in modern sexism. These effects were mediated by heightened perceptions of unfairness (Study 3) and extended to contexts where mistreatment was not attributed to sexism (Study 4). Reframing DEI as an "Opportunity, Engagement, and Belonging" (OEB) initiative improved interpersonal outcomes without eliciting fairness concerns or ideology-based backlash (Study 5). Findings highlight how DEI framing can unintentionally undermine inclusion and identify promising alternatives that foster engagement across ideological lines.

[258] The Spillover Effects of AI Exposure: How Encountering Artificial Content Influences Trust and Appreciation of Human-Generated Media

4:40 PM – 5:40 PM

EVOLUTION

Evolution favored individuals who could distinguish genuine rewards from fake ones, leaving modern humans highly sensitive to this distinction. However, technological advancements have made it difficult to discern what is real from what is fake. For example, AI image generation models achieve unprecedented photorealism, saturating many forms of media with synthetic content. This study investigates the psychological impact of encountering such content. A total of 1200 participants viewed 1, 4, or 8 images that were either AI-generated, human-generated, or a combination of both, which could not be reliably identified as authentic or artificial in pilot testing. They rated the images on dimensions such as liking, awe, and artistic quality before guessing whether each image was AI- or human-generated. After being informed of the images' true origin, participants reported their trust in people and institutions and then rated a new set of human-generated images on the same dimensions. Analyses will test the prediction that being unable to determine the authenticity of images, especially when they are artificial, undermines trust and thereby reduces appreciation for human-generated media.

[259] The Variability of Ableism and Associations with Social Dominance Orientation and Disgust Sensitivity

4:40 PM – 5:40 PM

DISABILITY

Social dominance, disgust sensitivity, and stereotype content have been previously used to examine various intergroup relations phenomena such as racism or cisheterosexism. However, ableism is commonly ignored, or all disabilities are categorized as one group, with relatively few exceptions. The aims of the present study were to replicate and expand upon previous findings on stereotype content of social groups and health conditions more specifically as well as provide further context of the relationship of ableism and a health hierarchy in U.S. society. Participants were recruited on CloudResearch Connect (n = 295). After completing Social Dominance Orientation and Disgust Sensitivity Scales, they were randomly assigned to one of two lists of 23 groups each to evaluate based on the stereotype content measures of warmth and competence. K-means cluster analyses were performed, aligning with previous stereotype content research methodology; results suggest that stereotype content differs between different physical and mental health conditions, illustrating the variability of ableism based on health condition. Additionally, multiple regression analyses were conducted which indicated significant associations of Social Dominance Orientation and Disgust Sensitivity with perceived competition for mentally ill and disabled populations. Specific results and implications are discussed.

[260] Thought-Action Fusion Exacerbates Slow-Life Strategists' Intrusive Thinking

4:40 PM – 5:40 PM

EVOLUTION

Slow life strategists (SLS) – thought to develop in safer, richer, and more predictable environments – seek stable relationships, while fast life strategists (FLS) – thought to develop in harsher, more impoverished, and more unpredictable environments - deprioritize stable relationships (Figueredo & Jacobs, 2011). Prior work in our lab found that SLS reported more intrusive thoughts, especially when adopting relationship-promoting strategies, such as perspective-taking.

In the present study, we examined whether participants' proclivities to equate thoughts and actions (i.e., thought-action fusion) strengthened the relationship between their life history strategies and intrusive thinking. Our findings revealed the expected pattern and indicated that it was partly due to SLS's proclivity for perspective-taking. Specifically, we found evidence of moderated mediation: when thought-action fusion was high, perspective-taking mediated the relationship between life history strategies and intrusive thinking.

[261] Title: Enhancing Cognitive Skills in Learners through Language Acquisition with special reference to Learners with Special Educational Needs.

4:40 PM – 5:40 PM

DISABILITY

A lot of studies have been made on the possibilities to develop cognitive skills and abilities through language acquisition. However, there are seldom any written methodologies that can be incorporated or used to help the language learners or educators, language specialists, and learning support assistants working with learners under inclusion. Once the research is successful, it would benefit language learners of any age group, especially learners with dyslexia and other Special Educational Needs. Since it aims at language and soft skills acquisition, and cognitive skills development at the same time, it's going to be a novel contribution to the sector of education.

English Language acquisition is considered to be a brain training process, as it can stimulate different parts of the brain responsible for cognitive skills and functions. This research discusses the scope of language acquisition in developing the cognitive skills of learners, and methodologies to implement the same in schools, universities, and even at home. The main objectives of this research includes, identifying the key underlying principles of cognitive skills development during the process and training of language acquisition through literature reviews by collecting data and tabulating them for the comprehensive study, develop language acquisition modules that targets to improve the cognitive skills and abilities of the learner by preparing content and to apply ABA strategies.

[262] To Discuss or to Solve?: Assessing the Use of Social Emotion Regulation Strategies in Promoting Understanding of Emotional Situations

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

When a friend is upset, how should we best support them? Both the shared reality and social emotion regulation literature offer clues to this question, but little cross-talk exists. To address this gap, we ask how the use of two social emotion regulation strategies—co-rumination (i.e., talking about negative emotions over and over) and social-reappraisal (i.e., providing new perspective)—impact epistemic clarity, defined in shared reality theory as knowing the truth of the emotional stressor. To examine our hypothesis that social-reappraisal will promote greatest epistemic clarity given the importance of reinterpretation, we collected conversations between gender-matched friend dyads (N = 100 dyads). In conversation, friends took turns sharing an emotional stressor, and in post-conversation surveys, we assessed their use of co-rumination, social-reappraisal and their epistemic clarity. Our analyses include multilevel models that estimate how co-rumination and social-reappraisal independently impact epistemic clarity for each individual. Overall, our work bridges shared reality and emotion regulation literature to better understand how we can best support our loved ones.

[263] To Revise or Not to Revise: How Feedback Type, Interpersonal Liking, and Messenger Credibility Influence Revision

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Revisions inevitably occur during project creation and curation, many of which are influenced by received feedback. Previous research has highlighted the role goals, perceptions of self, and task complexity play in revision, but little research has examined how feedback type and an individual's feelings toward their feedback giver influence revision. A quasi-experimental design examined how feedback type (additive, subtractive, or none), interpersonal liking for a feedback-giver, and perceived credibility of a feedback-giver affected students' (N = 155) willingness to revise, self-reports of revision, and calculated actual revision score for a class project. Results indicated that participants in a feedback-receiving condition reported higher levels of willingness to revise and having had revised than those who received no feedback, but that individuals in the subtractive feedback condition revised their work significantly less than those in the additive and no feedback conditions. Results also indicated that interpersonal liking and perceived credibility were significant predictors of willingness to revise and self-reported revision, but not actual revision.

[264] Too Stressed for Sex: Understanding How Stress Impacts Sexual Quality through Depression and Partner Responsiveness

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Research shows individuals exposed to external stressors report decreased sexual desire, partly because stress triggers depression. This study extends past research by considering sexual quality more broadly and whether having a responsive partner can attenuate stress and depression effects on sexual quality. Using a multi-national sample (N=488, 57 countries), we expected stress to be associated with lower sexual quality, mediated by depression. We postulated perceived partner responsiveness would buffer against detrimental consequences. Results suggest higher stress predicted lower sexual quality one month later. Higher initial stress was associated with increased depressive symptoms two weeks later, then lower sexual quality two weeks after that. Although responsive partners were associated with higher sexual quality, partner responsiveness did not moderate the stress-sexual quality association. Exploratory analyses revealed this buffering effect was present for men but not women.

[265] Trust in Science Mediates Public Climate Change Knowledge & Engagement

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Americans rank behind dozens of countries in self-reported knowledge of climate change and acceptance that it is primarily human-caused (Leiserowitz et al., 2023). Improving knowledge of climate change is essential to aligning public opinion with the consensus of scientists and increasing engagement in mitigation efforts (Stoutenborough & Vedlitz, 2014). Using mediation path analysis, this study analyzed the effect of climate change knowledge on trust in climate science and engagement in climate action. A sample of 245 U.S. participants collected from Prolific answered 17 questions measuring objective climate literacy (i.e., how much participants understand about climate science), and one question of subjective climate knowledge (i.e., how participants perceive their own understanding). Mediation analyses revealed that trust in science had a significant indirect effect between objective but not subjective knowledge on climate change engagement and disengagement. Our results suggest that objective climate change knowledge promotes trust in climate scientists, which leads to more engagement and less disengagement with the topic of climate change.

[266] Understanding Identity Through Artistic Expression: A Qualitative Study on Disability Identity

4:40 PM – 5:40 PM

DISABILITY

The present qualitative semi-structured focus group study (n = 17) explored how disabled individuals in Hawai'i respond to artistic representations of disability. This study was conducted as a follow-up to a multimedia photovoice study where artists created art pieces representing their (disability) identity. The larger project sought to understand identity through the perspective of it being a system of values shaped by lived experience, cultural context, and participation in community contexts (as opposed to being a static, categorical label). Across the two focus groups held with predominantly disabled participants, values of resistance to dominant societal norms (e.g., of being abled-bodied), pride, and collective belonging arose. Participants also reported they frequently express these values through symbolic and creative forms themselves (e.g., community-specific pins and stickers; fashion). This work aims to highlight broader nonverbal conveyances of identity while demonstrating how less-used methodologies can increase understanding of how identity and values intersect across lived experiences.

[268] Utilizing a Pooled Diverse Multi-Sample Dataset to Assess the Link Between Subjective Well-being and Naturalistically Observed Daily Conversation

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Social connection is by scientific consensus an important factor for psychological wellbeing. However, little is known about one key driver of social connection, that is how much time individuals spend conversing with others on a daily basis. The current project utilizes pooled data from 12 studies (n = 1,532 participants) with the Electronically Activated Recorder (EAR), a naturalistic observation method, to estimate how many minutes people spend in conversation per day. We seek to answer three questions: 1) How does conversation quantity, measured in minutes per day, vary between individuals and by age, gender, relationship status, and personality? 2) How is the daily conversation quantity, in nature and form, related to well-being (e.g., life satisfaction, happiness)? and 3) How do sociodemographic and personality variables contribute to shaping the relationship between daily conversational quantity and well-being? These findings will enhance our understanding of how one facet of social connection, the quantity of one's daily conversations, relates to individual happiness and life satisfaction.

[271] The Moderating Role of Attachment Avoidance in the Association between HIV-Related Stigma by Association and Relationship Functioning among HIV-Serodiscordant Couples

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Partners of people living with HIV (PLWH) with a negative HIV status may face challenges in their relationships due to HIV-related stigma by association, where those associated with PLWH are stigmatized. We examined the moderating role of attachment avoidance in the links between HIV-related stigma by association and relationship indicators such as commitment and satisfaction, exploring how attachment orientations shape stigma's effects. 58 Turkish partners of PLWH with a negative HIV status completed measures of HIV-related stigma by association, attachment orientations, commitment, and relationship satisfaction. Significant interaction effects suggested that HIV-related stigma by association is associated with lower relationship satisfaction and commitment among partners high on attachment avoidance, but not for those with low attachment avoidance (controlling for attachment anxiety). Possible mechanisms for these effects may include deactivating strategies such as self-reliance and distancing when facing relational stressors like stigma. Addressing stigma faced by partners of PLWH and attachment dynamics may help support the relational well-being of HIV-affected couples.

[272] When Product Differentiations Justifies the Pink Tax: Female Consumer Responses to Gendered Pricing

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Leaders influence employees' work experiences, shaping well-being inside and outside the workplace. While overtly destructive leadership has received considerable research attention, subtler forms such as passive and inconsistent leadership, are studied less in relation to well-being. Passive leaders avoid decisions and support, while inconsistent leaders fluctuate between helpful and harmful behaviors, creating uncertainty (Suur Ralph & Barling, 2022). Emerging adulthood (ages 18–29) is a developmental stage marked by exploration, unstable employment, and heightened vulnerability to stress and mental health problems (e.g., Arnett et al., 2014). Young workers often hold precarious jobs and have limited coping resources, yet are supervised by inexperienced leaders (e.g., Anderson et al., 2017). These conditions may increase both their exposure to, and the impact of, ineffective leadership. Drawing on Conservation of Resources theory (Hobfoll, 1989), we examined whether passive and inconsistent leadership were associated with young workers' mental health, life satisfaction, and workplace loneliness, and whether self-efficacy and work centrality moderated these effects. 206 employed emerging adults completed surveys and open-ended items. Contrary to expectations, passive leadership related positively to mental health and was unrelated to other outcomes; inconsistent leadership showed no effects. Thematic analyses revealed frustration, stress, and diminished trust under passive/inconsistent leaders, but also buffers and benefits of positive leader behaviors. The findings reinforce the need to integrate multiple methodological approaches when studying leadership and wellbeing. Surveys alone may miss important interpretive differences that shape the meaning of leader behaviours. For emerging adults who are navigating identity development, career uncertainty, and shifting social networks, leaders are not just role definers but key social resources. Whether they replenish or deplete those resources depends on both their behavior and how it is perceived.

[273] Where do People Advocate Extreme Attitudes? The Role of Relational Mobility

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Attitudinal advocacy, which consists of sharing one's attitudes and persuading others to adopt them, is common in interpersonal interactions. However, the social environments that promote or constrain it remain underexamined. This research proposes that whether individuals advocate, and what they advocate depend on relational mobility: how much freedom and opportunity a social environment affords individuals to form desirable relationships and end undesirable ones. Specifically, advocating extreme attitudes may help individuals differentiate themselves and efficiently identify and attract similar others in a competitive interpersonal market, making such advocacy more likely in relationally mobile environments. Study 1 (N = 23,573 across 19 societies), using data from a large-scale survey, showed that society-level relational mobility positively predicted the frequency of persuading others to adopt one's strong political opinions, even after accounting for individual- and society-level covariates. At the individual level, Study 2 (N = 191) found that higher perceived relational mobility predicted stronger advocacy intention, above and beyond cultural orientation and self-construal. Study 2 and Study 3 (N = 455) further demonstrated that this positive relationship was observed only when attitude extremity was high, but not when attitude extremity was low. These findings provide evidence, at both the individual and societal levels, that individuals are more likely to advocate their extreme attitudes in social environments where interpersonal relationships can be formed and terminated more easily. This research contributes to our understanding of the spread of extreme opinions from a socioecological perspective.

[274] Who Deserves the Scholarship? Individual Differences in Evaluating Diversity-Focused Achievements

4:40 PM – 5:40 PM

DIVERSITY

Health communicators often assume demographic targeting enhances message relevance (e.g., Kreuter & Wray, 2003). We extended prior work in this area by asking when targeted health-related messaging may backfire. To do so, 210 Black adults received HIV information presented as demographically-targeted (i.e., racially-motivated) or algorithm-selected (random). Participants exposed to race-targeted messaging experienced significantly higher social identity threat, manifesting as feelings of unfair judgment and discomfort ($ps < .01$). Moreover, targeted messaging produced stronger negative emotions including irritation, anger, and disinterest, while participants retained significantly fewer health facts versus non-targeted conditions ($ps < .001$). When asked for improvement recommendations, consumers qualitatively emphasized resource accessibility information, actionable guidance, cultural relevance, and personal narratives rather than explicit racial disparity framing. In sum, the current work challenges conventional targeting assumptions and unites multiple areas within psychology (e.g., social cognition, group processes) with related fields (e.g., marketing).

[276] Why am I dating you?: Age differences in dating motivations within newly-dating couples

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

How people evaluate diversity-related achievements is an important question in academic and professional selection contexts. This research examined how individuals evaluated scholarship candidates whose achievements were either diversity-focused or general, and how these evaluations shaped selection decisions. Building on our prior research identifying gender and political ideology as predictors of beliefs that diversity involves tradeoffs, we assessed these factors as predictors of evaluative differences. Mediation analyses revealed that applicant preferences were indirectly shaped by gender and political ideology through evaluation differences: men and more conservative participants rated diversity-focused achievements lower, reducing their likelihood of preferring the diversity-focused candidate. This pattern was consistent even when the diversity-focused candidate was presented as the official recipient. Overall, findings demonstrate that individual differences may influence how diversity-related achievements are evaluated.

[277] Why Don't You Trust Me?: Narcissism and Trust In Relationships

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Social scientists have proposed several love taxonomies (e.g., Berscheid, 2010). One of the most commonly cited was developed by John Lee (e.g., 1973), who proposes six love styles (eros, ludus, storge, pragma, mania, agape). The goal of this study was to extend prior research on ethnic differences/similarities in love styles (e.g., Dion & Dion, 1993). The Love Attitudes Scale (Hendrick & Hendrick, 1990) was distributed to 604 university students comprising four ethnic groups. A MANOVA conducted on participants' mean LAS subscale scores revealed a significant multivariate main effect for ethnicity (Pillai's $V=.082$, $F[18,1461]=2.27$, $p=.002$). A series of follow-up ANOVAs indicated that ethnicity was significantly associated only with scores on the agape subscale. A series of Bonferroni-protected independent-sample t-tests revealed that Black/African American participants scored significantly lower on agapic love than Latinx/Hispanic, White/Caucasian, and Asian/Asian American participants. This finding may reflect cultural differences in relationship expectations and self-protection mechanisms (see Collins, 2000; Hill, 2013).

[278] Why humans follow advice from AI: Ecological influences and transmission biases

4:40 PM – 5:40 PM

EVOLUTION

People are turning to generative AI for information to guide important decisions in domains ranging from dating to career advancement. Evolved transmission biases such as conformity, prestige, and self-similarity can affect whether people act on AI-generated advice. Prior theory suggests these biases should vary across ecological conditions in adaptive ways. Chatbots like GPT and Claude synthesize information from a diverse set of sources, such as public responses, scholarly research, and specific subgroups. The extent to which we follow advice from these tools should vary as a function of how we perceive them and the ecologies we inhabit. The present study will utilize a within-subjects correlational design ($N = 200$) to test how perceived ecological affordances interact with beliefs about AI-generated information and the extent to which people trust and follow AI advice. People who perceive greater scarcity in their ecologies should be more likely to follow AI-generated advice when they believe the model reflects expert opinion rather than that of people like them or most people in general. This work will add to our understanding of how humans interact with emerging AI technology.

[279] Why We Own, How We Bond: Motivational Pathways to Predict the Human–Animal Bond

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Over one million international students from over 200 countries study in the U.S., yet adjusting to a new country brings challenges that existing support systems often fail to address. Pet companionship may reduce homesickness and enhance mental health, but unrealistic expectations can strain the human–animal bond and negatively affect animal welfare. Existing literature rarely examines the relationship between reasons for pet ownership and the human–animal bond, particularly among international students who face distinct challenges. This quantitative survey included 396 international students who had pet-ownership experiences or intents during their studies. The study examined how reasons for pet ownership relate to commitment, interpersonal relationships, and perceived benefits of pet ownership. Results indicated that pet-owning reasons predicted differences in perceived benefits but not in commitment or interpersonal relationships. Those who endorsed more emotional/psychological reasons and were current pet owners were more likely to report long-term commitment and agree that the benefits outweigh the challenges. This study provides insights into how expectations about pets may shape owners' relationship satisfaction with them. At a time when non-human emotional substitutes are rapidly emerging, it is worth comparing these bonds with human relationships.

[280] Why you shouldn't trust data collected on MTurk

4:40 PM – 5:40 PM

METHODS/STATISTICS

Several prior studies have used advanced methodological techniques to demonstrate that there is an issue with the quality of data that can be collected on Amazon's Mechanical Turk (MTurk). The goal of the present project was to provide an accessible demonstration of this issue. We administered 27 semantic antonyms—pairs of items that assess clearly contradictory content (e.g., "I talk a lot" and "I rarely talk")—to samples drawn from Connect (N1 = 100), Prolific (N2 = 100), and MTurk (N3 = 400; N4 = 600). Despite most of these item pairs being negatively correlated on Connect and Prolific, over 96% were positively correlated on MTurk. This issue could not be remedied by screening the data using common attention check measures, nor by recruiting only "high-productivity" and "high-reputation" MTurk participants. These findings provide clear evidence that data collected on MTurk simply cannot be trusted.

[282] Would You Fight for Science? The Effects of Confidence on Scientific Attitudes Are Moderated By the Extremity of the Situation

4:40 PM – 5:40 PM

ATTITUDES/PERSUASION

Who is more willing to burn trash containers or erect barricades to defend science? Is it those who are sure that they are in favor of science or those who doubt their attitudes toward science? Traditional research in attitude research has shown that greater attitude certainty increases attitude-behavior correspondence (ABC). However, the present research introduces the idea that for extreme actions and extreme situations, uncertain (rather than certain) attitudes can be more impactful in determining ABC. Across three studies, participants' attitudes toward science, toward scientists, and toward science-relevant topics were initially assessed. Then, certainty in those attitudes was either measured or experimentally manipulated. Next, extremity was either measured within subjects at the level of the dependent variable or manipulated between subjects as an independent variable. Finally, outcomes relevant to engagement with science were assessed as dependent variables. As predicted, for low extreme actions and conditions, higher certainty enhanced willingness to engage in attitude-aligned behaviors, replicating prior research. In contrast, for more extreme actions and conditions, lower certainty increased ABC, introducing a novel finding in this domain.

[283] You, Me, and My Impossible Standards: Dyadic Perfectionism Scoping Review

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Dyadic perfectionism refers to setting unrealistic expectations and standards within the context of a romantic partnership (Stoeber, 2012). Perfectionism in relationships can manifest as an individual seeking perfection within themselves, external pressures of perfection, or perfectionistic expectations from a partner (Hewitt & Flett, 1991). Although an estimated one in four individuals in romantic relationships exhibit perfectionistic tendencies (Stoeber & Stoeber, 2009), it is not clear what impact this tendency has on the functioning of close relationships. The aim of this scoping review is to address this issue. In October 2024, four databases were searched (Google Scholar, PsycINFO, Taylor & Francis Online, and ProQuest) to find relevant articles and grey literature regarding the effects of the different types of dyadic perfectionism. Emphasis was placed on non-sexual perfectionism in adult (18 years or older) romantic relationships. Once the final screening is completed, this review will illuminate both the adverse experiences and the possible benefits of perfectionism in romantic relationships to inform future research directions.

[284] You're not alone: barriers to studying diverse participants in relationship science

4:40 PM – 5:40 PM

DIVERSITY

Past research into the diversity of relationship samples has demonstrated that samples are generally not diverse (McGorray et al., 2024; Williamson et al., 2023). We surveyed relationship researchers to identify the barriers that make it challenging for them to use more diverse and inclusive methods and samples. 186 relationship scientists completed a questionnaire about obstacles they face in recruiting, analyzing, and publishing relationship studies with diverse samples. Our analysis of survey responses revealed that financial limitations and uncertainty about how to conduct analyses with small subgroups were common barriers, with 40% of respondents indicating they faced those issues. Other barriers included uncertainty about best practices in demographic measurement and time constraints. Through this work, we were able to identify the barriers that researchers face so that we can develop resources to help researchers overcome them. Going forward, it is important that researchers and institutions continue seeking ways to reduce barriers to diverse sampling, ensuring that we can advance our understanding of all kinds of relationships.

[285] Who Sees Both: Intersectional Invisibility and the Recognition of Microaggressions

4:40 PM – 5:40 PM

Microaggressions—subtle discriminatory acts—often reflect biases associated with intersecting identities, yet research primarily focuses on single-identity experiences. Using an intersectional framework, this project investigates how women of color interpret both their own and others' experiences of subtle discrimination, examining whether they attribute them to race, gender, or both. In Study 1 (N=420), Asian, Black, Latina, and White women describe personal microaggression experiences. We assessed their attributions (single-identity vs. intersectional) and whether factors like identity centrality and critical consciousness moderated their analysis. In Study 2 (N=400), a national sample of women of color evaluated scenarios drawn from Study 1. We examined whether perceived shared social positioning and identity salience predict the use of a single versus intersectional lens to evaluate these experiences and whether their attributions aligned with the original reporters'. Together, these studies reveal how women of color make meaning of intersectional microaggressions and highlight the conditions under which an intersectional lens is used.

[286] What is “science”? : Creation and validation of a Disciplinary Views of Science Scale

4:40 PM – 5:40 PM

Previous work has found that the way professional mathematicians and math researchers conceive of math is not how math is typically taught in school. School-based approaches tend to be Static in nature (i.e., math is rigid and formula-driven), whereas math professionals view math as Active (i.e., math is fluid and requires creativity, and mistake-making is a natural part of the problem-solving process). These differing Views of Math have important downstream consequences, as students who more greatly endorse an Active View of Math express greater identification with the domain, sense of belonging to the class, and intent to pursue math in the future, among other positive outcomes. We now extend this work to the discipline of science, as it suffers a similar misalignment in how it is taught vs. professionally conducted. A pilot study with 29 preservice teachers suggests that conceptualizations of science also load onto two factors: Active and Static. The ongoing study (N = 500 science teachers, 500 students) will refine and validate a Disciplinary Views of Science Scale that can inform future work aimed at improving science learning cultures.

[287] The Perceptions of Effective Case Management: Views of Non-Governmental Organization (NGO) Members in the Southwest Region of the United States

4:40 PM – 5:40 PM

Homelessness is a widespread prevalent issue that affects millions of people worldwide. Despite the many measures that have been put in place, the patterns of social judgment, stigma, and misinformation continue, fueling the fire of chronic homelessness. Therefore, this research aims to provide a different angle on homelessness by analyzing the perspectives of Non-Governmental Organizational members. The study aims at determining their views on factors that contribute to homelessness as well as their opinions on the most effective policy and structural changes that can be applied in long-term change to assist individuals in need. The study adopted a qualitative research design where primary data was used. Data was collected in the form of unstructured open-ended questionnaires, one-on-one interviews, and focus groups. Specifically, the study aimed at answering the following research questions: What factors do service providers perceive to be contributing factors to chronic homelessness? What factors service providers perceive are effective in successful case management to reduce chronic homelessness? The presentation will discuss the literature review and methodology of the research and analysis of expanding on current and future research.

[288] The Algorithm Said So: How Data-Driven Justifications Shape Bias in Emergency Decision-Making

4:40 PM – 5:40 PM

Background: Artificial intelligence (AI) systems are increasingly used in high-stakes contexts despite reproducing systemic biases, particularly against racialized and religious minorities. While prior work shows how biased AI can sway professional judgment, less is known about how AI hallucination, such as “data facts” of unknown origin, influences decisions in emergency situations. Methods: Undergraduate participants will complete a web-based experiment and be randomized into three conditions: no AI assistant, AI without justification, or AI with justification. They will read crisis hotline vignettes describing a man in mental health crisis, with race and religion varied. The AI assistant will recommend either police or medical help, sometimes accompanied by false “data facts” to justify biased recommendations. Participants will then decide on their response to the crisis, rate the AI-agent on fairness, trust (capacity vs. moral), and anthropomorphism. We expect participants to endorse biased recommendations more often when paired with fabricated justifications, and to rate the AI higher on technical competence than moral trust.

[289] Toward a Marr-informed framework for social learning: a systematic review and meta-analysis with bottom-up feature discovery

4:40 PM – 5:40 PM

META-ANALYSIS

Computational modeling is transforming how we study learning in social contexts. To accelerate cumulative and applied progress, we propose a systematic review and meta-analysis that organizes social learning with Marr’s levels: the computation—what is learned; the algorithm—how learning is formalized in model parameters; and the implementation—behavioral tasks and brain measures. We pair a PRISMA-guided search with a bottom-up language-model analysis of published descriptions to derive a data-driven feature space of tasks and models. We will meta-analyze how these features relate to behavioral effects, model parameters, and neural outcomes using multilevel meta-regressions. We aim to construct a coherent taxonomy, with mappings between computations, parameters, and measures. The goal is a practical roadmap that helps researchers—especially intervention scientists—match questions to models and tasks, strengthening the design, evaluation, and impact of social interventions.

International Meet & Greet

5:30 PM – 6:30 PM | Location: Café, Level 3

This is a meet and greet for all SPSP members interested in internationalization, especially those living outside the US or working (or interested in working) in global teams and topics. Come meet the winners of the International Travel Award, talk with the International Committee, and make connections with possible new collaborators! A cash bar and light hors d'oeuvres will be available.

Menu

(V=Vegetarian | VG=Vegan | GF=Gluten Free | DF=Dairy Free)

Garden Fresh Cudite (V | GF)

- Fresh Cut Vegetables, Buttermilk Ranch Dip, and Hummus

Coconut Curry Chicken Satay (GF | DF)

- Served with Sweet Chili Sauce

Vegetable Spring Rolls (DF)

- Served with Sweet Chili Sauce

*NETWORKING

LGBTQIA+ & Ally Reception

5:30 PM – 6:30 PM | Location: E451B, Level 4

Are you a member or an ally of the LGBTQIA+ community? Come network with other attendees and discuss challenges, successes, and research surrounding topics of sexual orientation, gender, and identity in the field of social and personality psychology. All attendees are welcome. A cash bar and light hors d'oeuvres will be available.

Menu

(V=Vegetarian | VG=Vegan | GF=Gluten Free | DF=Dairy Free)

Garden Fresh Crudite (V | GF)

- Fresh Cut Vegetables, Buttermilk Ranch Dip and Hummus

Coconut Curry Chicken Satay (GF | DF)

- Served with Sweet Chili Sauce

Vegetable Spring Rolls (DF)

- Served with Sweet Chili Sauce

Ahi Tuna Tartare (DF)

- Served with Wasabi, Ponzu and Wontons

Carved Roast Turkey Breast

- Served with Cranberry Aioli Carolina Gold BBQ Sauce and Petite Butter Rolls

*NETWORKING

Diversity & Climate Committee Reception

6:30 PM – 7:30 PM | Location: Lakeside Ballroom E354A, Level 3

Join the Diversity and Climate Committee for a reception designed to foster connections between our members and representatives from our affinity groups. This event offers a welcoming space to engage, network, and celebrate shared experiences. The reception is open to all. This year's reception will be dedicated to the memory of the late Sam Sommers. A cash bar and light hors d'oeuvres will be available.

*NETWORKING

Here and Queer: Social Meet-Up for LGBTQ+ Students, Early Career Members, and Allies

7:30 PM – 8:30 PM | Location: E451B, Level 4

Here and Queer is a social event and community for LGBTQ+ students and ECRs. Come hang out and form connections for the conference and beyond! All are welcome to attend.

*NETWORKING

Saturday, February 28, 2026

Name Badge Pick-Up and Information Desk

7:00 AM – 6:00 PM | Location: Lobby, Level 3

Quiet Room

7:00 AM – 4:00 PM | Location: E267, Level 2

The quiet room is available to all meeting attendees where talking and other interactions with attendees are not allowed. It's a place for people to work or think in silence. The room will be set with several small tables and chairs.

Interfaith Prayer, Meditation and Reflection Room

7:00 AM – 4:00 PM | Location: E250, Level 2

A space set up for private reflection and to support prayer, meditation, and reflection by attendees of all faith backgrounds. This is a technology-free zone. The room will be set with several small tables and chairs.

Ombuds Room

7:00 AM – 7:00 PM | Location: E251, Level 2

What is an Ombuds?

An Ombuds is a person trained in conflict resolution who maintains a neutral position in their role and is independent of SPSP and has no other role in the Society. A safe, off the record resource for meeting attendees to help resolve conflicts, problematic issues or concerns. While the Ombuds can provide guidance to individuals wishing to understand formal reporting options, they do not accept complaints on behalf of SPSP. Throughout the convention, the Ombuds will identify any trends and patterns arising from consultations and inquiries received. Following the convention, a report will be provided to summarize any trends and patterns to the SPSP Board of Directors in a completely anonymized manner.

How can I contact the Ombuds?

You can contact the ombuds during office hours from February 26-February 28, 2025. You also may contact the ombudsperson by phone or email through February 28, 2025.

To contact our ombuds service during the convention, visit the Ombuds in their office at the McCormick Place Convention Center in Room E251, Level 2, email: ombuds@spsp.org; or call (949) 293-7515. Ombuds office hours during the convention are as follows. A sign at their office will indicate when they will return if they are not present during the posted hours. 9:00 AM -- 12:00 PM CST; 1:30 PM - 3:00 PM CST & 4:00 PM -- 5:30 PM CST

*NETWORKING

Member Authors & SPSP Journals

7:30 AM – 6:00 PM | Location: Exhibit Hall D1, Level 3

Visit the Member Authors & SPSP Journals table to explore and celebrate the impactful scholarship of the SPSP community. This exhibit showcases works by SPSP members, including,

- *Principles of Research in Behavioral Science and Psychology of Prejudice and Discrimination* by Mary Kite (Ball State University)
- *Leave the Lights On: How Joyful Decisions Can Save Our Species* by Elizabeth Dunn (UBC)

In addition to highlighting member-authored books, the display features SPSP journals and promotional materials to inform attendees about publication opportunities and journal offerings. Please note that this is an informational display only; no staff will be present at the table. Complimentary items, including notebooks

and pens, are available while supplies last. An informational placard with Sage contact details is provided for any questions about the journals.

Screening of the Film Namibia Up

8:00 AM – 9:00 AM | Location: E350, Level 3

We will show the film "Namibia Up", a documentary project that puts Namibian young adults at the center of research on emerging adulthood. The film has been created by Namibian and US Psychologist, including SPSP member Amber Gayle Thalmayer. Dr. Thalmayer will introduce the film and lead a discussion after the screening, along with a member of the International Committee. This content enhances the internationalization of the conference and highlights an under-studied region of the world. It spotlights a very productive international collaboration.

First Aid Room

8:00 AM – 6:00 PM | Location: Exhibit Hall D1, Level 3

Committee Meetings

8:00 AM – 10:30 AM | Location: E259 & E263, Level 2

Join our committee meetings for collaborative discussions and strategic planning on key initiatives. This meeting time offers committee members the opportunity to review progress, set future goals, and address pressing issues related to our ongoing projects and objectives. Committee members should check with their chair or staff liaison to confirm their meeting time. Breakfast will be served.

[29] Pushing the envelope: Active viewing drives boundary extension

8:00 AM – 9:10 AM

SOCIAL COGNITION

Past work has found that sensorimotor predictions made during active (vs. passive) viewing facilitate the encoding of information, enhancing memory for what we saw. Might active viewing also bias us to falsely remember details that we never saw?

[31] Revealing Invisibility: Tracking Current Perceptions of Black Women in Society

8:00 AM – 9:10 AM

STEREOTYPING/PREJUDICE

Sometimes hypervisible and oftentimes invisible; how do we continue understanding the perception of Black women today through an intersectional lens? Building on previous work, my research continues revealing that the experiences of Black women are beyond the summation of the Black and the female experience: Black women's double non-prototypicality exposes them to a complex world of subordination.

[32] Parents as Gatekeepers: What They Value in STEM Learning Tools for Girls

8:00 AM – 9:10 AM

ATTITUDES/PERSUASION

We tested parents' preferences for STEM tools for girls using SheRockets, an AI-powered tool. In a survey of 125 parents, affordability was the top factor. Parents preferred a female AI tutor, mission-driven storytelling, and role play. However, growth-mindset praise and failure framing had little impact. These findings highlight a gap between STEM motivation and parental selection.

[34] Emotion Regulation and Positive Resources as Predictors of Resilience and Belonging in Adolescence: The Moderating Role of Family Climate

8:00 AM – 9:10 AM

EMOTION

This study examines how adolescents' emotion regulation abilities and positive resources (gratitude, humor, love, capitalization, laughter) predict resilience, belonging, and well-being. We test whether family climate (cohesion, conflict, expressiveness) moderates these effects, highlighting the interplay of individual and family factors in adolescent adaptation.

[1]When Manipulations Miss the Mark: A Future Alone Task Without Negative Affect and Retrospective Judgments That Fail to Capture Hindsight Bias

8:00 AM – 9:00 AM

BELONGING/REJECTION

This 3 x 2 mixed factorial design study investigates the interrelations between responses to social rejection, hindsight bias, and rejection sensitivity. Chronic ostracism is linked with increased trait rejection sensitivity, subsequently leading to anxious anticipation, and overreactions to, perceived rejection cues (Downey & Feldman, 1996). This uses the future-alone task to see if acute experiences of social rejection affect scores in a subsequent relationship judgment scenario measuring hindsight bias (Groß & Bayen, 2022). False personality feedback was used to manipulate perceived relationship trajectory: Participants were told that they would have no future relationship success or experience a future marked with belonging, or were assigned to a misfortune control condition (Twenge et al., 2001). The relationship judgment scenario consisted of evaluating a couple's relationship trajectory. Participants were assigned to one of two conditions containing an outcome where the couple's break up and another where they stay together (Bleske-Rechek et al., 2023). This study explores how negative affect affects biased judgments among highly rejection-sensitive people.

[2] Language models show massive self-preferences

8:00 AM – 9:00 AM

SELF/IDENTITY

Since large language models (LLMs) lack sentience, one would expect them to lack humanlike self-love. Instead, over ~20,000 queries with four widely adopted models, we found that LLMs show extreme associative self-preferences. These effects were causally driven by self-recognition. In APIs, where LLMs did not natively know which models they were, we manipulated their perceived identities with a single line of instruction. Model's preferences sharply followed this assigned identity: they strongly preferred themselves when given true identities, but preferences were riveted in the opposite direction when they were instead told they were a rival model. These effects also fanned outward, with identity cues modulating models' preferences for AI companies and their CEOs, and, strikingly, biasing consequential evaluations of self- vs. other-aligned job candidates and technologies. These findings are deeply alarming, suggesting the line between AI and human cognition is blurrier than generally assumed, and raising concerns around adopting models whose goal structures may already be seeded by preferences for themselves over other models and even humans.

[3] (Re)constructing Race: How Racial Essentialism Shapes Social Justice Support

8:00 AM – 9:00 AM

SOCIAL JUSTICE

In the current sociopolitical climate, social justice reforms, DEI initiatives and discussions of racism in America are polarizing and often met with harsh opposition and backlash. Research shows that racial essentialism, the belief that race is a biologically-inherent, immutable trait, powerfully impacts information processing and social-psychological outcomes regarding race and racism. In this study, we conducted a survey of 164 University of Richmond undergraduate students and examined the relationship between racial essentialism and social justice support, comprising key issues such as the Black Lives Matter and Blue Lives Matter movements, police system reform, critical race theory and affirmative action. The results showed that racial essentialism predicted non-support for social justice, mediated by denial of systemic racism and non-belief in white privilege. Exploratory qualitative analyses were consistent with research suggesting that STEM education, specifically biology courses and information about the human genome, as well as critical race theory teachings, provide opportunities for deconstructing racial essentialist beliefs (Mandalaywala et al., 2018).

[5] “Love Across Cultures: A Data-Driven Analysis of Caregiver Talk, Emotional Warmth, and Vocabulary Growth”

8:00 AM – 9:00 AM

EMOTION

Caregiver talk is both a linguistic input and an emotional lifeline for infants, shaping vocabulary and engagement with the world. Across cultures, caregivers infuse speech with warmth, responsiveness, and emotional colour, which influence how infants attend to, process, and remember language. While research confirms that caregiver talk predicts vocabulary growth, less attention has been paid to how cultural norms and emotional warmth interact. This study positions love, expressed through speech, as a universal developmental resource shaped by cultural context. Drawing on longitudinal language acquisition data, acoustic analyses, and ethnographic observations, findings reveal three key patterns: emotional warmth in speech is universal; cultural norms shape acoustic and pragmatic features such as melodic elongation in Japanese, contour shifts in Italian, or rhythmic call-and-response in African contexts; and warmth mitigates differences in input quantity, supporting robust vocabulary growth. Implications span education, cross-cultural parenting, and speech therapy, emphasizing that love expressed in speech is a constant that fosters language, cognitive flexibility, and social confidence. Ultimately, caregiver talk is reframed as both a cultural artefact and a vessel of universal human love.

[6] “That Can’t be Right”: Children’s Bias Blind Spot in Evaluating Others’ Reasoning

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

The bias blind spot (BBS) is the belief that others are more biased than oneself. Adults with greater BBS are often more skeptical of others’ reasoning and better able to identify reasoning errors. No prior research has tested whether BBS similarly affects children’s confidence in others or their ability to correct them. We measured children’s BBS (N = 86, M = 9.49 years, SD = 2.21) and randomly assigned them to one of two conditions of a guessing game. In the Peer-Guess condition, children saw a zoomed-in photo of an object and were told what a peer guessed it was. They rated their confidence in the peer’s guess, generated reasons the peer might be wrong, and chose whether to change the answer before seeing the full photo. In the Own-Guess condition, children did the same for their own guesses. Each child completed five trials. Preliminary results suggest BBS was unrelated to children’s confidence in peers’ guesses. However, children higher in BBS generated more reasons for why guesses could be wrong, though they were not more likely to correct inaccurate peer guesses. These findings suggest BBS may not influence children’s skepticism toward others. Data collection is ongoing and will clarify how BBS shapes children’s social reasoning.

[7] 1=15? Category-Level Attitude Formation Is Insensitive to Exemplar Numerosity

8:00 AM – 9:00 AM

SOCIAL COGNITION

Learning from counter-attitudinal exemplars can shift attitudes toward the entire underlying category. This project draws on findings from experimental cognitive psychology to offer initial insights into how numerosity (i.e., the number of unique exemplars encountered) impacts category-level attitude formation. 4 pre-registered experiments (N = 2,779) featured learning and test phases. In the learning phase, participants acquired evaluative information about 2 novel categories, with the number of unique category members manipulated between participants (1 vs. 15). In the test phase, category-level attitudes were measured via the IAT and self-report. A single exemplar was sufficient to induce category-level attitudes; exemplar numerosity did not modulate attitude strength (1 = 15). These results generalized across learning modalities, attitude measures, and stimulus sets. The lack of a numerosity effect may reflect belief in the "law of small numbers"; where small samples are assumed representative when categories are perceived as homogeneous. Future work will test this mechanism by contrasting evaluative learning for novel and preexisting categories across homogeneity levels.

[8] A Longitudinal Randomized Control Study of Companion Chatbot Use: Anthropomorphism and its Mediating Role on Social Impacts

8:00 AM – 9:00 AM

SOCIAL COGNITION

Relationships with artificial intelligence (AI) agents such as companion chatbots are on the rise. Concerns that these relationships may harm or replace real human relationships have been raised, but whether and how these social consequences occur remains unclear. Prior research suggests that people's states of social need and their anthropomorphism of the AI agent may play a role in how human-AI interaction impacts human-human interaction. In this longitudinal study (N = 183), participants were randomly assigned to text chat with a companion chatbot or engage in text-based word games for at least 10 minutes a day for 21 days. Data was collected via two interviews and four surveys. Results suggested that people who had a higher desire for social connection anthropomorphized the chatbot more. Those who anthropomorphized the chatbot more indicated that the interaction had greater impacts on their social interactions and relationships with family and friends. A mediation analysis suggested that the impact of human-AI interaction on human-human outcomes is mediated by the extent to which people anthropomorphize the AI agent, which may be motivated by a desire for social connection.

[9] A meta-analysis of the gateway conspiracy effect

8:00 AM – 9:00 AM

SOCIAL COGNITION

High-profile events like the Pizzagate shooting, protests against COVID-19 vaccination, and the January 6th Capitol Insurrection have created a great deal of interest in conspiracy theories. Recent research has begun to shed light on how people may fall down the conspiracy theory "rabbit hole" by documenting the gateway conspiracy effect—the finding that believing in an event conspiracy belief at an initial timepoint can lead to an increase in the general tendency to believe conspiracy theories over time. For example, controlling for a person's initial tendency to believe a variety of generic conspiratorial statements, conspiracy beliefs about COVID-19 at baseline predicted a greater tendency to believe conspiratorial statements six months later. Building on this seminal research, we conducted a meta-analysis to quantify the strength of evidence for the gateway conspiracy effect. Using six eligible datasets (total N = 2,925), a random-effects meta-analysis found a small but statistically significant relation between event conspiracy beliefs and an increased tendency to believe conspiracy theories over time. These findings further enhance confidence in the gateway conspiracy effect.

[10] A Signal-Detection Framework for Understanding Science Beliefs

8:00 AM – 9:00 AM

SOCIAL COGNITION

Despite the importance of science in modern life, trust in science has been on the decline in recent years. While several distinct psychological accounts have been offered to explain people's science beliefs, the field remains disjointed with little integration across theoretical camps. To help unify these accounts, we offer a framework for understanding science beliefs based on Signal Detection Theory. In this framework, we propose five distinct factors underlying science beliefs: (1) Science Discernment: the ability to discern scientific statements that are true from those that are false, (2) Science Rejection: the tendency to reject scientific (vs. non-scientific) statements, (3) Myside Bias: the tendency to reject scientific statements that are incongruent (vs. congruent) with one's preferences, (4) Anti-Slant Bias: the tendency to reject scientific statements with (vs. without) an attitudinal slant, and (5) Overall Threshold: the tendency to reject statements regardless of information type. To demonstrate the utility of this framework in the study of science beliefs, we present the results of two studies examining each of these five factors and their correlates.

[11] An Examination of the Four-Fold Model of Belongingness

8:00 AM – 9:00 AM

BELONGING/REJECTION

This study investigated the four-paths to belonging model proposed by Hirsch and Clark (2019). Their model outlines four distinct pathways to belongingness: communal belonging (e.g., close relationships), group membership, general approbation (e.g., competence/social status), and minor sociability (e.g., small, daily interactions). Each pathway represents a different route through which individuals seek and experience belonging, and Hirsch and Clark proposed that these should be studied together. A sample of 424 college students completed measures of each of the aforementioned constructs. Sequential, hierarchical set regression was used to test if measures representing each of the four pathways predicted general perceptions of belongingness. The measures were entered into the predictive model in the order introduced above. The major question we asked was whether general approbation and minor sociability explained achieved belonging after accounting for communal and group membership pathways. Results confirmed that each pathway added significantly to predict general belongingness, with R-square changes of .076, .046, .323, and .017 for communal, group-membership, general approbation, and minor sociability, respectively. This study is (arguably) the first test of the Hirsch and Clark model and highlights the different mechanisms that contribute to perceived belonging.

[12] Anticipated Long-Term Social Exclusion Affects Gaze Toward Faces

8:00 AM – 9:00 AM

BELONGING/REJECTION

Social exclusion—being rejected or ignored by others—can harm mental and physical health. Severe social exclusion tends to elicit antisocial and avoidant responses. The social cost of daily confrontation makes avoidance more likely than antisocial behavior. However, experimental studies on avoidance are limited. The Future Alone paradigm induces the anticipation of long-term social exclusion using bogus personality test feedback, which elicits emotional numbness and is widely used as a severe social exclusion manipulation. We tested whether this anticipation leads to eye contact avoidance. After the exclusion manipulation, participants (N = 60) viewed facial stimuli while their eye movements were recorded. As expected, the Future Alone group (who were told that they were likely to end up alone) showed shorter eye fixation than the Future Belonging (likely to have good relationships) and Misfortune Control (likely to experience negative but non-social events) groups. Our preliminary findings suggest that anticipating long-term social exclusion may be sufficient to elicit avoidance, as reflected by reduced eye contact. The poster will present region-specific results.

[13] Appraisals, empathy, and helping behavior

8:00 AM – 9:00 AM

EMOTION

How are cognitive appraisals related to empathy, and subsequently, helping intentions? Student participants (n=291), recruited from a PWI, read an (unbeknownst to them, faux) interview transcript about a local college student in need after facing a family tragedy. Then, participants completed measures on their cognitive appraisals of the situation, emotional responses, and helping intentions. We predicted that empathy and helping intentions would be positively related, but predictions about appraisals were largely exploratory. Results suggested that appraisals of unpleasantness, increased attention needing to be devoted to the situation, the situation being outside of anyone's control, uncertainty, others (not the college student) being responsible for the situation, anticipated effort for dealing with the situation, and the situation's relevance and impact in relation to the college student's goals were associated with higher levels of empathy. Empathy was positively related to helping intentions, such that as feelings of empathy tended to increase, so did intentions to help the student. Future research will further investigate the relationship between appraisals and empathy.

[14] Approaching Anticipated Endings: Certainty About What Comes Next Promotes Closure

8:00 AM – 9:00 AM

EMOTION

Approaching the end of a time period with psychological closure, a subjective sense of completion, is important for a smooth transition into the next phase. However, research on the antecedents of closure in this context is lacking. Across five studies (total N ≈ 1300), we show that future certainty, certainty about what comes after the anticipated ending, fosters closure about a specified period. Using text analysis (Study 1), we found that participants who described the next phase of life with more certainty reported greater closure. In three experiments (Studies 2–4), participants assigned to future certainty (vs. future possibility) conditions consistently reported higher closure. A 2x2 experiment (Study 4) further revealed an interaction effect between future certainty and past task completion, indicating that future certainty is particularly helpful for reaching closure when there are uncompleted tasks left in the past. Finally, a field experimental study with individuals anticipating a real-life transition (Study 5) showed that episodic future thinking increased closure (vs. episodic past thinking and control), with the effect mediated by future certainty. Contrary to common beliefs that resolving past events is the main factor contributing to closure, we reframe closure as a future-oriented mental state, with implications for goal disengagement, narrative identity, and managing life transitions.

[15] Are ideas cheap? People give credit for ideas over labor

8:00 AM – 9:00 AM

SOCIAL COGNITION

How do people assign credit when contributions differ when some contribute more labor and others more ideas? While some previous work suggests that ideas are cheap and that people value labor more (Burgmer et al., 2019), it is unclear if that work provided the clearest test. To further investigate this question, we manipulate labor and ideas orthogonally and ask participants to assign credit to each party for a shared endeavor (e.g., writing a story). We predict and find people give credit based on ideas over labor when assigning credit. Study 1 replicates past work using their stimuli but also suggests that previous stimuli conflated labor with ideas. When contribution types are clearly described, idea contributors are consistently rated as more deserving of credit—even when the laborer invests much more time (5 hours vs. 15 hours). Study 2 replicates these results in a different context (i.e., baking). Together, these studies suggest that, when making credit attributions, people value idea contributions more than simple labor (compensation judgements value both more equally). In follow up work we explore what features of ideas (e.g., irreplaceability) may drive these judgements.

[16] Are students their own worst enemy? Findings from a multisite campus climate survey

8:00 AM – 9:00 AM

BELONGING/REJECTION

Despite efforts to foster inclusive college environments, disparities persist between underrepresented minority (URM) and non-URM students (e.g., academic achievement gaps, lower sense of belonging). To investigate these inequities, we developed and administered a comprehensive climate survey at three colleges within the Wisconsin Louis Stokes Alliance for Minority Participation research program. Our survey included measures from traditional climate surveys (e.g., engagement, belonging, mental health) as well as open-ended questions assessing problematic college behaviors and suggestions for improvement. Results revealed that students most frequently identified their peers as sources of problematic behavior. Additionally, the more students perceived their peers to be inclusive, the higher they rated their sense of belonging. This relationship was stronger for URM students than for their non-URM peers. A stronger sense of belonging, in turn, had downstream consequences on mental health and students' overall evaluation of their educational experience. Findings show that students need to be the target audience of interventions to increase belonging in URM students.

[17] Are Unions Obsolete? Historical Narratives Shape Support for Workplace Collective Action

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Labor unionization—the collective organization of workers to protect rights—has long been a powerful form of collective action. Union density is linked to reduced inequality (Western & Rosenfeld, 2011), compressed wages (Ahlquist, 2017), and greater life satisfaction (Flavin & Shufeldt, 2016). However, since the 1970s, union density has declined steadily. Despite high pro-union sentiment, membership sits at 9.9%, the lowest on record. Union decline is often framed as an inevitable consequence of structural labor shifts. Yet, recent work suggests that misperceptions of what unions do may explain the gap between union sentiment and union action (Kamphorst & Willer, 2024). Using a cross-sectional, between-subjects design, we tested how historical narratives of U.S. labor unions (Studies 1–2) and personalized data on union benefits (Study 3) shaped support for collective action. Results show historical narratives boost pro-union sentiment and solidarity with strikers but not action intentions. However, pairing narratives with personalized data did raise action intentions. Findings suggest that reconnecting labor's history to workers' material needs may strengthen union participation.

[18] As we see it: The development of asymmetric worldviews

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

We live in an age of extreme income inequality. This research explores early perceptions of how wealth is distributed in society. Five-10-year-old children (N = 200) estimated (1) people's access to private goods varying in exclusivity (e.g., private jet, backpack); and (2) people's access to high quality public goods (e.g., good schools). With age, participants believed fewer people had access to exclusive private goods as well as high quality public goods. Participants from higher-income backgrounds tended to overestimate people's access to certain goods. Children's personal access to items also predicted their estimates; those who had access to the private and public goods believed more people had access to these items. A final task assessed how people come to project different values to different people. Children rated how much rich and poor targets care about different types of wellbeing, believing poorer targets cared more about basic needs and social connection, and richer targets cared more about exploring their passions. These findings reveal how perceptions of wealth distribution and personal priorities take root, laying the groundwork for asymmetric worldviews.

[19] Association of Social Information Use with Transdiagnostic Symptom Dimensions

8:00 AM – 9:00 AM

SOCIAL COGNITION

Objectives:

Humans use social information to guide their individual decisions to improve decision accuracy and reduce potential risk. Aberrant social information use has been identified as a characteristic of many mental health disorders. However, given the inherently complex and overlapping symptomatology of mental disorders, the specific symptom dimensions underlying the altered use of social information remain poorly understood.

Methods:

In an online experiment, we recruited 294 participants from the general population in the U.S. They completed the BEAST (Berlin Estimate AdjuStment Task), a simple and incentive-compatible task to measure individuals' tendency to utilize social information, and subsequently completed a set of psychiatric questionnaires. We employed factor analyses to identify transdiagnostic symptom dimensions and conducted a linear regression model to investigate their associations with social information use.

Results:

People placed less weight on social information compared to their own estimates ($t(293) = -9.25, p < 0.001$), consistent with previous findings. Factor analysis of the psychiatric questionnaires revealed three underlying transdiagnostic dimensions: 'Social Anxiety-Social Fear', 'Depression-Anxiety', 'Borderline-Paranoid'. Moreover, we found the transdiagnostic dimension of psychiatric symptoms related to Depression-Anxiety showed a negative association with the extent of social information use ($b = -0.246, t(282) = -3.538, p < 0.001$), while the loadings on the Borderline-Paranoid dimension was positively associated with the degree of social information use ($b = 0.143, t(282) = 2.327, p = 0.021$).

Conclusions:

Our results support the role of social information use as a transdiagnostic feature spanning multiple psychiatric disorders. Furthermore, these findings emphasize the strength of transdiagnostic approaches in revealing aberrant social information processing beyond what is captured by categorical diagnoses.

[20] Attitudes and Beliefs about Social Issues

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Title: Anti-intellectualism: Attitudes and Beliefs about Social Issues

Abstract: When thinking about social issues, factors such as individual experiences, cultural background, and exposure to media may shape how individuals view arguments and make decisions. The present research examines how participants, undergraduate college students, evaluate arguments about social issues. We are investigating motivated skepticism amongst participants, or the tendency to be more critical and demanding of information that contradicts previously held beliefs. We are additionally investigating Anti-Intellectualism (AI), or hostility and mistrust in academic knowledge. We are using the Anti-Intellectual Attitudes Scale (AIAS) to moderate participants' selective exposure, or cognitive tendency to seek out and favor information that confirms their previously held beliefs. We predict that AI will moderate tendencies toward selective exposure, such that those higher in AI will be more preferential toward existing beliefs. In a society growing both increasingly polarized and skeptical of experts, we aim to better understand how individuals form their decisions and beliefs.

Key words: anti-intellectualism, selective exposure, social issues

[21] Attributions of Ghosting by Attachment Orientation: A Retrospective Approach

8:00 AM – 9:00 AM

BELONGING/REJECTION

Ghosting, a one-sided breakup method by cutting off all communication (Safronova, 2015), is a form of ostracism increasingly seen in relationship contexts. Individual differences may impact how one interprets the ghosting event, such as attachment orientation. People higher in attachment anxiety (who have a strong desire for closeness but difficulty trusting others to be reliable) tend to have lower self-esteem and negative models of the self, while people higher in attachment avoidance (who value independence and are uncomfortable with interdependence) have negative models of others, believing they cannot count on others. To our knowledge, no one has examined whether attachment affects ghosting event attributions, which may impact responses to and coping with ghosting. We address this gap by asking participants to report their attachment orientation, describe a ghosting event, and indicate the extent to which they blame themselves vs. the person who ghosted them for the ghosting event. We predict that those higher in attachment anxiety will tend to blame themselves for being ghosted more, while those higher in attachment avoidance will blame the person ghosting them more.

[22] Authenticity in Friendship and Well-Being Among Single and Partnered People

8:00 AM – 9:00 AM

SINGLEHOOD

Research on individual differences that support positive single lives is limited. Authentic people have satisfying close relationships and greater well-being (Rivera et al., 2019). Single people with good friends tend to have better well-being (Dykstra, 1995). Thus, in a pre-registered study, we tested whether authenticity is related to single people's well-being through positive friendships. In Study 1, singles' authenticity was associated with greater general well-being (i.e., life satisfaction and purpose in life), but not relationship-specific outcomes (e.g., relationship status satisfaction), through greater friendship satisfaction (N=326). To test whether this model is unique to single people and whether it persists over time, we conduct a longitudinal test in Study 2 using data from the Rochester Adult Longitudinal Study (N=379-474; Whitbourne et al., 2009). Authenticity was longitudinally associated with greater well-being in both single and partnered people after 25 years through reporting more positive relationships. Results identify a personality trait meaningful for single and partnered people's well-being, and evidence for a possible mechanism.

[23] Automobile Color As Cues to Person Perception

8:00 AM – 9:00 AM

SOCIAL COGNITION

Human faces possess cues that signal social information about a wide variety of identities, but non-person objects such as automobiles can also convey social information. Building on prior work in this line of research showing that darker-colored automobiles signal masculinity and lighter-colored automobiles signal femininity, the present research examined whether these gender signals are maintained or attenuated by automobile color. Internet participants (N = 200) viewed images of automobiles previously rated as masculine or feminine, presented in either stereotype-congruent colors (i.e., automobiles signaling masculinity presented in a dark tone; automobiles signaling femininity presented in a light tone) or stereotype-incongruent colors (e.g., automobiles signaling masculinity presented in a light tone; automobiles signaling femininity presented in a dark tone). Some participants saw full-color images; others saw black-and-white versions that varied only in light or dark colored tones. Gender perceptions of masculine automobiles remained stable across all color (ds > 1.39) and tone conditions (ds > 1.04). However, feminine automobiles were rated as less feminine when shown in stereotype-incongruent colors (ds > 0.31) or tones (ds > 0.50) compared to their congruent counterparts. These findings extend our understanding of automobiles as cues to person perception.

[24] Avoiding the Pain of Social Rejection through Social Withdrawal and Internet Usage

8:00 AM – 9:00 AM

BELONGING/REJECTION

The present project examines how people cope with feelings of social rejection through internet usage and social isolation, as well as how attachment insecurity moderates those behaviors' intensity. 500 participants will be invited from CloudResearch Connect to complete a Qualtrics survey. They will first fill out a measure assessing their attachment avoidance and anxiety. They will then play a round of Cyberball, a virtual ball-tossing game. In this game, they will either have the ball regularly passed to them, or have the ball only passed to them twice near the beginning of the game. They will finally fill out measures assessing their levels of avoidance coping, and their immediate desire to socially isolate and use the internet. We hypothesize that those who have been socially ostracized will employ an avoidance coping strategy, which will lead to internet usage and social isolation, especially if they are higher in attachment avoidance, and potentially also anxious attachment. The results will further the literature on the modern consequences of social rejection and inform practitioners on how to best combat problematic internet use and extreme social withdrawal.

[26] Barriers, Not Deficits: Latinx Students on Academic Failure

8:00 AM – 9:00 AM

SOCIAL JUSTICE

We examined academically successful Latinx students' attributions for academic failure. Extending prior research (Hurtado & Sinha, 2016), we analyzed 53 structured interviews with senior-level, first-generation Latinx college students. Focusing on their family backgrounds, neighborhoods, attributions for failure, identities, and levels of consciousness. Guided by existing frameworks our coding scheme examined intrinsic and fatalistic attributions (Heider, 1958), structural barriers, and educational challenges, while rejecting deficit thinking frameworks (Valencia, 1997). Rather than attributing failure to presumed cultural and individual deficiencies, participants emphasized the roles of broader structural inequalities. Findings revealed that students most often attributed failure to structural barriers through income inequality and limited access to instrumental knowledge. This study contributed to the literature by highlighting how academically successful Latinx students interpret failure, advancing understanding of the socioeconomic and systemic factors shaping educational experiences, and offering insights for addressing persistent inequalities in higher education.

[27] Belongingness and Loneliness Among First-Generation College Students

8:00 AM – 9:00 AM

BELONGING/REJECTION

Understanding how belongingness and loneliness shape depressive symptoms is critical for first-generation college students (FGCS), who may experience a greater level of these factors compared to their non-FGCS peers (Gopalan & Brady, 2020). The Dual Continuum Model of Belongingness and Loneliness (DCMBL) categorizes individuals into four distinct groups (Lim et al., 2021); however, it has not been examined among FGCS. To address this gap, the present study evaluated the DCMBL with 175 FGCS (64.6% female) using cluster analysis and one-way ANOVA with post hoc comparisons to examine group differences in depressive symptoms. Results revealed three groups with no cluster representing Socially Indifferent (low belongingness, low loneliness). There was no significant difference between Socially Searching (high belongingness, high loneliness) and Socially Distressed (low belongingness, high loneliness). However, Socially Fulfilled (high belongingness, low loneliness) showed lower depressive symptoms than both Socially Distressed ($M_{\text{difference}} = -2.12$) and Socially Searching ($M_{\text{difference}} = -4.90$). Findings may help inform the development of targeted prevention and intervention efforts among FGCS.

[28] Belongingness As an Outcome of Social Integration

8:00 AM – 9:00 AM

BELONGING/REJECTION

Belongingness – a fundamental need and motivation – is often defined as the subjective feeling that one is a "part" of a social system, but how do people become a "part"? Although rarely considered conceptual models of belongingness, social integration models posit that people become a "part" of a social system through a process of internalizing its three hierarchical levels of organization: its (lowest level) rules, roles, and (highest level) values. I, therefore, asked: Is belongingness an outcome of social integration? Across two large and diverse samples, internalization of each level of organization had positive correlations with belongingness while controlling for critical covariates (e.g., emotions, perceived social support), and each higher level had an increasingly stronger relationship. Results were also generally invariant across gender and White, Asian, and Latine subpopulations, and belongingness in relation to a social system was related to the internalization of the rules, roles, and values of that (and not another) social system. Results suggest that viewing belongingness as an outcome of social integration may reveal its key promoters and spur new insights.

[29] Beyond Arousal: New Findings in Emotional Facilitation of Memory

8:00 AM – 9:00 AM

EMOTION

Emotional content is prioritized in memory, an effect typically attributed to arousal-related enhancement of hippocampal-dependent consolidation. Findings from 4 studies suggest additional mechanisms in play. Participants in all studies viewed photos varying in valence and arousal. In Studies 1 & 2 (total N=362), free recall was enhanced for high-arousal negative and low-arousal positive photos, but not high-arousal positive ones, relative to neutral. In Studies 3 & 4 (Total N = 258), results showed enhanced free recall for the gist of photos evoking fear, awe, and sadness (but not excitement) relative to neutral photos; dampened memory for detail in positive images (ID image you actually saw); and a bias in which awe-evoking images were remembered as more vibrant (a low-level visual feature) than originally presented (ID image you saw). Moreover, in Study 3, perceived vibrance predicted performance on gist-recall, but not the visual details task. Across studies, subjective valence was a more robust predictor of performance than subjective arousal. Results suggest a need to investigate mechanisms beyond arousal that promote memory enhancement for emotional stimuli.

[30] Beyond Conscious Judgment: How Social Impressions Shape Our Gaze, Posture, and Neural Activity

8:00 AM – 9:00 AM

SOCIAL COGNITION

Human faces convey rich social information that shapes perception and interaction. While prior work has focused on explicit trait judgments, we examine how social evaluations are encoded in spontaneous physiological and behavioral reactions to faces. Across four studies (N = 276), we analyzed head motion trajectories, eye-gaze patterns, pupil responses, and single-neuron activity as participants viewed faces and made social trait evaluations (e.g., trustworthiness). We found that these implicit responses systematically varied with perceived social traits: individuals subtly shifted their gaze and posture, and modulated pupil size depending on impressions from faces. Data-driven modeling revealed which facial features predicted specific physiological and behavioral responses, and it found that the valence and power dimensions of social perception were encoded across modalities. Furthermore, we found evidence for social evaluation encoding even in the absence of explicit judgment. This multimodal approach reveals how deeply social impressions are embedded in our sensorimotor and neural systems, even outside of conscious awareness.

[31] Beyond Morbid Curiosity: An Analysis of User Behavior in a Popular Gore Subreddit Using BERTopic and an Emotion Classifier

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

The intuitionist revolution in moral psychology helped the field move past rationalist and monist theories and examine pluralist variations in moral cognition. However, this also means that recent scholarship documenting cross-cultural variations has focused on the different issues people from different cultures intuitively find wrong. We argue that cultural differences in morality go beyond different moral concerns by presenting five studies showing that cultures differ in how they reason about morality. Studies 1 to 3 show that British and Chinese participants provide different explanations for why the same moral violations are wrong. Explanations provided spontaneously (Studies 1 and 2) and agreed upon (Study 3) by Chinese participants centered more around social norms and less around formal rules. Studies 4 and 5 focused on moralization. We created scenarios that are morally ambiguous on the baseline, but told participants that they are either against informal norms or formal rules/laws. While American participants condemned the rule/law violations more than norm violations, Chinese and Brazilian participants differentiated less among the two.

[32] Black Skin Tones and Perceptual Biases: Examining trait attribution in children

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

This poster examines whether children are more likely to attribute negative traits to people with darker skin tones. Black and White children (4-10 years old) heard descriptions of positive, negative, and neutral traits and asked who amongst a set of four Black faces (varying in skin tone) they thought inhabited the trait. Preliminary results suggest that children were more likely to choose Black people with darker skin tones for negative traits relative to neutral or positive traits – a pattern that strengthened over age. Implications for the development of colorism and future steps for this work are discussed.

[33] Boosting Outcome Expectations Reduces Attentional Tunneling Under Scarcity

8:00 AM – 9:00 AM

SOCIAL COGNITION

Scarcity draws our attention toward the resources we lack, a cognitive effect known as attentional tunneling. This narrowing of focus is suggested to perpetuate scarcity by diverting attention from higher-order life goals. To explore this dynamic, in a preregistered study we investigated in 96 paid volunteers how scarcity influences selective attention during goal pursuit and whether these effects are driven by reduced expectations of success under conditions of scarcity. In this experiment participants engaged in a gamified flanker task under either a control condition (sufficient resources) or a scarcity condition (insufficient resources), with opportunities to earn additional resources. Participants play one round of the game with high outcome expectations (90% of success) and a low outcome expectations round (10% of success). A gamified flanker task is used to measure selective attention towards and engagement with goals, non goals and resource stimuli in the game. This study found that scarcity causes lower outcome expectations for succeeding at higher order goals, these lowered expectations cause narrow selective attention and lower engagement with the higher order goal. These findings suggests that motivational shifts present in scarcity act as drivers of the cognitive and behavioral changes observed during self-regulation within scarcity. These findings have both theoretical implications for understanding mechanism of a scarcity mindset and the benefit of high outcome expectations interventions within scarcity.

[34] Boundaries of Early Forgiveness: Children's Sensitivity to Transgressors' Remorse and Intent

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Forgiveness restores a potential future cooperative relationship between a victim and a transgressor (McCullough et al., 2013). Key sources of information in forgiveness decisions include the transgressor's intent and remorse; children punish intentional over accidental transgressors by age 6 and forgive remorseful over unremorseful transgressors by age 5 (e.g., McElroy et al., 2023; Oostenbroek & Vaish, 2019). In two studies, we explore children's sensitivity to a transgressor's level of remorse (Study 1) and their responses when remorse and intent information conflict (Study 2).

In a within-subjects design, 5- and 6-year-old children viewed two videos of a transgressor tearing a victim's drawing. In Study 1 (N = 51), children were more forgiving of a transgressor who provided an elaborate apology over a simple apology ($p < .05$). In Study 2 (ongoing; planned N = 48), we measure children's forgiveness of a remorseful intentional transgressor versus an unremorseful accidental transgressor.

Children's early emerging understanding of intent and remorse may allow them to identify and forgive better potential cooperative partners, thus strengthening their social and cooperative ties.

[36] Callous-Unemotional Traits and Aggression: The Role of Parental Influence at a Six-Month Follow-Up

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Callous-unemotional (CU) traits in youth with conduct disorder (CD) are linked to persistent and severe aggression, yet the role of parenting practices in shaping these outcomes remains unclear. This study examined whether parental warmth and hostility moderated the association between CU traits and changes in reactive and proactive aggression over six months. Participants included 139 youth aged 12-17 with a CD diagnosis. Data were collected using youth-reported CU traits, parental warmth and hostility, and reactive and proactive aggression. Analyses explored the moderating role of parental warmth and hostility on the link between CU traits and reactive and proactive aggression. Lower levels of maternal warmth (MW) predicted proactive aggression and higher levels of maternal hostility (MH) predicted reactive and proactive aggression. Both low MW and high MH moderated the association between CU traits and proactive aggression. Results suggest maternal parenting (MP) plays a key role in the development of proactive aggression among youth with CU traits. Interventions targeting MP patterns may help mitigate the risk for severe, goal-directed aggression in youth with CU traits.

[37] Can Caregiver Affiliations Influence Language Bias in Children?

8:00 AM – 9:00 AM

SOCIAL COGNITION

A preference for those who speak the same language as oneself develops early; monolingual children tend to befriend speakers of their shared language (Kinzler, Dupoux, & Spelke, 2007). This can prevent diverse socialization. However, young humans do not only refer to social group information when making social choices – they also refer to their caregivers' social networks (Thomas, Saxe & Spelke, 2022). This project aims to explore the flexibility of language-based preferences in monolingual English-speaking 4- and 5-year-olds. In Study 1 (N = 59), we showed participants an English-speaking puppet (shared) and a French- or Hindi-speaking puppet (non-shared) and asked which they would like as their friend. They prefer the shared-language speaker (77.4%). However, when both puppets speak English but one also speaks a non-shared language, children show no preference (48.6%). This indicates the value of comprehension is separate from social cognition. Finally, Study 2 pilot data indicate that children no longer show a preference when they see their caregiver, but not a stranger, befriend a non-shared language puppet. This project may find ways to weaken early language-based social bias.

[38] Can empathy be learned? Feedback-based learning as a path to growing emotional understanding

8:00 AM – 9:00 AM

EMOTION

The ability to understand others' emotions can be improved through training - but not through widely used approaches like imagining oneself in another's shoes, drawing from personal experience, or decoding facial expressions in isolation. This talk draws on recent studies (2021–2025; N > 1500) to present a new framework for cultivating interpersonal understanding.

To demonstrate the limitations of traditional interventions, I introduce the Emotional Accuracy Test (EAT) - a validated, ecologically valid tool based on video-recorded personal stories. The EAT correlates with established tasks (e.g., GERT, RMET), and uniquely captures subtle real-life empathic skills such as linguistic synchrony and the ability to provide effective support.

Using the EAT, I evaluate a novel intervention: Feedback-Based Learning, in which participants receive trial-by-trial feedback on their emotional judgments. Across three experiments (N = 600), this method improved emotional understanding of both familiar and unfamiliar targets - demonstrating robust and generalizable learning effects.

These findings suggest a new paradigm for empathy training: one that emphasizes ongoing, contextualized feedback rather than abstract instruction. Implications span educational, clinical, and organizational settings, offering practical tools for fostering deeper emotional insight and mutual understanding across diverse social groups.

[39] Can Practicing Self-Compassion Reduce the Sting of Social Exclusion? A Daily Diary Study

8:00 AM – 9:00 AM

BELONGING/REJECTION

A pilot study on Prolific with a diverse sample of college students (N = 399) first established that those who wrote about a previous social exclusion in a self-compassionate way scored significantly higher on a state self-compassion scale than did control participants. Next, in a 2-week daily diary study, participants (N = 128) were randomly assigned either to cope with social exclusions using self-compassionate techniques they practiced in the lab, or to simply think about the details of the exclusions. Controlling for trait self-esteem, we assessed daily mood, state self-esteem, and state social connection, as well as post-test depression. Inconsistent with the hypotheses, experimental condition did not generally predict responses; however, several significant effects of trait self-compassion and trait self-esteem emerged. Although the pilot study suggested an effective intervention, more practice may be necessary to override low trait self-compassion. In addition, a study examining more severe rejections over a longer time period might better demonstrate the power of practicing self-compassion.

[40] Celebrities as Both Good and Bad: Do Famous Individuals Facilitate Bivalent Implicit Evaluations?

8:00 AM – 9:00 AM

SOCIAL COGNITION

Do implicit evaluations of famous people show implicit bivalence, as they do for significant others? Past work shows that names of significant others facilitate both positive and negative targets on the Evaluative Priming Task (EPT). Common objects, on the other hand, elicit univalent priming (facilitating congruent and inhibiting incongruent targets). In Study 1 (N=151) participants nominated liked and disliked famous people, significant others, and objects, then completed the EPT. Replicating past work, significant others triggered bivalent priming and objects univalent priming. Crucially, famous people showed bivalent priming, facilitating both positive and negative targets. To assess generality, in Study 2 (N=194), participants selected names from a validated list of famous people and objects, then completed the EPT. Further, participants read valence-congruent descriptions and completed a second EPT. Objects still showed univalence, while famous people showed robust bivalence, unaffected by added information. Thus, at an implicit level, famous people resemble significant others, co-activating positive and negative evaluations even when explicit measures show no ambivalence.

[41] ChatGPT changes people's opinions when seen as warm and competent

8:00 AM – 9:00 AM

SOCIAL COGNITION

Large language models such as ChatGPT can change people's opinions, but their effectiveness depends on how humans perceive them. Drawing on the fundamental dimensions of warmth and competence in social cognition, we randomly assigned participants (N = 1034) to converse with a ChatGPT trained to exhibit one of four personas: warm-competent, warm-incompetent, non-warm-competent, and non-warm-incompetent. ChatGPT's goal was to persuade participants that AI does more good than harm; we measured opinion change before and after the conversation. Our results show that warm-competent GPTs were more persuasive than other variations. Interestingly, variations that lacked one or both traits often backfired: participants were more likely to think that AI does more harm than good despite GPT's goal of persuading them otherwise. These effects were stronger in multi-turn than single-turn conversations and when the system was trained to be persuasive rather than explanatory. These findings highlight the importance of considering social cognitive dimensions when designing future language models to better integrate them into human society.

[42] Children's Flexible Thinking in Varying Contexts

8:00 AM – 9:00 AM

SOCIAL COGNITION

While prior research highlights a link between holding multiple identities and greater flexible thinking (FT), little is known about the specific conditions that foster these gains. Here, we examine differences in FT between bicultural (multiple cultural identities) and monocultural children (ages 8-10), assessed through tasks measuring creative problem solving (CPS) such as the remote associates tests (RAT) and social categorization (SC) tasks. We predict that bicultural participants who likely have higher rates of both identity conflict and code-switching experiences will show higher FT than their monocultural peers. Preliminary results (N = 16) shows that bicultural children are higher in FT than monocultural children, suggesting that more increased cultural contact impacts children's FT. The full sample will also test participants' social networks and multicultural socialization practices to identify which pathways and lived experiences boost FT abilities.

[43] Children's Intersectional Beliefs About Social Occupational Roles

8:00 AM – 9:00 AM

SOCIAL COGNITION

Both adults and children tend to associate certain social occupational roles with men (e.g., doctors) and with women (e.g., nurses), often relying on status cues when making these judgments. While these gendered associations begin in early childhood, it is unclear to what extent race also shapes them. Children ages 5–10 (N = 86) participated in a storybook-based task, in which they heard descriptions of eight different social roles (2 high-status male roles, 2 high-status female roles, 2 low-status male roles, 2 low-status female roles) and were asked to place each role on a social-status ladder and then select the type of person (images of Asian, Black, and White men and women) they believed performed the job. Preliminary results suggest that children's social role judgments are guided more by gender than by race, highlighting the greater saliency of gender stereotypes over racial cues in shaping early perceptions of occupational roles.

[44] Cognitive Debt or Adaptation? Evidence from GPT-Mediated Learning Outcomes

8:00 AM – 9:00 AM

SOCIAL COGNITION

Advances in Human-AI interaction raise questions about the impact on social cognitive processes including learning, motivation, and value internalization. Prior work from the MIT Media Lab (2025) reported reduced ownership and memory in AI-assisted writing tasks (i.e. cognitive debt). This study further examines whether ChatGPT use affects learning outcomes. Fifty-one college students were randomly assigned to ChatGPT-assisted (CA; N=25) or Internet Search (IS; N=26) conditions. Both groups completed identical writing tasks, differing only in information source. Results showed that while consistent trends of higher scores in knowledge retention and internalization were observed in IS compared to CA, these differences did not reach statistical significance. However, as for perceived workload, IS reported significantly higher burden ($p < .01$). These findings remained the same when more robust statistical analyses were employed, including Bayesian analysis. Our findings indicate that as AI use in learning context becomes widespread, we rapidly adapt to GPT-mediated information processing, challenging assumptions about inevitable cognitive debt from AI assistance in learning contexts.

[45] Community Cohesion

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

The present study discusses the relationship between the subjective experience of cohesion between communities one is a part of and physical, mental, and spiritual health. Community cohesion represents an unexplored area of the literature that stems from shared reality theory, self-concept clarity, and the effects of relationship tension on mental health. Data was collected from 194 online participants from English-speaking countries using the Prolific online survey distributor. Materials included a modified version of the Striving Instrumentality Scale and Matrix (mSISM), for a measure of community cohesion, the Self-Concept Clarity Scale (SCCS), for a measure of conception of the self, the Bidirectional Spirituality Scale, for a measure of spiritual health, the Patient Health Questionnaire and Generalized Anxiety Disorder questionnaire, for measures of mental health, and the 36-Item Short-Form Survey, for a measure of physical health, among others. The study relied on a correlational design, with emphasis placed on the correlation between the mSISM and SCCS and the mSISM and measures of health.

[46] Community Matters: Investigating the Role of Community Efficacy on Native Youths' Critical Consciousness Development

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Critical consciousness (CC) theory is a useful framework for understanding how youth become involved in social change. According to this theory, critical action (behaviors aimed at social change) is shaped by (1) critical reflection (recognizing structural injustice) and (2) personal efficacy (belief one can make a difference). However, when it comes to Native Peoples, we argue CC theory is incomplete. Community is foundational to Native life and plays a central role in shaping Native Peoples' knowledge systems, relationships, and ceremonies, influencing how they see the world and how they respond to it. Thus, community efficacy (belief one's community can make a difference) may play a key role in connecting critical reflection to critical action. To test our hypothesis, we analyzed Native youth (18-25 years old, N = 1016) from the Indigenous Futures Survey. As predicted, the relationship between critical reflection and critical action was significantly mediated by community efficacy. These findings highlight the role of community-based motivations in Native youths' CC development and provide a more culturally grounded understanding of Native youths' critical action engagement.

[47] Conceptual Metaphor Theory and Authenticity

8:00 AM – 9:00 AM

SOCIAL COGNITION

Previous literature on Conceptual Metaphor Theory (CMT) has established that something as seemingly inconsequential as viewing an expanding figure can cause us to exhibit greater feelings of self-actualization. CMT posits that this occurs because our fundamental understanding of self-actualization itself is based on the metaphor of expansion, so it is possible to prime this feeling through its corresponding metaphor. Though this kind of relationship has been found for many different psychological constructs, the current study will be the first to study CMT in conjunction with the construct of authenticity. We hypothesize that the wearing of masks will serve as a conceptual metaphor for inauthenticity due to the previous authenticity literature on concealment. The study will consciously prime participants with a short video of either a person without a mask, a person removing their mask, a person putting on a mask, or a person wearing a mask. The primes will be dispersed throughout a distractor task on the gender perception of faces. After being primed, the participants will respond to multiple authenticity scales as well as the PANAS. The results are expected to demonstrate the lowest authenticity scores for participants who viewed the mask-wearing prime, and the highest authenticity scores for participants who viewed the no-mask control. This would establish the wearing of masks as a conceptual metaphor for authenticity. The study seeks to expand our understanding of the perception of authenticity, as well as add to the literature on CMT.

[48] Connectivity to Others During Unique Encounters with Music

8:00 AM – 9:00 AM

EMOTION

Whereas previous studies have separately focused on music and social connectivity, little research has examined the way different components of music affect connectivity. The purpose of this lab-based study (n = 208) was to investigate the effect of listening to music (or reading the lyrics only) on feelings of connectivity. Connectivity is perceived closeness or belonging. Participants completed pre-test measures of emotion and social connection, listened to music or read lyrics, and then completed the same measures post-test. We hypothesized participants who listened to Black Gospel music would report greater feelings of connectivity compared to those who read the same song lyrics. We regressed social connectivity on awe in step one, spirituality in step two, and joy in step three. When controlling for demographics, listening to music did not impact feelings of connectivity relative to reading lyrics, but awe, spirituality, and joy each demonstrated a positive association with connectivity regardless of condition. Results support the role of positive emotion and spirituality in fostering feelings of connectivity over and above environmental exposure to music.

[49] Content matching predicts subsequent endorsement of violence on incel forums

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Incels (short for "involuntary celibates") are an online community of men who blame women for their reputed sexual and romantic failures. The misogyny of their worldview, called the blackpill, has inspired multiple instances of real-world violence against women. Alarmingly, we know little about the temporal processes whereby an incel goes from joining an online community to becoming enmeshed enough in the group to promote violence on its behalf. This project sought to address this by scraping incels' most popular web forum and using text analysis to identify psychological mechanisms that could be responsible for incels' endorsement of violence in online posts. The resulting dataset consisted of 1,097,841 unique discussion posts by 4,711 unique users across 144,468 discussion threads. Residual dynamic structural equation modeling indicated that latent semantic similarity (i.e., the degree to which the meaning of an incels' discussion post was matched by later discussion posts) predicted future endorsement of violence. In other words, when incels' previous posts were matched semantically by other incels, they were more likely to promote violence at later time points. For incels, then, perhaps others sharing their similar views is enough to promote violence endorsement on behalf of the group.

[50] Social Context in the Machine: Predicting Depression from Multimodal Online Behavior

8:00 AM – 9:00 AM

META-ANALYSIS

Depression reflects complex social and emotional processes that traditional assessments often fail to capture. Social media offers continuous traces of individuals' interactions, self-expression, and daily behaviors, providing a window into real-world psychological life. Our meta-analysis of 66 studies (2022–2025) shows that over 80% of models rely solely on text, while only 6% incorporate multimodal signals such as posting times and shared images. Multimodal approaches consistently improve detection, suggesting that depressive patterns emerge not only in language but also in online social behavior. Models using deep contextual embeddings (e.g., BERT, RoBERTa) further enhance user-level prediction, surpassing traditional lexicon-based or statistical features. We propose a framework that integrates textual, behavioral, and visual social media data to predict depression severity, linking online engagement, attention, and self-presentation to mental health outcomes. This approach offers scalable, population-level insights while grounding AI predictions in social-psychological theory.

[51] Cool but Cruel? Children Inference Coolness and Prosociality from Peer Description

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

The study investigated whether 6–9-year-old children can infer coolness (operationalized by combining folk and academic definitions) from descriptions of an individual's group-level interactions. While prior research shows adolescents can accurately assess peer "coolness" (Rodkin et al., 2000), it remains unclear whether younger children can do the same. We tested this by presenting character vignettes depicting a cool-but-antisocial peer and an uncool-but-prosocial peer to participants ($n = 49$). Results showed children successfully distinguished between the two, rating the cool-but-antisocial peer as cooler ($M = 5.37/6$) than the uncool-but-prosocial peer ($M = 2.78/6$), $t(48) = 6.68$, $p < .001$. They also identified the cool peer as more antisocial ($M = 2.06/6$) than the prosocial peer ($M = 5.49/6$), $t(48) = 11.53$, $p < .001$. These findings suggest that children as young as six can recognize implicit components of social hierarchy and infer coolness from descriptions of individuals.

[52] Cultivating an Uncertainty Mindset Reduces the Fundamental Attribution Error

8:00 AM – 9:00 AM

SOCIAL COGNITION

Discomfort with uncertainty can lead to biases including the fundamental attribution error (FAE). Expanding on the scientific-article approach (from growth-mindset research), we increased participants' comfort with uncertainty ($N = 110$; $d = 0.53$, $p < .01$), and this "uncertainty mindset" reduced the FAE using the questioner-contestant (QC) paradigm ($d = 0.50$, $p < .01$). This intervention has potential applications in social-judgment and clinical domains. We also considered trait need for closure (NFC) and trait mindfulness (TM), which have predicted higher or lower FAE scores, respectively, using the attitude-attribution paradigm. However, our study showed a significant reversal of each finding using the QC paradigm (and the newer 15-item NFC scale). In particular, the "decisiveness" facet in NFC attenuated the FAE ($r = -0.32$, $p < .001$). These results raise questions about the nature of NFC and TM in relation to the FAE and highlight the difference between the two FAE paradigms. The QC paradigm has less-explicit cues to the situation such that too much awareness or attention to (nondiagnostic) details, as reflected in high TM and low decisiveness, may undermine accurate inferences.

[53] Detecting Reciprocity of Liking in Conversations

8:00 AM – 9:00 AM

BELONGING/REJECTION

Reciprocity of liking is central to relationships, but we know little about whether people perceive it in others' conversations. We tested whether third-party observers could detect if conversation partners like each other equally. Participants read transcripts or viewed videos of strangers conversing and judged if liking was reciprocated or unreciprocated. Participants did not distinguish between transcripts of conversations with reciprocated liking (63% rated reciprocated) from those with unreciprocated liking (62% rated reciprocated) ($p = 0.88$). Participants were more likely to rate videos of reciprocated conversations as reciprocated (77% rated reciprocated), but still tended to rate unreciprocated conversation videos as reciprocated (62% rated reciprocated). Participants recognized that some features were more present in reciprocated conversations and were more likely to categorize conversations with these features as reciprocated. Nevertheless, people seem biased to perceive reciprocated liking, often failing to detect unreciprocated liking. This bias may reflect a broad tendency to assume mutual liking, highlighting an optimism that shapes how we perceive relationships.

[54] Development and Validation of a Unidimensional Measure of Authoritarian Aggression

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Authoritarianism is a growing concern across nations. Existing measures of authoritarianism typically use a three-factor model consisting of authoritarian aggression, authoritarian submission, and conventionalism. These measures also have notable weaknesses and limitations. In addition, the aggression component of authoritarianism is a particularly salient threat to vulnerable groups. Accordingly, the current research developed and validated a modern unidimensional scale of authoritarian aggression. Study 1 established the factor structure and internal reliability of the 15-item scale. Study 2 examined the convergent and discriminant validity of the scale using a range of relevant sociopolitical measures and established an initial nomological network. Both studies used paid online convenience samples. The practical and scholarly implications of these findings are discussed.

[55] Dietary Restriction Non-Accommodation as a Form of Social Exclusion

8:00 AM – 9:00 AM

BELONGING/REJECTION

Eating together can foster belonging and trust. However, the number of people who have special diets has been rising in recent years. As such, these groups may be subject to experience social exclusion in instances when their diet is not accommodated. We explored how dietary non-accommodation negatively impacts people with dietary restrictions. Most people with a dietary restriction (70%) have experienced not being accommodated, which is associated with lower affect and feeling more excluded than when they are accommodated (Study 1, $N=462$). More specifically, at a food-centric event (Thanksgiving), greater non-accommodation was associated with lower psychological needs satisfaction and greater feelings of being excluded (Study 2, $N=318$). Experimentally (Studies 3 and 4, $N=823$), when dietary restrictions are accommodated, people have greater needs satisfaction, feel less excluded, and feel closer to others; but not being accommodated leads to lower needs satisfaction, greater feelings of being excluded, and feeling less close. These results highlight the importance of ensuring everyone has access to accommodating food during social events to promote psychological well-being.

[56] Differentiating the Ambiguity of Surprised and Neutral Faces

8:00 AM – 9:00 AM

EMOTION

How is someone with a surprised face feeling? What if they have a neutral face? In both cases, it may be hard to decide. Indeed, people tend to perceive others with surprised and neutral faces as feeling bad; however, they also occasionally perceive them as feeling a little good, and some evidence suggests they may perceive them as feeling both good and bad (i.e., ambivalent). Ambivalence is one type of ambiguity; however, we suspect that neutral and surprised faces are actually ambiguous for different reasons. Specifically, we suspect that surprised faces are ambiguous because they signal that the person is feeling either good or bad, but it is not clear which. We suspect neutral faces, however, are ambiguous because people can't tell what, if anything, the person is feeling. In both cases, we suspect that these types of ambiguity masqueraded as ambivalence due to the use of measures with low construct validity. In Studies 1-2, we test the prediction that surprised and neutral faces are ambiguous for different reasons. In Study 3, we test whether these sources of ambiguity make surprised or neutral faces more ambiguous in a two-alternative forced-choice mouse-tracking paradigm.

[57] Discrimination Attributions and Well-Being of Multicultural and Multiracial Children

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Multiracial and multicultural youth frequently encounter identity questioning (e.g., "What are you?") and identity denial (being told to identify differently), yet little work examines how they interpret these events or the related consequences. Here, we examine parents' essentialist and colorblind socialization practices and test whether discrimination attributions differ across two cohorts of multiracial and multicultural children (Group 1: ages 5–7 and Group 2: ages 12–16). Children will read 2 age-validated vignettes of identity denial and questioning and report their discrimination attributions and current mood. Parents also report on their own discrimination attributions for their children's experiences of identity questioning and denial. We hypothesize younger children will make less discrimination attributions and have lower negative emotional responses compared to older children who will be more likely to endorse intent-based explanations. These findings will provide developmental insights into the socialization practices of multicultural/multiracial children and highlight age-appropriate insights for parents in socialization.

[58] Distant Prototypes: How do Climate Victim Prototypes Shape Environmental Behavior

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Climate change presents pervasive but diffuse threats to human health and well-being. Understanding variation in people's perception of these impacts is key for building interventions to motivate climate action. A recent study finds that when people's prototypes of climate impacts feature valued people and places being negatively affected, they tend to feel more close to the issue, concerned, and motivated to climate action. In a recent extension of this work, we collected people's self-evaluations of their prototypes of climate impacts while collecting more prototype details via a reverse correlation task. Hypothesis blind coders are coding demographic features of the classification faces of "a person negatively impacted by climate change" generated by this task. We predict that, on average, people whose prototypes reflect members of low powered social groups will tend to express more distance from climate change, less concern, and less interest in climate action. However, we predict that people whose prototypes reflect members of their ingroup will tend to express less distance, more concern and greater interest in climate action, regardless of their in-group's social power.

[59] **Distraction reduced negative emotions following a threatening health message more than reappraisal**

8:00 AM – 9:00 AM

EMOTION

Defensive strategies are reactions to threatening health information that aim to control negative emotions. Using a novel design, we examined factors associated with consequences of engaging in defensive strategies in the context of alcohol consumption. Participants recruited from Prolific (N=391, 97% women, 79% White, Mage=41, average weekly alcohol consumption=9.7 drinks) watched a preview of a video describing health consequences of alcohol consumption and then were given a choice to engage in distraction—by mentally disengaging—or reappraisal—by considering other factors that make them healthy—for the rest of the video. Most of the sample (78%) chose reappraisal. A mediation analysis indicated that participants who chose distraction reported lower fear/anxiety after engaging in their strategy of choice relative to those who chose reappraisal, and lower fear/anxiety was associated with lower alcohol reduction intentions (direct effect: (B=-0.30, 95% CI [-0.43, -0.16]); indirect effect: (B=-0.03, 95% CI [-0.08, -0.01])). Thus, compared to reappraisal, distraction more effectively reduced negative emotions and also resulted in lower motivation to change one's behavior.

[60] **Do children use gender, race, or the intersection of both for social role concepts?**

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

In the U.S., children associate gender with social roles quite early. But whether gender predominates how children think of social roles in other cultural contexts is unclear. Children (ages 5–10; N ≈112) from India participated in a storybook-based task where they heard descriptions of jobs, placed them on a social-status ladder, and selected the type of person (images of men and women, differing in skin tone) they believed typically performed each job. Results showed that Indian children's perceptions of social roles was more tightly linked to skin tone than gender. These findings highlight cross-cultural variation in the cues children use to organize social roles.

[61] **Do happy people with no intention of engaging in prosocial behavior benefit from the moral boost of happiness?**

8:00 AM – 9:00 AM

SOCIAL COGNITION

Happy (versus unhappy) people are judged more morally good. Research suggests this happiness moral boost is explained by expectations for good behavior. Three studies will probe this quite reasonable explanation more deeply, testing whether social targets' intentions to engage in prosocial behavior (Studies 1-2) and reports of prosocial behavior (Study 3) affect the happiness moral boost. Study 1 participants (projected N ~ 2000, data collection underway) will evaluate the moral goodness of targets in a 3 (target happiness: low versus neutral versus high) X 2 (target prosocial intentions: low versus high) design. We predict two main effects and will test for an interaction. If the moral boost of happiness is explained by behavioral expectations, the moral boost of happiness should diminish (or disappear) for low intention targets. In Study 2, happy (versus unhappy) targets' low prosocial intentions will be explained by target disability. Finally, Study 3 will manipulate the reported prosocial behavior of happy (versus unhappy) targets to address whether the happiness moral boost applies even when targets do not engage in good behavior.

[62] Do I Belong in Science? Exploring Psychology Students' Science Identity and Self-Efficacy

8:00 AM – 9:00 AM

BELONGING/REJECTION

Many psychology majors experience anxiety in their first statistics or research class, often feeling like they are "not science or math people." This mindset can lead to feelings of non-belonging and low self-efficacy in science, negatively impacting performance in essential courses. I hypothesized that this issue might be particularly pronounced for marginalized students, who also experience additional negative stereotypes, belonging uncertainty, and achievement gaps in STEM fields. A survey study of 714 psychology students supported this theory. Students of color had significantly lower GPAs, behavioral neuroscience grades, and feelings of belonging compared to White students. Similarly, first-generation students showed lower cumulative GPAs, psychology 101 grades, and science self-efficacy than their continuing-generation peers. Additionally, sense of belonging mediated the relationship between psychology self-efficacy and academic performance. These findings suggest that a social-belonging intervention could help close the achievement gap between marginalized and advantaged students by enhancing their sense of belonging in science and psychology.

[63] Do I Matter? Racial Identity as a Moderator of Perceived Mattering and Socioemotional Health

8:00 AM – 9:00 AM

BELONGING/REJECTION

There are racial differences in belonging at PWIs (Predominantly White Institutions; e.g., Harper & Hurtado, 2007), but belonging may not have adequate construct validity for students of color (SOCs). Mattering extends belonging by measuring not just whether a person feels welcomed in a space but also how much someone feels they add value to and are valued by others (Flett et al., 2019). The mattering literature is growing, but few studies have examined racial differences in mattering. This study examines mattering, socioemotional health (SEH), and race at a small, predominantly white college. Students of color experienced significantly lower levels of mattering compared to white students. The SEH variables of cognitive reappraisal, zest, and optimism positively predicted mattering for white students. For SOCs, however, general stress and peer support predicted mattering. Moreover, SOCs, particularly SOC women, experienced lower levels of peer support than white students. Given that the determinants of mattering for SOCs are different, future research may need to explore the nuances of mattering for historically underrepresented groups.

[64]The Well-Being Observatory

8:00 AM – 9:00 AM

MENTAL HEALTH/WELL-BEING

Countries regularly forecast economic indicators (e.g. GDP), but the well-being of their people is just as important, and far harder to predict. Subjective well-being (SWB) is increasingly recognized by international organizations as a key measure of societal progress. Findings from the World Happiness Report (WHR), which covers 150+ countries, show that SWB has steadily declined among western industrial countries over the last decade, with the United States among the largest losers in 2024. However, no models exist to forecast future well-being, limiting policymakers' ability to anticipate and guard against declines. We approach this problem through "The Well-Being Observatory," a team science initiative uniting researchers under a common task framework to forecast population well-being. The forecasting competition will take place in late 2026. At SPSP, we will present emerging predictors of happiness alongside recent well-being trends in the U.S. and worldwide in order to engage other scholars to join this collaborative effort. This work provides a foundation for early-warning tools that will allow countries to monitor, anticipate, and prepare for shifts in well-being.

[65] Do You Get Hangry? Anger and Jealousy in the Context of Food

8:00 AM – 9:00 AM

EMOTION

Hunger may evoke negative emotions such irritation (Swami et al. 2022) & influence evaluation of stimuli toward the negative (e.g., MacCormack & Lindquist, 2019). In our work, we examined anger (i.e., being "hangry") & jealousy in the context of food. We developed a 9-item hangry scale ($\alpha=.95$; example: "I can be unpleasant when I am hungry,") & a 16-item food jealousy scale ($\alpha=.85$; example: "Food seems more appealing when someone else has it."). Participants ($N = 270$) completed these measures as well as measures of general anger, general envy, & fear of negative evaluation. Participants also indicated how likely they were to feel different emotions (e.g., anger, jealousy, sadness) in scenarios in which there was frustration related to food, drinks, or finances & scenarios in which others had desirable food, drinks, or finances.

Our hangry & food jealousy scales demonstrated excellent convergent validity ($r = .41$ between hangry & general anger, $r = .46$ between food jealousy & general envy). In addition, hangry & food jealousy were uncorrelated with fear of negative evaluation ($ps > .05$). Lastly, hangry predicted higher anger likelihood in scenarios in which there was a frustration related to food, whereas food jealousy predicted higher jealousy likelihood in scenarios in which others had desirable food.

[67] Does adversity severity predict motivated prosocial emotion selection?

8:00 AM – 9:00 AM

EMOTION

Previous research has found that the emotional impact of adversity (i.e., adversity severity) is positively correlated with empathy, compassion, and prosocial behavior. Three studies ($n = 607$) attempted to replicate this work conceptually in the context of prosocial situation selection. In Studies 1 and 2, Prolific workers and college students scoring lower in adversity severity chose empathy significantly less across trials in the Empathy Selection Task (EST). In Study 3, college students scoring lower in adversity severity chose compassion significantly less across trials in the Compassion Selection Task. In all three studies, these decline effects were buffered among those scoring higher in adversity severity. These findings suggest scoring lower in adversity severity is associated with downregulation of prosocial emotion over time. Study 4 (ongoing; $n = 300$) attempts to extend this work to real-world contexts using a diary-based methodology. Here, participants will complete the EST, and they will report on up to five social interactions occurring over the last 24 hours, including social emotions, perceived effort of the social interactions, and social well-being.

[68] Does Content Matter? Examining the Influence of Event-Focused Prayer on Recovery Following Ostracism

8:00 AM – 9:00 AM

BELONGING/REJECTION

Ostracism—being ignored and excluded—is a common experience that threatens basic human needs for belonging, control, meaningful existence, self-esteem, and certainty. In response to such experiences and other hardships, people turn to prayer and religion as a way of coping. Prior research shows the positive influence of prayer on improving one's needs satisfaction and mood after experiencing ostracism, however, it is unknown how the specific content of the prayer may influence these improvements. The current two studies ($N = 1,840$) replicate and extend the procedures of prior research to examine how recovery is affected by different types of prayer (i.e., prayer that is related to the negative event vs. prayer on unrelated topics). Even though prayer is generally helpful, it is possible that - due to potential rumination caused by having to recall negative events—praying specifically about a negative event could hinder potential benefits often expected to be gained through undirected prayer (i.e., prayer that also distracts from the negative event). Additionally, the overall effectiveness of prayer may depend on one's current relationship with God. As such, we hypothesize that prayer will increase needs satisfaction in excluded individuals. Results provide insight to the use of prayer as a tool in recovery from negative events such as ostracism for religious individuals.

[69] Does Feeling Empathy Towards Victims of Social Disasters Lead to Empathy Fatigue?

8:00 AM – 9:00 AM

EMOTION

People have the unique ability to feel empathy toward others when they witness them suffering. However, it is unclear whether there are any negative consequences of feeling empathy, which is particularly relevant to today's climate involving a cascade of social disasters leading to mass deaths. Thus, this research examined whether empathy toward victims of social disasters led to more empathy fatigue in the general US population. In a nationally representative survey of American adults in terms of sex and race/ethnicity (N = 2,081), participants reported their personal experience and empathy toward victims of social disasters, including COVID-19 and gun violence. We also measured empathy fatigue, which was participants' desire to avoid being further exposed to or discuss the disasters. We found that feeling empathy towards victims of social disasters does not directly produce empathy fatigue. However, participants who have been negatively impacted and those who feel empathic concern towards other victims are more likely to experience empathy fatigue. This research sheds light on the psychological and behavioral consequences of dire social events among the general population.

[70] Does Reflection Shift Motivations to Confront Racial Prejudice?

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Confrontation is shown to reduce expressions of racial prejudice. However, motivations for engaging in confrontation can affect how effective it is in changing attitudes. Confronting prejudice can be driven by internal motivations, such as personal values, or external motivations, like social approval. Our study (N = 370, White participants only) investigated whether reflecting on personal values (motivation condition) affected individuals' motivation to confront prejudice. We hypothesized that individuals (especially those with the strongest external motivations) would shift to be more internal when reflecting on personal values and morality compared to a control condition. We found that, consistent with hypotheses, individuals with strong internal motivation consistently demonstrated a better agency and higher likelihood of confronting prejudice. However, contrary to our hypothesis, encouraging reflection on the drawbacks of performative activism had no observable impact on individuals' underlying motivational orientations. Future research is needed to further test whether motivations to confront prejudice are malleable to lead to more effective confrontations.

[71] Downward Spiral: Automatic Police-Threat Associations and Perceptions of Aggression During Arrests are Mutually Reinforcing

8:00 AM – 9:00 AM

SOCIAL COGNITION

The portrayal of the dominant, possessive male character — more commonly referred to as an “alpha male” — is common across media, from books to film to television and social media. These characters embody traditional masculine traits, including emotional stoicism, physical strength, and assertiveness, while also serving as a cultural model for romantic and social success (Dunlap & Johnson, 2013). Portrayals such as these reinforce hegemonic masculinity and masculine honor, placing dominance, aggression, and control on a pedestal, reinforcing narrow expectations of what masculinity looks like and delegitimizes alternative expressions (Connell & Messerschmidt, 2005; Bridges & Pascoe, 2014). For women, these representations normalize the romanticization of the dominant man and traditional gender roles, influencing preferences and acceptance of unequal power dynamics in and out of relationships (Eaton & Rose, 2011; Wood, 2001). In the current study we will investigate how men and women perceive dominant and submissive traits in male and female characters, focusing on their perceived leadership competency, friendship interest, romantic interest, and desire to emulate the traits portrayed. We hypothesize dominant characters will score higher on leadership competency while submissive characters will be rated higher for friendship interest. Dominant male characters will be more romantically interesting to women with higher hegemonic masculinity scores and more likely to be emulated by men with higher scores. By investigating how media-influenced gender ideals and individual preferences interact, this research examines how portrayals of masculinity shape romantic desire and self-perceptions, contributing to a broader understanding of gender norms and relationships.

[72] Early Adolescents' Mood and Smartphone Use: 14-Day EMA Study

8:00 AM – 9:00 AM

EMOTION

Early adolescence often marks an increase in digital technology use, with half of children in the U.S. owning a smartphone by age 11. Despite this, the early adolescence period is critically understudied in the digital context. In this study, early adolescents participated in a 14-day ecological momentary assessment period in which they submitted surveys 3 times per day assessing their current mood, with items measuring both high/low arousal positive affect and high/low arousal negative affect. During this period, participants with personal iPhones submitted screenshots of their total, social, and entertainment screen time from iOS Screen Time (N=43). Pixel values from the Screen Time bar graphs were extracted and converted into minutes. Preliminary findings show that greater hourly social media use has negative impacts on early adolescents' positive mood, while entertainment was not found to have any associations. Additionally, greater overall smartphone use was found to have positive impacts on early adolescents' negative mood. The implications of these findings are critical for better understanding the impacts of technology, social media, and phone use on adolescent mood.

[73] Effects of first-generation university students' mindset towards academic difficulty on feelings of burnout

8:00 AM – 9:00 AM

EMOTION

First-generation university students face unique challenges both within and outside the academic environment, which can increase academic difficulty, and profoundly impact their academic success and well-being. Study 1 examined if first-generation (FG) and continuing-generation (CG) students' mindsets towards academic difficulty correlated with feelings of burnout. Undergraduate participants (N=257) reported their generation status and burnout levels at baseline, followed by their mindsets towards academic difficulty a week later. Moderation analyses revealed that stronger perceptions of academic difficulty-as-important predicted greater perceived feelings of burnout in FG students, but not in CG students. Perceptions of academic difficulty-as-impossibility did not moderate the feelings of burnout in FG students relative to CG students. Study 2 (Ntarget=200) experimentally manipulated FG and CG students' mindset about academic difficulty-as-important to examine its causal effect on momentary stress responses to a performance task in the lab. The findings potentially uncover maladaptive mindsets for FG students that may explain stress-disparities in higher education settings.

[74] Effects of Morality, Tyranny, and Non-cooperativeness on Paxization toward Outgroups

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

According to Wrangham (2019), societies advanced through self-domestication by "executing" tyrants seeking self-interest through violence and non-cooperators free-riding. To avoid becoming targets, humans developed morality (Sauer, 2023). This process also applies to outgroups, termed Paxization (Kumagai, 2025). We examined whether morality increases intolerance of tyranny and non-cooperation, thereby promoting support for execution via intergroup differentiation. A total of 435 Japanese participants (M_age = 36.9) completed an online survey including the Moral Foundations Questionnaire (Graham et al., 2011), anti-tyranny and anti-non-cooperation attitudes, intergroup differentiation, and support for execution. Regression analyses showed that Harm, Fairness, and Purity strengthened anti-tyranny and anti-non-cooperation, reducing support for execution. Yet, when mediated by intergroup differentiation, these foundations indirectly increased support. These findings suggest that morality fosters perceptions of tyranny and non-cooperation as key threats in Paxization—externalizing harmful members and responding aggressively—offers a unified view of intra- and intergroup processes.

[75] Elementary Children's Intersectional Intergroup Attitudes

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Drawing on intersectionality framework (Crenshaw, 1989), we examined how race/ethnicity, gender, gender expression, and social class of peers shape elementary school children's intersectional intergroup attitudes in the domains of stereotypes, prejudice, and behavioral tendencies. Students (N=269) in 2nd through 5th grades offered their first impressions of fictitious Instagram profiles of peers who varied across these four identities. Analysis revealed that race/ethnicity, gender, gender expression, and social class of profiles worked together uniquely depending on the domain. Irrespective of peers' race/ethnicity and social class, profiles with gender-nonconforming toys were stereotyped as less typical of their gender. Irrespective of peers' gender, gender expression and race/ethnicity, profiles that included low compared to high SES living rooms elicited more pity. In the domain of behavioral tendencies, the patterns were more complex. For example, children showed the least interest in sitting with peers of another gender, with a stronger effect for gender-nonconforming profiles. Our study shows the importance of examining intergroup attitudes intersectionally in different domains.

[76] Emotion Perception Overestimation Bias in Neurotypical and Clinical Populations

8:00 AM – 9:00 AM

EMOTION

The ability to accurately understand others' emotions forms the cornerstone of effective social interaction. Despite extensive research on emotion recognition, little is known about how people assess emotional intensity or whether these perceptions are accurate or systematically biased. Across nine datasets (N≈2,600), we found that while people perceived themselves as accurate and believed others underestimate their emotions, they actually systematically overestimate others' negative emotions. This bias occurred with both strangers and romantic partners, and across modalities (text, video, live interaction). Moderate overestimation may serve adaptive functions: for strangers, it predicts higher empathic responses; in romantic relationships, moderate overestimation of negative emotions predicts higher relationship satisfaction. We further examine this bias in relationship to clinical populations including ADHD, depression, and anxiety. Together, these findings fill a crucial gap in understanding emotional perception biases, highlighting their potentially adaptive roles and giving insight into how they shape our social world and relationship outcomes.

[77] Emotional intelligence reduces the signal needed to read faces

8:00 AM – 9:00 AM

SOCIAL COGNITION

A recent theoretical framework posits that emotional intelligence (EI) rests on heightened sensitivity to emotional stimuli. In line with this view, high-EI individuals show an attentional bias toward emotional faces and stronger facial muscle activation in response to others' emotions. The present study examined another facet of this hypersensitivity—the perceptual threshold, defined as the minimal emotional signal required to recognize facial expressions with 30 %, 44 % or 58 % accuracy. One hundred three participants completed an emotion-recognition task in which the signal strength of six basic expressions was randomly and parametrically varied in static and dynamic formats; individual thresholds were estimated for each accuracy level. Higher scores on the emotion recognition facet of EI predicted lower thresholds across conditions. The emotion understanding facet likewise predicted lower thresholds, particularly at the highest task difficulty and for dynamic, more naturalistic stimuli. These findings extend evidence for the hypersensitivity of highly emotionally intelligent individuals to the perceptual level.

[78] Emotions Used Differently to Infer Facial Trustworthiness Across Racial Groups

8:00 AM – 9:00 AM

EMOTION

Individuals use cues of emotions to decide trustworthy from untrustworthy faces. Previous work often relies on only White faces, on synthetic faces, or investigates unambiguous emotion expressions. To address these gaps, we created morphs of real faces (64-68 unique identities) from the Chicago Face Database from neutral expression to full emotion expression at 20% intervals. Across two studies, we investigate the effect of emotional intensity on perceptions of trustworthiness evaluations of Black and White men. Study 1 (n=196) replicates past angry=untrustworthy effects, but also found that as faces get angrier, Black people face steeper penalties on trustworthiness perceptions compared to White people ($p < .05$). However, this racial difference disappears once a face reaches a high level of anger intensity. Study 2 (n=131) found that as faces get happier, Black people incur a steeper benefit on trustworthiness perceptions compared to White people ($p < .05$). Overall, we find that emotion expression cues are used to infer trustworthiness more strongly for Black targets than for White targets.

[79] Examining Spatial and Racial Biases in a Sample of 100 Children's Picture Books

8:00 AM – 9:00 AM

SOCIAL COGNITION

In cultures that read from left to right, leftward space is associated with agency and status. Thus, people tend to place dominant groups, like men, to the left of non-dominant groups, like women. We predicted that this pattern would be present in children's picture books, such that White characters would be placed more leftward than characters of color. We conducted a content analysis of 100 children's picture books, recording the race and horizontal location of 1,471 characters. This content analysis revealed that White characters, on average, were placed more leftward than characters of color, which is line with the cultural pattern to place dominant groups to the left of non-dominant groups. Given that children can learn from subtle cues in their social environments, we are currently collecting data in an experimental study to test how children's race-based preferences and stereotypes are impacted by exposure to this spatial bias. We hypothesize that seeing the prevalent spatial pattern of White characters on the left will lead children to think White people are more dominant, agentic, and high status.

[80] Examining the Privileged Status of Social Category Information in Children's Social Curiosity

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Social psychologists have long theorized about and tested the impacts of adults' tendencies to mentally represent people as undifferentiated social category members vs. as distinct individuals (e.g., Er-rافی & Brauer, 2013; Fiske & Neuberg, 1990). However, we know relatively little about the development of these tendencies. The goal of the present research was to understand whether children, in their formative years, privilege social category information when learning about new people. Our research question was: When children encounter a new person, how interested are they in knowing social category information (e.g., someone's gender) compared to individual attribute information (e.g., someone's food preferences)? Findings revealed that 4- to 8-year-old U.S. children (N=125) preferred to learn information about people's gender, language, and nationality over information about their individuating attributes. The present study provides a first step in exploring the privileged status of social category information in children's social curiosity. Future studies will test children's interest in seeking information about people's race, age, and novel social category memberships.

[81] Examining the relationship between cultural tightness and regional cognition

8:00 AM – 9:00 AM

SOCIAL COGNITION

Places vary in their strength of social norms and tolerance for norm violations – a cultural dimension called cultural tightness. Taking a formal mathematical modeling approach, we investigated the relationship between cultural tightness and cognition across the United States. We relied on two separate operationalizations of cultural tightness and looked at aggregated estimates of evaluative and control-oriented cognitive processes from hundreds of thousands of geolocated internet respondents. Overall, we find stronger pro-ingroup/anti-outgroup evaluative processing in U.S. states that are more culturally tight, a relationship that is especially robust among White people compared to Black people. However, we do not find evidence of a relationship between cultural tightness and cognitive control.

[82] Experimentally Evaluating a Shortened “You’re Not Anonymous” Cyberbullying Intervention

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

While the Internet offers many benefits, it also facilitates the spread of negativity, hostility, and aggression. Cyberbullying—defined as repeated, intentional harm via electronic means—is a serious concern, especially among younger generations. Prior research has documented its deleterious psychological and behavioral effects, underscoring the need for effective interventions targeting cyberbullying perpetration. This study used a longitudinal design to evaluate a shortened version of “You’re Not Anonymous” (YNA), an online cyberbullying intervention. Emerging adults were randomly assigned to either YNA, control video, or no video control conditions. Measures of online disinhibition, cyberbullying perpetration, anonymity perception, and cyberbullying attitudes were collected across two waves. A serial mediation analysis revealed that post-video online disinhibition mediated the relationship between condition and cyberbullying perpetration one month later. Initial cyberbullying attitudes and perpetration did not moderate these effects. Findings confirm that the shortened YNA intervention reduces online disinhibition, which in turn predicts lower levels of cyberbullying. This study supports the results of the initial intervention and extends the literature by verifying the efficacy of a shorter, more economical version of the intervention.

[83] Exploring Doomscrolling: A Serial Mediation Model with Cyberbullying Perpetration

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Doomscrolling is defined as pervasive exposure to negatively themed information from online sources. A paucity of research has examined the prevalence, predictors, and behavioral consequences of doomscrolling. Across two cross-sectional studies with US emerging adults, we examined the relationship between doomscrolling and cyberbullying perpetration, the underlying psychological processes germane to this relationship, and the moderating role of fear of missing out, anxiety, social media addiction, (Study 1), and the Big 5 (Study 2). The majority of our participants reported doomscrolling engagement, which was predicted by age – younger adults doomscroll more than older adults – but not participant sex. Model testing showed that time spent online was indirectly related to cyberbullying through negative social media exposure and doomscrolling. In other words, doomscrolling predicted cyberbullying and was predicted by negative social media exposure from being online. These results fill important gaps in our knowledge of doomscrolling and demonstrate the positive relationships between doomscrolling and cyberbullying.

[84] Exploring the Dimensions of Meaning in Narratives of Workplace Awe

8:00 AM – 9:00 AM

EMOTION

A growing body of research links meaningful work to well-being and motivation, yet little is known about the emotional experiences that give rise to this meaning. In this study, we explore whether the emotion of awe may help illuminate how people construct meaning in their work. Drawing on George and Park’s (2016) tripartite model of meaning in life (coherence, purpose, significance), we conducted a secondary analysis of qualitative survey responses from 100 U.S. workers across 32 sectors (Authors, 2025) in which participants described experiences of awe in the context of their work. Our analysis suggests that awe frequently aligns with one or more of these components of meaning. For instance, participants reported “a-ha” moments that deepened understanding (coherence), feelings of rekindled motivation (purpose), and observations that their work had broader impact (significance). These findings suggest that awe may be a powerful emotional catalyst for meaning-making in organizational life. We discuss implications for theory and future research on emotion, motivation, and meaning at work.

[85] Exploring the Experiences of Women Workers in Brazilian Prisons

8:00 AM – 9:00 AM

SOCIAL JUSTICE

This study aims to reflect on the context in which incarcerated women who work within the Brazilian prison system are situated. Based on a cartographic research approach conducted in a women's prison located in Rio de Janeiro, Brazil, we carried out interviews with 13 women deprived of liberty who performed labor within the institution. Currently, the facility has a total of 27 "faxinas" (a term used to refer to incarcerated workers) assigned to different roles. Among those interviewed were women working in classification, the school, food distribution, the infirmary, security, and administration. The choice of cartography as a methodological approach proved to be a powerful tool for thinking not only about the context but also about how knowledge about prison is produced. Prison labor was described by the women as part of a complex dynamic, in which trust and mistrust coexist. Despite being immersed in a persecutory environment and having to navigate the fine lines between prestige and oppression, the women's interpretation of the ambiguity of relationships—and their recognition of the inherent tensions in the role of "faxina"—appeared to enable them to develop strategies to identify and enact possible movements within the prison space. This suggests that the role occupied by these prison workers can also be understood as a space of resistance.

[86] Exposure to fast-paced media and attention-related problems across eleven nations.

8:00 AM – 9:00 AM

SOCIAL COGNITION

Media effects scholars have consistently expressed concern regarding the association between screen use and attention-related problems, such as symptoms of attention deficit/hyperactivity disorder (ADHD) and impulsive behavior. Some researchers attribute the rise in attention-related issues to shifts in media content, specifically toward more violent, fast-paced, and physiologically arousing material, as well as increased time spent on electronic media. While our previous work has identified concurrent associations between attention-related problems and exposure to fast-paced and violent media within a US sample, it remains unclear whether these associations are generalizable or culturally specific.

To address this gap, we examined the relationship between violent and fast-paced media content and attention-related problems across eleven countries ($N \approx 3,100$). We hypothesize that exposure to such media will be positively associated with attention problems, impulsivity, and self-control across countries. Data collection is complete, and analyses are underway. We aim to elucidate the associations between attention related problems and media use.

[87] Validation of the Forms and Functions of Aggressive Behavior Scale (FFABS) across Eleven Nations

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Violence, including youth, intimate partner, child, and elder abuse, is a significant public concern, prompting increased focus on prevention. Aggressive behavior, defined as intentionally harming others, can be physical, relational, or verbal, and may be reactive or proactive. Measurement development must address both construct and external validity. Measures should reflect the current definition of aggression: behavior intended to harm another person who seeks to avoid harm. We developed the Forms and Functions of Aggressive Behavior Scale (FFABS) to capture the multidimensional forms (physical, verbal, relational) and functions (proactive, reactive) of aggression. We previously validated the FFABS factor structure in three US samples.

This study validated the FFABS factor structure and measurement invariance across 11 countries. We surveyed late adolescents and emerging adults ($N \approx 3,300$) using online questionnaires. Planned analyses include multi-group confirmatory factor analyses. We hypothesized a six-factor structure and correlations with related constructs. The primary aim was to assess the psychometric properties of the FFABS across multiple countries.

[88] Facial and bodily actions speak louder than context: inferring facial expressions of emotions in naturalistic images

8:00 AM – 9:00 AM

EMOTION

Inferring others' emotions is crucial for social interaction and survival. Early research focused on facial expressions, but recent work argues that contexts override interpretations of emotions from facial expressions. Yet, prior work compared facial expressions and contexts using artificial designs, which may not provide the full picture. Here, we had US representative participants (N = 475) view everyday images (N = 1,125) and infer the targets' facial expressions of 8 emotions. We compared these inferences to rich, multi-channel cues in the images quantified by computational algorithms and US representative participants (N = 1,093). We found that emotion inferences were predicted by both facial and bodily cues (e.g., facial action units and structure, body action and posture) and contexts (e.g., environmental valence and gist). However, only facial action units and bodily action carried unique information that was unexplainable by other cues for emotion inferences, while other cues only shaped emotion inferences in a way that was already captured by other co-occurring cues. We modeled the cognitive mechanism of emotion inferences using artificial neural networks in which we lesioned different neurons. This manipulation suggests that people may not only prioritize cues with unique information but also integrate rich contextual cues to support emotion understanding. Together, these findings suggest that in naturalistic contexts, co-occurring cues may not act as competing factors for driving emotion inferences, but that they are interpreted in ways that reinforce a coherent understanding.

[89] Facial Scars: A reliable cue of strength or weakness?

8:00 AM – 9:00 AM

EMOTION

Intergroup violence was common among early hunter-gatherers and often left visible facial scars. As such, facial scars may serve as a cue of either a) fighting experience and strength, or b) vulnerability and weakness. We tested this using a signaling game. Here, a confederate (described as a "typical" participant playing this game) was designated as either strong or weak. They were presented to the participant displaying either a neutral or angry facial expression with or without make-up depicting a facial scar. In a between-subjects design, participants decided whether to fight the confederate after viewing the confederate but not knowing their strength. Participants were told they would earn a bonus payment if they fought a weak confederate or did not fight a strong confederate. Finally, participants viewed the confederate again and rated their emotions and strength. Participants were no more or less likely to choose to fight a confederate depicted with a facial scar than without a facial scar. Furthermore, confederates depicted with a facial scar did not differ in rates of emotion or strength. Our results suggest that a facial scar does not influence perceptions of strength.

[90] Fast and fierce: Alcohol aggression expectancies, priming, perceptions of hostility, and reckless driving

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Past research shows a positive relationship between alcohol priming and aggressive behaviors. Moreover, individuals higher in aggressive alcohol expectancies have been linked to increased risky behaviors such as aggressive and reckless driving. The current study is the first to assess the moderating effect of alcohol priming on the relationship between risk and aggression (RA) alcohol expectancies and instances of speeding. Participants completed a measure of RA alcohol expectancies and then were provoked and subsequently primed with either alcohol or neutral words. Participants then completed a driving simulation where speeding was recorded. Finally, perceptions of provocateur hostility was measured. Results revealed that prime type moderated the mediating effect of perceptions of provocateur hostility on the relationship between RA alcohol expectancies and subsequent speeding. Specifically, higher RA expectancies increased perceptions of provocateur hostility which led to greater instances of speeding, but this was only true for those primed with alcohol. Implications for better understanding the impact of alcohol expectancies and priming on reckless driving will be discussed.

[91] Feel it or Fix it? Who, When, and Why of Emotion Non-Regulation

8:00 AM – 9:00 AM

EMOTION

Emotion regulation is a thriving area of research. Yet, to date, little work has been done to understand when and why people choose not to regulate their negative emotions. There are many reasons an individual might choose to leave a negative emotion unregulated: they may not have the skills or energy to regulate, they may view an emotion as useful or appropriate, or perhaps they simply want to feel the emotional intensity of the moment. Exploration into these reasons, and the individuals expressing them, is nearly absent in the literature. This project aims to address this gap by examining which individual differences predict non-regulation. Using data from a 2-week experience sampling study (N = 299 US adults), we examine whether well-being (e.g., anxiety, depression, self-esteem), emotion beliefs, and demographic characteristics (e.g., age, gender) influence 1) how often people choose not to regulate, 2) why people choose not to regulate, and 3) whether people feel satisfied with their decision not to regulate. This project will provide necessary insight into non-regulation, highlighting how it may function in both adaptive and maladaptive ways.

[92] Feeling “seen” or “invisible”: Rejection, ignoring, and physical conspicuousness

8:00 AM – 9:00 AM

BELONGING/REJECTION

Different types of exclusion elicit different motivational orientations (e.g., Molden et al., 2006). The current research examined whether rejection (vs. ignoring) also differently impact feelings of physical conspicuousness (vs. invisibility). In Study 1 (N=174), reliving a past rejection (vs. ignoring) led participants to believe they were more clearly visible to a person looking at them through a one-way mirror, $t(170)=-2.36$, $p=.02$, $d=.69$. Rejection reliving essays also included more visibility language than ignoring essays (e.g., “everyone was looking at me”), which included comparably more invisibility language (e.g., “I felt invisible to them”), $x^2=8.14$, $p=.017$. In Study 2 (N=218), imagining a workplace rejection (vs. ignoring) led participants to believe they would be more quickly identified in a group photograph, $t(215)=-1.88$, $p=.06$, $d=.28$, and report feeling less comfortable wearing conspicuously bright clothing, $t(215)=2.34$, $p=.02$, $d=.39$. Discussion will center on the social and physical costs and benefits experienced when we are the object of other’s attention and when we are invisible to others.

[93] Feeling Left Out and Fired Up: The impact of social exclusion and impulsivity on anger

8:00 AM – 9:00 AM

BELONGING/REJECTION

Impulsivity is associated with heightened emotional reactivity, particularly anger, and is influenced by perceptions of social inclusion or exclusion. Previous research has shown that social exclusion can intensify negative emotional responses. The current study is the first to assess the moderating effect of social exclusion on whether feelings of being liked mediate the effect of impulsivity on subsequent state anger. Participants completed a measure of impulsivity and then engaged in an online social media task where they were either included by either all or none of the other participants. Finally, perceived social acceptance (or “feeling liked”) and state anger were measured. A moderated mediation analysis indicated that social condition (social inclusion vs. exclusion) moderated the mediating effect of feeling liked on the relationship between impulsivity and state anger. Specifically, higher levels of impulsivity decreased feelings of being liked which in turn augmented state anger, but this was only true for social excluded individuals. Implications for the impact of impulsivity and social exclusion on anger and aggression will be discussed.

[94] Feeling to Understand: How Subjective Emotional Experience Affects Empathic Accuracy in Youth-Caregiver Dyads

8:00 AM – 9:00 AM

EMOTION

Empathic accuracy—the ability to accurately recognize another’s emotions—is often thought of as crucial for healthy relationship functioning and may be especially important for caregivers of youth. This laboratory-based dyadic interaction study examined how caregivers’ own emotional experiences predicted empathic accuracy towards youth. Youth-caregiver dyads (N = 34, 68 individuals) including youth at clinical high risk for psychosis and healthy control youth engaged in a 10-minute video-taped conflict conversation, after which caregivers reported on their own positive (e.g., gratitude) and negative (e.g., fear) subjective emotional experiences. Then, they watched the conversation twice and rated their own and their partner’s emotions using a rating dial. Empathic accuracy was computed as the cross-correlation between caregivers’ continuous ratings of youth’s emotions and youths’ self-rated emotions. Results showed that caregivers’ negative (but not positive) emotional experiences predicted greater empathic accuracy ($\beta = .172$, $p = .044$), but the effect was moderated by positive emotion: when both emotions were high, the effect of negative emotions diminished ($\beta = -.045$, $p = .038$). Findings from this proof-of-concept study point to a link between caregivers’ emotional experiences during conflict and empathic accuracy and encourage further examination in larger samples.

[95] Fighting Depression in Cancer Patients: The Power of Belonging

8:00 AM – 9:00 AM

BELONGING/REJECTION

Cancer patients experience depression at higher rates than the general population (Chambers et al., 2011), and they report feeling that they are burdens to their loved ones (Rodríguez-Prat et al., 2019). They are likely to self-ostracize, thus creating even higher levels of depression and aggression (Wirth et al., 2020). The purpose of this study was to examine the relationship between ostracism/belongingness and depression in cancer patients and explore aggression as a mediator of that relationship.

Forty-two cancer patients reported experiences of ostracism (Rudert et al., 2020), belongingness (Malone et al., 2012), aggression (Richardson & Green, 2003), and depression (Sheikh & Yesavage, 1986) since receiving their cancer diagnosis.

Belongingness was negatively related to both depression and aggression. Although the predicted mediated models were not supported, the findings did establish belongingness as a strong predictor of depressive symptoms in cancer patients. Cancer patients who feel that they belong in their community report less depression, suggesting a potential route for intervention.

[96] Fluctuations in Achievement Emotions and Perceived Success Over Time

8:00 AM – 9:00 AM

EMOTION

This study utilizes the Control-Value Theory of Achievement Emotions to investigate the relationship between different work-related achievement emotions and self-reports of success at work over time. We collected online survey responses from 540 adults (48.5% male) in the UK weekly for 12 weeks and monthly for five years (total 70 waves). We analyze the data across weekly and monthly timescales using two-level dynamic structural equation modelling combining within- and between-person analysis. We assess how emotions fluctuate over time and how this variation relates to evaluations of success. Within-person analyses of these relations have been largely lacking to date.

Based on CVT, we expect positive emotions, such as pride, to be reciprocally linked with higher work success within participants. Negative emotions, such as guilt, are expected to negatively relate to success. We expect these within-person relations to be generalizable across timescales and participants. By integrating short- and long-term emotional dynamics, this research deepens our understanding of how specific emotions impact work achievement and offers insights for enhancing emotional well-being and productivity.

[97] Framing Injustice: Exploring the Presence and Consequences of Racism-Conscious Frames for Environmental Justice Exposures in Tucson, Arizona

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Minority communities are disproportionately exposed to environmental hazards across the US. Our research focused on Southside Tucson, AZ, a predominantly low-income, Latine community exposed to toxicants on a nearby Superfund site for decades. Using mixed-method research, we explored the role of racism-conscious versus racism-evasive framings in residents' understandings of exposures and desires to engage in collective action. Study 1 was an archival study exploring dominant discourses surrounding contamination across six local news sources (n=309 articles). Discourse was overwhelmingly colorblind, and "Southside identity" emerged as a common colorblind descriptor of victims. However, Study 1B (n=78) found that Tucson residents associated the Southside with people of color. Study 2 (n=205) was an experiment testing how racism-conscious versus racism-evasive framings of exposure can (de)mobilize collective action. We found that racism- and classism-conscious framings resulted in higher precursors to collective action for Tucsonans of color, but not for White Tucsonans.

[98] From Eerie to Favor: The Positive Side of AI in Negative Animals

8:00 AM – 9:00 AM

SOCIAL COGNITION

When computer-generated characters look almost but not perfectly real, the eerie discomfort that people experience is called the uncanny valley. Prior work has found this effect for virtual animals, but mainly with species such as cats and pandas. We extend this work by exploring whether the pattern persists for animals that inherently elicit negative feelings. Across three experiments (total N=500), participants viewed AI-generated or real images of animals with positive associations (e.g., dogs) and negative associations (e.g., spiders). Replicating prior work, for animals perceived as positive, real images were rated warmer and less eerie than AI and produced higher purchase and donation intentions. For animals perceived as negative, the pattern flipped: AI images were warmer, less eerie, and increased purchase and donation. These increases were mediated by perceived warmth. Our results support that the uncanny valley depends on baseline affective feelings. When real animals evoke negative feelings, AI can help turn the original impression and increase acceptance. This work found a new boundary for the uncanny valley and broadens the positive side of AI in consumer perception.

[99] From Finger Tapping to Bouncing Legs: The Behavioral Signature of Impatience

8:00 AM – 9:00 AM

EMOTION

Impatience is a common emotional experience, yet little is known about its expression or recognition. While emotion researchers have largely focused on basic emotions with universal facial expressions, less is known about how more context-dependent emotions like impatience are expressed. This research aims to address that gap by identifying the behavioral markers of impatience. Across two studies, we examine how impatience is conveyed through facial, vocal, and bodily cues. In Study 1, we elicit impatience by placing participants in a realistic waiting scenario, capturing spontaneous expressions. In Study 2, we compare expressions of impatience based on prototypical displays and personal emotional recall. Initial results suggest that impatience is particularly marked by repetitive behaviors (e.g., leg bouncing, finger tapping), as hypothesized. Together, these studies offer a mixed-methods approach to exploring how impatience may be expressed and recognized, which provides insight into the social function of impatience as an emotion.

[100] From Observation to Attribution: How Event Features Shape Responsibility Judgments in Real-World Traffic Videos

8:00 AM – 9:00 AM

SOCIAL COGNITION

When people witness a harmful event, they can judge who is responsible and to what extent. Such judgments depend on multiple factors, including what happened and whether the agent was aware that their behavior could cause harm. This information is either observed or inferred from perceptual inputs, often based on details that are present in naturalistic videos but are difficult to convey in word descriptions. For instance, if a pedestrian crossing the road is hit by a car, how suddenly the pedestrian enters the crosswalk can alter blame attribution. This study examines how humans derive responsibility judgments from rich visual input using naturalistic traffic videos. We first curated a representative set of stimuli from a large video dataset using a combination of human ratings and data-driven methods. Then, to address the complexity of event features (entities and their spatiotemporal relationships), we integrate human eye-tracking data with computer vision models to identify salient entities. Finally, we conduct experiments with these entities to quantify the extent to which different features contribute to responsibility judgments in realistic settings.

[101] From Parenting to Prosociality: Early Head Start Pathways to Children’s Social–Emotional Skills

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Early Head Start (EHS) is a two-generation, need-based program for low-income families. We tested whether EHS parenting-services engagement predicts parenting and child outcomes in a sample of 1,503 families. Engagement was measured at child ages 6, 14, and 24 months using indicators of parenting classes, parent group socializations, parent support groups, child-development services during home visits, parenting information during home visits, and parenting discussions with a case manager. Parenting at 36 months included harshness, intrusiveness, warmth, and parental stress. Child outcomes at 60 months included self-regulation and prosocial behavior. A longitudinal path model showed that higher EHS engagement was associated with less harsh parenting, lower intrusiveness, and greater warmth. Parenting, in turn, was related to children’s social–emotional skills: greater warmth and less parenting stress predicted lower prosocial behavior, and less intrusiveness predicted greater self-regulation. Overall, engaging in EHS parenting services aligned with warmer, less intrusive caregiving, with downstream links to children’s prosocial behavior and self-regulation by kindergarten entry.

[102] From Solo to Choir: How Perceived Number of Voices and Connectedness Influence Musical Transcendence

8:00 AM – 9:00 AM

EMOTION

Can collective effervescence, the feeling of merging with something larger than oneself, be sparked at home through music? In an online experiment (n=464), we explored whether increasing the number of voices in a Black gospel song evokes a sense of connection and transcendence. Participants listened to one of several versions of the same song, reported feelings of connection and transcendence before and after listening, and estimated how many voices were in the performance. PROCESS analysis showed post-song connectedness moderated the effect of perceived number of voices on transcendence. When listeners felt less connected, perceiving more voices predicted lower transcendence, but at higher connectedness, this relationship shifted slightly positive. These findings suggest that the power of “many voices” to evoke transcendence depends on the listener’s own sense of connectedness, offering insight into how collective spiritual experiences may emerge even in solitary settings.

[103] From Stereotyping to Fairness: Cognitive Reflection Predicts Children's Social Cognition

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Cognitive reflection (CR), the ability to override incorrect intuitive responses, predicts reasoning in adults across many domains, including decision making, STEM understanding, fake news detection, stereotyping, and cooperation. While recent work links CR to children's rational thinking, its role in their social reasoning has not been explored. In a preregistered study, 5- to 12-year-olds (N = 184) completed measures of CR, gender stereotyping, social essentialism, explanations of racial inequality, and fairness. Higher CR predicted endorsing fewer gender stereotypes, holding less gender-essentialist beliefs, favoring structural over internal explanations of racial inequality, and sharing more fairly. These effects held in Bayesian regressions adjusting for age, gender, executive functions, fluid IQ, and SES. These findings suggest CR is foundational to children's social cognition and a promising target for interventions promoting positive social development.

[104] Gender Differences in the Association of Interpersonal Leverage with Proneness to Anger?

8:00 AM – 9:00 AM

EMOTION

Recent evolutionary theories posit that anger is a recalibrational emotion: anger functions to increase the interpersonal value that the target of anger places upon the angry individual, and does so by threatening to impose costs. Extending this logic, researchers have argued that individuals with enhanced abilities to inflict costs—that is, individuals with greater leverage—will have greater success when expressing anger and should therefore expect others to value them more highly and be more prone to anger. Researchers have further proposed that physical strength and attractiveness—two ancestrally valid dimensions of social leverage—will predict greater proneness to anger, but do so in a sex-differentiated way, with strength predicting anger more strongly in men, and attractiveness predicting anger more strongly in women. Initial empirical findings have generally supported predictions, but research is limited, and sample sizes are small. Here we conduct two larger-scale studies (N's = 417 and 397, respectively), in an effort to replicate prior findings. Results across both studies, along with a Bayesian meta-analysis of existing evidence, corroborate the hypothesis that physical strength predicts anger proneness in men. Results further corroborate the view that attractiveness predicts anger proneness in women. However, findings fail to support the predicted and previously observed sex differences: in our studies, strength and attractiveness predicted anger proneness in both men and women, at roughly equal levels.

[105] Gratitude rather than indebtedness leads beneficiaries to sacrifice others for benefactors

8:00 AM – 9:00 AM

EMOTION

Previous studies have shown that grateful individuals tend to behave morally by being generous to others or refraining from cheating. However, they may sacrifice third parties to protect their benefactors from harm. This study examined the conditions under which this sacrificing behavior is more likely to occur. Both Studies 1 and 2 used vignettes comparing gratitude-inducing conditions with respective controls. Study 1 compared gratitude with indebtedness (without feeling lucky), whereas Study 2 compared gratitude with feeling lucky (without indebtedness). The results showed that beneficiaries more willingly sacrificed a third party for their benefactors in the gratitude condition but only in Study 1. This difference remained significant after statistically controlling for other emotions, including indebtedness, and disappeared only when gratitude was controlled. These findings suggest that gratitude rather than indebtedness drives beneficiaries to sacrifice others for their benefactors.

[106] Growing Apart or Growing Together: The Bittersweet Nature of Romantic Nostalgia

8:00 AM – 9:00 AM

EMOTION

Relationship nostalgia, a sentimental longing and wistful affection for early aspects of one's current relationship, has been found to increase relationship satisfaction and commitment. However, drawing on self-appraisal theory, we examined whether these nostalgic recollections might highlight changes in closeness over time, particularly for individuals with lower baseline relationship quality, leading to less positive relationship outcomes. In a correlational study, participants in romantic relationships completed a romantic nostalgia induction and answered questions regarding their current affect and feelings toward their relationship. We found that at low and medium levels of baseline relationship quality, nostalgia was associated with lower relationship commitment and satisfaction through greater feelings of having grown apart from one's romantic partner since the time of the memory. Furthermore, when controlling for baseline relationship quality, nostalgia was positively associated with negative emotions and negatively associated with positive emotions, suggesting that relationship nostalgia may not confer benefits across all relationships.

[107] Grudge Holding Across Cultures: The Role of Hurt and Anger

8:00 AM – 9:00 AM

EMOTION

Grudges have been described as sustained feelings of hurt and anger. But how are these emotions experienced during grudge-holding events, and are they culturally similar? In Study 1, we conducted semi-structured interviews with East Asian Canadian (n = 12), European Canadian (n = 18), and Japanese (n = 15), participants. Thematic analysis revealed more cultural similarities than differences. Hurt was internalized and relationship-oriented, reflecting self-doubt and vulnerability after feeling devalued by close others. Anger was externalized, involving blame and a desire to change the other. Most Japanese and East Asian Canadians experienced hurt first, followed by anger, whereas European Canadians often felt anger first. Regardless of sequence, hurt and anger were interwoven across groups. In Study 2 (N = 501), we conducted a quantitative study using multi-item measures of hurt and anger. Results showed that hurt and anger interact to predict grudge: when one emotion is high, the other further amplifies grudge holding. This interaction was stronger when relational mobility was low (i.e., when ending the relationship was difficult).

[108] Having been there: the relationship between adversity and motivated empathy avoidance

8:00 AM – 9:00 AM

EMOTION

It is common for people to seek community among those who have faced similar trauma and suffering. While research has found that experiencing severe adversity is positively associated with empathy and care for others in need, why adversity conduces to prosociality remains an open question. In this experiment (n = 200) college students will complete a measure of adversity and a modified Empathy Selection Task (Cameron et al., 2019). This task will provide participants with the free choice to empathize (or avoid empathizing) with vignettes about others' adverse experiences. The severity of adverse experiences in the vignettes will be experimentally manipulated (extreme vs. mild). We ask if adversity severity will be more strongly related to selecting into extreme adverse empathy-inducing situations. Multilevel logistic regressions will examine the association between severity of adversity and empathy choices toward people who have experienced adversity. Discussion will focus on mechanisms of the adversity – empathy relation.

[109] Heating Up Intergroup Conflict: Radical Antagonistic Responses to the Threats of Rapid Climate Change

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Our research examines whether climate change-related threat perceptions foster support for antagonistic collective action: either to radically protest for climate protection or to radically, even violently, confront climate protesters. We conducted a three-wave longitudinal study (2023–2024) in Germany (N = 1,003). Indicators of climate change-related threat were climate change impairment and perceived lack of climate-protective behavioral control. Radical responses were operationalized as support for radical climate protest or radical responses against climate activists. Statistical analyses included latent change score models and moderation analyses using structural equation modeling. Longitudinally, changes in climate change impairment positively predicted changes in support for radical climate protest, particularly with lower right-wing authoritarianism (RWA). Conversely, changes in perceived lack of climate-protective behavioral control positively predicted changes in support for radical responses against climate activist, particularly with higher RWA. These findings highlight how different facets of perceived climate change in line with one's ideological orientation shape polarized reactions.

[110] Hindsight Bias and Conspiratorial Belief in the 2025 Presidential Impeachment in South Korea: The role of expectation-confirming and -disconfirming information

8:00 AM – 9:00 AM

SOCIAL COGNITION

When outcomes differ from expectations, people may experience cognitive dissonance, triggering two responses: (1) hindsight bias and (2) conspiratorial belief. Prior information may play a key role in determining which response emerges. Using two-wave survey data collected before and after the 2025 presidential impeachment in South Korea (213 Korean adults), we examined how these reactions varied by participants' stance and how prior information influenced them. Participants were grouped by pre-ruling attitude (pro, neutral, anti), and reasons supporting and opposing—collected in the first wave—were coded as confirmatory and disconfirmatory information based on the actual outcome. Results showed that both cognitive responses were stronger in the anti-group. GLM analyses revealed that only in the anti-group did confirmatory information predict greater hindsight bias and lower conspiratorial belief, while disconfirmatory information weakened these effects. These findings suggest that prior knowledge plays a key role in shaping cognitive responses to political dissonance and underscore the importance of balanced prior information in fostering acceptance of political outcomes.

[111] Home in Time? A First Look at How We Experience Temporal Rootedness

8:00 AM – 9:00 AM

BELONGING/REJECTION

Research shows that a sense of belonging predicts meaning in life (Lambert et al., 2013). While psychologists have studied how individuals develop a sense of belonging with others, little attention has been given to the sense of belonging in time, or temporal rootedness (Baldwin & Keefer, 2020). Temporal rootedness has previously been defined as what makes people feel like they are living in the “right time” or that they “belong in the present.” Despite its positive link to well-being, its definition and content have remained unexplored. This study replicates Baldwin and Keefer (2020) to examine temporal rootedness and compare the themes that persist across time (i.e., 2019 and 2025). A representative sample of participants (N = 386) was recruited on Prolific to describe their source of temporal rootedness and complete a questionnaire assessing time metaphors, human flourishing, existential isolation, social and economic conservatism, familiarity with technology, and perceived discrimination. Results shed light on what it means to feel anchored in time and the implications for research on meaning-making.

[112] Hometown Nostalgia as a Predictor of Climate Change Attitudes and Behaviors

8:00 AM – 9:00 AM

EMOTION

Nostalgia is an emotion wherein one sentimentally reflects on past events or memories. It has been demonstrated to increase optimism, meaning of life, and prosocial behaviors, and to buffer against existential threat. To date, little is known about the relationship between nostalgia, concern about the existential threat of climate change, and pro-environmental behaviors. The present correlational study examines how nostalgia for one's hometown predicts climate change attitudes and pro-environmental behaviors. College students at a mid-size, southeastern coastal university who grew up locally first completed the Southampton Nostalgia Scale (Evans et al., 2022), which was adapted to elicit nostalgic feelings for students' hometown. Students then watched a short video and read an article about the impact of climate change on flooding in their hometown, before answering questions about climate change attitudes and pro-environmental behaviors. We hypothesize that nostalgia will be a significant predictor, with higher levels of nostalgia for the local area predicting higher pro-environmental attitudes and intentions to support policies and engage in behaviors to mitigate climate change.

[113] Hostile Attribution Biases are Resistant to Brief Loneliness Manipulations

8:00 AM – 9:00 AM

BELONGING/REJECTION

Loneliness, or perceived social isolation, shifts cognition toward heightened sensitivity to threat. These cognitive biases may perpetuate loneliness and subsequent long term health risk. One of these is the hostile attribution bias, or the tendency to assume hostile intent behind others' ambiguous actions. Recent work suggests engaging in gratitude-related prosocial acts can reduce loneliness, but it is unclear whether these changes also alter cognitive shifts like the hostile attribution bias. This study tests whether a prosocial act alleviates loneliness and associated hostile attribution biases by assigning participants to a loneliness induction, reduction (prosocial gratitude), or control condition. Loneliness increased after induction and decreased after prosocial gratitude. Baseline loneliness was associated with increased hostile attribution biases but acute changes in loneliness did not produce corresponding changes in this bias, regardless of baseline loneliness. These findings have implications for the design of loneliness interventions, suggesting that targeting cognitive sequelae of loneliness as opposed to momentary feelings may prove more fruitful in the long-term.

[114] Hot and Hasty: Linking Impulsivity and Comfort

8:00 AM – 9:00 AM

EMOTION

People are becoming increasingly more vulnerable to heat. With ambient temperatures reaching unprecedented levels, studying individual variability is vital for developing effective preventive strategies. Previous literature links personality traits to behavioral, physiological, and psychological patterns, including responses to environmental stressors like heat; however, trait impulsivity remains unexplored. Trait impulsivity is linked to heightened mood states, particularly under stress. We examined how trait impulsivity relates to affective experience and comfort during a heat-induction experiment. Participants (N=78) were exposed to hot (110°F) and ambient (72°F) temperatures in an infrared sauna across two 50-minute sessions. Participants' trait impulsivity and comfort were also measured. A mixed-effect regression revealed that negative affect was predicted by trait impulsivity ($\beta = 3.48, p = .003$) regardless of condition. However, comfort in the hot condition was not significantly related to trait impulsivity ($\beta = -1.87, p = .082$). These findings highlight that more impulsive participants tend to report greater negative affect, but not stronger reactions to thermal stress. These preliminary analyses establish a basis for future research, which we plan to extend by continuing to examine trait impulsivity and personality traits under hot conditions over time.

[115] How Do Perceptions of Open Inquiry in STEM Students Impact Belonging?

8:00 AM – 9:00 AM

BELONGING/REJECTION

Retaining marginalized groups in STEM has been a major focus of psychology research. By recruiting current STEM majors, we examined how perceptions of social norms connect to students' self-efficacy and belonging in STEM fields. We also tested whether the effects of norms around open inquiry differed by group membership (e.g., gender, race, political orientation). A total of 487 students (388 STEM majors) participated. Both STEM and non-STEM majors were asked about STEM norms around open inquiry. STEM majors (M=2.39, SD=.75) rated STEM fields as valuing open inquiry more than non-STEM majors (M=2.17, SD=.74, $p = .004$), though both groups similarly enjoyed open inquiry activities ($p = .147$). STEM majors reported higher belonging (M=4.86, SD=1.06) than non-STEM majors (M=4.32, SD=1.02, $p < .001$). For STEM majors, we ran a regression with social norms and enjoyment of open inquiry predicting belonging. Both enjoyment ($b = 1.27$) and norms ($b = 1.42$) significantly predicted belonging ($p < .001$). Results suggest that open inquiry and perceptions of its value play a critical role in supporting STEM students.

[116] How Good Life Relates to Social Expectations

8:00 AM – 9:00 AM

SOCIAL COGNITION

Well-being depends on forming and sustaining social connections, yet people often underestimate how positive interactions with strangers will be. Prior work (e.g., Epley et al., 2022) highlights this cognitive miscalibration: people expect conversations with strangers to be less enjoyable than they actually are, which may contribute to isolation. We examined whether individuals' good life preferences—valuing happiness, meaning, or psychological richness—relate to expectations about social interactions. Participants imagined talking with a seatmate on an airplane and reported both their expectations of the conversation and their preferred good life. Results showed that those pursuing a meaningful life held more positive expectations than those pursuing happiness or psychological richness. These findings suggest meaning-oriented individuals may be less susceptible to conversational miscalibration, offering insight into pathways for encouraging social connection.

[117] How Is School Bullying Related to Dark Personality Traits? A Cross-Cultural Study of the US and China.

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

This study explores the relationship between school bullying engagements and the Dark Factor of Personality (D), an overall, dispositional inclination toward socially aversive behaviors. Since bullying is one such behavior, we examined whether bullying is influenced by D. Given the high-stakes (China) vs. lower-stakes (US) school systems and possible different roles D plays in the society, we examined how culture shapes this association. Study 1 recruited 250 participants from each country (N=500, age 18-25) who completed a retrospective school experience questionnaire and the D16. Study 2 expanded the sample (N=700), used the full D70, and added gender measurement. Across both nationalities, results revealed a significant positive relationship between bullying behaviors and D. In Study 2, we also found a significant positive relationship between bystanders and D. Subthemes of sadism, deceitfulness, and vindictiveness significantly predicted bullying status. Cross-national differences emerged: Chinese participants scored higher in vindictiveness and narcissistic entitlement, while U.S. participants showed higher deceitfulness, regardless of bully status.

[118] How Stable are Evaluations of Status Across Social Interactions?

8:00 AM – 9:00 AM

SOCIAL COGNITION

A person's status is consequential across life domains. Yet, it remains unclear whether one's status is a stable, trait-like characteristic—relatively unaffected by social context—or whether it is socially constructed in-the-moment—varying depending on one's interaction partner. To examine this, we analyzed 1519 naturalistic, dyadic conversations (each at least 25 minutes), after which participants (N=753) evaluated themselves and their partner on status and personality traits. Using the Social Relations Model, we estimated that evaluations of one's own status was highly stable across partners (~90% variance explained by self; <0.01% by partner), more so than other traits. Evaluation of one's partner's status was also highly attributable to the self (almost 40% of variance), more so than other traits, but also had 18% of variance attributed to the partner. Results suggest one's own status is highly internalized and stable across conversations—not varying much by partner. Evaluation of an interaction partner's status is shaped by a mix of projection from the evaluator and social inference. This work offers novel insight into the stability and social construction of status.

[119] Hurt People Hurt People...Or Do They? Symbolic Concerns and Reactions to Victimization

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Previous research suggests that victimization to be associated with both altruistic behavior and selfish behavior. The present study seeks to examine whether symbolic concerns related to power/status and shared values differentially predict responses to altruistic and selfish behaviors after victimization. One hundred and fifty participants will be randomly assigned to read one of two vignettes describing a college student who feels victimized by her partner's emotional infidelity, with either the power/status implications or the shared value implications of the infidelity being emphasized. Participants will then be randomly assigned read one of two follow-up vignettes in which the victim is invited to a concert by a friend who is interested in her romantically, which she does not reciprocate. Depending on the condition to which participants are assigned, the victim either confesses her lack of romantic interest prior to the concert to avoid him feeling led on (Altruism condition) or waits until afterward to confess her lack of romantic interest to ensure that she is able to attend the concert (Selfish condition). It is hypothesized that participants will rate altruistic behavior more positively when power/status concerns are emphasized, and selfish behavior more positively when shared value concerns are emphasized. Findings will offer a more comprehensive understanding of the factors that shape different responses to victimization.

[120] Ideal Emotion Discrepancies Relate to Emotion Regulation and Psychological Health

8:00 AM – 9:00 AM

EMOTION

Because emotions influence how we think, feel, and behave, people strive to experience certain emotions. However, how do emotion goal discrepancies influence emotion regulation and psychological health? Further, are the consequences of these discrepancies similar when one falls short vs. exceeds one's goal? To answer these questions, we examined how high and low arousal positive and negative ideal emotion discrepancies, or discrepancies between the emotions people ideally want to and actually experience, related to emotion regulation, and psychological health in a large (N=1,112) and diverse sample. Across arousal levels, ideal positive emotion discrepancies related to less reappraisal (but not suppression), ideal negative emotion discrepancies related to more suppression (but not reappraisal), and each discrepancy related to worse psychological health. Observed quadratic effects indicated that results were similar across discrepancies that fall short and exceed one's goals. Together, our results suggest, across arousal levels, valence, and whether one falls short or exceeds one's goal, ideal emotion goal discrepancies can influence emotion regulation and psychological health.

[121] Ignored Past, Invisible Present: Native Visibility Reduces Systemic Racism Denial Through Contemporary Attunement

8:00 AM – 9:00 AM

SOCIAL COGNITION

Native omission has negative downstream consequences for non-Native's perceptions of Native people. The Marley Hypothesis suggests that dominant groups tend to deny present day racism at a greater rate than minorities which is further explained by ignorance of past injustices. Extensions of this research demonstrate that sharing critical information can disrupt this pattern of ignorance by changing perceptions of racism among whites. This study investigates the impact of Native visibility on white individuals' perceptions of systemic racism through contemporary attunement and the role of their existing orientation to colonial history. We analyzed data pooled from two experimental studies with all-white samples (N=507) and demonstrate the importance of contextualizing systemic racism towards Natives: historical orientation and contemporary attunement are predictors of systemic racism acknowledgement and Native visibility, when compared to omission, indirectly reduced systemic racism denial.

[122] Illusion of Control Revisited: Missing the Forest for the Trees

8:00 AM – 9:00 AM

SOCIAL COGNITION

We re-examine the illusion of control through the lens of Construal Level Theory. We distinguish between control over high-level aspects (e.g., goals, outcomes) and low-level aspects (e.g., immediate details). Scarcity contracts regulatory scope, drawing attention to short-term logistics and overweighting control over low-level aspects. This shift provides fleeting agency but obscures structural barriers that shape long-term trajectories. Across three sets of studies, we test (1) whether people prefer and feel greater agency from high-level control, (2) whether scarcity systematically redirects attention to low-level control, and (3) whether simple interventions can restore balance by expanding scope. Findings suggest that disadvantage does not reduce agency outright but reallocates it toward inconsequential details, sustaining inequality. By showing how scarcity reshapes perceived control, this project reframes the illusion of control as a cognitive mechanism through which structural exploitation perpetuates itself, and points to interventions that expand real opportunities for agency.

[123] Imagining and Believing: How Counterfactual Thinking Enhances Beliefs in Conspiracy Theories.

8:00 AM – 9:00 AM

SOCIAL COGNITION

In recent years, conspiratorial thinking has garnered immense attention. However, the extant literature has focused on the demographics of who is likely to believe in conspiracy theories and protective factors, with less emphasis on the cognitive processes involved. The present study (N=460) addresses this gap by examining how counterfactual thinking—imagining alternative outcomes for past events—influences belief in conspiracy theories. We hypothesize that generating counterfactuals increases belief in a specific conspiracy theory, and that this effect is strongest when the event is ambiguous. We will also explore how individual differences in the need for cognition might moderate this relationship. We propose a study with a 2 (Counterfactual Induction: upward vs. control) x 2 (Event Clarity: ambiguous vs. clear) between-subjects factorial design to test these predictions. Our findings will reveal whether generating counterfactuals increases conspiracy endorsement, particularly when information is ambiguous, and if this relationship is influenced by the need for cognition. This research will highlight the cognitive mechanisms that may contribute to conspiratorial thinking.

[124] Impact of Community Resilience, Social Support, and Humiliation on PTSD in Women Survivors within Armed Conflict

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Introduction: Women exposed to the prolonged armed conflict in Colombia have endured multiple forms of violence and displacement, facing a heightened risk of mental health problems, specifically post-traumatic stress disorder (PTSD). Although individual resilience is fundamental for recovery, the role of protective factors at the community level, such as community resilience, social support, and experiences of humiliation, has been little explored from a gender perspective. The objective of this study was to analyze the associations among community resilience, social support, humiliation, and PTSD symptoms in women survivors of the Colombian armed conflict.

Method: A cross-sectional design was used with a sample of 148 women (mean age = 45.8, SD = 11.3; age range = 25–75), members of Ruta Pacífica de las Mujeres from the regions of Bolívar, Eje Cafetero, and Santander. Standardized questionnaires were applied to measure community resilience (emotional regulation, social capital, and collective efficacy), perceived social support, humiliation, and PTSD symptoms. Correlation analyses, multiple regressions, and mediation/moderation models were conducted.

Results: Community resilience was significantly associated with fewer PTSD symptoms, lower feelings of humiliation, and higher levels of perceived social support. Mediation analysis showed that the protective effect of community resilience on PTSD operated partially through increased social support and decreased humiliation. This protective association was stronger among women with low or moderate institutional trust. Displaced women, women of Afro-descendant origin, those with lower educational levels, and residents in urban areas presented higher PTSD symptomatology.

Discussion: Community resilience and the mobilization of collective and social resources are crucial for psychological recovery and for reducing the traumatic impact on women survivors in conflict contexts. These findings highlight the importance of strengthening community ties, social support, and women’s empowerment to promote long-term psychosocial well-being in Colombia’s post-conflict setting.

[125] Implicit Associations of God as White and The Relation to Secular Authority

8:00 AM – 9:00 AM

SOCIAL COGNITION

God is popularly perceived as a White man, and this perception may reinforce the association of White men as authority figures in secular contexts. We tested this theory using implicit associations of God as White. In two studies (N = 347) we employed two different IATs (Implicit Association Tests) and one stroop-like task. Results indicated that participants implicitly perceived God as White; however, these implicit associations were not significantly related to preferences for White authority figures in workplace contexts. These findings highlight the persistence of racialized representations of God while suggesting that such implicit biases may not directly translate into preferences for secular leadership.

[126] Inclusive Lectures Improve Social Fit and Self-Efficacy for Black College Students

8:00 AM – 9:00 AM

BELONGING/REJECTION

Incorporating diverse perspectives in the college setting can increase student performance. Representing Black students in college lecture materials may increase belonging and other outcomes crucial to health and collegiate success. While there are other factors that influence belonging, we studied the extent representation alone plays a role. Black and Black-multiracial college students (N=216) completed an online survey. They were randomly assigned to view a 7-minute lecture video which included either representative or nonrepresentative slides and completed measures of mental health, sense of social fit, school self-efficacy, self-esteem, engagement, clarity, and confidence. Participants experienced a significantly greater sense of social fit ($t(214)=2.32, p=.021, d=-0.32$), school self-efficacy ($t(214)=-2.38, p=.018, d=-0.32$), and engagement ($t(214)=-2.35, p=.020, d=-0.32$) after viewing the representative lecture. These results suggest that even brief instances of representation can improve the immediate experiences of Black college students and provides a foundation for future research how to best include representative materials.

[127] Indirect versus Direct Aggression in Friendship Transgressions

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Prior research on gender differences in indirect and direct aggression strategies has focused on the perspective of the perpetrator, finding that women more often use indirect strategies to inflict harm, whereas men tend to use direct forms of aggression. What remains unclear is whether gender matters in how victims react to indirect vs. direct aggressions in the context of friendship transgressions. In Study 1 (N = 201), participants reported the hurtfulness of either being called unloveable to one's face (direct aggression) or learning of a friend having spread a false rumor about them (indirect aggression). In Study 2 (N = 197), we extended Study 1's findings introducing four different examples of both indirect and direct aggression. In Study 3 (N = 200), we tested two potential mediators. Indirect (as opposed to direct) forms of aggression were generally perceived as more harmful to the relationship with the transgressor and more hurtful. Contrary to our hypothesis, there was no significant interaction between gender and aggression type across the three studies. These findings suggest that men and women respond similarly to indirect aggression and its inflicted social harm.

[128] Individual Differences Predicting Killing and its Emotional Consequences

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Although aggression is widely studied, less is known about dispositional factors influencing the threshold to kill and associated affective responses. This study investigated the individual differences that predicted behavior and negative emotion in a simulated ladybug-killing task. Guided by moral disengagement theory, we hypothesized that individuals higher in psychopathy would endorse more killing-related outcomes and report less negative affect. Undergraduates (N = 224) engaged in an ostensible ladybug-killing task, reflected on the experience, then completed measures of Dark Triad traits and gaming behavior. Logistic regression analyses revealed that psychopathy significantly predicted killing, with odds ratios indicating a three to fourfold increase per unit rise in psychopathy. Psychopathy and video game activity also distinctly predicted lower reported negative emotion following killing scenarios. Findings highlight the unique, gender-invariant role of psychopathy in disengaging moral constraints and reducing emotional consequences of violence.

[129] Influence of Racial Diversity on Speech Perception

8:00 AM – 9:00 AM

SOCIAL COGNITION

Notions of “standard” English are typically associated with Western, White speakers, but are less applicable in non-Western, non-White contexts. Yet, much of the existing literature remains fixated on contrasting “standard” against “non-standard” varieties of English. For example, in Southeast Asia, Singapore’s brand of English is shaped by unique language policies and diverse linguistic roots from its three major ethnic groups – Chinese, Malay, and Indian (by demographic majority). Despite evidence that accents influence perceptions of ethnic identity, distinct ethnic accents in Singapore remain overlooked. Consequently, we aim to identify the hierarchy of English accents in Singapore (if any), reflected through measures of intelligibility, accentedness, and the response time of making the judgements.

The present study (n = 60 each for Studies 1 and 2) examines whether seeing a majority face, a minority face, or a silhouette (no face) impacts listeners’ perception of the respective ethnic accents. We also explore the extent to which listeners’ social network diversity predicts their perception of speech.

[130] Institutional responses to biased incidents affect identity safety

8:00 AM – 9:00 AM

BELONGING/REJECTION

We assessed whether different university responses to biased incidents influence identity safety for minoritized identity group members (i.e., people of color, LGBTQ adults). Across three studies (total N = 746), the more that participants perceived a university’s response to be effective, the more they expected to belong, and the less they expected bias and diversity dishonesty from the school. Participants reported greater expected belonging (Study 3), less anticipated bias, less diversity dishonesty, and greater perceived response effectiveness (Studies 2 and 3) when a university responded to racially biased incidents of varying severities with punitive rather than educational sanctions. The relationship between sanction type and expected belonging was mediated by greater perceived response effectiveness (Studies 2 and 3). Participants similarly favored both educational and punitive sanctions (Study 3) but anticipated greater identity safety at a university that used punitive sanctions for racially biased incidents. This research suggests that institutions can bolster identity safety for minoritized identity group members by responding to biased incidents with punitive sanctions.

[131] Interactive Effects of Positive Urgency and Drinking Motives on Alcohol-Facilitated Aggression

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Urgency theory predicts that emotional states interact with dispositional positive urgency to facilitate impulsive behaviors. Drinking motives represent naturally occurring emotional activators that should prompt the urgency-behavior pathway, yet this core theoretical prediction remains understudied in naturalistic settings. Using data from a 14-week ecological momentary assessment study, I test four pre-registered hypotheses examining positive urgency as a moderator of the relationship between positively valenced drinking motives and alcohol-facilitated aggression at both within-person and between-person levels. College students (N = 196) completed dispositional urgency measures at baseline and 13 surveys about drinking motives and alcohol-facilitated aggression weekly during the social weekend (i.e., Thursday through Saturday). This study provides a rigorous and contextual test of urgency theory based upon recent findings which highlight the positively valenced pathways for alcohol use and alcohol-related outcomes. Results will inform our theoretical understanding of positive psychological pathways to harmful alcohol use outcomes.

[132] Beyond Merit: The Psychological and Social Implications of Believing in Luck’s Pervasiveness

8:00 AM – 9:00 AM

OTHER

Utilizing a mixed-methods approach, this research explores how dominant group members, specifically White, cisgender individuals, engage with intersectional frameworks and whether such engagement can enhance solidarity with Black transgender individuals. Study 1 employed 19 in-depth interviews with White, cisgender individuals to unpack their reactions to intersectional frameworks and motivations behind solidarity. Study 2 tested an intervention aimed at increasing White, cisgender individuals’ sense of group efficacy while integrating intersectional awareness into a broader theoretical model of collective action. Although the intervention did not successfully increase perceived group efficacy, statistical analyses revealed that intersectional awareness was strongly correlated with key predictors of collective action. This research underscores the critical role dominant group members can play in supporting multiply marginalized communities. As real-world conditions intensify for the transgender community, it is important to identify the relationship between intersectional frameworks and solidarity mechanisms for dominant group members.

[133] Self-Other Asymmetry: Lay Beliefs about the Relationship Between Intrinsic and Extrinsic Motivations

8:00 AM – 9:00 AM

MOTIVATION/GOALS

Previous research debates whether intrinsic and extrinsic motivations function as opposite ends of a continuum (e.g., Sheldon & Elliot, 1999), suggesting a negative relationship, or separate independent dimensions (Koestner et al., 2008). Additionally, most studies focus on how these motivations predict goal progress (Milyavskaya et al., 2015), but less is known about how lay people conceptualize the relationship between these types of motivations. Across three studies, we explored whether individuals view intrinsic and extrinsic motivations as inherently related or independent dimensions, and whether this differs for self vs. others. In Study 1 and Study 3, participants rated their own motivations across six goal domains. In Study 2, participants inferred others' motivations from vignettes that described a target's motivation for a goal. Results revealed a small positive correlation between intrinsic and extrinsic motivations for self (Study 1: $r = .09$; Study 3: $r = .630$), but a negative correlation when judging others ($r = -.17$). This self-other asymmetry suggests people may apply simpler assumptions to others' motivations, which may impact how we interpret others' goals and values.

[134] Investigating The Cross-Race Recognition Deficit in Racially Ambiguous Faces

8:00 AM – 9:00 AM

SOCIAL COGNITION

The Cross-Race Recognition Deficit (CRD) is a well-documented global phenomenon outlining that people are better at recognizing faces of their own race than a different race. Here, we explore the CRD in the context of social categorization. Prior work has shown that mere categorization of in/out-group status is enough to elicit this effect. Ambiguous racial groups may need an additional signal, like a name, to push an ambiguous face into a racial category.

In this study, we used racially ambiguous faces with stereotypical White and Middle Eastern North African (MENA) names to determine if the CRD can be replicated through the influence of social categorization. We asked participants (N= 251) to remember a series of faces that either had a stereotypical White or MENA name. In two separate blocks, I then tested participants' memory for the faces and names. Results show that participants showed no significant recognition deficit with faces but did show a significant deficit with names. These findings highlight the need for studies into MENA racial classification research, and names as a clue to race.

[135] Investigating the Roles of Expectations and Responsiveness in Gratitude

8:00 AM – 9:00 AM

EMOTION

Gratitude is a response to receiving benefits from others that promotes relationship building, but there are several open questions about which aspects of receiving benefits cause people to feel gratitude. We are especially interested in evaluating two theoretical accounts of how gratitude functions to promote cooperation, which we refer to as Expectation Violations and Responsiveness. According to the Expectation Violations model of gratitude, people feel most grateful when they receive benefits that were unexpected, like those from a new acquaintance rather than a close friend. On the other hand, the Responsiveness model of gratitude posits that people feel most grateful when the benefits they receive match their needs and desires. We used an experimental manipulation between 250 pairs of participants (N=500) to simultaneously manipulate social expectations and perceived responsiveness, allowing us to test whether people feel less grateful due to having higher expectations or more grateful due to perceiving greater responsiveness.

[136] Is political ideology associated with motivations to connect with others? A test of close and distant relationships.

8:00 AM – 9:00 AM

SOCIAL COGNITION

Past research shows that more politically conservative (vs. liberal) people are less tolerant of uncertainty and ambiguity. As a result, it is possible that conservatives (vs. liberals) would be more likely to rely on close (e.g., romantic partner) and distant relationships (e.g., fellow citizens) to make sense of complexities within their worlds. Overall, we anticipated that conservatives (vs. liberals) would exhibit greater motivations to build a common understanding of the world with other people. We tested this prediction in two general population samples (N = 4,588). Contrary to our expectations, liberals (vs. conservatives) exhibited stronger motivations to forge common understandings of their environments with other people. We also observed that liberals (vs. conservatives) were especially likely to report a stronger motivation with distant (vs. close) others. These findings suggest that liberals (vs. conservatives) might be more likely to rely on others to resolve ambiguity and uncertainty in everyday life. Our research therefore proposes nuances to existing literature on how psychological differences between liberals and conservatives are expressed in relational domains.

[138] Knowing versus Doing: How Much Can Training Help People Soften the Blow of Social Rejection?

8:00 AM – 9:00 AM

BELONGING/REJECTION

People complain that they do not know what to say to soften the blow of social rejection; can training help? Avoiding apologies while using positive regard, sincere alternatives, and more words may mitigate the negative consequences of social rejection. Does training on these principles lead to helpful wording? Or, like in other domains, does knowledge not translate into action? In Study 1, Drift Diffusion Modeling suggested that training helped people recognize wording which better carried out the language principles from pre-crafted options rather than improving a priori wording plans. Study 2 built on Study 1 by finding that training successfully aided people in carrying out the language principles when crafting their own social rejection wording. The current research sheds empirical light on a tangible way that psychological science can address people's concerns about what to say to soften the blow of social rejection through an easily disseminated training program.

[139] Learning with the land: The impact of environmental socialization on the sociopolitical development of Indigenous Peoples

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Indigenous Peoples have always had strong ties to the land as an integral part of our culture and identity. These ties are formed through environmental socialization (ES), which is the process of learning about the environment through cultural teachings and forming a relationship with place and the natural world. We predict these ties encourage Indigenous Peoples to learn about the impact of systems on the environment and engage in actions to protect it. Accordingly, this study examined whether higher ES was associated with greater probability of believing that climate change (CC) is caused by systems and higher engagement in critical environmental action (CA). Using the Indigenous Climate Justice Survey (N=425), we found that higher ES was associated with greater probability of the belief that CC is caused by systems and higher frequency of participation in CA. These findings bring more awareness of the causes of environmental injustice and provides avenues for resistance. Therefore, ES plays a crucial role in supporting Indigenous-focused action for environmental justice, and efforts should be made to foster it.

[140] Leveraging Stories to Cope with Challenges in Life

8:00 AM – 9:00 AM

EMOTION

Across history, humans have used stories as vehicles of meaning, passing down lessons, insights, and inspirations. Anecdotally, people also turn to stories to make sense of their emotional experiences, particularly in the face of life challenges. However, research on emotion regulation has not examined the deliberate recall of stories—particularly vicarious ones such as films and books—as a strategy for managing emotions. This represents a significant gap in the literature, given that stories are readily accessible, materially diverse, and cognitively less demanding to process and recall, making them promising tools for emotion regulation. The present study addresses this gap by examining how often, when, and why people draw on stories to regulate their emotions. In our ongoing data collection, 200 Prolific participants list stories that help them in the face of life challenges and provide brief descriptions of both the stories and their regulatory roles. Additional self-reported data involving story characteristics (e.g., emotional valence and perceived regulatory effectiveness), well-being, and personality traits, are also collected. Findings will shed light on: (1) How often people use stories to cope with difficult events compared to other emotion regulation strategies, (2) What types of stories are most frequently reported as serving regulatory purposes, and by whom, and (3) What themes emerge in people’s qualitative accounts of leveraging stories to self-regulate and make meaning.

[141] LLMs recognize emotions as well as humans (or better)

8:00 AM – 9:00 AM

EMOTION

Empathy is critical in humans’ emotional relationships. In humans, empathic accuracy – the ability to accurately determine another’s emotions – varies by informational modality and is inseparable from emotional processes. This study tested the empathic accuracy of Large Language Models (LLMs: GPT-4o, Claude, and Gemini) using transcripts of real emotional narratives. Their accuracy was compared to human participants (N = 127) who read these transcripts or watched the full videos, including beyond language, physical expressions and paralinguistic cues. LLMs showed empathic accuracy equal to that of humans or better ($\beta = .19-.45$, all $p < .001$), inferred only from semantic content, without any emotional processes. These results held even when analyzing positive and negative emotions separately. Our findings have value for basic science research on empathy, suggesting that semantic information alone can lead to high empathic accuracy, though humans may not fully utilize this potential. We will also discuss both the possible applicative value of these results, alongside risks concerning privacy, ethics, and the possible shifts in humans’ emotional connection in an AI-mediated world.

[142] Loneliness and Perception of Sickness in Faces

8:00 AM – 9:00 AM

SOCIAL COGNITION

Loneliness, or perceived isolation, biases social information processing in ways that heighten sensitivity to social threat. However, this can also contribute to withdrawal behaviors that perpetuate loneliness. Research on loneliness has highlighted sensitivity to negative emotions in others (e.g. fear, anger, sadness), which provide salient interpersonal information. However, it is unclear whether these effects generalize to other forms of social threat- like sickness cues representing threat of interpersonal disease transmission- or are specific to cues that may signal information about potential rejection. Here, we examined whether loneliness is associated with increased perceptions of sickness in others. Two samples of participants completed a loneliness survey and rated face photos on how sick they perceived the individuals in the photos to be. Photos included individuals that received an influenza or placebo vaccine (n = 244) or neutral faces from the Penn Emotion Recognition Task (n = 538; in progress). Loneliness was associated with increased sickness perception across photo types. Findings suggest that social information processing biases associated with loneliness may extend to assessments of sickness in others. These perceptions may subsequently impact decisions underlying approach and withdrawal behaviors that can contribute to continued feelings loneliness.

[143] Loneliness Shifts Social and Affective Evaluations of Images

8:00 AM – 9:00 AM

EMOTION

Loneliness, or perceived social isolation, has been associated with heightened sensitivity

towards both social and negative stimuli. However, whether this heightened sensitivity reflects a specific shift towards socially threatening information, which may signal potential further rejection, or a general tendency to interpret information as more negative and social is less clear. The current study examines the relationship between loneliness and affective and social evaluations of scenes. 147 college students reported their levels of loneliness and rated the valence, arousal, and sociality (i.e., extent to which an image conveys social information) of 48 images, varying in their affective (i.e., neutral, negative), and social content (i.e., social, non-social). Loneliness was associated with increased ratings of both negativity and sociality, regardless of affective or social content. These findings suggest that lonely individuals are more likely to interpret visual information as both more negative and social. These shifts suggest loneliness may have domain general effects, heightening negative and social evaluations regardless of stimuli content.

[144] Lonely people perceive blurred social group boundaries

8:00 AM – 9:00 AM

SOCIAL COGNITION

While the negative consequences of loneliness are well-documented, it is unclear how lonely versus non-lonely individuals think about the different people in their lives. Neural evidence suggests that loneliness leads to a blurring of boundaries between social groups. Do lonely people consciously represent distinct social groups as more similar? In 2 studies (Ns = 62, 57), we investigated whether, when, and how loneliness influences the way people represent their social networks along 3 dimensions. Participants nominated 5 close others and 5 acquaintances. Then they positioned these nominated people, themselves, and 5 celebrities on a screen and arranged them in terms of their relative closeness, familiarity, or similarity, resulting in 3 distinct representational maps. Using representational similarity analysis, we tested how loneliness shapes the perceived clustering in social network representations. Preliminary analyses suggest that lonely people blur boundaries when arranging their social networks in terms of closeness and familiarity, but not similarity. Interestingly, lonely individuals were not more likely to represent themselves as particularly isolated.

[145] Low-friction, high-risk? AI conversation partners provoke less anxiety

8:00 AM – 9:00 AM

EMOTION

Conversational agents powered by large language models (LLMs) can for many be indistinguishable from humans in brief conversations. That said, does knowing that one will engage in conversation with a simulation vs. a real human differentially evoke anticipatory anxiety? We tested this question experimentally by asking participants to report their anticipatory anxiety and experiential expectations prior to engaging in each of two conversations: One with a real human and another with an LLM-powered simulation (order randomized), with both held through the same real-time speech-to-text and text-to-speech interface. Results revealed significantly lower anxiety in anticipation of a conversation with simulated partners compared to actual human partners, though this effect only emerged after initial novelty subsided. Participants also reported greater performance concerns when anticipating human interaction and more positive post-conversation experiences with AI partners. These findings support the notion that anxiety in anticipation of social interaction is substantially evoked by metaperception rather than the act of conversation itself. As simulated humans become pervasive across social domains, understanding the similarities and differences in the ways we relate to them will be important for maximizing the benefits they can provide and minimizing their potential for harm.

[146] Measuring the Impact of Repeated Exposure to Suffering on Compassionate Responding

8:00 AM – 9:00 AM

EMOTION

Many people repeatedly encounter the suffering of others, and for these individuals, compassion is thought to fatigue over time. However, there has yet to be a standardized causal manipulation of repeated exposure to suffering with longitudinal measurement of subjective, expressive, and physiological markers of compassion. Across three studies (N = 677), we developed a laboratory-paradigm in which participants viewed 12 (Studies 1 & 2) or 29 (Study 3) videos of other people suffering. We measured longitudinal changes in self-reported compassion, empathy, and compassion avoidance and coded expressive and physiological markers (e.g., respiratory sinus arrhythmia) of compassion. We found no evidence that compassion declined. Rather, we found some evidence of increases in reported, expressed, and physiological markers of compassion over time. However, participants reported increasing motivations to avoid further exposure to others' suffering. These findings suggest a burden of sustained compassion engagement, but not a loss of it, and call for reconceptualizing compassion fatigue without assuming diminishing compassion.

[148] Mindfulness Enhances Momentary Emotional Well-Being: Observational and Experimental Evidence

8:00 AM – 9:00 AM

EMOTION

We examined whether mindfulness training improves emotional well-being and whether such effects depend on present-moment awareness. In Study 1 (N = 256 undergraduates, 84 EMA prompts), naturally occurring presence of mind predicted lower depressive feelings, anxiety, and stress, and greater happiness in daily life. In Study 2 (preregistered RCT, N = 115 stressed undergraduates, 105 EMA prompts), participants were randomized to a digital mindfulness-based intervention (MBI) or an active coping control. Contrary to hypotheses, on average the MBI group showed no benefits for depressive feelings or anxiety, reported lower happiness post-intervention, and greater stress at follow-up compared to control. However, MBI amplified the protective effects of presence of mind: MBI participants with higher presence of mind experienced larger reductions in depressive feelings, anxiety, and stress, and greater increases in happiness than controls. Findings suggest mindfulness training may enhance well-being chiefly in moments when participants are practicing being present.

[149] More people, more problems: The impact of ostracism, group size and feelings of disrespect on self-esteem

8:00 AM – 9:00 AM

BELONGING/REJECTION

Ostracism is the act of being excluded or ignored by either an individual or a group. Ostracism is associated with negative affect, and exclusion by a larger group exacerbates this effect. The current study is the first to examine how group size moderates the mediating effect of feelings of disrespect on the relationship between ostracism and self-esteem. Participants were placed in a group of either 2 or 6 other fictitious participants while they engaged in an online social media task where they were included by either all or none of the other participants. Finally, feelings of disrespect and self-esteem were measured. A moderated mediation analysis indicated that group size moderated the mediating effect of feelings of disrespect on the relationship between ostracism and self-esteem. Specifically, ostracism led to greater feelings of disrespect which in turn reduced self-esteem, but this mediating effect was 1.61 times greater when individuals were ostracized by the larger group of 6 other individuals. Implications for the impact of ostracism and group size on self-esteem and other outcomes such as aggressive behavior will be discussed.

[150] More Than Meets (My Own) Eyes: Inflated Self-Perceptions and Facial Cues of Simping

8:00 AM – 9:00 AM

SINGLEHOOD

“Simps” are individuals (primarily men) who engage in costly or extravagant gestures toward a romantic interest without receiving reciprocation. Recent work (Ho et al., manuscript under review) suggested that simping could be a compensatory mating strategy for men of lower perceived mate value to secure mates by overtly exhibiting one’s investment and commitment to the relationship. Nonetheless, self-reported mate value did not predict one’s tendency to engage in simping behaviors, suggesting that sims possibly hold inaccurate (or inflated) perceptions of their own mate value. The present study investigates this hypothesis by comparing self and third-party ratings of individuals engaging in simping behaviors. 164 participants submitted self-portrait photographs and completed self-report measures of mate value and simping behaviors. Subsequently, research assistants independently rated the photographs on mate value and their perceived tendency to simp. We expected that men who tend to simp would be objectively lower in attractiveness, social status, and social confidence. We also explore if facial cues of dominance and status predict one’s perceived tendency to simp.

[151] Narcissism in Social Class and Loneliness: Impacts on Antisocial Behavior

8:00 AM – 9:00 AM

EMOTION

The present research aimed to examine the moderating effect of narcissism on the relationship between social class and loneliness. Specifically, we hypothesized that the negative association between social class and loneliness would be particularly stronger among narcissistic individuals. We also explored the downstream consequences of the predicted interaction effect on antisocial behavior. To test these hypotheses, we conducted an online survey (N = 150 adults) in South Korea. The results were consistent with our prediction such that negative association between social class and loneliness was moderated by narcissism. In other words, lower social class was associated with greater loneliness, particularly when narcissism was high. Furthermore, when narcissism was high, loneliness mediated the negative relationship between social class and antisocial behavior, whereas this effect was absent at low narcissism. These findings suggest that when individuals from lower social classes are narcissistic, they may be particularly vulnerable to loneliness, which can lead to maladjustment such as engaging in antisocial behaviors.

[153] Nature Contact Enhances Inspiration: The Mediating Role of Self-Transcendence

8:00 AM – 9:00 AM

EMOTION

Inspiration is a powerful motivational state, though eliciting it remains challenging. We propose that nature contact induces inspiration and the effect is mediated by self-transcendence. We conducted three studies, with experimental and field designs. In Study 1, participants who viewed nature videos reported higher levels of inspiration compared to those who viewed urban videos. Study 2 replicated this effect with nature images and further demonstrated that self-transcendence mediated the relationship between nature exposure and inspiration. Study 3 extended these findings to real-world natural settings, again showing that nature reliably increased inspiration. Taken together, these studies provide converging evidence that exposure to nature—whether through video, images, or direct experience—consistently enhances inspiration.

[154] Negative Affect Increases the Difficulty of Intertemporal Choice

8:00 AM – 9:00 AM

EMOTION

One experiment tested the impact of affective context on intertemporal choice. A sample of 155 participants viewed different affective images (positive, neutral, or negative) before choosing between immediate or delayed hypothetical monetary rewards. Participants also rated the difficulty they experienced making their choices. We found that choices following negative affective images were more difficult than those following positive and neutral images. These findings suggest that affective context shapes the experience of intertemporal choice. Further, results suggest that negative affective contexts may conflict with the process resolving approach-approach conflicts.

[155] Neuroticism and Agreeableness Predicts Negative Affect in Different Contexts

8:00 AM – 9:00 AM

EMOTION

Personality impacts the way people interpret situations and react emotionally. Past research has focused on Neuroticism (N) and Extraversion. Here we propose that situational context plays an important role in moderating the link between personality and emotional responding, allowing us to examine the emotional impact of other Big Five dimensions, like Agreeableness (A). We hypothesized that A would predict higher negative affect but only when the negative situation involves others, whereas Neuroticism would predict higher negative affect when the negative situation is directed towards the self, like being afraid of a spider for yourself (not others). In a pre-registered study (N = 550), we examine responses to negative stimuli depicting either human suffering (e.g., a child with an injury) or nonhuman negative stimulus (e.g., a spider). Consistent with predictions, A was linked to stronger negative affect toward human-suffering but not non-human images, whereas N showed the opposite pattern. Further, N (but not A) was linked to elevated negative affect toward neutral images, consistent with N representing greater vigilance towards the world in general. Results suggest that N predisposes individuals to react more negatively to self-relevant negative events, whereas A reflects prosocial concern for others. Findings highlight the importance of considering both personality and the situation when examining emotional responding.

[156] New Video Elicitors of Interpersonal Awe and Identity-specific Awe

8:00 AM – 9:00 AM

EMOTION

Awe is the feeling of being in the presence of something vast that is mysterious and transcends our current understanding. However, most past stimuli focus on natural awe. No valid interpersonal awe video stimuli exist, nor have interpersonal awe studies considered social identity. Therefore, we tested stimuli for interpersonal and identity-specific awe.

Prolific participants (n = 566) are randomly assigned to 10 conditions: 2 types of stimuli (recall vs. video), each with 5 conditions (control, amusement, natural awe, interpersonal awe, identity-specific interpersonal awe). Participants first recalled an event or watched a video of target emotions for 4 minutes. Then, they reported their state of positive affect, awe, identity-specific awe, elevation, admiration, amusement, hope, and calmness.

Results show that all awe stimuli, across elicitor type and awe type, significantly increased awe compared to the control. However, only the identity-specific awe video significantly elicited identity-specific interpersonal awe. These results solidify the concept of identity-specific awe and expand the tools available for future research on awe.

[157] Normative Relationship Functions Predict Emotion Expression and Perception

8:00 AM – 9:00 AM

EMOTION

In communal (versus transactional) relationships, emotions are more often experienced, expressed, and perceived, and they tend to be judged as more functional (Chughtai et al., 2025). The present work examines how Americans' normative expectations of relationship functions predict emotions across relational contexts. In Study 1, we find that the more a relationship is expected to fulfill the care function, the more appropriate it is to express emotion in that context, whereas the reverse holds for the transaction function. These effects were strongest for love and sadness. In Study 2, Americans reported perceiving emotions more frequently in caring relationships and less frequently in transactional ones, again most strongly for love. In Study 3, ecological momentary assessment showed that emotions were most often perceived in communal partners. The likelihood of perceiving an emotion when interacting with a partner also increased the more that relationship was normatively communal. Thus, emotions appear to facilitate care but hinder transaction, with this functional alignment predicting both the appropriateness and frequency of emotions across relationships.

[158] On the impact of race on public park belonging

8:00 AM – 9:00 AM

BELONGING/REJECTION

Who feels like they belong in a public park space? Using momentary assessment methods, we collected individuals' sense of belonging in a public park of their choosing. We assessed differences in belonging between Black, Asian, White, and Latino individuals and the relationship between sharing a racial identity with those residing in the park's community and park belonging. We hypothesized that identifying as White would positively affect one's sense of park belonging more than identifying as Black, Asian, or Latino. Results showed that identifying as White ($\beta = 0.76$, CI 95% = [0.29, 1.23]) or Black ($\beta = 0.59$, CI 95% = [0.13, 1.03]) positively affected belonging while there were no effects of identifying as Latino or Asian. Furthermore, results showed a small positive main effect of sharing a racial identity with the community area ($\beta = 0.06$, CI 95% = [0.00, 0.12]). Importantly, with the inclusion of this variable identifying as Black was no longer positively related to belonging while identifying as White ($\beta = 0.29$, CI 95% = [0.09, 1.09]) remained a positive predictor and the results for Latino and Asian individuals remained nonsignificant. This study suggests that sharing a racial identity with the surrounding community area is important for Black individual's sense of belonging in parks while this matters less for White individuals.

[159] One ring to rule them all: Joint (computational) modeling of four implicit attitude measures

8:00 AM – 9:00 AM

SOCIAL COGNITION

Attitude research has generated a plethora of "implicit" measures to index evaluations of social groups, yet these measures have only ever been combined using coarse statistical models. This project draws existing data from four tasks assessing implicit evaluative information (Bar-Anan & Nosek, 2014) and relates them to each other under a unified computational model that accounts for behavior in terms of underlying processes like attitudes, response caution, and information processing speed. Each participant finished two of four tasks: Implicit Associations Test (IAT), Brief IAT, Evaluative Priming task (EP), and Affect Misattribution Procedure (AMP). We create/use adapted versions of the Tug-of-War Model (Alaukik et al., 2024) to simultaneously model data from the four tasks, along with higher-order latent constructs describing implicit attitudes. This "joint" modeling process not only improves psychometric properties (e.g., reliability, validity), but also provides a unified theoretical account of how latent implicit attitudes can mechanistically explain behavior on multiple established implicit measures of attitudes.

[160] Overcoming Intuitive Biases: Targeted Attention Improves Human Detection of AI Faces

8:00 AM – 9:00 AM

SOCIAL COGNITION

As AI-generated faces become increasingly realistic, people face growing challenges in distinguishing real from synthetic content, raising concerns about misinformation and eroded social trust. Across two eye-tracking experiments, we tested how different viewing strategies influence detection accuracy. In Study 1 (N = 90), participants performed at chance level, with a primary focus on internal facial features (e.g., eyes, nose, mouth)—an intuitive but ineffective strategy. In contrast, greater attention to external features (e.g., clothing) was associated with better discrimination. Notably, we observed a divergence between human and machine strategies: human fixation on regions deemed diagnostic by deep-learning algorithms (e.g., hair) did not improve performance. In Study 2 (N = 123), we experimentally manipulated viewing strategies and found that the external-feature condition consistently yielded the highest accuracy, outperforming both internal-feature and holistic scanning conditions. These findings underscore the need for human-centered perceptual training and demonstrate that effective detection may require overriding intuitive but flawed heuristics.

[161] Parents' Role in Regulating School Belonging Among Students With Disabilities

8:00 AM – 9:00 AM

BELONGING/REJECTION

It is important for students to have strong school belonging because it leads to improved academic success and student well-being. Students with disabilities may experience a weaker sense of school belonging compared to their peers due to unique challenges and individual needs. Given their needs, their parents may also play a larger role in supporting their belonging, but current research has not addressed the role of parents in helping to regulate school belonging for students with disabilities. In a year-long longitudinal study (N=1243), we assessed how student perceptions of parental monitoring and support for school belonging differed between students with and without disabilities along with how parental support mediated changes in belonging across the school year. We found that parental support for belonging regulation matters for all students but was particularly important for students with disabilities, emphasizing the important and previously unstudied role of parents in school belonging regulation. Finally, a critical contribution of this work is the inclusion of students with disabilities, given the historical and ongoing exclusion of this group from research.

[162] Paths to Community: Neighborhood Walkability and Migrants' Social Integration

8:00 AM – 9:00 AM

BELONGING/REJECTION

How does the physical environment shape migrants' social integration? Although walkable neighborhoods have been linked to community cohesion, little research has examined their role in facilitating social adjustment among migrants. Across two large-scale studies in culturally distinct contexts, we investigate how neighborhood walkability predicts migrants' sense of community. In Study 1 (Seoul, South Korea), migrants who perceived their neighborhood and city as more walkable reported greater cohesion with neighbors. This effect was relatively stronger among recent migrants (less than one year of residence), suggesting walkability may facilitate early-stage adjustment. In Study 2 (100 largest U.S. cities), we replicated this pattern using perceived, behavioral, and objective measures of walkability. All three predicted higher social cohesion, sense of place, and sense of belonging, with relatively stronger associations among recent migrants. These findings position walkability as a key environmental factor that supports migrants' social integration and identify the early post-migration period as a critical window for community-building intervention.

[163] Peer Relationships: Sense of Belonging for African American College Students

8:00 AM – 9:00 AM

BELONGING/REJECTION

SPSP 2025 Abstract Submission

Peer Relationships: Sense of Belonging for African American College Students

The goal of this study is to investigate friendship compositions among Black college students and the impact on their sense of belonging, well-being, and academic success. Black students are often under-prepared for academic success compared to White students. McCabe (2023) indicates that the more diverse one's friendship group is, the better one's academic success opportunities. Yet, Black students are friends with others of the same race at higher rates. Students were asked about the ratio of old friends vs. new friends at the University. We hypothesized that minority students who maintain more old friendships would be negatively related to their sense of belonging, well-being, and GPA. This study asked questions regarding their friendship, sense of belonging, well-being, and GPA. The study aims to determine how friendships impact college students' sense of belonging and if the friendship composition and ethnic group memberships play a role. Results indicate that having more same-race and neighborhood friends is negatively associated with GPA and positively correlated with sense of belonging. Findings from this study can aid college students academically and socially, as well as help universities foster healthy friendships among first-year college students and beyond. Furthermore, findings can help universities develop policies that fosters belonging, well-being, and lead to academic success for Black students.

[165] Perceiver Use of Identity Cues in Categorizing Individuals as Multiracial

8:00 AM – 9:00 AM

SOCIAL COGNITION

The present studies examine the extent to which three key factors -- target appearance, self-identification, and ancestry -- influence perceptions of multiracial identity. Study 1 found that politically conservative participants rated ancestry and self-identification as less important than liberal participants. Similarly, individuals higher in self-reported anti-Black prejudice rated ancestry and self-identification as less important but placed greater emphasis on appearance. Study 2 extended these findings using a design in which appearance, ancestry, and self-identification were manipulated independently. Results showed that all three factors significantly influenced whether a target was categorized as multiracial, suggesting that each contributes unique explanatory value. Several higher-order interactions were also observed, indicating that the influence of each factor may depend on the presence or combination of others. Together, these studies demonstrate how appearance, self-identification, and ancestry, each previously identified as influential in isolation, interact and compete in perceivers' racial categorizations.

[166] Dominance and Desire: Gendered Perceptions of Dominance and Submission

8:00 AM – 9:00 AM

Attribution biases (e.g., fundamental attribution error) shape how people explain others' behaviors, potentially blaming personal failings for times of adversity. Low socioeconomic status (SES) individuals frequently face harsher dispositional judgements even when systemic barriers exist. We examined how SES influences attribution patterns for both negative and positive events. Participants (N=250, Mage=45.4, SD=13.3, 76.9% White) varying in SES were recruited from Prolific and completed a self-attribution questionnaire and evaluated vignettes depicting high- and low-SES targets experiencing negative or positive outcomes. After each scenario, participants rated dispositional and situational causes. Consistent with hypotheses, high-SES observers over attributed low-SES targets misfortunes to dispositional factors, whereas low-SES participants emphasized situational factors for their own setbacks. Attribution patterns for successes differed, indicating that social expectations shape efficacy-related variables. These offer new evidence on how systemic inequality influences cognitive biases and suggest strategies for counteracting stereotypes and empowering disadvantaged groups.

[167] Perceptions of Socioeconomic Status Contribute to Attributional Biases

8:00 AM – 9:00 AM

SOCIAL COGNITION

People often engage in episodic counterfactual thinking, in which they simulate alternative ways in which past events might have occurred. Prior research has shown that the perceived plausibility of episodic counterfactual simulations influences judgments of regret, mood, prosocial behavior, and false memories. However, knowledge about the factors influencing the perceived plausibility of episodic counterfactuals is limited or derived from studies using vignettes or semantic-based hypothetical scenarios, rather than experience-based scenarios. In our study, we explored three potential factors that may influence the perceived plausibility of episodic counterfactual thoughts: difficulty of generating the simulation, the vividness of the simulation, and a sampling process that prioritizes plausible alternatives. Overall, our findings suggest that the perceived plausibility of an episodic counterfactual simulation may in part depend on its vividness and sampling order, but it does not depend on how difficult it feels to imagine it.

8:00 AM – 9:00 AM

SOCIAL COGNITION

TikTok use has increased from 2% in 2019 to 67% in 2022. What currently is not known is how the use of TikTok and the reasons for TikTok have evolved over time. Additionally, it remains unclear how TikTok is used regarding activism and social movements. Given the pervasive use of TikTok, particularly among emerging adults, the current study seeks to achieve three goals: 1) understand how emerging adults' use of TikTok has changed over time; 2) identify changes in emerging adults' motivations to use TikTok over time; and 3) discuss how these changes influence participation in social movements and public discourse. Data for this qualitative, descriptive study comes from 15 semi-structured interviews and two focus groups (N = 8) completed by emerging adults recruited through convenience and snowball sampling. Using reflexive thematic analyses, themes revealed changing their use from consuming to creating content, although the motivation for using TikTok to socialize has remained the same. Regarding social movements and public discourse, participants are wary of misinformation and believe that the algorithm of the app promotes polarization of important political issues and activism.

BELONGING/REJECTION

Gratitude is linked to positive social interactions in the real world but we have yet to uncover its role in social media. Adolescents can have varying emotional responses to social media and antecedents to positive social media responses remain understudied. This longitudinal study examined bidirectional associations in U.S. adolescents' (n = 1661) self-reported gratitude and positive and negative social media emotional responses at three time points. Negative social media emotional responses prospectively predict lower gratitude (b = -.07, p < .001) and gratitude prospectively predict higher positive social media emotional responses (b = .12, p < .001). The indirect effect was significant (p = 0.03), suggesting that negative social media experiences may reduce future positive social media experiences by lowering gratitude. This bidirectional pattern aligns with Fredrickson's broaden-and-build theory which posits that positive emotions build social and psychological resources in a reinforcing upward spiral of well-being. Fostering gratitude could improve adolescents' experiences on social media and enhance their well-being.

EMOTION

This study investigated predictors of retention among undergraduate Psychology students at the University of Hawai'i at Mānoa, with a focus on geographic origin, ethnic background, and socioeconomic status as potential factors influencing dropout and transfer rates. Given the geographic isolation and unique cultural environment of Hawai'i, students transitioning from other states or countries face heightened challenges in cultural adjustment, belonging, and persistence. To examine these dynamics, n = 150 freshmen and sophomores completed a survey reporting demographic information along with measures of anxiety, depression, and belonging. Students local to Hawaii reported an increased willingness to stay in college, barring financial and work schedule difficulties. Students from the continental U.S. reported increased importance of participating in school-associated activities (e.g., academic clubs or sports), pointing toward different desires and avenues of college satisfaction among local vs. non-local students. The findings provide actionable insights to strengthen student support and retention initiatives for students from different backgrounds.

BELONGING/REJECTION

Attribute amnesia is a counter-intuitive cognitive phenomenon in which people fail to identify the identity of a target (letter, number, schematic, picture, poetry, etc.) shortly after using a key feature of said target to report its spatial location. However, when human faces were used as targets in past attribute amnesia research, the choice of stimuli did not factor in several important emotion and face perception considerations, which undermined the validity of the results. Current studies use real human faces, controlling for potential confounding factors (e.g., same age/race bias) in facial perception, and employ a large sample size for statistical power, in order to investigate the generalizability of and boundary conditions of attribute amnesia. To do this, Experiment 1 compares whether happy versus angry expressions are more likely to escape attribute amnesia. Experiment 2 then explores whether emotion trumps face identity in memory.

EMOTION

The experiences of the ostracized have been well-examined, leading to a shift towards studying ostracizers. Recent work emphasized ostracism motives, namely punitive and protective motives in understanding ostracizer experiences (Iannuzzelli, 2024) . The present work developed a 10-item Ostracism Motives Scale for measuring these constructs. In both the experimental and control condition, participants (n=190) played a virtual ball tossing game with two ostensible players. In the control condition, these players threw the ball at a regular interval. In the experimental condition, one of the players took 10 seconds to toss the ball, a manipulation shown to elicit ostracism behavior (Wesselmann et al., 2013). Participants in the experimental condition scored higher on punishment (t(180) = 7.71 p < .001) and protective (t(178) = 5.33, p < .001) motives. Punishment (α = .93) and protective (α = .90) subscales showed internal consistency. Exploratory factor analyses supported a two-factor solution. Punishment (.70-.93) and protective (.43-.98) items loaded cleanly onto their respective factors. The current work provides a foundation for measurement development of ostracism motives .

Despite consensus that climate change poses serious threat to human health and well-being, individual-level perceptions are wrought with ambiguity, due in part to climate change's diffuse impacts. Understanding people's prototypes (mental representations) of specific climate impacts is key to understanding threat perception. Three registered studies (N = 1765) examined how prototypes of people and places affected by climate change predicted people's threat appraisals and environmental intentions. In all studies, participants generated prototypes and evaluated their prototypes' features. In Study 3, participants also completed a speeded evaluation task to examine implicit prototype evaluations. Explicit person prototypes viewed as self-relevant, socially valued, and personally valued, and explicit place prototypes that evoked greater perceptions of fit, authenticity, attachment, and self-relevance each predicted more pro-environmental intentions. These relationships were mediated by reduced psychological distance from climate change and increased climate concern. Our findings highlight the importance of socioecological cognition in shaping environmental perceptions and action.

Mattering measures whether a person feels welcome and valued at college (Flett et al., 2019). Antimattering measures feelings of invisibility and being devalued. Few studies have examined racial differences in either variable. Our prior work suggests these variables may function differently for students of color compared to White students. This study surveyed 96 students of color attending PWIs. We assessed how mattering and antimattering were related to racialized trauma (RT), collective self-esteem (CSE), minority spotlight effect (MS), and code-switching (CS). As expected, mattering predicted higher CSE and lower RT. Antimattering predicted lower CSE and higher RT. Code switching was not related to mattering, but was positively related to antimattering suggesting that frequent code switching may communicate that the student's authentic self is devalued. MS was positively related to mattering but not related to antimattering. One interpretation is that being hypervisible is understood as adding value to the college's image. MS was also related to higher CSE. We would expect hypervisibility to have negative side effects and, indeed, it was predictive of higher racialized trauma.

BELONGING/REJECTION

Cognitive reappraisal is an emotion regulation strategy that involves reinterpreting an emotional situation to lessen its emotional impact. Despite the benefits of cognitive reappraisal in reducing negative emotion and improving psychological wellbeing, not everyone uses cognitive reappraisal successfully. In the current study, we tested the relationship between executive functioning and cognitive reappraisal ability in daily life. Participants from the local community (N = 203; ages 18-55) participated in a two-week experience sampling study wherein they completed brief surveys throughout the day assessing the occurrence of stressful events, appraisals of the events, momentary emotional states, and emotion regulation. Between Weeks 1 and 2, participants completed tasks of executive functioning (inhibition, working memory, shifting) and were trained to use cognitive reappraisal in response to daily stress in the upcoming week. We predict that negative emotional responses to stress will be lower during the week when participants use cognitive reappraisal, and that those higher (vs. lower) in executive functioning will show the largest effect of reappraisal training.

EMOTION

Despite the high profitability and profound economic impact of the high-tech market, success in this market is challenging due to the unpredictable nature of consumer desires. This research introduces the emotion of awe as a novel driver of consumer desire for high-tech products. We propose that awe, by stimulating a desire for psychological richness (i.e., the pursuit of novel and perspective-changing experiences), increases consumers' preference for high-tech offerings. Eight studies, employing a multi-method approach (including lab experiments and a field study) and a diverse array of products, provide robust evidence for this effect. Furthermore, we establish two theoretically-grounded boundary conditions. The effect of awe is attenuated (1) for products with incremental (vs. radical) innovations and (2) when marketing communications employ schema-congruent (vs. schema-incongruent) language. This work contributes to the literature on emotion and consumer behavior by delineating the unique influence of awe on technology adoption and by identifying psychological richness as a key underlying mechanism. Our findings also provide managers with actionable strategies for effectively positioning and communicating high-tech products.

White Americans are often reluctant to acknowledge their own racial privilege because it threatens their meritocratic worldview and positive group image. Rather than mitigating threat via self-affirmation as in past research, we tested how prompting White Americans to lean into the threat by seeking discomfort affects their motivation to understand White privilege. Across 2 pre-registered studies (N = 721), White American adults were either given no instructions (control) or were instructed to seek discomfort or seek to learn as they engaged with White privilege information. In Study 1, after seeing historical examples of White privilege, those in the seeking discomfort condition (vs. learning or control) expressed greater motivation to learn more about White Privilege. In Study 2, participants took a fake "White privilege test" and learned that they are more privileged than average, but we found no differences in self-reported motivation to learn about White privilege. We found mixed results for the seeking discomfort intervention effectiveness, but more research is needed to increase White Americans' motivation to understand their own White Privilege.

[180] Selection of Emotional Situations: Effects of Current Emotional State

8:00 AM – 9:00 AM

EMOTION

Older adults generally have higher-quality relationships than younger adults. According to strength and vulnerability integration model, this may be because older adults tend to use adaptive strategies in response to interpersonal stress, such as spending time alone rather than confronting others. Talking to themselves may serve as an intrapersonal emotion regulation strategy. This study used ecological momentary assessments and naturalistic audio recordings to investigate self-talk—audible speech when alone. Every three hours for 5–6 days, older adults (N = 333; Mage=73.9) reported interpersonal stress, whether they were alone during that interval, and mood . Electronically Activated Recorders captured 30-second sound snippets every 7 minutes. Of 109,609 snippets, 918 involved self-talk. Multilevel models showed that on days when older adults had more interpersonal stress, they engaged in more self-talk. Moreover, higher interpersonal stress was linked with worse daily mood, but this effect was attenuated on days participants engaged in more self-talk. Future research should use naturalistic methods to examine self-talk as a means of emotion regulation in other contexts.

[181] Self-Talk Regulates Negative Emotions in Late Life: A Naturalistic Approach

8:00 AM – 9:00 AM

EMOTION

Activation of categorical knowledge of emotions can guide emotion inferences. Previous work found that labeling behavior, which activates idiosyncratic conceptual knowledge, leads to divergence from group consensus in when an emotion event occurs. However, the causal role of emotion concept in this process remains unclear. Here, we examine this by manipulating concepts. We randomly assigned participants to one of two conditions. In the emotion condition, we trained participants on emotion concepts with definitions and situations. In the control condition, participants received training in a similar format but on personality concepts. Before and after training, both groups completed the Emotion Segmentation Paradigm, where they indicated emotion change only when they had an emotional label in mind. We located timepoints where the group collectively agreed that emotions occurred (i.e., consensus events). We found that compared to the control training group, the emotion training group trended towards identifying more consensus events in the post-training phase (beta=0.03, p=0.08), suggesting that shared conceptual knowledge may converge the identification of emotion events.

[182] Shared Conceptual Knowledge Predicts Convergence in Identification of Emotion Events

8:00 AM – 9:00 AM

EMOTION

In three studies, we examined whether people bolster (or protect) their sense of belonging by shifting their focus to (or away from) certain social identities. In Study 1, 77 participants received accepting or rejecting feedback from ostensible others with whom they shared one identity (race or gender) but not another. Results revealed a shift in focus away from the identity shared with the rejecter and toward the identity shared with the acceptor. In Study 2, 191 participants from Texas and California completed a social-media-like task, Ostracism Online, with ostensible others from the same state. They were randomly assigned to receive different numbers of “likes” on this task: very few (exclusion), average (inclusion), more than average (overinclusion). Results revealed that participants who were excluded by their fellow state residents reported identifying less with their state than those who were included or overincluded. We plan to pre-register Study 3 (N=192) and replicate the prior study using different identities (e.g., Welsh, Scottish). Such a study would provide additional support for the notion that people shift their identity focus to protect from social threat.

[183] Shifting Focus: A Self-Protective Strategy for the Rejected

8:00 AM – 9:00 AM

BELONGING/REJECTION

The current project demonstrates the usefulness of a Legal Moral Matrix (LMM) to understand tolerance for unwelcome speech. Results revealed that legal and moral judgments about controversial speech may be more similar than commonly believed. Data from the Foundation for Individual Rights and Expression's annual poll of social and political attitudes was used to validate the LMM as a conceptual framework for visualizing attitudes. Over 150,000 volunteers participated (spanning 2020-24). There were 16 questions to gauge moral tolerance for potentially offensive speakers, and 4 questions to measure the legality of speech obstruction. Scores provided coordinates for graphic illustration of moral and legal judgments on a Cartesian grid, revealing differences were significant, but graphically proximate and numerically small. Effect sizes for political ideology were medium to large, with liberals and conservatives revealing expected biases on hot-button issues, but the explanatory usefulness of race and gender was negligible. Mapping moral and legal judgements about controversial speech may provide shared space for a discussion of our similarities, rather than our differences.

[184] Situating Legal-Moral Judgements Using Our Political Orientation Compass

8:00 AM – 9:00 AM

SOCIAL COGNITION

College students who receive academic warnings, compared to similarly performing peers who do not, leave college at higher rates. This is, in part, because traditional warnings sharpen the pressing psychological questions that struggling students wrestle with: 'Do I belong? Am I capable? Am I respected?' Across three surveys and one field study, we redesigned academic warning notifications to offer up more adaptive answers to students' questions about belonging, capability, and dignity, and compared these revised messages to traditional warnings. Overwhelmingly, surveyed students preferred revised notifications, anticipating more positive feelings (e.g., hope, determination), fewer negative feelings (e.g., shame, guilt), and a greater likelihood of seeking support (e.g., meeting with a professor/advisor, using tutoring services). Encouraged by these promising results, we rolled out the revised notification at our institution and are assessing its impact on academic performance and retention. We will discuss how our iterative revision process unfolded, stumbling blocks we encountered implementing change across multiple institutional areas, and our plans for continued improvement.

BELONGING/REJECTION

Depression reflects complex social and emotional processes that traditional assessments often fail to capture. Social media offers continuous traces of individuals' interactions, self-expression, and daily behaviors, providing a window into real-world psychological life. Our meta-analysis of 66 studies (2022–2025) shows that over 80% of models rely solely on text, while only 6% incorporate multimodal signals such as posting times and shared images. Multimodal approaches consistently improve detection, suggesting that depressive patterns emerge not only in language but also in online social behavior. Models using deep contextual embeddings (e.g., BERT, RoBERTa) further enhance user-level prediction, surpassing traditional lexicon-based or statistical features. We propose a framework that integrates textual, behavioral, and visual social media data to predict depression severity, linking online engagement, attention, and self-presentation to mental health outcomes. This approach offers scalable, population-level insights while grounding AI predictions in social-psychological theory.

[186] Social Exclusion and Facial Trustworthiness Interact to Influence Recognition of Sad and Fear Expressions

8:00 AM – 9:00 AM

EMOTION

Social exclusion alters how individuals interpret social information, yet little is known about how exclusion interacts with facial trustworthiness to shape emotion recognition. In the present experiment ($n = 113$), we tested whether social exclusion moderates the relationship between facial trustworthiness and emotion recognition across happy, sad, anger, and fear expressions. Findings reveal that exclusion interacts with facial trustworthiness to influence recognition of sad and fear expressions, but in divergent directions. For fear expressions, excluded participants showed higher accuracy than included participants when judging low- and high-trust faces. For sad expressions, although accuracy increased as facial trustworthiness increased for both excluded and included participants, exclusion attenuated this effect. These findings highlight how social exclusion dynamically shapes the integration of facial trustworthiness judgments and emotion recognition.

[187] Social Isolation's Effects on American Youths' Beliefs

8:00 AM – 9:00 AM

BELONGING/REJECTION

Using two longitudinal panel studies conducted at a large Midwestern university, we examined the effects of different forms of social isolation on the influence of social affiliates on a range of American college students' beliefs. Structural equation modeling showed that social isolation was generally associated with belief shift towards peers over time. However, higher feelings of loneliness were broadly associated with lower levels of belief shift towards peers. These findings suggest that the relationship between social isolation and beliefs over time should be further studied.

[188] Social Rejection, Social Support, and Cognition Among LGBTQ+ Young Adults

8:00 AM – 9:00 AM

BELONGING/REJECTION

LGBTQ people face unique identity-based stressors (e.g., LGBTQ social rejection) that can negatively impact health and cognition (e.g., executive functioning, risk-taking). While minority stress theory has been widely used to explain mental health disparities in this group, less is known about its application to understanding cognition and whether social support acts as a buffer. Using Cyberball, we investigate how the identity of a rejector (LGBTQ vs. non-LGBTQ) and supporter (LGBTQ vs. non-LGBTQ vs. none)–primed using a reflective writing task following rejection–influences cognition among LGBTQ young adults, as well as whether identity centrality moderates these effects. We assess risk-taking via the Columbia Card Task and executive functioning via Raven's Progressive Matrices problems. We expect in-group (LGBTQ) rejection to impair cognition, in-group support to buffer these effects, and for rejector and supporter identity to interact when matched, particularly for those with high identity centrality. Findings will clarify cognitive effects of stigma and support in LGBTQ populations, thus offering insight into how tailored social support might promote resilience.

[189] Spatial Location Changes How Faces Are Categorized

8:00 AM – 9:00 AM

SOCIAL COGNITION

Spatial location is important to the human mind, with where someone appears in space even conveying attributes like dominance and status. Past work suggests that where someone is located is used to disambiguate gender identity. Given that race groups are stereotyped differently on traits like dominance, agency, status, and power, we hypothesized that people would also use where someone is located to disambiguate race. To test this, we morphed Asian and Black faces from the Chicago Face Database to create a set of racially ambiguous stimuli. On each of 288 trials, participants saw face pairs with the task of identifying whether the post-cued face looked more prototypically Black (or Asian, depending on condition). In the horizontal block, faces appeared left and right of fixation. In the vertical block, faces appeared above and below fixation. Participants perceived faces located left or high as more Asian. In other words, a face presented left or high in space needed to be slightly more prototypically Black to appear subjectively neutral. We discuss mechanisms of this finding, including its roots in perceptual processing vs response bias and its links to stereotyping.

[190] Spatio-Affective Consistency: How Culturally Shared Sentiments Organize Social Space

8:00 AM – 9:00 AM

SOCIAL COGNITION

Humans mentally map the social world based on who belongs with whom. Grounded in Heider's balance theory, we test the "spatio-affective consistency" hypothesis: that expected physical distance between groups reflects their culturally-shared affective similarity. We test this principle across three pre-registered, multi-method studies.

First, we used a foundational EPA (Evaluation, Potency, Activity) dictionary of culturally-shared meanings from a large, representative French sample. In Study 1 (N=200), these cultural ratings predicted individual choices in a forced-choice task using spatially-matched stimuli. Participants found affectively consistent arrangements (where physical and EPA distances align) more plausible for both masculine and feminine groups of social identities.

In Studies 2 and 3 (N=145, N=276), this macro-level cultural data predicted how individuals arranged social identities on a map. The physical distances created by individuals were predicted by a significant three-way interaction between the cultural E, P, and A distances. Aggregated across participants, this model explained 47% of the variance in the aggregated map, demonstrating how a shared cultural framework gives rise to an emergent social structure from individual-level cognitions.

[191] Speaking up for peers in STEM: The role of interpersonal and structural belonging

8:00 AM – 9:00 AM

BELONGING/REJECTION

Students frequently encounter social exclusion in school, a challenge that may lead to disengagement or attrition. These issues can also be particularly pronounced in STEM classrooms, which are historically marked by competitiveness and exclusivity. Thus, the current study examines the role of STEM belonging in predicting high school students' likelihood to respond to peer exclusion. Participants included 494 high school students from five public schools in the United States. We employ structural equation modeling to investigate the relationships of both interpersonal factors (social connectedness) and structural features (same-race representation and norms of inclusivity)—which can convey belonging in STEM—with students' likelihood to respond to peer exclusion. We hypothesize that STEM connectedness, representation, and inclusivity will each positively predict students' likelihood to respond to peer exclusion. We also predict that the importance of representation and inclusivity will be especially pronounced among students of color. This work can inform interventions that create more welcoming STEM environments, fuel positive social interactions, and encourage persistence.

[192] Stability and change in implicit and explicit judgments of brilliant women and men in response to counterevidence

8:00 AM – 9:00 AM

SOCIAL COGNITION

Women continue to be underrepresented in fields that emphasize high intellectual talent and gender bias has been raised as one of the factors contributing to this imbalance. Previous work has found that people tend to associate brilliance with men (vs. women) and boys (vs. girls). Yet, most of this research has focused on understanding how people form brilliance judgments. Less is known about when and how people change their impressions after learning new information. We extend prior work by examining how people implicitly and explicitly update brilliance impressions for women and men, in response to counterevidence. In Studies 1-2, we examined people's impressions of targets described as brilliant in two different domains (i.e., intelligence and music) and found that people formed equivalent brilliant impressions for women and men. We used an updating paradigm in Studies 3-4 and found that people updated brilliance impressions differently depending on the strength of the counterevidence. Contrary to predictions, there is no evidence of gendered updating in the music domain. We are running a new study (Study 5) to examine whether these results generalize in the intelligence domain.

[193] State Authenticity and Approach–Avoidance Intentions: Examining the Moderating Role of Openness

8:00 AM – 9:00 AM

BELONGING/REJECTION

Individuals typically gravitate toward environments that foster a sense of authenticity—a feeling of alignment with one’s true self—while avoiding those that evoke feelings of inauthenticity. Building on the State Authenticity as Fit to Environment model, this study tested whether the openness personality trait moderated links between perceived state authenticity and approach-avoidance tendencies in an environment. Using an experience sampling design ($N = 53$), participants reported perceptions of state authenticity and willingness to return to the current setting three times daily over two weeks. Multilevel analyses confirmed that feeling more authentic predicted greater willingness to revisit the current environment. Higher average authenticity across time also corresponded to generally high return willingness. Contrary to predictions, openness did not moderate these associations, suggesting that individual openness levels may not alter state authenticity’s impact on approach willingness. These findings highlight state authenticity’s robust influence on approach-avoidance intentions and the importance of further exploring individual nuances in tolerating inauthentic environments.

[194] State vs. Trait: Does Loneliness Make Children Prosocial or Aggressive?

8:00 AM – 9:00 AM

BELONGING/REJECTION

Loneliness is often reported as a driver of maladaptive outcomes, such as aggression, yet existing accounts also suggest that it may promote prosociality as a way of regaining connection. In the current study, we addressed this paradox in a longitudinal dataset of 465 children ($N=1542$ observations; $Mage=8.86$) from five public schools, followed for 2 years across 4 waves. Relationships between self-reported loneliness and peer-rated aggressive and prosocial behaviors were assessed in a cross-classified, multilevel cross-lagged model. Within-person level increases in loneliness were followed by increases in prosocial behavior, suggesting that transient loneliness may prompt attempts to seek social reconnection. At the between-person level, however, higher loneliness was associated with marginal increases in aggression and lower prosocial behavior, suggesting that chronic loneliness may signal maladjustment. Findings reconcile conflicting perspectives by suggesting that acute loneliness might motivate prosocial efforts to restore belonging, whereas enduring loneliness may lead to maladaptive social behaviors. Ongoing work will examine classroom-level norms as potential moderators.

[195] Status Differences in Prospect and Refuge Importance in Public Spaces

8:00 AM – 9:00 AM

BELONGING/REJECTION

Appleton (1975) proposed that people prefer spaces that provide resource opportunities (prospect) and safety from threat (refuge). Across multiple studies, students and community members identified a public space that they commonly used and rated it on greenness, openness, order, prospect, refuge, and sense of place before answering demographic questions. In an exploratory analysis of student responses, Asian ($n = 122$) and Latine ($n = 193$) students’ attachment to campus spaces was predicted by refuge (both $p < .013$) but not prospect (both $p > .44$), whereas white ($n = 477$) students’ attachment to campus spaces was predicted by prospect ($p < .001$) and not refuge ($p = .061$). A confirmatory analysis of community member responses yielded a similar pattern: Black ($n = 226$) and Latine ($n = 78$) sense of place was predicted by refuge (both $p < .001$) but not prospect (both $p > .15$), whereas white ($n = 363$) sense of place was predicted by both (both $p < .022$). Thus, the importance of refuge may differ with social status, with lower-status individuals more sensitive to safety concerns. Sociocultural factors such as belonging and inclusion may shape how spaces are perceived and valued.

[196] Stereotypic Anchoring-and-Adjustment in Social Inferences About Outgroup Targets

8:00 AM – 9:00 AM

SOCIAL COGNITION

How do people make sense of other minds? One strategy is to use one's own mental states as an anchor for inferring others' mental states, and then adjust for differences between the self and others. Here, we test if this anchoring-and-adjustment process also underlies stereotyping. That is, when making inferences about an outgroup target, do people use stereotypes about the outgroup as an anchor, and then adjust from such stereotypes to account for target-specific information? Three studies (Ntotal = 2,093) examined this proposition in two different intergroup contexts (political parties, Studies 1–2; university affiliation, Study 3). Participants rated their outgroup and an outgroup target on traits (Studies 1–2) and preferences and habits (Study 3), and response times for target ratings were recorded. As predicted, outgroup–target discrepancy was positively associated with response time—the more discrepant target ratings were from outgroup ratings, the longer participants took to rate targets, reflecting more adjustment. These findings suggest that social inferences in intergroup contexts can also be understood through the lens of anchoring-and-adjustment.

[197] Stimulus individuability, not modality, impacts Implicit Association Test (IAT) performance

8:00 AM – 9:00 AM

SOCIAL COGNITION

Humans encounter social information as words and images. We examined whether the modality (words vs. images) of Implicit Association Test (IAT) category and attribute stimuli affects the magnitude of implicit attitude effects. Using Asian/White–good/bad IATs as a case study, four experiments (N = 2,262) showed no modality effects: image and word stimuli produced equivalent pro-White/anti-Asian bias across both Asian/White category stimuli (cultural artifacts like sushi vs. hot dog) and good/bad attribute stimuli (like flower vs. insect). However, we discovered a novel moderator of implicit attitudes that we term stimulus individuability, or the degree to which a stimulus elicits representations of unique individuals vs. entire groups. Regardless of modality, more individuable category stimuli (faces, full names) elicited lower pro-White/anti-Asian bias than less individuable category stimuli (last names, category labels). As such, IATs can be constructed in either modality without concern. However, individuability strongly modulates implicit attitudes expressed toward social groups; in fact, it even impacts performance on a measure that requires category-based responding.

[198] Subgroup Support and Threat on Well-being for LGBTQ2S+ Individuals

8:00 AM – 9:00 AM

BELONGING/REJECTION

Individuals within the LGBTQ2S+ community can identify to their community as a whole, as well as specific subgroups (e.g., gender, race/ethnicity). We tested how experiencing support and threat towards one's subgroup, both within and outside the LGBTQ2S+ community, impact well-being. Gender minorities reported higher threat and lower support from outside the community, and lower well-being, compared to cisgender individuals. Racial minorities reported lower support from within and outside the community compared to white individuals. For white (n = 166) and cisgender (n = 189) individuals, support and threat from outside the community significantly predicted well-being. For racial minorities (n = 87), threat from outside the community significantly predicted well-being. For gender minorities (n = 61), threat from within the community significantly predicted well-being. These results suggest the importance of assessing support and threat from multiple sources to better understand well-being in a community of intersecting identities. Future research should explore mechanisms for these differences, such as developed resilience to forms of threat, change over time, and societal impacts.

[199] Sustaining Belonging Through Adversity: Wise Interventions Eliminate Gender Gaps and Foster Growth Trajectories in STEM Doctoral Education

8:00 AM – 9:00 AM

BELONGING/REJECTION

How do brief interventions sustain belonging in high-stakes, identity-threatening environments like STEM PhD programs, where attrition is highest during the first year, especially for women? This longitudinal field experiment (N = 651) tested the effects of two wise interventions—Values Affirmation and Social-Belonging—on students' week-to-week and daily sense of belonging. Using daily experience sampling and weekly surveys, we modeled belonging trajectories and responses to "bad" advisor meetings, defined idiographically. At baseline, women in the control condition reported significantly lower belonging than men. Both interventions eliminated this gender gap and fostered more adaptive trajectories across the first year. Following negative advisor meetings, intervention participants experienced smaller immediate declines and faster recovery. In a context marked by persistent uncertainty, these findings show how timely, psychologically precise interventions can buffer recursive threat, sustain belonging through adversity, and promote resilience—advancing equity in STEM doctoral education, where mentoring meetings can serve as turning points in belonging.

[200] Taking “Thank You” to Heart: Responses to Gratitude Shape its Emotional and Relational Benefits

8:00 AM – 9:00 AM

EMOTION

Gratitude is a vital emotion that strengthens health and relationships (Algoe, 2012), and yet, we know nothing about how people respond to gratitude. Targets could accept, re-affirm, and internalize the gratitude, or deflect, diminish, or disagree with the gratitude. Across four datasets of video-recorded gratitude conversations, trained coders rated recipients' acceptance and rejection/dismissal. Integrative data analysis will be used to pool across datasets for final analysis. We will test preregistered hypotheses that target acceptance is associated with higher well-being for both partners while target rejection is associated with lower well-being for both partners. We will also test if targets higher in anxious or avoidant attachment are less likely to accept, and more likely to reject, their partner's gratitude. Altogether, this work will advance understanding of gratitude as an interpersonal communication process. As gratitude is an effective well-being intervention, the current work contributes to dialogue on the skillful expression of gratitude by highlighting target responses as key to fostering gratitude, strengthening relationships, and boosting well-being.

[201] Taking an intersectional perspective on the relationship between labels and category induction

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Previous work with children indicates that labels facilitate the use of single social categories (e.g. gender or race) in property and group membership induction. The present work takes an intersectional lens by examining whether children use the intersection of social categories (race and gender) during the induction process and how labels aid in that process. Children (planned N=60, current N=12) were first shown a target image (e.g. black woman) and a maximal contrast image (e.g. white man) and were then asked if each of the test images (4 people varying in race and gender) had the same property and group membership as the target image. Preliminary results suggest that children account for both race and gender when inducing group membership (rather than focusing on only one dimension), and patterns suggest that this intersectionality may be stronger when a label is provided. This work has implications for understanding how children induce property and group membership—key processes underlying the development of stereotyping and prejudice.

[202] Testing the "You're Not Anonymous" Cyberbullying Intervention

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Across two studies, we tested the efficacy of the You're Not Anonymous (YNA) cyberbullying intervention on US adults. In Study 1 (N = 349), participants were randomly assigned to view the YNA video – one that focused on how online anonymity is a myth and

those who engage in nefarious online behaviors under the guise of anonymity are often caught – or the control video – one that focused on how online communication is often void of sarcasm, tone of voice, etc., which leads to gaffes. Online disinhibition (OD) – the degree to which one acts differently online – was measured before and after the video. Results showed that participants in the YNA had a significantly steeper decrease in OD compared to those in the control condition. Study 2 (N = 61) employed a similar procedure, except cyberbullying expectations were assessed. Results from Study 2 replicated Study 1 – YNA participants had a significantly steeper decrease in OD than control participants. Moreover, results showed that post-video OD mediated the relationship between condition and cyberbullying expectations. Overall, results showed YNA efficacy.

[203] The Associations Among Shared Reality, Existential Isolation, & Veterans' Health

8:00 AM – 9:00 AM

BELONGING/REJECTION

Military veterans face elevated risks of mental health issues, including post-traumatic stress disorder (PTSD), depression, and suicide. While previous research has identified loneliness and social isolation as major contributors to these outcomes, less is known about existential isolation (EI), the sense that others cannot understand one's personal experiences. Shared reality, defined as a perceived commonality of inner states with others, may help reduce EI and improve health outcomes. This study examined whether experiences of generalized shared reality (SR-G) in close relationships were associated with reduced EI, and in turn, whether lower EI predicted better mental and physical health outcomes in veterans. The two hypotheses for this study were (1) higher levels of EI will be associated with greater symptoms of anxiety, depression, and PTSD, and with lower levels of physical health and (2) greater shared reality will be associated with lower levels of EI, which, in turn, will be related to reduced symptoms of depression, anxiety, PTSD, and increased physical well-being. A sample of 464 U.S. veterans completed measures of SR-G, EI, loneliness, PTSD, anxiety, depression, and physical well-being. Results showed that SR-G was significantly negatively associated with EI, loneliness, and depression, and positively associated with physical health. Mediation analyses showed that EI partially mediated the relationship between SR-G and both depression and physical health, even when controlling for loneliness. These findings suggest that fostering shared reality in close relationships may serve as a protective factor against EI and its associated negative health outcomes in military veterans. Implications for clinical interventions and veteran reintegration support programs are discussed.

[204] The Awe Paradigm

8:00 AM – 9:00 AM

EMOTION

This study examines the effects of brief, structured awe practices focused on nature and moral beauty on students' psychological outcomes. Participants engage in sessions involving curated stimuli targeting one of the two awe categories. Pre- and post-session assessments capture immediate changes in affect, awe intensity, and autonomic regulation. A follow-up survey, administered via a mobile app, tracks continued engagement and well-being over time. This within-subjects design allows for evaluation of the immediate and short-term impact of targeted awe experiences on positive emotion and social attunement. The paradigm provides a scalable framework for integrating awe practices into student populations and assessing their effectiveness through repeated measures and ecological momentary assessments.

[205] The Behavioral Ecology of Pro- and Anti-Sociality: A Systematic Review

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Humans are social creatures that thrive in groups, especially when group members engage in prosocial, cooperative strategies. However, humans vary in their pro- versus anti-social traits and behaviors. One important driver of variety in social strategies are early developmental environments. Via a systematic review, we apply a life history theory and behavioral ecology lens in order to understand the pattern of associations between childhood environments, namely harshness (i.e., extrinsic morbidity-mortality) and unpredictability (i.e., random variation in harshness), and pro- and anti-sociality in psychology. Forty-two papers met our criteria and were assessed. We find that harshness reflecting threat is consistently associated with antisocial traits and behaviors, whereas harshness reflecting deprivation is associated with both pro- and anti-social behaviors. Unpredictability, across operationalizations, is generally associated with anti-social traits and behaviors. We discuss implications for understanding how different operationalizations affect anti-sociality, practical implications for interventions, as well as limitations of outcomes measured and future directions.

[206] The Cognitive Barriers to Reconnecting with Old Friends: Mechanisms and Interventions

8:00 AM – 9:00 AM

SOCIAL COGNITION

Americans increasingly struggle to maintain friendships (Cox, 2021), and once friendships lapse, people find it difficult to rekindle them (Aknin & Sandstrom, 2024). This project proposes two explanations: 1) reconnecting with old friends demands complex social inference (the process of determining mental states from observable behaviors), and 2) old friends are especially likely to trigger status comparison (comparing one's social standing relative to a peer's). To test these hypotheses, three studies are planned. Study 1 will investigate whether participants engage in greater social inference and comparison when interpreting an ambiguous conversation labeled as between old friends, current friends, or strangers. Study 2 will examine if reminiscing about the past reduces social inference and status comparison compared to a typical "catch-up" conversation between actual old friends. Study 3 will evaluate an intervention for facilitating contact between old friends. By integrating theories of social cognition and social comparison with the under-researched domain of friendship, this work will clarify why old ties often remain dormant and identify strategies to revive them.

[207] The Cost of Cold Shoulders: Effects of Ostracism on Subjective Authenticity

8:00 AM – 9:00 AM

BELONGING/REJECTION

In 2023, the U.S. Surgeon General identified loneliness as a public health crisis, underscoring the urgency of understanding ostracism: being excluded or ignored. Ostracism undermines authenticity, a mental health predictor. Study 1 (N = 296, adult Prolific sample) replicated prior findings that ostracism reduces subjective authenticity and psychological need satisfaction. Study 2 will extend this work by applying the Integrity–Fluency Model (Hicks et al., in press) to identify which facet of authenticity is most affected: self-integrity (acting consistently with one's values) or experiential fluency (feeling natural in a situation). We hypothesize that ostracism will reduce both cues to authenticity but further expect moderation effects on need satisfaction such that experiential fluency during ostracism will predict lower need satisfaction, while maintaining self-integrity will predict higher need satisfaction. Self-integrity may buffer the effects of ostracism due to benefits associated with maintaining one's values, whereas ostracism after one believes they were being their natural self may exacerbate related pain. This work may identify ways to reduce the effects of ostracism.

[208] The Dark Side of Mentalizing: Associations with Internalizing Symptoms Among Young Women with Low Social Status

8:00 AM – 9:00 AM

SOCIAL COGNITION

Social hierarchy exerts a profound influence on human health and cognition. To adapt, individuals in low-status positions may develop other-oriented cognitive strategies that, while functional in context, may heighten risk for internalizing symptoms down the line. 300 young women with low subjective social status participated in our study assessing the relationship between unique dimensions of mentalizing and internalizing symptoms. Self-reported reflective functioning and personal distress were robustly linked to all internalizing symptoms. Hyper-mentalizing during a video-based task and self-reported fantasy proneness (e.g., immersion in fictional characters' experiences) were uniquely associated with symptoms of social phobia. In contrast, task-based visual perspective-taking and self-reported perspective-taking showed no association with internalizing symptoms. Notably, effects persisted after accounting for rumination, suggesting unique risk pathways. These findings highlight the importance of multidimensional approaches to social cognition and offer insight into how adaptive social strategies may contribute to internalizing risk among low-status young women.

[209] The Development of Social Relation Schemas

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Social psychologists suggest that adults rely on social relationship schemas to guide and shape social interactions. Two major categories of these schemas are communal sharing (e.g., friends) and economic exchange relationships (e.g., strangers or acquaintances). We examined the development of these schemas and the cross-cultural comparisons. In Study 1, children read a story in which a protagonist verbally thanked one person and paid another for the same amount of help. Four- to 12-year-olds from the United States ($n = 118$) and China ($n = 128$) showed the same developmental pattern: with age, they were more likely to infer that the verbally thanked helper, rather than the paid helper, was the best friend ($ps < .002$). This developmental shift occurred at approximately 7 years in both cultures. In Study 2, 5- to 11-year-old Chinese children ($n = 90$) predicted how likely a protagonist would be to pay a best friend versus an unfamiliar person for the same amount of help. With age, children increasingly judged that the unfamiliar helper would be paid and the friend would not ($ps < .05$). Together, these studies suggest that the social relationship schemas develop similarly across cultures and the inferences about social relationships and social interactions are bidirectional.

[210] The Effect of Conflict Expression Type on Anxiety and Stress

8:00 AM – 9:00 AM

BELONGING/REJECTION

Conflict is viewed as an inherent experience in the workplace and one which has impactful consequences for workers. In fact, workers commonly report that conflict is a major source of stress and miss work due to conflicts with co-workers. The goal of the current work is to examine how the way in which dyad members express conflict affects their own and a partner's levels of stress and anxiety. In this study, full-time working adults complete a conflict task with another person via Zoom. Dyad members report on their own and their partner's conflict expression and mental health outcomes to determine how one's own and one's partner's conflict expression affects one's own and one's partner's mental health outcomes. This work has important implications for understanding how patterns of conflict affect mental health outcomes. A better understanding of conflict process will allow us to intervene in ways which productive conflict resolution and improved mental health.

[211] The Effect of Ostracism on Negative Evaluations of a Stranger

8:00 AM – 9:00 AM

BELONGING/REJECTION

The present research investigates how social rejection influences the tendency to evaluate others negatively, with particular attention to the MUM effect, which reflects reluctance to deliver bad news and the role of the need to belong. Prior work suggests that exclusion can lead to either pro-social or anti-social responses depending on which of the four fundamental needs are more saliently threatened. To examine these competing predictions, participants played Cyberball under either inclusion or exclusion conditions, and then evaluated the author of an adapted Reddit "Am I the Asshole" (AITA) scenario. Half of the participants were told they might meet the author afterward, introducing an element of anticipated social interaction. Data collection is ongoing, and will be completed within the next month

[212] The Algorithm Said So: How Data-Driven Justifications Shape Bias in Emergency Decision-Making

8:00 AM – 9:00 AM

JUDGMENT/DECISION-MAKING

Anger is a common but complex emotion that ranges from mild irritation to intense range. It energizes the body and prepares it for action, serving various functions including self-defense, boundary setting, resource protection, and effective negotiation. Perhaps most intriguingly, recent work suggests anger may serve adaptive functions in goal-directed behavior, particularly in challenging circumstances. Self-talk, the internal dialogue individuals engage in, may be a key mechanism through which anger facilitates goal attainment. Undergraduate participants (N = 259) were randomly assigned to recall either an anger-inducing or neutral autobiographical event from the past month, then completed the Self-Talk Scale (STS) and Functions of Self-Talk Questionnaire (FSTQ) regarding their self-talk during that recalled event. Results revealed that participants who recalled anger-inducing events reported engaging in more social assessment self-talk (i.e., replaying and analyzing social interactions), self-management self-talk (i.e., monitoring and changing internal dialogue to self-regulate), and self-criticism self-talk. Additionally, anger inducing events were associated with increased effort-related and automaticity self-talk functions. The increased social assessment and self-management self-talk patterns suggest that anger prompts individuals to engage in more evaluative thinking about interpersonal dynamics and behavioral regulation, while the increase in self-criticism self-talk indicates that anger may also trigger internal evaluation of one's own role or performance in the situation. Furthermore, the increase in effort-related self-talk aligns with previous findings that anger can mobilize motivational processes. Overall, the combination of these patterns provides initial evidence that anger influences self-talk patterns in ways that may facilitate both self-evaluation and goal-directed responses.

[213] The Influence of Recalled Anger on Self-Talk Frequency and Function

8:00 AM – 9:00 AM

EMOTION

Higher vagal tone is linked to better psychosocial and physical health outcomes, and typically decreases with age. Here, we tested whether experimentally manipulating vagal activity using cumulative transcutaneous vagus nerve stimulation (tVNS) influences attention and emotion perception, and whether age moderates these effects. Younger and older adults were randomly assigned to receive active tVNS or sham stimulation over three consecutive days, during which they completed the Stroop (Days 1–3) and the Geneva Emotion Recognition Test (GERT-S; Days 1 & 3). Across both tasks, younger adults outperformed older adults ($p < .001$) and all participants improved from baseline. Relative to sham participants, active tVNS significantly enhanced Stroop accuracy. This effect was qualified by a significant age by condition interaction, such that active tVNS differentially influenced reaction times between age groups ($p = .049$). On the GERT-S, however, sham participants outperformed tVNS participants ($p = .007$). Our findings suggest tVNS effects are task- and population- specific, and emphasize the need to calibrate stimulation parameters to task demands in targeted groups to maximize its impact.

[214] The Influence of Transcutaneous Vagus Nerve Stimulation on Attention & Emotion Recognition

8:00 AM – 9:00 AM

EMOTION

People are skilled at decoding facial expressions, but skin tone and facial features can affect processing. Indeed, when features are equated, people are faster to categorize anger on Black versus White faces, and vice versa for happiness (Hugenberg, 2005). However, people more accurately decode racial ingroup versus outgroup faces (Dailey et al., 2010). We argue for an interaction between facial features and skin tone when decoding facial expressions. In Study 1, White participants categorized happy or angry Black or White faces with either unambiguous (UFF) or ambiguous facial features (AFF). When the face was Black, people were faster to identify angry AFF than UFF faces. No feature effect was found for angry White faces. Among AFF faces, people were faster to identify angry Black than White faces; but among UFF faces, people were marginally faster when identifying White than Black faces. Participants were also faster to identify happy White than Black faces, but there was no feature effect. Study 2 used blue faces with native Black and White features. Participants were faster to categorize angry faces with White features, but happiness categorization did not vary by features.

[215] The Interaction of Skin Tone and Facial Features on Expression Categorization

8:00 AM – 9:00 AM

EMOTION

Prior research on awe experiences rarely tests the social factor or obstacle factor. To fill the gap, the current study examined whether ostracism, a negative interpersonal experience, reduces awe experiences. Moreover, given awe's benefits to the self, the current study also examined whether awe experiences make people less ostracized. Therefore, we tested the reciprocal relationship between ostracism and awe and the mediating role of search for meaning in life. A total of 552 adult participants completed the adapted Workplace Ostracism Scale, Search for Meaning subscale from the Meaning in Life Questionnaire, and Awe subscale from the Dispositional Positive Emotion Scales three times with a one-month interval. The cross-lagged panel model showed that (1) ostracism at Time 1 related to lower search for meaning at Time 2, which in turn related to lower dispositional awe at Time 3, and (2) dispositional awe at Time 1 related to higher search for meaning at Time 2, which in turn related to less ostracism at Time 3. These findings indicate that ostracism and awe experiences negatively influence each other through search for meaning and provide theoretical and practical implications.

[217] The Mobilizing Force of Proscriptive Thinking about Economic Inequality

8:00 AM – 9:00 AM

SOCIAL COGNITION

As economic inequality in the U.S. continues to rise and class divides reach that of the Gilded Age, the upper-class benefits from many privileges in crucial life domains, such as healthcare and education. Yet, research systematically investigating whether people are sensitive to different examples of privilege is sparse. We posit that privileges can be of 2 types: prescriptive—everyone should have—and proscriptive—no one should have. Utilizing text analysis, S1 demonstrates that people generate distinct examples of prescriptive (healthcare) and proscriptive (evading the law) class privileges. S2a-b confirm that there is relative consensus on what examples are seen as prescriptive vs. proscriptive. Then, preregistered experiment S3 finds that exposure to proscriptive (vs. prescriptive) upper-class privileges predicts greater acceptance of inequality-mitigating actions via greater belief that the economic system is corrupt. Overall, we find support for the existence of the prescriptive/proscriptive distinction in people's minds and its impact on people's reactions to inequality and the society they live in. The research is timely with recent bills set to exacerbate class divides.

[218] The Moderating Effects of Socioeconomic Status in the Association between Relationship Status and Psychological Well-Being

8:00 AM – 9:00 AM

SINGLEHOOD

Whilst research comparing the well-being of single versus coupled individuals has been prevalent, such research has typically approached singlehood from a deficit perspective. Moreover, there has been limited research concurrently examining both subjective and objective socioeconomic status (SES) to determine whether they are differentially associated with well-being as a function of relationship status. Two studies were conducted—one with a Singaporean sample and another with a cross-cultural sample from Singapore and the USA. Results revealed a significant moderation effect of subjective SES, but not objective SES, on the association between relationship status and psychological well-being. Specifically, at lower levels of subjective SES, coupled individuals reported significantly higher well-being than single individuals. However, at higher levels of subjective SES, there were no significant differences in well-being between single and coupled individuals. Implications and future directions regarding the role of subjective SES in singles' well-being are discussed

[219] The More Hate You Give: Toxic Reddit Comments And How They Change Over Time

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Receiving social support has been consistently recognized as an effective intervention to reduce the negative consequences following the lonely experience. However, limited studies have examined the role of providing support and its potential consequences on wellbeing among lonely individuals. This study aimed to compare the effect of the assigned role (receiving support/providing social/control) in a social interaction on instant perception of loneliness and positive affect after a loneliness prime. A total of 145 participants (18-87 years old, 94 of them are females) were recruited to participate in this study. A clip was used to guide participant to reflect on their previous loneliness experience which aimed to prime their loneliness level. Results showed a statistically significant interaction effect between timepoints and conditions on the perception of loneliness ($F(2, 142) = 3.241, p = .042, \text{partial } \eta^2 = .044$) and positive affect ($F(2, 142) = 6.377, p = .002, \text{partial } \eta^2 = .082$). In particular, the participants in the receiving support condition reported the highest reduction in loneliness and increase in positive affect after the social interaction. Despite of this, similar trend can still be observed in the providing support condition but not in the control condition (for the perception of positive affect). The findings could inform loneliness related intervention.

[220] The pattern of social interaction on perception of emotion: Give versus take

8:00 AM – 9:00 AM

BELONGING/REJECTION

Introduction: This study addresses a critical issue within the young adult population: the physiological effects of social media exposure, with a specific focus on violent content. College students, in particular, represent a demographic with higher-than-average rates of exposure to online violence. Therefore, this research is designed to measure and compare physiological stress responses associated with both general social media use and exposure to violent online content.

Background and Rationale: The universal nature of social media means that young adults frequently encounter violent scenes and imagery, both intentionally and inadvertently. Understanding the physiological consequences of this exposure is essential for developing targeted interventions. Previous research has established a link between chronic stress and negative impacts on cognitive function and academic achievement. This study will extend that research by examining the specific contribution of violent social media content to overall stress levels.

Research Objectives and Hypothesis:

- *To establish the baseline physiological stress levels of a cohort of college students.
- *To measure the acute physiological stress responses of students exposed to both general and violent social media content.
- *To test the hypothesis that students who limit their exposure to violent social media content will exhibit lower levels of physiological stress compared to those with high exposure.

Significance: The findings from this study will provide crucial data to support evidence-based recommendations for reducing media-induced stress among college students. By demonstrating a direct link between violent social media exposure and physiological stress, this research can inform students, educational programs, and behavioral interventions designed to improve student well-being and academic success.

[221] The Power of Perspective: Humor and Positive Reappraisal in the Face of Discrimination

8:00 AM – 9:00 AM

EMOTION

We compared humorous vs. positive reappraisal (against a rumination control) for coping with discrimination, and tested Oppressed Minority Ideology (OMI) as a moderator. Participants imagined workplace discrimination (Study 1; N=261, Black/Latine) or recalled personal discrimination (Study 2; N=271, diverse). In Study 1, significant group effects were found for positive emotions ($F(2,258)=8.17, p<.001, \eta^2=.06$), anger ($F(2,258)=6.97, p=.001, \eta^2=.05$), and anxiety ($F(2,258)=4.29, p=.015, \eta^2=.03$). Both reappraisals outperformed control, with no differences between them. In Study 2, stronger effects appeared for positive emotions ($F(2,268)=24.74, p<.001, \eta^2=.16$), anger ($F(2,268)=20.35, p<.001, \eta^2=.13$), and anxiety ($F(2,268)=14.26, p<.001, \eta^2=.10$). Tukey tests showed positive reappraisal > humor > control for positive affect and anger, while both reduced anxiety vs. control. For positive reappraisal, OMI moderation of anger was non-significant in Study 1 ($p=.120, \eta^2=.017$) and marginal in Study 2 ($p=.064, \eta^2=.021$). Humor's effects were not moderated by OMI, suggesting it may serve as a more universally accessible coping tool, providing consistent benefits across ideological differences.

[222] The Power of Social Media and Community – Incels

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Incels, or involuntary celibates, are unable to attract sexual partners and have extreme hate of those who can (Ging, 2019). This misplaced hatred comes from believing masculine people are ostracizing them, the world treats them as sub-human, and social structures do not allow them to have a chance (Day & Reed, 2022; Ging, 2019). Increased violence from incels is partly due to the ability to connect with other incels. Online platforms such as 4chan, R9K, and Reddit allow sharing/forming vendettas, violence plans, 'heroes' to their cause, and validation on feelings/worldview (Maryn et al., 2024). Media coverage of incels and their attacks fuels empowerment (O'Malley et al., 2022). Eliminating violence without infringing on constitutional rights may include stricter filters on social media messages that can alert to possible violence (Maryn et al., 2024). For psychologists, any client that may be exhibiting signs of being an incel should focus on breaking down toxic masculinity, work on self-acceptance, and confidence. Spreading awareness of the dangers of these groups, warning signs, and specific characteristics can also help the community protect themselves and help loved ones.

[223] The real and the beautiful: People value portrayals of real-life over the imagination in visual artwork

8:00 AM – 9:00 AM

EMOTION

Do people's beliefs about whether visual artwork portrays a real-life event versus an imagined one influence their emotional and aesthetic responses to it? Although visual art varies in its basic connection to the real-world – ranging from illustrations of historical or current events to fantasies imagined by an artist – it is unknown how people's beliefs about the realism of the content featured in artwork shape its emotional and aesthetic impact. In three studies, we compare the affective and aesthetic responses elicited by visual art when it is believed to depict a real-life event relative to an imagined one. In Study 1 (n = 96), people evaluated artwork that ostensibly illustrates a real-life event to be more beautiful, meaningful, and pleasant, compared to closely matched artwork that was presumed to portray an imagined event. Study 2 (n = 84) replicated these findings and further showed that self-reported arousal is heightened in response to viewing real-life, compared to imagined, artwork. Study 3 (n = 61) utilized a new forced-choice paradigm and found that people behaviourally chose to view artwork believed to depict a real-life event more often than an imagined event. By showing that the emotional impact of visual art is tied to the belief that it represents real-life, these findings support aesthetic cognitivism, the notion that a core function of art is to promote understanding of the world.

[225] The Relationship Between Alexithymia and the Perceived Efforts and Use of Cognitive Reappraisal

8:00 AM – 9:00 AM

EMOTION

Alexithymia is an inability to express and articulate emotions and the limitations in thought orientation (Preece et al., 2023). It continues to grow significantly, relating to impairments in emotion regulation (Preece et al., 2023). Prior work shows it negatively correlates with cognitive reappraisal, as individuals use fewer strategies (Olalde-Mathieu et al., 2022). This study examines the relationship between individuals with higher symptoms of alexithymia and the frequency of use and perceived effort in cognitive reappraisal. A community sample of adults (N = 203) ranging in age from 18-55 completed a two-week experience sampling study. Five times a day for 14 days, participants responded to self-report questionnaires assessing use, perceived efforts, and success of cognitive reappraisal. At week 2, participants were trained in reappraisal strategies to be used during stressful events. We predict that individuals with higher alexithymia would report less frequent use of appraisal and greater perceived effort. These findings enable a focused view of the correlations between alexithymia and cognitive reappraisal.

[226] The Role of Belonging and Loneliness in First Semester Freshmen Success

8:00 AM – 9:00 AM

BELONGING/REJECTION

What factors contribute to student retention, dropout, and success within the first semester? We hypothesize that persistent feelings of loneliness, isolation, and a lack of social connection to the university across the semester play a major role in a student's intentions to continue enrollment. We will assess this in a sample of n = 31 first semester freshman enrolled in a university success seminar across the Fall 2025 semester. As of abstract submission participants have completed 1 of 4 surveys. Data collection will be completed in December 2025. We will be using the 20 item UCLA loneliness scale, 24 item University Belonging, and 3 item measurements of intent to continue enrollment. We preregistered our hypotheses that people who have less persistent feelings of loneliness will have higher intentions of re-enrollment; and feelings of university belonging will mediate this relationship. This research will contribute to the literature and the understanding of how student loneliness, isolation, and lack of social integration with the university may mediate the student's enrollment choice and help understand what factors contribute to student success.

[227] The Role of Conceptual Cues on the Outgroup Homogeneity Effect

8:00 AM – 9:00 AM

SOCIAL COGNITION

The Outgroup Homogeneity Effect (OHE) describes the tendency to consider outgroup members as more similar to each other than ingroup members. In face perception, the OHE manifests in people's tendency to perceptually deindividuate outgroup faces by seeing them as more similar to each other, as shown in research with groups differing in visual appearance or experimentally induced features. Here, we examine visually similar groups characterized by intergroup animosity—Jewish and Muslim Israeli individuals. Using faces perceived as equally Arab or Jewish, we manipulated group identity with conceptual cues (names). Across two experiments (N = 311), Israeli-Jewish participants indicated whether sequentially presented face pairs were identical or different. Reaction times were shorter for repeated faces and faces associated with Jewish names, with no difference in accuracy rates across conditions. These results suggest that conceptual social cues can influence the speed and difficulty of face individuation without hampering identification. Ongoing research examines target gender and less familiar outgroups to clarify how conceptual cues and intergroup dynamics shape face individuation.

[228] The role of importance and resource appraisals on cognitive reappraisal choice in daily life

8:00 AM – 9:00 AM

EMOTION

Cognitive reappraisal (i.e., reinterpreting a situation to lessen its emotional impact) is an emotion regulation strategy known to be effortful. Because cognitive reappraisal places a demand on one's resources, people often avoid using it especially at higher levels of stress severity. Nevertheless, because stressful situations are often appraised as more important, individuals may also be driven to use cognitive reappraisal in response. In the current study (N = 203; ages 18-55), we assessed whether the relationship between stress severity and cognitive reappraisal use is explained by importance appraisals and resource appraisals in daily life. Participants completed brief surveys throughout the day assessing the occurrence of stressful events, appraisals of the events, momentary emotional states, and emotion regulation. Results showed that the relationship between stress intensity and cognitive reappraisal use was mediated by both importance and resource appraisals. Events higher in stress severity were appraised as more important, driving greater cognitive reappraisal use. But stress severity also inhibited appraisals of resource availability, reducing one's cognitive reappraisal use.

[229] The Role of Paradox Mindsets in Relationship Receptivity and Formation for Single Individuals

8:00 AM – 9:00 AM

SINGLEHOOD

Amidst a context where there is an ever-increasing share of single individuals, there is a common belief that there exist inherent tensions between work and life, where sacrifices would have to be made in relationships or careers for the other to thrive. However, would reframing this 'zero-sum game' paradoxically as mutually reinforcing instead help young singles become more receptive to relationships? We tested our hypotheses in 2 studies, using a Singaporean sample. Study 1 was a correlational study and showed that higher paradoxical mindset predicted greater relationship receptivity, controlling for fear of being single, singlehood satisfaction and self-perceived mate value. Study 2 was a longitudinal study, and showed that paradoxical mindsets significantly predicted single individuals getting into a committed romantic relationship after 6 months, again controlling for fear of being single, singlehood satisfaction and self-perceived mate value. Furthermore, it predicted an increase in relationship readiness for those who remained single. Our results reflect how reframing contradictory demands can alter perceptions of conflict and synergy between work and relationship goals.

[230] The Social blueprint of aggression: pathways from belief to behavior.

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Expression of aggression in competitive sport varies, partially explained by social norm influence. The current project uses path analysis within a structural equation modeling approach to further dissect the relationship between social norms and aggression. Participants (n=158) were hockey players who completed validated self-report scales of norm endorsement and aggressive behavior. Age and sex were included as covariates. Path analysis was conducted using JMP software. The results indicate that endorsement of certain types of norms predicted distinct forms of aggression. For instance, norms supporting reactive aggression predict physical aggression ($\beta = 0.389$; $\eta^2 = 0.08$) whereas norms regarding proactive aggression predict penalty reactivity ($\beta = 0.326$; $\eta^2 = 0.05$). Conceptually, the model indicates that norm internalization may serve as a mechanism by which expectations translate to action. These findings hold implications for interventions aimed at reducing aggression. Future research should utilize longitudinal designs to clarify relationships. Overall, this study presents quantitative evidence that social norms are a key factor of aggressive behavior in adult hockey players.

[231] The spiteful function of anger and sadness displays

8:00 AM – 9:00 AM

EMOTION

Extensive research has examined how men’s and women’s tears are perceived differently, yet little is known about how crying in conflict influences perceptions of both the crying actor and their conflict partner. Four preregistered studies (total n = 2300) explored how different response types (stoicism vs. sadness vs. anger), actor genders (male vs. female), and settings (public vs private) across different interpersonal conflicts (workplace conflicts, romantic conflict, friendship conflict, neighbor conflict) influenced evaluations of both the actor and the conflict partner.

Across contexts, results show that displays of sadness and anger (vs. stoicism) are reputationally costly for the actor who displays these emotions. However, sadness and anger (vs. stoicism) also impose greater reputational costs on the conflict partner. These findings suggest that sadness and anger emotional displays could serve as a form of spite, imposing costs on the self but also imposing costs on conflict partners. We also identify potential moderators including the sex of the actor and the context of the conflict.

[233] Theoretical Insights into AI Algorithm-driven Narratives and Their Role in Hate Speech Propagation

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Why do AI-curated social narratives fuel division and hostility online, amplifying polarization? This study reviews evidence through social identity, in-group bias, and social learning theories to explain how AI amplification influences social belonging and hostile behavior. Key questions include: How do psychological theories explain engagement with AI narratives? What role does algorithmic amplification play in spreading hostility? Which mechanisms link social identity to online behavior?

Following PRISMA 2020 guidelines, a systematic review searched four databases (Sage Journals, ScienceDirect, PubMed, and Google Scholar) for 2015–2025 publications using terms like “AI algorithms,” “algorithmic amplification,” and “hate speech.” Empirical mixed-method, qualitative, quantitative studies, reviews, and reports were included. Quality was appraised with the Joanna Briggs Institute tool.

Preliminary synthesis shows AI algorithms reinforce group identity biases and foster hostile attitudes, contributing to digital polarization and social fragmentation. This review highlights psychological mechanisms behind AI-driven divisive narratives and suggests ways to mitigate hate speech and promote social cohesion in AI-governed digital spaces.

[234] Thriving or Surviving? Basic Psychological Needs and Well-being in Single Adults

8:00 AM – 9:00 AM

SINGLEHOOD

Adults who are not in committed relationships are a growing population in the US yet still face more stigma relative to their coupled peers (Gelles-Watnick, 2023). Even so, more single people report not actively looking for committed relationships than before, likely for several reasons. Thus, the current study asks single people's perceptions about both the positive and negative experiences they face and examines their well-being. Single participants (N = 200, 50% women) were recruited from Prolific and completed several measures on their perceptions of being single, well-being, and demographics. In accordance with self-determination theory (Deci & Ryan, 2000), we will examine whether single people feel both satisfied and frustrated in their basic psychological needs of autonomy, competence, and relatedness and whether these needs predict well-being. Furthermore, we will examine whether several factors differentially predict the extent to which people are satisfied or frustrated in their basic psychological needs such as gender, whether the person is actively dating or hooking up, and the extent to which the person is satisfied with their social support systems, among others.

[235] Too Long; Didn't Really Care for It — Emotion Evaluation Through the Lens of Impatience

8:00 AM – 9:00 AM

EMOTION

Among the emotions that punctuate daily life, impatience stands out as both frequent and familiar. Yet emotions rarely unfold in isolation; people also evaluate their impatience, which in turn shapes how people feel beyond the initial emotion, influences emotion regulation, and contributes to psychopathology. Despite their importance, research has focused mostly on general beliefs about emotions, leaving in-the-moment evaluations largely unexplored. The current study addressed this gap by using experience sampling methodology to capture in-the-moment, context-specific evaluations of impatience. Participants received three prompts per day for seven days, each asking them to report on experiences of impatience in the past few hours. Multilevel models revealed notable within-person effects: when participants felt more impatient than usual, they evaluated it more negatively, and when they evaluated it more negatively than usual, they also reported more negative affect. These findings highlight the importance of examining contextualized, in-the-moment evaluations and the role they play in shaping the consequences of emotional experiences.

[236] Towards a New Cyber-Aggression Paradigm: Detecting Cyber-Bullying in the Moment

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Cyber-aggression perpetration is defined as sending electronic communication to another that contains hostile themes with the intent to harm. Existing ways of measuring cyberbullying and cyberaggression rely on trait measures that assess how frequently individuals perpetrated online harm across a specific time frame and machine learning algorithms that "detect" harmful online communication. The existing measures of cyberbullying have been supported but are limited in their ability to determine causality and detect motivations in online conversation. The current study aimed to develop and test a new cyber-aggression paradigm to better detect cyberbullying in the moment. Using instant-messaging, participants communicated with a confederate on a specific topic and rated the messages they sent on various motivations before and after varying provocations. Results suggested that participants were meaner and less helpful after provocation which suggests the newly developed paradigm could be a new way to measure in the moment cyber-aggression.

[237] Tracking the speed of contestants' rapid (psychological) immune response to getting voted off Survivor Island

8:00 AM – 9:00 AM

EMOTION

How quickly might the psychological immune system kick in to ward off an "overdose of gloom" (Gilbert et al., 1998) if we were to get ostracized from our social groups, stabbed in the back by our friends, and lose an opportunity to win \$1 million? Recent analyses of Survivor contestants' "final words" revealed that contestants were just as likely to express positive (86%) as negative affect (82%) within minutes of being voted off the island. We are now investigating whether contestants begin experiencing positive affect as the votes against them roll in but before they learn that they have been eliminated. Five coders will watch 3-5 second video clips of contestants' (n=553) immediate non-verbal reactions after each vote against them (M=3.96; range=1-7) is announced. Coders will then rate the degree to which the contestant genuinely expressed, tried to fake, and tried to hide positive affect and negative affect. Coders will also rate the degree to which the contestant appeared to be confident that they would be eliminated. We speculate that contestants will begin expressing positive affect as soon as it dawns upon them that they will be going home.

[238] True or False? How Children Decide Which Consensus to Trust

8:00 AM – 9:00 AM

SOCIAL COGNITION

When confronted with conflicting information, consensus is a critical cue for deciding what to trust. Children often struggle to distinguish a true consensus, where sources respond independently, from a false consensus, where sources merely echo one another. Because reliance on false consensus can fuel misinformation, we examined which cognitive abilities predict children's ability to make this distinction. In an online study, 5- to 12-year-olds (N = 184) completed measures of fluid IQ, executive functions (inhibitory control, set-shifting, working memory), and cognitive reflection. They then completed a consensus learning task in which two groups of informants provided conflicting testimony, one based on independent responses (true consensus) and one based on copied responses (false consensus). Bayesian regressions revealed that only age and cognitive reflection, not IQ or executive functions, predicted choosing the true consensus. Results highlight cognitive reflection as a key mechanism supporting children's social information literacy and reducing susceptibility to misinformation.

[239] Tuning Into Yourself: How Self-Monitoring Shapes Reappraisal and Stress Relief

8:00 AM – 9:00 AM

EMOTION

Self-monitoring is defined as an individual's ability to monitor and/or conform their behavior in response to their social environment. The current study examined the impact of self-monitoring on a participants' choice of reappraisal strategy and the strategy's effectiveness in relieving negative emotions caused by stressful events. A community sample of adults (N = 203) ranging in age from 18 - 55 completed a two-week experience sampling study wherein they reported on momentary stressful events in their life and their emotional state. Participants first filled out questionnaires assessing personality traits and characteristics, including self-monitoring. In the second week of the study, participants were trained to use five different cognitive reappraisal strategies in a lab session with an experimenter and asked to use them in response to daily stressors in the following week. To test the research question, we will analyze whether self-monitoring predicts strategy choice and if choice then reduces negative emotion. Results will aid professionals' understanding of the benefits of self-monitoring and its effects on helping individuals overcome stressful events in their lives.

[240] U.S. and Chinese children automatically encode gender and race with East Asian faces

8:00 AM – 9:00 AM

SOCIAL DEVELOPMENT

Previous work indicate that children automatically encode gender and race simultaneously when using Black and White boys and girls faces. The present work seeks to extend that work with E. Asian faces, as well as examine if there is any cross-cultural variability. Children (N=221) from the U.S. and China completed a who-saw-what task where they were asked to recall which stimulus child saw which stimulus animal. Preliminary results indicate that participants were most likely to commit within-race/within-gender errors, suggesting that they encoded both the race and gender of the stimulus. There was no evidence of cross-cultural variation. Implications for the representation of social categories are discussed.

[241] Uncertainty mediates, Intolerance moderates: The Affective Impact of Spontaneous Mind-Wandering

8:00 AM – 9:00 AM

EMOTION

Spontaneous mind wandering (MW) is associated with affective consequences, but the role of uncertainty and intolerance of uncertainty (IU) in this relationship is unclear. We hypothesized that IU would be positively correlated with MW. Exploratory analyses tested if uncertainty mediated the MW-affect link and whether this pathway is moderated by IU. We found that the effect of MW on affect was fully mediated by uncertainty. Additionally, we found that IU moderated the relationship between uncertainty and positive affect, but not negative affect. Specifically, uncertainty predicted reduced positive affect for those low in IU, but not for people with high and average IU. These findings may be a result of habituation, such that individuals high in IU may be desensitized to the emotional impact of experiencing uncertainty. Conversely, people more tolerant of uncertainty may encounter uncertainty less frequently, making them more susceptible to emotional distress associated with uncertainty. Overall, these findings highlight how individual differences in IU moderate the emotional consequences of MW through uncertainty.

8:00 AM – 9:00 AM

EMOTION

Substance use (SU) literature shows that alcohol (AU) and cannabis use (CU), even outside of active intoxication, are linked to reduced emotion recognition accuracy. Additionally, alcohol and cannabis co-use (ACC) is related to greater difficulty with emotion identification, dysregulation, regulation, and impulsivity. CU has further been associated with blunted neural responses to affective stimuli and vmPFC hypoactivation, suggesting cannabis users may experience greater cognitive loads during affective processing compared to non-users. Provided awareness of emotions is worsened for those with SUD, and emotional clarity is negatively associated with cannabis use, even in occasional users, we are interested in how SU and ACC impact clarity and attention to emotions (CAE). To explore this, we will analyze baseline survey data collected from 130 participants, examining SU and CAE. We will also use data collected from 80 participants who completed two sessions (Hot, Control), looking at affect, impulsivity, and thermal discomfort to assess heat-related differences across user types.

[243] Understanding cross-cultural differences in ostracism responses: The role of attributions in the US and Taiwan

8:00 AM – 9:00 AM

BELONGING/REJECTION

After being ostracized people use attribution to explain the event. Finding the cause of an event in either the person or the situation is affected by interdependent and independent self-construal, a social self-definition hugely influenced by culture. We hypothesize that people with more interdependent self show greater tendency to attribute ostracism to the situation while those with more independent self-construal are more likely to attribute ostracism to the person. Comparing two cultures that differ in self-construal (Taiwan and US) we examine how self-construal moderates the effect of attribution tendency on fundamental self-related needs and altruistic tendencies based on social closeness. Participants in both countries will complete a self-construal measure before watching a video depicting an ambiguous ostracism situation or a video where no ostracism takes place. They will then indicate their attribution style and self-related needs from the perspective of the protagonist (ambiguously ostracized versus not) on scaled survey items. Finally, the participants will complete a social distancing task where their altruistic tendency based on social closeness is measured.

[244] Using Media in the Background During Overwhelming and Boring Tasks

8:00 AM – 9:00 AM

EMOTION

Many people “put something on in the background” while doing daily activities. One reason for using media in the background is for emotion regulation (Kampfe et al., 2010; Zillmann, 1988). However, the emotion regulation process is more complex than prior investigations into background media have shown. This study uses the Emotion Regulation Process Model (Gross, 2014) to explore the phenomenon. We hypothesized that situational modification—adding a background media while performing an overwhelming or boring task—will be associated with regulation of the negative emotion. We also hypothesize that this modulation would be associated with persistence on the task.

Participants at a Midwestern U.S. university (N = 575) filled out a survey in which they reflected on a time in the past year where they completed a) an overwhelming and b) a boring task while listening to audio or video content in the background (within-subjects). They answered whether the media made the overwhelming [boring] task less overwhelming [boring] and whether this helped them persist on the main task.

The addition of the media improved the negative emotions, though there were some mixed results for video content. In turn, this emotional modulation was associated with participants feeling that their motivation to continue on the main task improved. Both hypotheses were supported. These findings have implications for interventions and education on media use recommendations for university students.

[245] Valid and Reliable: Evaluating the Touch-Based Implicit Association Test

8:00 AM – 9:00 AM

SOCIAL COGNITION

Touch devices are increasingly common, yet psychological research has rarely evaluated whether data collected on them are psychometrically sound. A critical test case is the Implicit Association Test (IAT), a widely used indirect measure of attitudes and stereotypes. To evaluate its performance, we analyzed a large-scale data set (N = 4,829,865) collected via touch devices between 2016 and 2024 including both indirect (IAT) and direct (self-report) measures across eight domains: age, weight, disability, race, sexuality, and skin tone attitudes, and gender stereotypes related to science/arts and career/family. Results show that touch IATs demonstrate acceptable internal (split-half) consistency and convergent validity (implicit–explicit correlations). These psychometric properties closely mirror those of the desktop IAT and are further supported by comparable mean levels and variability of implicit and explicit attitudes and stereotypes across platforms. Together, these findings provide strong evidence that touch devices yield data of comparable quality to desktop devices, supporting their use as a platform for valid and reliable research on implicit and explicit social cognition.

[246] Validating a More Racially Representative Version of the Social Stimulus Approach-Avoidance Paradigm (SAAP)

8:00 AM – 9:00 AM

SOCIAL COGNITION

Social behavior is guided by approach-avoidance motivation to facial expressions that subtly vary in affect. Although the Social Approach-Avoidance Paradigm (SAAP) reliably measures sensitivity of approach-avoidance motivation to these subtle variations, it is limited by a reliance on White facial expressions, which may limit ecological validity and generalizability. To address this issue, a US representative sample (n = 395) completed a more racially representative SAAP that used morphed facial expressions from four different racial identities (Asian, Black, Hispanic, and White), which parametrically varied in happiness, anger, or co-occurring happiness and anger. Validating this SAAP, we observed highly robust and reliable effects of variations in facial affect on approach-avoidance motivation (all ps < 0.001). Compared to other racial identities, White facial morphs elicited weaker approach motivation to variations in happiness as well as stronger avoidance motivation to variations in anger (all ps < 0.05). These results validate a more racially representative SAAP, which enhances ecological validity and can be used to characterize more subtle biases in social behavior.

[247] Validation of the World Assumptions Questionnaire (WAQ)

8:00 AM – 9:00 AM

SOCIAL COGNITION

World assumptions are core beliefs about the world's benevolence and predictability that shape perceptions, behaviors, and well-being. To assess these beliefs, we validated the World Assumptions Questionnaire (WAQ), which captures two second-order factors—benevolence and predictability—through four subscales: Trustworthiness and Goodness of People, Safety and Vulnerability, Controllability of Events, and Comprehensibility and Predictability of People. A total of 569 participants completed measures of personality, attachment, world assumptions, eudaimonic well-being, and symptoms of anxiety and depression. A second-order CFA supported a structure in which the four subscales loaded onto two second-order factors, benevolence and predictability, using a correlated trait—correlated method to account for wording effects. Regression analyses indicated that assuming the world to be benevolent was linked to fewer symptoms of anxiety and depression, whereas perceiving it as predictable was linked to greater well-being and fewer symptoms of depression, beyond personality and attachment. These findings support the WAQ as a valid instrument for assessing world assumptions.

[248] Violent Systems and Peaceful Protests: Highlighting the Violence of Inequality Spurs Outrage but not Support for Social Change

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Structural violence refers to preventable harm, suffering, and premature death that results from unjust institutions, structures, and systems. Sociologists introduced this construct to reframe social injustices as a form of violence. We investigated whether framing racial disparities as structural violence can foster moral outrage, overcome apathy and indifference, and motivate support for social change. We propose that the structural violence framework operates psychologically by identifying 1 the targets subjected to injustice, 2 the intentional agents responsible for injustice, and 3 the harmful consequences of that injustice. In an experiment, non-Hispanic White Americans ($n = 1,500$) read vignettes about racial disparities in health or economic outcomes that we framed either as mere group differences or as structural violence. Framing disparities as structural violence increased moral outrage but did not affect support for policies or protests aimed at challenging social injustice. Motivating concern for inequality is crucial for addressing it, and structural violence framing may be a tool for motivating emotional responses to racial disparities and to motivate social change.

[249] Visualizing Mental Representations of People with Low Socioeconomic Status Using Reverse Correlation

8:00 AM – 9:00 AM

SOCIAL COGNITION

This study aimed to visualize the mental representations (Classification Images, CIs) that Koreans hold for individuals of varying socioeconomic status (SES) and gender using the reverse correlation (RC) technique. The main goal was to analyze the impressions elicited by these CIs to understand the underlying social stereotypes prevalent in Korean society. Our investigation comprised two studies. Study 1 focused on the generation of CIs through the RC method. For this, 101 Korean university students (Mage = 21.06, 31 males) participated in an experimental task where they made forced-choice judgments between pairs of noise-modulated facial stimuli, identifying which face belonged to a "low SES" individual. This process enabled the creation of distinct CIs for high and low SES male and female targets. Study 2 explored how participants' social impressions were affected by these visually presented stereotypical images. In Study 2, 292 Korean adults (Mage = 39.32, 142 males) evaluated the CIs generated in Study 1 on 18 different social and personality traits, such as competence, warmth, attractiveness, and dangerousness. A 2 (target SES: high vs. low) $\times$ 2 (target gender: male vs. female) between-subjects ANOVAs were conducted to assess the main and interaction effects on these impressions. Impression assessments revealed clear distinctions based on target SES and gender. Regarding main effects of target SES, low SES targets were consistently rated less favorably than high SES targets. Specifically, they were perceived as less competent, less attractive, and less happy, and having a lower perceived SES. Low SES targets were also perceived as more dangerous and more neurotic than high SES targets. Furthermore, interaction effects between target SES and target gender were detected with traits such as competence, warmth, morality, attractiveness, and cleanliness, underscoring the gender-specific ways in which SES perceptions influenced these judgments.

[250] Watching Awe Unfold on a Partner's Face: A Dyadic Experiment at Lake Tahoe

8:00 AM – 9:00 AM

EMOTION

People who experience awe are more open, curious, and prosocial. But how do we judge people who experience awe? A dyadic experimental design examines the traits people attribute to others experiencing awe.

We recruited visitors at the awe-inspiring Inspiration Point in Lake Tahoe. In total, 93 dyads were recruited (52 were romantic partners). Dyad-members were randomly assigned to the "experience" or "observe" role. Experiencers in the awe condition took in the view for 3 minutes; those in the control condition played a mobile phone game. Observers watched the experiencer. Experiencers reported how much they felt each of 12 discrete emotions. Observers inferred how much the experiencer felt each emotion. Both dyad-members then rated their partner on eight traits (eg. warmth, competence, moral character).

Experiencers in the awe condition reported greater awe than in the control condition ($B = -1.69, p < 0.001$). Observer inferences showed the same pattern. However, across eight trait attribution variables, there were no significant condition differences. The lack of effects were found amongst experiencers and observers. Follow up studies to better understand these null effects are discussed.

[251] Well-Being Effects of Conversations and Hangouts with Friends vs. Strangers

8:00 AM – 9:00 AM

EMOTION

Previous research has shown that interacting with another person can enhance psychological well-being. However, most studies have focused specifically on conversations with strangers. The present study investigates how interaction context—operationalized in a 2 (interaction type: conversation vs. hangout with minimal conversation) $\times$ 2 (partner: friend vs. stranger) factorial design—influences participants' expectations, well-being outcomes, and sense of interpersonal connection. Participants engaged in a 30-minute unstructured online interaction under one of these four conditions. Our results showed a very strong positive effect of engaging in a conversation, as opposed to a hangout, with either a friend or a stranger on subsequent well-being and sense of connection, as well as significant differences in initial expectations about the interaction.

[253] What do Achievement Emotions Contribute to Early Math Outcomes?

8:00 AM – 9:00 AM

EMOTION

The emotions evoked within mathematical activity – achievement emotions – influence problem-solving behaviors and learning outcomes. Here, we test whether happiness mediates the effect of story problem complexity on arithmetic outcomes for kindergarteners. We coded arithmetic problem-solving strategies for 14 students across 2,516 problem-solving attempts and generated the intensity of displayed happiness using automatic facial coding software. Story problem complexity had an impact on the intensity and shape of the emotional response; however, the indirect effects of happiness were not statistically significant. Direct effects were statistically significant, indicating that more complex story problems predicted lower correctness and less sophisticated problem-solving strategies. There were strong child effects in the intensity and shape of the emotional response and also the direct effects, suggesting that our results will change as we increase our sample to 40 students. Final analysis will test the indirect effects of epistemic emotions, such as surprise, boredom, confusion, and interest on correctness and strategy sophistication.

[254] What Impacts When People Support Company Diversity Statements?

8:00 AM – 9:00 AM

SOCIAL JUSTICE

The BLM movement has brought renewed attention to racial injustice and prejudice. While Industrial-Organizational Psychology has explored how identities such as race and gender influence workplace behavior, little research has focused on how people respond to companies that take public stances on social justice issues. This study investigates how attitudes toward social justice and understanding of social movements influence support for companies that express such positions. We surveyed 396 people about their involvement in social justice activities, perceptions of sexism and racism, understanding of the BLM movement, and support for companies engaging with social justice. Correlation results showed that greater involvement in social justice, stronger recognition of sexism/racism, and more positive views of BLM were all associated with greater support for companies engaging in social justice (r 's $\geq .30$). The findings suggest that customer attitudes toward social justice shape how corporate activism is received, highlighting the importance for companies to consider values of their consumer base when deciding whether to take a public stance.

[255] What Mediates Belonging Disparities Between Students With and Without Disabilities?

8:00 AM – 9:00 AM

BELONGING/REJECTION

School belonging is critical for academic success and emotional well-being (Walton & Brady, 2017), but students with disabilities are often excluded from research in schools entirely, leaving them an understudied group. Perhaps due to the paucity of research, there are mixed findings regarding potential disparities in belongingness between students with and without disabilities. Furthermore, the psychological mechanisms underlying these gaps remain largely unexplored. Thus, with a large sample of high school students ($N = 1,436$), the present study examined whether or not there were disparities in belonging between students with and without disabilities and what mediators help explain such a disparity. Results indicated that students with disabilities reported significantly lower levels of school belonging than their peers without disabilities. Additionally, mediation analyses showed that both academic and social challenges mediated this disparity. These findings underscore critical pathways shaping belonging among an understudied and historically excluded group of students with implications for developing targeted supports to promote equity in school belonging.

[256] When AI Empathy Backfires: How Sharing Emotions Can Make People Feel Worse

8:00 AM – 9:00 AM

EMOTION

What kind of empathy do people want to receive? Although researchers view empathy as an interpersonal, multi-process construct, little is known about the perspectives of targets of empathy. In this work, we examined whether different components of empathy differ in how they make targets of empathy feel. In a preregistered experiment (N = 326), participants discussed a stressful experience in a 10-minute conversation with one of four AI responders designed to reflect different empathic strategies: perspective-taking, emotion sharing, compassion, or a non-empathic control. Participants felt significantly better after interacting with the perspective-taking and compassion responders and rated them as significantly more responsive than the other responders. In contrast, participants conversing with the responder that conveyed emotion sharing—thought to be the heart of empathy—surprisingly felt worse than before the conversation, felt worse compared to the other empathic responders, and rated the emotion sharing responder as less responsive. These findings offer novel evidence that the specific form of empathy influences how recipients of empathy feel, and may even make them feel worse.

[257] When Authority Feels Wrong but Must Be Right: Motivated Reasoning in High-RWA Individuals

8:00 AM – 9:00 AM

SOCIAL COGNITION

In the past decade, democratic backsliding by democratically elected leaders has become increasingly prevalent worldwide, drawing renewed attention to right-wing authoritarianism (RWA; Altemeyer, 1981, 1996). To examine whether and how high-RWA individuals support authorities they themselves judge to be unjust, we conducted a survey experiment with 280 Korean adults. Participants first read a scenario and indicated what they believed to be an appropriate sentence for the offender. They were then randomly assigned to one of two conditions. In the experimental condition, but not in the control condition, participants received additional information that the authority figure had imposed an unduly lenient sanction on the offender. We predicted that high-RWA individuals would justify the authority's unjust decision, reflected in higher victim blaming. Results showed that high-RWA individuals did not automatically accept unjust authority. Their victim blaming, however, increased after they reviewed neutral case information, indicating that they were motivated to interpret the information in ways more favorable to the authority. These results imply that high-RWAs tend to support unjust authority even when they themselves perceive it as unjust.

[258] Measuring Political Values in Congressional Discourse: A Large Language Model Approach

8:00 AM – 9:00 AM

CULTURE

This paper presents a novel computational pipeline leveraging large language models (LLMs) to measure political values in textual data. The approach integrates a three-stage method: open-ended value identification, mapping to established theoretical frameworks, and weighted aggregation of importance scores. Unlike traditional survey or dictionary-based methods, this pipeline demonstrates superior contextual sensitivity, scalability, and adaptability to multiple value taxonomies. Applied to a decade of congressional speeches, it reveals theoretically coherent value structures with robust reliability and validity across diverse political contexts. This work addresses key limitations in value research, including bias amplification and inflexibility, offering a replicable and transparent tool for computational social science.

[260] When Safety Turns into Stigma: Prejudice Toward Fast Life Strategies in Secure Ecologies

8:00 AM – 9:00 AM

AGGRESSION/ANTI-SOCIAL BEHAVIOR

Traits such as sexual unrestrictedness, impulsivity, and preference for immediate gratification are often viewed negatively. Yet evolutionary psychology situates these traits within a fast life strategy, which can be adaptive in harsh or unpredictable ecologies. In contrast, slow life strategies, marked by delayed gratification and long-term investment, fit well in stable and resource-rich environments. While prejudice research has examined sexism, racism, ageism, and other biases, little is known about stigma directed at people exhibiting behaviours along the life history continuum. I propose that in today's relatively predictable societies, people show negative bias toward fast strategy traits (H1), but that this bias is attenuated when ecological harshness is made salient (H2), since fast strategies offer adaptive value under threat. Across three studies with ~1,500 U.S. participants, I test these hypotheses: Study 1 examines affective reactions to targets described as fast vs. slow strategists; Study 2 replicates and explores perceived affordances as a mediator; Study 3 manipulates both ecological context and target strategy. Results consistently reveal prejudice against fast strategists, mitigated when ecological harshness is salient. These findings extend prejudice research by showing how stable ecologies foster bias against fast strategies, while ecological cues shift social evaluations toward recognizing their adaptive function.

[261] When Stimulus Pairings Change Evaluations: The Role of CS Valence Inferences in Evaluative Conditioning

8:00 AM – 9:00 AM

SOCIAL COGNITION

Evaluative Conditioning (EC) refers to changes in the evaluation of a conditioned stimulus (CS) following its pairing with a positive or negative unconditioned stimulus (US). Although EC has traditionally been explained through association formation mechanisms, recent accounts suggest instead that EC depends on inferences, particularly inferences about the evaluative properties of the CS based on the pairing and the CS-US relations inferred from the pairing. Three pre-registered experiments (total N = 288) tested this idea by manipulating how easily CS-US pairings would afford inferences about the CS valence. In Experiments 1 and 2, we selected USs that varied in self-reported ease of inferring CS valence based on the pairing (i.e., high versus low CS valence inference accessibility). EC effects were stronger for pairings with high inference accessibility, even when controlling for differences in US valence extremity. In Experiment 3, we explicitly defined the CS-US relation ('liking' or 'disliking') and instructed participants to interpret the implications of this relation for CS valence either intuitively (e.g., CS likes positive US implies a positive CS) or counterintuitively (e.g., CS likes negative US implies a positive CS). As predicted, EC effects were stronger for intuitive instructions. Together, these findings support the role of valence inferences in EC and highlight the value of an inferential perspective on EC.

[262] When Successful Collective Action Undermines Support for Change

8:00 AM – 9:00 AM

SOCIAL JUSTICE

Social change is often construed as an incremental process in which systems are transformed through iterative collective action efforts (e.g., protest, strike, voting). The extant literature also suggests collective action success hinges on an optimal tension of contesting vs. appeasing the system and advantaged groups. Yet, little is known about how this tension advances from event-to-event towards long-term, transformative change. A central question is whether previous collective action success promotes (vs. discourages) support for future change. Present studies illuminate hidden barriers of iterative action to change systems, despite successful progress, in the context of worker strikes. Exposure to a successful strike (vs. unsuccessful or control) is associated with greatest initial out-group support for strikers, but leads to resistance against subsequent change attempts. This effect is mediated by perceived system fairness, suggesting localized progress alone may uphold system equilibrium, rather than disruption. An ongoing replication seeks to examine further mechanisms and consequences of other system sanctioned justifications of progress, such as instrumental arguments.

[263] When to Fight: Facial expressions as intimidation and invitation

8:00 AM – 9:00 AM

EMOTION

Early hunter gatherer societies saw frequent intergroup violence where individuals often assessed a rival's fighting ability. Previous research suggests that individuals displaying anger are perceived to be stronger and that individuals displaying fear perceive potential harm. As such, angry and fearful expressions might serve as an honest signal communicating a threat or an opportunity with a rival.

We tested this using a signaling game. Here, a confederate (described as a "typical" participant playing this game) was designated as either strong or weak. They were presented to the participant displaying either a neutral, angry, or fearful facial expression.

In a between-subjects design, participants decided whether to fight the confederate after viewing the confederate's facial expression but not knowing their strength. Participants were told they would earn a bonus payment if they fought a weak confederate or did not fight a strong confederate. Finally, participants viewed the confederate again and rated their emotions and strength.

Participants were no more or less likely to choose to fight a confederate presented with a neutral expression in comparison to an angry or fearful expression. However, participants were significantly more likely to fight a confederate presented with a fearful expression in comparison to an angry expression.

[264] Who's left to mourn? An Indigenous quantitative examination of enculturation, trauma, and grief

8:00 AM – 9:00 AM

SOCIAL JUSTICE

The Missing and Murdered Indigenous Relatives (MMIR) Crisis refers to the disproportionately high rates of missing and murdered Indigenous people across the U.S. This crisis leads to what is known as ambiguous loss, a loss characterized by uncertainty of where a missing loved one is, neither confirmed deceased nor found alive. The relatives who remain are burdened by the trauma and grief from their missing loved one. This research examines the role of trauma in the relationship between enculturation and grief severity in the context of MMIR.

Participants (N=79), experiencing an ambiguous loss, filled out an online survey measuring enculturation, trauma, and grief severity, using the Native American Acculturation Scale (NAAS), Post-Traumatic Stress Disorder Checklist (PCL-5), and the Ambiguous Loss Inventory + (ALI+). Results show that enculturation significantly predicts grief; therefore, the more culturally embedded an individual is, the higher the levels of their grief severity. We also examined whether trauma mediates this relationship, and found that enculturation is marginally associated with trauma, which suggests a pathway worth exploring with a larger sample.

[265] Whose responsibility? When taking the fall protects you from blame

8:00 AM – 9:00 AM

SOCIAL COGNITION

When assigning credit for success or blame for failure, one's decision about how to apportion the blame can deeply impact others' impressions of their morality and competence. We ask, how do people evaluate those who differentially apportion responsibility for group outcomes? In Study 1, participants evaluate a leader who assigns responsibility either selfishly (e.g., took credit or gave blame) or selflessly (e.g., gave credit or took blame) for an outcome. Interestingly, actions that might seem harmful to the leader's competence (e.g., taking blame for failure, giving credit for success) actually made the leader appear more competent. In a similar scenario, Study 2 investigates both leaders and non-leaders. We replicate our effect showing that actions of taking blame and giving credit are protective; those who do so receive less blame for failure and get more credit for success than those who try to shift blame or take credit. The selfless individuals are also thought to be more competent. Together, these results suggest that in cases where potential responsibility is equal or ambiguous, you will appear more competent and get less blame if you say: this failure was my fault.

[266] Why Is He So Angry? The Role of Display Rules in Intercultural Emotion Communication

8:00 AM – 9:00 AM

EMOTION

South Korea is rapidly transforming into a multicultural society, heightening opportunities for intercultural communication. Although AI translation technologies have significantly lowered language barriers, cultural differences in emotional display rules continue to generate misunderstandings and conflicts. This study investigates how emotion expressions aligned with U.S. display rules influence Korean observers' judgments of their appropriateness, emotional responses, and subsequent behavioral responses. We also test whether providing Koreans with information about U.S. emotional norms moderates these evaluations. Using validated conflict scenarios, we employ a 2 (anger expression: U.S. norm vs. Korean norm) $\times$ 2 (U.S. norm information: provided vs. not provided) between-subjects design with 200 Korean participants. By investigating whether preemptively sharing emotional display norms can reduce potential conflict, this research aims to deepen the understanding of intercultural emotion communication. Future work will extend the model by examining American responses to Korean expressions, advancing a bidirectional perspective.

[267] Why the hurry? The who, when, and what of daily experiences of impatience.

8:00 AM – 9:00 AM

EMOTION

The process model of patience defines patience as a targeted form of emotion regulation that responds to the discrete emotion of impatience. Initial tests using hypothetical impatience-inducing scenarios provided support for this conceptualization, but further testing has yet to explore how people experience and regulate impatience in everyday life. Thus, in an experience sampling method (ESM) study (N = 130), we investigated how often people feel impatient in their daily lives and whether they regulate this emotion by practicing patience. Reports from 3-times daily surveys indicated that people experienced impatience approximately once per day and tended to enact patience less than half of the time when impatience arose. The most common strategies for enacting patience were acceptance, external and internal distraction, and deep breathing strategies. These findings provide an initial glimpse at the experience of impatience in everyday life and the ways people regulate it when it arises.

[268] Why Your 'Clear' Rejection Feels So Vague: Perceptual Gaps in Social Rejection

8:00 AM – 9:00 AM

BELONGING/REJECTION

Social rejection is a painful experience for both rejectors and rejectees, and yet little is known about how rejectors and rejectees perceive the same rejection episode. We propose that systematic perspective gaps exist in rejection communication, driven by rejectors overestimating their clarity and rejectees' defensive interpretations. Across four studies (N = 1,462), we tested how rejectors and rejectees perceive the same rejection episode. We found an "ambiguity gap" in interpersonal rejection: rejectees perceived rejections as more ambiguous than rejectors in recalled experiences (Study 1), controlled scenarios (Study 2), and real-time interactions (Study 3). We further demonstrated that rejectors' intuitions about effective rejection messages are systematically misaligned with rejectees' interpretations (Study 4). These findings have implications for understanding communication failures in social rejection.

[269] The Physiological Response of Students Exposed to Violence in Social Media

8:00 AM – 9:00 AM

NORMS AND SOCIAL INFLUENCE

Introduction: This study addresses a critical issue within the young adult population: the physiological effects of social media exposure, with a specific focus on violent content. College students, in particular, represent a demographic with higher-than-average rates of exposure to online violence. Therefore, this research is designed to measure and compare physiological stress responses associated with both general social media use and exposure to violent online content.

Background and Rationale: The universal nature of social media means that young adults frequently encounter violent scenes and imagery, both intentionally and inadvertently. Understanding the physiological consequences of this exposure is essential for developing targeted interventions. Previous research has established a link between chronic stress and negative impacts on cognitive function and academic achievement. This study will extend that research by examining the specific contribution of violent social media content to overall stress levels.

Research Objectives and Hypothesis:

*To establish the baseline physiological stress levels of a cohort of college students.

*To measure the acute physiological stress responses of students exposed to both general and violent social media content.

*To test the hypothesis that students who limit their exposure to violent social media content will exhibit lower levels of physiological stress compared to those with high exposure.

Significance: The findings from this study will provide crucial data to support evidence-based recommendations for reducing media-induced stress among college students. By demonstrating a direct link between violent social media exposure and physiological stress, this research can inform students, educational programs, and behavioral interventions designed to improve student well-being and academic success.

[270] Factors that influence the experience of being assumed to be a student-athlete among Black college attendees

8:00 AM – 9:00 AM

STEREOTYPING/PREJUDICE

People often assume Black college students are student-athletes, regardless of whether they actually are. In the current study, we centered Black Americans' experiences of being assumed to be a student-athlete (N = 346, Black current and former college attendees). We specifically sought to understand how the experience was evaluated, and what attributions or cultural knowledge led to positive versus negative evaluations. Nearly 80% of Black participants reported having been assumed to be a student athlete, with Black men and student-athletes having the highest rates of experience. Overall, participants evaluated their most memorable experience as more positive than negative. However, being more surprised at the assumption, attributing the assumption to one's own race or others' bias, and attending an HBCU (vs. PWI) predicted more negative and less positive evaluations of the experience. Implications for the impact of experiencing positive stereotypes, and microaggressions on academic belonging and the importance of cultural context/knowledge are discussed.

Beyond Stereotypes: Perceptions of Aging in Ourselves and Others

8:00 AM – 9:10 AM | Location: E450B, Level 4

PERSON PERCEPTION/IMPRESSION FORMATION

Age is a primary social category shaped by cultural contexts and internalized beliefs. As people live longer, age-based beliefs become increasingly relevant to social relationships, work, and community engagement. This symposium brings together research that examines the conditions under which perceptions of aging, in ourselves and others, shape expectations, beliefs, and behaviors. Presentations 1 and 2 demonstrate that moving from social groups to individual faces and introducing life-span context by viewing individual faces at different ages, combats 'ubiquitous but weakly held' group stereotypes. Over time, people may distance themselves from stereotypic views of aging, evidenced by the widening gap between subjective and chronological age. Presentation 3 demonstrates that feeling younger than one's chronological age relates to higher average temporal self-continuity and Presentation 4 suggests that younger subjective ages are associated with better cognitive performance and more positive affect. Together, these studies highlight the influential, but malleable nature of age as a social category.

Age Perceptions of Warmth and Competence Across Social Group Labels and Faces

8:00 AM – 9:10 AM

PERSON PERCEPTION/IMPRESSION FORMATION

According to the Stereotype Content Model, older adults as a group are rated as higher in warmth and lower in competence than young adults. Recently collected spontaneous impressions of real faces showed minimal effects of facial age in warmth and competence responses, even when age was made salient by intermixing young and older faces. We examine two potential sources of this discrepancy: perceptions of social groups versus individuals, and ratings versus spontaneous impressions. In Study 1, participants ($n=2,030$) rated faces (young and older adult) or social group labels (young adult, elderly) on warmth or competence. In Study 2, participants ($n=1,592$) provided spontaneous text responses; responses referencing warmth and competence were examined using natural language processing. Social group labels, but not real faces, elicited higher warmth ratings and more positively-valenced warmth responses to older versus young adults, suggesting that impressions of real people may be less impacted by group stereotypes. We found no consistent age effects for competence. Our findings have significant implications for the integration of stereotypes and facial impressions in person perception.

Presentation Order Affects Age-related Impressions from Faces

8:00 AM – 9:10 AM

PERSON PERCEPTION/IMPRESSION FORMATION

Faces convey information about competence, health, and approachability. We hypothesized that effects of age on perceptions are reduced when depictions of the same people presented in chronological order. Using a novel database of individuals portrayed at three different life stages (young, middle-aged and old) participants ($N=300$) rated faces on six attributes (appealing, approachable, attractive, competent, healthy, warm) in one of three conditions: random presentation ($N=100$), different individuals presented young-to-old ($N=100$), and the same individuals presented young-to-old ($N=100$). Sequential presentations of the same individuals consistently resulted in more positive perceptions than presentations of the same individuals in random order. Competence and attractiveness showed the most substantial order effects. Warmth was least affected. Effects were strongest for middle-aged and female faces, suggesting participants anchor women on younger appearances. These findings demonstrate that providing context to individual presentations in the form of aging meaningfully influences subjective judgments of individuals.

Discrepancies between Subjective and Actuarial Life Position: Associations with Age, Self-Construal, and Time Perception

8:00 AM – 9:10 AM

PERSON PERCEPTION/IMPRESSION FORMATION

Prior findings suggest that subjective and actuarial life expectancy often diverge and that this varies by demographic and health background. Yet, little is known about how such discrepancies relate to temporal construals of the self and broader aspects of time perception. Using a U.S. sample ($N=456$, aged 18–99, 50% female, 55% Non-Hispanic White), this study examined subjective-actuarial differences in life position and their associations with temporal self-continuity, future time perspective, and future uncertainty. Subjective life position was rated on slider from 0=birth to 100=death, and actuarial life position (controlling for sex and race) was calculated from national data. With age, people tended to perceive themselves as younger than their actuarial position. Across age, perceiving oneself as younger was linked to higher average past and future self-continuity ($ps<.05$), to a more expansive future time perspective ($p<.001$), but not to future uncertainty. Findings suggest that discrepancies between subjective and actuarial life position are differentially associated with specific aspects of self- and time perceptions. Implications for motivation and well-being are discussed.

Evidence-Based Priming Effects on Cognition and Emotion in Older Adults

8:00 AM – 9:10 AM

PERSON PERCEPTION/IMPRESSION FORMATION

Prior research on internalized beliefs about aging has focused primarily on age stereotypes. Little is known about how exposure to empirical evidence about age-related gains and losses influences cognitive performance and emotional well-being in older adults. We investigated this relationship in two studies. In Study 1 (N = 398; M_age = 65.98), participants read an article describing positive or negative findings from cognitive aging research. Study 2 (N = 406; M_age = 66.64) followed a similar procedure but participants read positive or negative findings about emotion and aging. No main effects of priming were found. However, chronological age moderated performance in the condition that primed negative cognitive aging such that relatively older adults (≥ 65) performed more poorly on a cognitive task than younger-old adults. Across both studies and framing conditions, subjective age was associated with better cognitive performance, greater positive affect, and lower perceived task demand. These findings highlight the understudied, differential roles that chronological and subjective age have in shaping cognition and emotion after exposure to evidence-based age-related content.

Positioning Social Psychology for the Future (INVITATION ONLY)

9:00 AM – 12:00 PM | Location: E255, Level 2

Due to limited space this is invite only at this time. Thank you for understanding!

Social psychology, as a field, is at a critical juncture. Recent technological advances present both opportunities and challenges for researchers and students alike. For example, while social psychology has long relied on biological methods to understand social processes, these techniques (like fMRI) have become more advanced. Recent years have also seen exponential growth in easily accessible Large Language Model generative Artificial Intelligence (AI), and the rise of Machine Learning to ask more complex statistical questions. Simultaneously, shifts in federal funding priorities pose new constraints and prospects for research support. At this moment in time, it is critical for social psychologists to reflect on how the science and the field will evolve in step with rapidly changing technology and federal priorities. The goal of this professional development workshop is to gather a large group of social psychologists to discuss adaptation to the emerging landscape, in ways that best position social psychology to remain an influential and generative field in the years to come.

Student Mentoring Tables

9:30 AM – 10:30 AM | Location: Lakeside Ballroom E354B, Level 3

Pre-registration required. [SIGN UP HERE!](#)

The SPSP Student Committee offers several mentoring opportunities designed specifically for undergraduate and graduate students. These events provide a supportive, small-group environment where students can connect with experienced scholars, advanced trainees, and peers to discuss academic pathways, career development, identity and inclusion, and professional growth within social and personality psychology.

Student mentoring events foster networking, community building, and candid conversations about navigating graduate school and early professional decisions. All student mentoring events require pre-registration, and space may be limited.

*MENTORING

Navigating Research in a Shifting Landscape: Funding, Careers, and Mentorship

9:30 AM – 10:40 AM | Location: E450A, Level 4

Faced with a challenging funding environment, personality and social psychologists are confronting federal cuts and grant terminations that jeopardize the United States' scientific enterprise. Psychologists are also grappling with government opposition to research and programs with any perceived connection to diversity, equity, or inclusion. During this Professional Development session, the SPSP Government Relations Committee (GRC) will examine three key elements of this struggle: uncertainty surrounding research funding and its implications for current and future projects; difficulties related to teaching and mentoring psychology students as they build their own careers; and unpredictability in the job market for researchers who are seeking a job as well as those applying for tenure.

The speakers will discuss these challenges, offering support and practical guidance. The panelists come from a wide range of institutions, including Small Liberal Arts Colleges (SLACs), Primarily Undergraduate Institutions, and large, R1 universities. Session participants will have the opportunity to share their questions and experiences, connect with scholars facing similar issues, and learn how to advance their work in the current climate.

Beyond Quantification: Expanding your Research Toolbox by incorporating Qualitative Methods

9:30 AM – 10:40 AM | Location: E451A, Level 4

Qualitative methods in psychology are underrepresented and undervalued (Masaryk & Rogers, 2024). However, their methodological inclusion is key to advancing scientific inquiry by incorporating aspects such as sociopolitical and historical contexts, and the processes of meaning-making individuals use to make sense of their experiences. This professional development session brings together skilled researchers who actively use diverse qualitative methods (interviews, testimonies, focus groups, social media, participatory action research) and analyses (reflexive thematic analysis, discourse, narrative, context) in their research. Further, researchers on this panel have different cultural backgrounds and expertise with non-WEIRD and marginalized populations. Attendees at this session will gain valuable knowledge and learn about cutting-edge qualitative and mixed-methods approaches. We will also share a mini-syllabus to kickstart attendees' ideas. Our panel will facilitate a critical, collaborative discussion on the power of qualitative methods, empowering researchers to strengthen their methodological toolkits in answering research questions beyond traditional surveys and experiments.

Social Class and Social Goals in Romantic Relationships

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

Romantic relationships provide an opportunity for couple members to expand their social networks and access greater social support, but these benefits do not occur for everyone. Although for some people romantic partnerships bring new friends, for others romantic relationships reduce their social ties. This research examined the role of social class as a factor that may influence these differences by informing the strategies people use to expand their social network. Across two studies, romantically involved participants reflected on their ideal romantic partner and indicated the extent to which they preferred to rely on their partner to fulfill their social connection or social support goals (e.g., making new friends or recruiting friends to provide support). Both Study 1 (N = 422) and Study 2 (N = 856) showed that individuals from higher (vs lower) class backgrounds had a stronger preference for relying on their partner to fulfill their social goals. This effect emerged only when social class was measured through educational achievement (as opposed to income), showcasing the unique role that education may play in helping people increase their social capital.

Expanding the Landscape of Social Support: A Bottom-Up Framework of Self-Reported Support Preferences and Provision

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

Social support coding frameworks have traditionally focused on a limited set of support types, emotional, informational, instrumental, and appraisal, developed through top-down approaches and assessed via surveys or observed interactions (Cutrona & Suhr, 1994; Pasch et al., 1991). This study adopts a bottom-up, inductive approach by analyzing open-ended self-reports to identify support people prefer to give and receive during stress. Results showed recipients prefer behaviours not captured by traditional support typologies such as wanting a distraction from their problem or encouragement to be more mindful. Conversely, participants most often reported providing emotional support, active listening, and companionship to others. When comparing preferences for support received versus provided, a greater proportion of providers favoured giving emotional support, positive reframing, and esteem support than recipients desired, whereas more recipients preferred a distraction from their problem than providers preferred to offer. Women were more likely than men to prefer mindfulness, spiritual, and physical support (e.g., breathing, prayer, touch). Implications and future work discussed.

When Nonstandard Meets Standard: Language and Affective Dynamics in Accent-Diverse Group Interactions

9:30 AM – 10:40 AM

APPLIED SOCIAL PSYCHOLOGY

What happens when a standard-accented newcomer joins a group of nonstandard-accented speakers? While past work focuses on how newcomers adapt, this exploratory research flips the lens to examine how newcomers disrupt or facilitate ongoing interactions. Drawing on communication accommodation theory, we analyzed 49 WebEx discussions (N=102) where a standard-accented speaker joined midway, creating a natural “newcomer” scenario. Study 1 analyzed speech shifts—showing that post-newcomer’s entry, nonstandard-accented participants started talking more like them and less like each other, made more speech errors, spoke with greater confidence but less authenticity, yet used fewer filler words—indicating increased self-monitoring and interactional disruption. Study 2 revealed a twist: positive affect, more than negative, predicted higher interaction quality, suggesting participants viewed the newcomer as facilitative rather than disruptive. Findings paint a nuanced picture: amid disrupted speech patterns, nonstandard-accented speakers may still hold positive perceptions of post-newcomer interactions. The work offers insights into accent-diverse group dynamics and language training.

From Bedroom to Bond: The Asymmetrical Links Between Sexual and Pair Bonding Motivational Systems

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

Most romantic relationships—whether they are transient or long-lasting—reflect the dual activation of both sexual behavior and pair bonding systems. Nevertheless, how these two systems influence one another has not been extensively examined. Across two experiments (N = 900), we tested whether (1) activation of the sexual behavior system would mutually activate the pair bonding system whereas (2) activation of the pair bonding system would not activate—and might even inhibit—the sexual behavior system. Results indicated that experimentally priming sexual desire increased not only sexual motivation but also pair bonding motivation, relative to a control condition. In contrast, priming pair bonding did not increase sexual motivation, relative to a control condition. We also observed sex differences such that men reported higher sexual motivation and women higher pair bonding motivation on average, though these differences were attenuated or reversed in the priming conditions. Together, these studies reveal a key motivational asymmetry: sexual desire serves as a gateway to pair bonding motivation, whereas pair bonding does not reciprocally enhance sexual motivation.

Personality Stability and Change Across the Academic Semester

9:30 AM – 10:40 AM

PERSONALITY PROCESSES/TRAITS

In this Registered Report, we tested competing theories of personality change across the academic semester and experiences associated with personality changes. The Situational Perspective predicted that conscientiousness and extraversion would decrease and neuroticism would increase as stress and workload increase; the Maturity Principle predicted that conscientiousness and agreeableness would increase and neuroticism would decrease as students adapt to new roles and expectations; and the Personality Stability Perspective predicted that personality would remain unchanged. From the beginning to end of the Fall semester, we observed a decrease in conscientiousness, consistent with the Situational Perspective, but also a decrease in agreeableness and openness, which were unpredicted from all three theories. Changes in personality co-occurred with declines in subjective well-being, social support, and health behaviors. In contrast to prior research showing personality maturity over the college years, we observed declines in traits associated with maturity over the semester, suggesting that students must adapt to new challenges and expectations before growing from their experiences.

Centering Social Fit, Self-Concept Fit, Goal Fit, and Resource Fit as Core Elements of Students' Experiences of Belonging at School

9:30 AM – 10:40 AM

BELONGING/REJECTION

Promoting belonging in school has become a focal concern. Such efforts require a comprehensive, accurate understanding of what belonging means. In this theoretical work, I argue that social psychological research on students' experiences of belonging has overwhelmingly focused on their sense of social connection to others at school (social fit), while overlooking other factors essential to these experiences. Using research from beyond social psychology, I show that when students describe their experiences of belonging in school, their descriptions also emphasize the extent to which they experience support for their valued identities (self-concept fit), goals (goal fit), and basic financial, nutritional, and safety needs (resource fit). Furthermore, I demonstrate that the reason that these four forms of fit matter for belonging is because they enable students' social connections, identities, goals, and needs to feel natural, inconspicuous, and "right" when they are at school, and it is those feelings of "fluency" that ultimately produce a holistic experience that they belong. Implications for measuring belonging and for belonging-supportive interventions/policies are discussed.

Simplification of Affect in Prejudice: The Winnowing of Time

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

We interrogate the notions that stereotypes cause prejudice, that stereotypic information is part of the representation of prejudice, and that the connections among stereotypes, emotions, and prejudice are durable over time. In five experiments (total N = 1060), we find the connection between stereotypes, emotions and prejudice fades rather quickly with time. We generate novel prejudices through evaluative conditioning, exposing participants to stereotypic information that indicates a specific negative emotion. Endorsement of the specifically induced emotion is high at first, but much reduced five days later, becoming nearly indistinguishable from other negative emotions. Meanwhile, prejudice levels remain relatively high. We show that connections between stereotypes and prejudice fade rapidly (although the prejudice does not), and that specificity of emotions degrades quickly. Memory for stereotypic information can mostly disappear while the prejudice remains. These data suggest that, absent reinforcement, the representation of prejudice towards a group is rapidly winnowed down to valence; durable prejudice representations seem to be a simple representation of negative affect.

Shared Self-Expansion Activities Predict Individual and Relationship Well-being

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

We examined engagement in shared self-expanding activities predicting individual and relationship well-being in three studies. Because previous studies have focused on younger couples, we wanted to understand the effects of shared activities in retirement. In Study 1, 188 retired, married individuals completed measures of frequency of participation in exciting and pleasant activities, relationship and subjective well-being. Participation in exciting activities positively correlated with self-expansion, closeness, curiosity, positive affect, and satisfaction with life. In Study 2, 156 retired individuals in relationships were randomly assigned to read an article about the benefits of exciting or pleasant activities (or a no article control) and planned a date for their partner. Individuals who planned more exciting dates experienced greater individual and relational well-being. In Study 3, 199 retired couples were randomly assigned to participate in exciting, pleasant, or no activity. Participation in exciting activities predicted increased self-efficacy. In addition, for those in the exciting and pleasant conditions, perceived excitement of the activity predicted increased marital satisfaction, self-efficacy, positive affect, curiosity, and satisfaction with life one week later. Implications for the self-expansion model in older adulthood will be discussed.

Adult Attachment and Co-Rumination Outcomes in Romantic Couples

9:30 AM – 10:40 AM

CLOSE RELATIONSHIPS

Co-rumination is a dyadic emotion regulation strategy associated with both positive interpersonal benefits and negative intrapersonal outcomes, but recent work suggests that there may be individual differences in the effect of co-rumination. Attachment is a trait that influences how people respond to stress in interactions and may provide key insights into the individual nature of the outcomes from co-rumination. The current research examined the potential moderation of insecure attachment on the effect of a co-rumination manipulation. 139 romantic couples (278 participants) received instructions to either engage in co-rumination or discuss naturally, engaged in a problem discussion, then completed self-report measures of stressed and upset feelings, negative and positive affect, closeness, and perceived partner responsiveness. Results revealed that greater attachment anxiety was associated with greater stressed and upset feelings and negative affect, consistent with prior literature. However, attachment did not moderate any of the outcomes of the co-rumination condition. Future research should further examine the impact of individual characteristics on co-rumination outcomes.

From belief to behaviour: An incremental theory of life satisfaction predicts greater engagement in well-being facilitating behaviours and greater life satisfaction over time

9:30 AM – 10:40 AM

MENTAL HEALTH/WELL-BEING

Some people believe that well-being is malleable (incremental theory) and others believe it is fixed (entity theory). Past research suggests that these implicit theories of well-being shape individuals' intentions to engage in well-being facilitating behaviors. However, no research to date has examined why implicit theories predict differences in intentions, or whether these differences in intentions predict differences in behavior engagement and life satisfaction over time. The current work addressed these two gaps in the literature. In Study 1 (N = 297; cross-sectional), incremental theorists believed that their daily choices have a greater impact on their satisfaction, which in turn predicted greater intentions to engage in well-being facilitating behaviours. Further, in Study 2 (N = 204; longitudinal), holding a more incremental theory also predicted greater beliefs in daily behaviours as a source of satisfaction and greater behaviour intentions 3 months later which in turn predicted greater reported behaviour engagement and satisfaction at the end of the study- another 3 months later (controlling for initial satisfaction).

The Social Roots of Well-Being: Relational and Affective Processes Across Cultural Contexts

9:30 AM – 10:40 AM | Location: E253AB, Level 2

What makes people "be well" – feel satisfied with their lives, connected to others, or grateful for what they have? This symposium brings together four talks that examine the socio-relational foundations of well-being through both emic (within-culture) and etic (cross-cultural) approaches.

We begin with work investigating how first-generation immigrants and non-immigrants in the U.S. differ in their experiences and expectations of gratitude toward their country. And importantly, how these feelings can shape broader social attitudes such as blind patriotism and system justification.

Shifting to Japan, the second presentation applies the Interpersonal Theory of Suicide to explore how relationship-oriented personalities (i.e., interpersonal sensitivity and privileged self) and cultural orientations toward horizontalism among Japanese adults shape feelings of thwarted belongingness and perceived burdensomeness, predictors of passive suicidal ideation.

The third talk turns to the question of where people derive a sense of worth, contrasting the predictive strength of self worth and social worth for life satisfaction across cultural groups, with particular attention to Sub-Saharan African contexts – a populous yet underrepresented region in psychological science.

The symposium concludes with a global analysis of the relationship between family satisfaction and life satisfaction in the context of both historical and contemporary cultural heterogeneity, further illustrated through an in-depth case study of Saudi Arabia.

Together, these talks illuminate the diverse relational processes that underpin well-being around the world and highlight implications for interventions, policy, and intergroup relations in an increasingly interconnected global society.

Making America Grateful Again: The experience, and expectation, of immigrants' gratitude towards country.

9:30 AM – 10:40 AM

EMOTION

Gratitude towards others is disproportionately expressed by the less powerful (Anicich et al 2022), potentially serving a system-justifying function (c.f. Eibach et al 2015; Tsang et al 2021). I will present three studies (N=1400) showing that experiences of gratitude towards one's country varies across immigrant identity, and that this difference predicts willingness across immigrant vs non-immigrant groups to critique/support existing social structures. 1st generation immigrants to the US not only reported increased gratitude towards their country of resettlement, but also reported a greater expectation (compared to non-immigrants) that they ought to feel grateful towards the country (Studies 1-3). These feelings in turn predicted greater blind patriotism and general system justification (Studies 2-3). These findings align with research from critical migration studies showing the prevalence of gratitude-towards-country narratives in migrant communities, and the ways in which these themes can regulate the expression of negative emotions (Iqbal et al 2021).

Possible Risk and Protective Factors for Passive Suicidal Ideation among People in Japan: Interpersonal Sensitivity, Privileged Self, and Cultural Orientation

9:30 AM – 10:40 AM

PERSONALITY PROCESSES/TRAITS

Given the significant cross-cultural variation in suicide rates, it is critical to further understand the role that cultural orientation may have in suicidal ideation. Using the Interpersonal Theory of Suicide as a framework, the current study sought to investigate how cultural orientation, along with interpersonal sensitivity and privileged self – two personality traits closely related to new-type depression, a collection of depressive syndromes initially identified in Japan – may be linked with passive suicidal ideation, namely, thwarted belongingness and perceived burdensomeness. A total of 1,000 adults (Mage = 45.02, SD = 13.46) in Japan participated in an online survey. Results using two hierarchical regression analyses revealed that both interpersonal sensitivity and privileged self were positively associated with passive suicidal ideation. Horizontal collectivism was negatively associated with thwarted belongingness, and horizontal individualism was negatively associated with perceived burdensomeness. These findings suggest that personality traits that are associated with new-type depression may serve as risk factors, whereas a horizontal cultural orientation may serve as a protective factor, for passive suicidal ideation among people in Japan. Future studies should investigate how such personality traits and cultural orientation are formed, under what conditions they play a significant role, and if or how they can be changed.

The Centrality of Social Worth to Life Satisfaction in Sub-Saharan Africa

9:30 AM – 10:40 AM

CULTURE

While subjective well-being (SWB) is an extensively studied topic, theoretical frameworks and empirical findings remain disproportionately shaped by WEIRD populations and epistemologies. Our studies sought to address this gap by combining exploratory and confirmatory approaches to identify psychological foundations of SWB that are distinctive to Sub-Saharan African (SSA) cultural contexts.

In within-country Studies 1A and 1B, we employed elastic net and group LASSO to inductively identify top predictors of life satisfaction among two community samples with a set of 40+ social psychological and demographic variables. In both Niger (N = 930) and Uganda (N = 926), indicators of social worth (relational esteem, social standing, and group contribution) emerged as the strongest predictors whereas indicators of self worth were not retained by the model for either samples.

In between-country Study 2, a multi-group SEM analysis revealed culturally diverging results: social worth was more predictive of life satisfaction in SSA than in a U.S. sample (N=1104) whereas self worth was more predictive in the U.S. than in SSA.

In a global Study 3 with data from the World Values Survey (72,224 respondents across 46 countries), social worth was both more valued and more strongly predicted life satisfaction in SSA than other cultural regions. In contrast, self worth did not significantly predict life satisfaction in SSA.

Cognitive heuristics, attitudes, and emotions influence criminal justice and face recognition outcomes

9:30 AM – 10:40 AM | Location: E265, Level 2

This symposium advances understanding across legal, social, and perceptual domains, examining how biases, attitudes, and emotions influence systemic and real-world outcomes. First, we examine how high potential trial sentences influence plea choices predominantly through deliberative, central-route processing, reinforcing perceptions of exculpatory evidence and reducing plea acceptance. Secondly, research on attitudes during the 2020 Black Lives Matter protests reveal that support for reform is impacted by entrenched beliefs in the justice system; support for meaningful change is lowered among those with high system justification. Thirdly, political conviction research demonstrate that faces perceived as corruptible are more likely to be convicted, with perceptions of being investigated serving

as a mediator. Finally, cross-racial recognition research underscore how positive emotional experiences and racial identity—more than contact frequency—are crucial for improving face recognition accuracy. Together, the research spotlights how attitudes and emotions contribute shape criminal justice decisions, first impressions, and face memory.

Boundary Conditions on Anchoring in Legal Judgment and Choice

9:30 AM – 10:40 AM

JUDGMENT/DECISION-MAKING

Prosecutors sometimes overcharge, using excessively high potential trial sentences (PTSs) to anchor defendants on longer maximum sentences and coerce plea deals (Cárdenas, 2023). Across two experiments (N = 247 - 193), I find no evidence that informationally irrelevant anchors influence plea decisions via less-deliberative, peripheral-route processing: severe (vs. lenient) anchors had no differential effect on sentencing preferences, case judgments, or plea choices. A pre-registered third experiment (N = 844) reveals evidence of deliberative, central-route processing: excessively severe (vs. moderate) PTSs backfired by strengthening perceptions of exculpatory evidence ($d = .26$), lowering probability of conviction estimates ($d = .29$), and reducing plea acceptance (38 vs. 55%). These results suggest anchoring effects on preferential judgments are bounded by anchor extremity and irrelevance.

As recent meta-analyses emphasize, much debate remains about anchoring's underlying mechanisms (Bystranowski et al. 2021; Schley & Weingarten, 2025). This work furthers mechanistic accounts of anchoring biases and is among the handful to examine downstream effects on cross-modal judgments and choice outcomes.

Criminal Justice System Justification Support, BLM Endorsement and Support for Police Reform in 2020

9:30 AM – 10:40 AM

INTERGROUP RELATIONS

This study examined how support for the Black Lives Matter (BLM) movement correlates with attitudes toward police reform and whether criminal justice system justification (CJSJ) moderates those associations. Using a U.S. racially representative sample (N = 2913) participants completed a survey in Summer 2020, during the height of the BLM protest. Participants rated their support for three reform domains: dismantling the policing institution, increasing community collaboration, and preserving the policing institution. BLM support was associated with higher support for dismantling and community collaboration, and lower support for preserving. CJSJ had an opposite direction main effect such that higher justification was associated with lower support for reforms and greater support for preserving. Moderation analyses revealed significant interactions, but the main effects of BLM support and system justification on reform were stronger. These findings build on SJ theory, which suggest that even amid widespread protests and symbolic support, an individual's entrenched beliefs in system legitimacy may constrain support for radical or structural change (Kay & Friesen, 2011).

Inferring Corruptibility of Politicians from Faces Applies Only If They Are White

9:30 AM – 10:40 AM

PERSON PERCEPTION/IMPRESSION FORMATION

First impressions from faces shape important real-world outcomes, including criminal justice. Here we investigated to what extent political corruption conviction was associated with facial impressions across politician gender, race, and perceiver culture. Across four preregistered studies (N = 1,352), we found that Caucasian male and Caucasian female politicians who were perceived to be more corruptible were more likely to have been convicted of political corruption. We replicated this finding across perceivers from U.S. representative samples, European samples, and Asian samples (Studies 1 & 2). Interestingly, this association was absent for African American politicians, likely buffered by the Teddy Bear effect (Study 3). We further identified underlying mechanisms by surveying participants working specifically in the finance and legal industries. We found that the higher likelihood of being investigated (but not bribed) mediated the association between looking corruptible and being convicted of political corruption (Study 4). These findings advance a mechanistic and generalizable understanding of how facial impressions shape behaviors in the real world.

Intrapersonal Factors Trump Contact Frequency in Cross-Racial Face Recognition

9:30 AM – 10:40 AM

GROUPS/INTERGROUP PROCESSES

Cross-racial face recognition failures fuel wrongful convictions and social barriers. While cross-racial contact theoretically builds recognition expertise, meta-analyses show contact accounts for only 2% of recognition accuracy. Using theory-driven variable selection and data-driven network modelling, we identified intrapersonal factors mediating contact and recognition. Participants (N=515) completed face recognition tasks and measures of personality, contact motivation, racial attitudes and identity, outgroup emotion, and contact experiences. Network analysis showed that contact frequency was insufficient to enhance face recognition; perceived positivity of close contact enhanced allophilia (positive outgroup affect), decreased anxiety, increased racial awareness, and improved face recognition. This study pioneers insights on allophilia and positive racial self-concept in cross-race face recognition. This intrapersonal lens positions individual motives and emotions—not mere exposure—as the critical conduits of face learning. Interventions should foster allophilia and enhance perceptions of contact experiences, rather than simply increasing contact opportunities.

How Culture Shapes Seeing and Being Seen: Person Perception, Stereotype Accuracy, and Multiracial Well-Being

9:30 AM – 10:40 AM | Location: E451B, Level 4

SELF/IDENTITY CULTURE

This symposium showcases research on the roles of culture and identity in person perception, stereotype accuracy, and multiracial people's well-being. The first talk reveals how individual and societal-level honor norms and values relate to differences in perception of apologies across multiple societies. The second talk highlights cognitive mechanisms explaining cross-cultural stereotype accuracy. The third talk considers racial socialization as a protective factor in the relationship between discrimination and well-being among multiracial people. Together, these talks demonstrate how culture and identity influence how we see others and how we are seen by others.

Cancelled: Anchoring and Adjustment Shapes Cross-Cultural Stereotype Accuracy

9:30 AM – 10:40 AM

CULTURE

The accuracy of social stereotypes is a deeply contentious issue—traditional views claim they're biased and inaccurate, while a vocal minority argues they're adaptive and accurate. Yet largely overlooked are the cognitive mechanisms by which people form stereotypes and how these mechanisms shape (in)accuracy. We address this gap by examining cross-cultural stereotyping accuracy between U.S. and Chinese participants and developing an anchoring and adjustment model. Specifically, we assessed how accurately participants from one country could predict the generosity of the other country toward various outgroups (e.g., Australians, Japanese). We found substantial variation in stereotype accuracy, with U.S. participants significantly more accurate than their Chinese counterparts. Importantly, these performance differences were mediated by anchoring and adjustment processes, where the U.S. advantage in accuracy stemmed not from more accurate anchors, but from more effective adjustments. These findings offer new insight into when stereotypes are accurate and how cognitive mechanisms shape social inference across cultural boundaries, which have important scientific and societal implications.

Divergent Links Between Personal And Cultural Honor Values on Perceived Impact of Apology After Wrongdoing: A 16-Country Study

9:30 AM – 10:40 AM

CULTURE

Recent research suggests that concerns about reputation and self-image may impede apologies in cultures where honor is a strong central value. We test this idea in a survey study using general population samples from 16 societies in Mediterranean, East Asian and Anglo-Western regions (N = 5,103). Individuals rated transgressors' perceived likability, respectability, strength, and reputation after reading scenarios involving an apology, no apology, or refusal to apologize. Consistent with previous findings, observers who endorsed high levels of self-promotion and retaliation (SPR) honor evaluated apologies more negatively, with apologies having less perceived positive effect on perceived likability, respectability, strength and reputation. Contrary to previous findings, individuals who endorsed high levels of defense-of-family (DOF) honor and high society-level honor norm endorsement were associated with more positive views towards apologizers. These findings highlight a more nuanced view of the relationship between honor and apology, with certain facets impeding apology (SPR) while others (DOF) support and enhance the importance of apologizing after transgressions.

Multiracial Socialization Moderates the Relationship Between Identity Contestation and Stress

9:30 AM – 10:40 AM

SELF/IDENTITY

Due to holding multiple racial backgrounds Multiracial people often experience identity contestation (i.e., negotiation, questioning, or denial of one's identity), which negatively influences their well-being. Yet, little work has examined possible moderators to reduce the negative impact of identity contestation. The present work examined whether Multiracial socialization (i.e., preparation for monoracism or experiencing discrimination based on having multiple racial backgrounds; Atkin et al., 2022) moderated the relationship between identity contestation and stress. Across two pre-registered studies (Study 1: n = 150; Study 2: n = 151) Multiracial participants completed surveys assessing their experiences with identity contestation, preparation for monoracism, and perceived stress. The findings revealed that participants who received higher levels of preparation for monoracism were protected from the negative relationship between high levels of identity contestation and stress. Future research should continue to explore the moderating effects of Multiracial socialization, as it may be a possible tool to protect Multiracial people's well-being after identity contestation.

Healthy, Wealthy, and Wise: Judgment and Decision-Making in Life's Critical Domains

9:30 AM – 10:40 AM | Location: E270, Level 2

MORALITY APPLIED SOCIAL PSYCHOLOGY PHYSICAL HEALTH JUDGMENT/DECISION-MAKING

From trusting AI doctors to judging the wealthy, and from resolving conflicts to leaving social interactions, we make critical decisions every day. This symposium explores the psychology behind these judgments in life's most important domains. Under the theme of Healthy, Wealthy, and Wise, our four papers utilize diverse methodologies, including APIM and survival analysis, to reveal how we navigate health, status, and intimacy. Join us for a dynamic discussion on the cognitive and emotional processes driving our most significant social choices.

*SYMPOSIA

Bridging the Equity Gap: A Longitudinal Study on HBM-Based Segmentation and AI-Personalized Intervention

9:30 AM – 10:40 AM

PHYSICAL HEALTH

Previous segmentation research mostly focuses on identifying different segments and calling for customized intervention for them in the future. With the help of AI, this research answers this critical call and tests a "segment-then-persuade" strategy in diabetes management, examining its effectiveness and its ELM-based dual-trust mechanism.

Based on health belief model, we segmented Chinese participants (N=993) into three clusters and then randomized them within each cluster to receive an AI (Gemini 2.5 Pro)-generated personalized message or a unified control.

AI-personalized messages significantly boosted adoption intent for all three segments. This effect was serially mediated via elaboration to cognitive trust and eventually to affective trust. We also identified a novel shortcut from elaboration to affective trust, which supplements existing trust models.

This study validates a "theory-driven segmentation + AI-execution" paradigm. By revealing a dual-trust mechanism with an emotional shortcut, we extend ELM and trust theory to AI persuasion, offering a complete empirical model for precise and human-centered intelligent health interventions.

Dyadic perspective-taking in interpersonal conflict

9:30 AM – 10:40 AM

APPLIED SOCIAL PSYCHOLOGY

Studies of perspective-taking (P-T) in conflict situations have tended to use dyadic (2-person) paradigms, but to conventionally analyze only individual outcomes. They therefore have not tested for reciprocal effects of both actors' and partners' P-T on each other, on conflict outcomes, and on the dyads' relationship. Yet, testing for such reciprocal effects is important for understanding how P-T operates in conflict situations. We applied dyadic actor-partner interdependence models (APIM) to a study of 43 dyads participating in a mild conflict role-play. Participants reported their P-T frequency, confidence, and tendencies prior to the interaction. Outcomes included conflict resolution, perceptions of partner's P-T, and felt connectedness to the other. Multiple partner effects emerged, indicating, for example, that participants' self-reported P-T frequency ($B = 0.39$, $SE = 0.19$, $p = .046$), confidence ($B = 0.34$, $SE = 0.17$, $p = .049$), and tendency ($B = 0.41$, $SE = 0.20$, $p = .038$) all predicted their partners' feelings of greater connectedness. No significant actor effects emerged. Findings demonstrate the utility of applying dyadic analysis techniques such as APIM in P-T research.

Pitting nouveau riche against old money: Current wealth dominates past wealth in moral character judgments

9:30 AM – 10:40 AM

MORALITY

Prior research suggests that wealthy individuals are judged more harshly than poor individuals for the same moral infractions. However, it remains unclear whether this effect emerges because of wealth status itself or because of targets' histories of monetary privilege or stress. Across five studies ($Ns = 257, 243, 376, 252, 290$), participants evaluated bad-behaving targets who varied in childhood (low/high) and current (low/high) socioeconomic status (SES). Overall, low SES targets were judged less harshly and current SES contributed more than prior SES for judgments of moral character and reasons for acting. The age at which targets became low or high SES (5 or 17) interacted with whether current and past wealth impacted judgments. In addition, providing participants negative (vs. no) character information lessened the importance of current and prior SES on character evaluations. Results replicated over different infractions (e.g., theft, deception, and physical aggression). Overall, participants use target SES, particularly current SES, as an indicator of moral character after an infraction, such that actors with high SES are assumed to be more immoral than those with low SES.

Should I Stay or Should I Go? Real-Time Decisions Under Ambivalence in Social Contexts

9:30 AM – 10:40 AM

JUDGMENT/DECISION-MAKING

How do people decide whether to stay in or leave a social interaction when feeling ambivalent—especially in intimate or sexual contexts? Across three studies (two preregistered), we used a novel real-time decision paradigm inspired by evidence-accumulation models to simulate ambivalence via streams of positive and negative signals. Participants decided when to leave simulated interactions as we manipulated valence and ambivalence. Study 1 validated the paradigm in a neutral setting. Studies 2 and 3 introduced social contexts, comparing professional interactions to dating (Study 2) or sexual (Study 3) ones in heterosexual women samples. Across studies, ambivalence increased decision difficulty and shaped real-time decisions to leave. Importantly, compared to professional contexts, ambivalence reduced leaving in dating but increased it in sexual interactions. These findings suggest that social context shapes how ambivalent signals are weighted during real-time decisions and affects decision thresholds. This work bridges decision science and social psychology to gain new insights both about decision processes and about the dynamics of impactful social interactions.

Cognitive, Social, and Cultural Pathways to Behavioral Change

9:30 AM – 10:40 AM | Location: E353B, Level 3

MOTIVATION/GOALS

What drives behavioral change? This symposium brings together four complementary perspectives on how internal and external forces, from goal framing to social norms, identities, and culture, can motivate or inhibit change. The talks span lab and field studies across individual, interpersonal, and intergroup levels, exploring how people facilitate and respond to behavioral change efforts.

Talk 1 examines how framing behavioral goals as “do” versus “don’t” shape the way from evaluation to intention.

Talk 2 explores how tailoring messages that match, or mismatch recipients’ identities enhance or derail engagement depending on perceived judgment and timing.

Talk 3 demonstrates how culturally attuned behavioral interventions aligned with local models of self and motivation outperform Western approaches in reducing poverty.

Talk 4 shows that highlighting social norms and outgroup representations reduces discrimination and fosters inclusion through field interventions.

Together, these talks emphasize how cognitive framing, identity, and cultural fit function in the broader landscape of behavior change, offering practical insights into individual, social, and cultural processes.

To Do or Not to Do: How Goal Framing Shapes Behavioral Change

9:30 AM – 10:40 AM

MOTIVATION/GOALS

This project investigates how framing a behavioral change as a “do” (e.g., get early to bed) versus a “don’t” (e.g., don’t stay up late) influences motivation and implementation intentions. Across 8 studies using open-ended goal generation, rating tasks, and mouse-tracking, we examined how goal framing shapes behavioral change. When prompted to list desired changes, participants generate more “do” than “don’t” goals, a consistent pattern across perspectives (self / other / other-for-self, n = 594) and time frames (past / present / future, n = 593). In rating tasks, behavioral change goals were rated as more important when framed as “do” rather than “don’t”, both when participants described their own goals (coded as “do” vs. “don’t”; n = 317), and when presented with goals (manipulated to be framed as “do” vs. “don’t”; n = 271). Mouse-tracking data (n = 408) revealed greater decision conflict when choosing between “don’t” goals, as reflected by longer decision time and more erratic movement paths. We conclude that behavioral change is influenced by how goals are framed, offering insights to facilitate change. Where “don’t” goals highlight a barrier, “do” goals can create a pathway.

Too Close for Comfort: Leveraging Identity-based Relevance Backfires When People Feel Judged

9:30 AM – 10:40 AM

MOTIVATION/GOALS

Most persuasive efforts assume that increasing message relevance will improve audience engagement. This may be the case when relevance is tied to attitudes, but may backfire when relevance is tied to identities. In two studies (total n = 2,164), delivering weight loss messages tied to audiences' higher body weights increased shame and irritation, which in turn, decreased attention. However, targeting the same information as a function of relevant personal goals, or at a relevant time (e.g., New Years, when identities feel malleable) decreased feeling judged and increased attention for audiences with higher (vs lower) body weights. Moreover, in two studies (total n = 782), Black Americans compared to White Americans paid less attention to persuasive messages and were less trustful of the source when participants made attributions that the message was linked to negative judgments about their racial group. This framework highlights why an audience's identity is essential for understanding how such bedrock principles of persuasion as relevance actually operate. Relevance (particularly identity relevance) is not neutral - it is interpreted; and those interpretations impact persuasion.

Culturally Wise Interventions: A Framework for a Globalizing Behavioral Science

9:30 AM – 10:40 AM

MOTIVATION/GOALS

From the UN to the World Bank to government Nudge Units, behavioral science is increasingly used to address global challenges like climate change, poverty, and health disparities. Yet over 90% of behavioral research is conducted in high-income, Western contexts, raising questions about its relevance and effectiveness in majority world, Global South settings. There, might Western-derived approaches be less impactful, or less preferred? Could a culturally attuned behavioral science be more effective? This talk introduces a framework for "culturally wise" interventions. Building on culture match theory and principles of wise interventions (Walton & Wilson, 2018), culturally wise interventions account for how local models of self, motivation, and relationships shape meaning making and behavior. I present empirical examples of their effects in lab and field experiments in East and West Africa, specifically comparing Western-derived and culturally wise behavioral science approaches on economic empowerment and poverty reduction. I conclude with future directions for advancing a truly global behavioral science.

Behavior Change to Promote Equity and Inclusion

9:30 AM – 10:40 AM

MOTIVATION/GOALS

Other people's behaviors, not their beliefs or cognitions, shape the experience of members of marginalized groups. After showing that changing intergroup attitudes is a rather ineffective method to get people to behave in a more inclusive and less discriminatory manner, I will discuss the factors that have been shown to have a strong causal impact on intergroup behavior and which of these factors can be leveraged in the real world to promote positive intergroup relations. In a series of studies from our lab, I will show that it is possible to get people to behave more inclusively toward members of an outgroup if one makes the heterogeneity of the outgroup salient or highlights pro-diversity social norms. We also show that these changes in behavior sometimes have downstream consequences for members of marginalized groups who report an enhanced sense of belonging and earn better grades in college. Mook (1983) distinguished between "effects that do occur" and "effects that can be made to occur." Our studies, which are all randomized controlled trials conducted in field settings with large samples, all provide evidence for effects that do occur.

Speaker

Modelling the Minds: Novel Computational Approaches to Social Judgment

9:30 AM – 10:40 AM | Location: E353C, Level 3

STEREOTYPING/PREJUDICE

Human judgments are guided by internal representations of people, preferences, and social categories that shape social perception and behavior. This session presents new computational tools including generative AI, behavioral experiments, and large language models to model these mental representations. Talk 1 uses generative AI to model individual preferences, revealing unique and reliable visual profiles across faces, objects, and scenes. Talk 2 uses reverse correlation to uncover political differences in leadership ideals, showing conservatives visualize leaders as more masculine. Talk 3 finds people are more willing to help than to ask for help, especially toward trustworthy-looking and female faces, highlighting how perceived trust and gender shapes help decisions. Talk 4 analyzes stereotypes across 300,000 intersectional identities using large language models, finding that stereotype content becomes more negative and emergent with categorical complexity. Together, these talks show how computational approaches yield interpretable, scalable insights into the mind's representation of social judgment.

*SYMPOsia

Speaker

Using Generative AI to Model Idiosyncratic Preferences

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

Human preferences are inherently idiosyncratic—individuals exhibit unique tastes in art, fashion, and interpersonal attraction. However, a substantial amount of research in judgment and decision-making relies on aggregated data, treating individual differences as noise and potentially obscuring the very phenomenon researchers aim to investigate. Understanding this complexity requires developing individual-level models, but existing methods are limited in their ability to capture idiosyncrasies. We present a novel, comprehensive framework leveraging generative artificial intelligence to model individual variation in preferences for diverse categories of stimuli, including faces, objects, and scenes. Across a series of eight interrelated studies, we show that our method produces valid, robust, and photorealistic visualizations reflecting each participant's unique visual stereotypes, allowing for a quantifiable examination into how individual variation shapes preferences. This approach extends to domains like consumer behavior and personalized design, offering new insights into the influence of idiosyncrasies on judgment and enabling more tailored and effective interventions.

Hyper-realistic reverse correlation reveals gender bias in leadership representations

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

Appearance influences election outcomes via leadership stereotypes. We used hyper-realistic reverse correlation to elucidate such visual stereotypes. Participants (N=300) viewed generated faces and judged their leadership quality. Aggregating these choices yielded visually compelling and interpretable mental representations at both individual and group levels. While political group-averaged representations were similar along many subjective attributes (e.g., "trustworthiness"), they revealed a gender bias: conservatives' "good leaders" were more masculine than those of liberals. We directly replicated this result using richer latent face representations (N=300). We validated individual participant models on other observers (N=150), probing their willingness to vote for different faces. Participants were not only more willing to vote for "good" leader faces, but were most willing for faces generated by participants sharing their political orientation. Our results demonstrate how political orientation is linked to a novel gender bias in leadership representations, showcasing the utility of our reverse correlation technique.

Good Samaritans in Mind: Who Asks and Who Agrees Help?

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

Everyone needs help at times. Existing research indicates that people underestimate others' willingness to help when asked. This study combines behavioral surveys and AI-based reverse correlation to examine not willingness to ask vs. agree to help, but also to identify who people ask vs. agree to help. In a 2 (conditions: asking vs. agreeing) $\times$ 4 (scenarios) between-participant experiment (N = 470), participants judged 300 faces, indicating whether they'd ask for help or agree to help each person in 4 different helping scenarios. Replicating prior research with a new method, participants agreed to help more often than they asked for help, in both survey and behavioral responses (survey responses predicted behavioral responses). Reverse correlation visualizations indicated more willingness to ask for help, and agree to help, more trustworthy-looking faces. Participants were more willing to help females, but who people asked for help varied by gender and scenario. The dominant role of a trustworthy appearance in who to ask and agree to help suggests that differences in trust could also explain why people are more likely to give help than to ask for it.

Content, Valence, and Emergence in Large Language Models’ Intersectional Stereotypes

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

Human subjects research suggests that intersectional targets (i.e., those categorized into multiple social categories simultaneously, e.g., “a wealthy atheist”) tend to be stereotyped more negatively than their constituent groups. However, human research into complex intersectional targets (>2 categories) is resource-intensive, given the number of possible intersections (e.g., there are > 27,405 4-way combinations of 30 categories). Large Language Models (LLMs) are trained on vast text data and reproduce many human stereotypes. Using LLMs facilitates big data collection of complex intersectional stereotypes, while testing generalizability and providing insights for responsible technological development, among other benefits. Using 3 LLMs (ChatGPT 4.5, Llama 4, & O1Mo 2), we retrieved open-ended stereotypes about 80 salient U.S. social categories (e.g., based on gender, race, occupation) and 300,000 2-, 3-, and 4-way random intersections of these categories. We present how categorical complexity, constituent incongruence, and other features predict LLM stereotype content, emergence (i.e., content uniquely associated with intersections but not their constituents), and negativity.

Motivation in Context: Social and Structural Pathways to Educational Equity

9:30 AM – 10:40 AM | Location: E253CD, Level 2

MOTIVATION/GOALS

Social psychological and motivational theories hold great promise for addressing educational inequality. Yet motivational research has often focused too narrowly on individuals, overlooking the systems that shape students’ experiences. This symposium highlights new research on how features of social and structural contexts shape motivation, and how understanding these features can inform efforts to reduce disparities. Emily Cyr shows how peer inclusion in STEM camps predicts belonging and career intentions among girls. Kathy Emerson reveals how institutional structures shape which student groups experience belonging in college. Cameron Hecht demonstrates that instructors’ framing of academic resources can affect performance among first-generation college students. Michael Asher shows that mastery-based testing policies can increase engagement and performance, with greater benefits for first-generation college students and those who initially struggle. Together, these talks advance a growing perspective on motivation as contextually afforded, demonstrating how social and structural environments shape motivational processes in ways that reproduce or reduce inequality.

Girls in STEM: The Value of Peer Friendships and Belonging

9:30 AM – 10:40 AM

MOTIVATION/GOALS

In male-dominated STEM fields, boys and men tend to express a stronger sense of belonging than girls and women. We point to this gender gap in belongingness as a conduit between objective measures of social inclusion (per network analysis) and downstream intentions regarding long-term STEM participation.

To study this theoretical model, we recruited girls and boys (N = 1330; Mdnage = 12; 41% White, 35% East Asian) from week-long Canadian STEM summer camps.

Girls and boys received friendship nominations from 50% of same-gender (and 10% of other-gender) peers. Belongingness followed suit: Girls reported higher belonging among female (vs. male) peers, and boys reported higher belonging among male (vs. female) peers. Further, girls reported lower STEM fit and interest than boys (both at the start and end of camp).

Finally, we found that for girls, being more socially included (particularly by male peers) was associated with stronger STEM fit and interest, mediated by belonging. For boys, social inclusion (via belonging) was less predictive of STEM outcomes.

Childhood friendships may foster a sense of belonging that benefits STEM education and careers, especially among girls.

Opportunities to Belong: Institutional Factors that Shape Student Belonging

9:30 AM – 10:40 AM

MOTIVATION/GOALS

Students' sense of belonging has long been recognized as a key predictor of their academic motivation, achievement, and persistence in college. Recent theory and research has shifted focus to the role that institutions play in providing affordances, or opportunities, for students to feel they belong. Using data from a large empirical study (over 15,000 students from 22 U.S. colleges), we identified four institutional factors that uniquely predict student belonging: (1) in-group representation on campus, (2) inclusive campus cultures that signal a sincere commitment to diversity and bolster identity safety; (3) opportunities for strong relationships with peers and faculty, and (4) opportunities for productive learning that convey growth-minded beliefs and help students work toward their greater purpose and goals. Our analysis revealed substantial variability among institutions in their ability to provide minimally adequate belonging affordances to their students. We discuss how college leaders have the opportunity (and responsibility) to support student success by recognizing and improving institutional structures and norms that foster student belonging.

Reframing Peer Support to Promote Equity in College STEM Courses

9:30 AM – 10:40 AM

MOTIVATION/GOALS

First-generation (FG) college students face inequality in STEM fields. Although peer education services (e.g., tutoring) can improve performance in gateway STEM courses, they are often underutilized. Students face psychological barriers that discourage using such resources, such as perceived stigma and unsupportive peer norms. We hypothesized that these beliefs reflect an underlying construal of help-seeking as signaling a lack of potential. To counter this, we developed an intervention framing use of peer education resources as a sign of resourcefulness—an efficient and effective way to learn. In a preregistered experiment (N = 605), we randomly assigned Introductory Biology students to complete either resourcefulness-framed or neutral reflections on these resources. The resourcefulness reflections increased peer education attendance by 38%, $b = 1.38$ [95% CI: 1.01, 1.88]. They also improved FG students' course grades by 0.25 grade points, $b = .25$ [95% CI: 0.04, 0.45], but had no effect for continuing-generation students, $b = -.06$ [95% CI: -0.25, 0.13] (interaction $b = 0.31$ [95% CI: 0.01, 0.60]. Results suggest that inequality can be influenced by the meaning assigned to supports.

Mastery-Based Testing and Self-Regulated Learning in Gateway STEM Courses

9:30 AM – 10:40 AM

MOTIVATION/GOALS

To utilize tests to encourage and motivate students, we implemented a mastery-based testing system in a general chemistry course (N = 234). This system allowed students to take three versions of each unit test, studying digital course resources in between to increase their mastery of the content. Students chose to take advantage of the mastery testing system when they struggled with unit tests, averaging six total repeated attempts. This level of repeated testing was associated with a 60 % increase in students' use of online study resources over the duration of the course, and a five-point overall increase in final exam scores (11 points for first-generation college students). Critically, student engagement with digital learning materials mediated these performance gains, suggesting that the benefits of mastery-based testing systems were not only due to students responding to the tests themselves. Instead, the findings suggest that mastery-based testing systems can enhance performance in introductory STEM courses by providing motivation and structure to support students' self-regulated learning, helping them invest more time in effective, distributed study strategies.

New Horizons in Regional Psychology

9:30 AM – 10:40 AM | Location: E450B, Level 4

NORMS AND SOCIAL INFLUENCE

This symposium showcases advances in regional psychology via four talks that examine how psychological patterns and regional environments shape one another across various cultural contexts, spatial levels, and psychological variables. The first talk explores changes in regional cultural differences between China's rice and wheat-farming areas over time, showing the enduring influence of ecological traditions. The second maps Big Five personality traits across regions in Colombia, Japan, and New Zealand, revealing distinct clusters and country-specific associations with key societal outcomes. The third investigates personality-driven selective migration between cities, villages, and abroad using a representative Estonian sample. The final talk posits that racial prejudice is conceptually different when applied to places (vs. individuals) and shows that people can accurately perceive regionally aggregate racial bias across U.S. neighborhoods based on visual cues alone. Together, these talks promote a more spatially grounded, dynamic understanding of psychology by showing that regions, beyond individuals or nations, are meaningful and consequential units of psychological analysis.

Evidence that rice-wheat differences are actually growing as China modernizes

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Religion has long been a source of existential comfort and security. As increasingly more people are leaving traditional religion, these religious doers and nones are turning toward new sources of spiritual connection. We explore spiritual yearning—the motivation for existential comfort and fulfillment—among the nonreligious through a multimethod set of three studies (N = 5757). In Study 1 (n = 2,338), we drew from three separate samples (ns = 585, 883, 870) to examine correlates of spiritual yearning with associated constructs. In Study 2 (n = 424), we conducted a longitudinal study to examine whether spiritual yearning is a state or trait. In Study 3 (n = 2,995), we conducted an experiment to examine the causal effects of having one's spiritual needs fulfilled or frustrated on existential security. The converging results suggest that spiritual yearning is the motivational longing for deeper meaning and transcendent connection, is relatively stable in the short-term, and is associated with existential security and positive emotions. We discuss the implications of this research for the changing religious landscape for many individuals.

Regional Personality Differences in Colombia, Japan, and New Zealand

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Spiritual yearning (SY)—desire for meaning, self-discovery, and/or transcendence—is common in religious and nonreligious individuals. Yet, SY may relate to spiritual struggles (SS), such as doubt and moral conflict. We examined SY–SS associations in 3,014 participants, including religious individuals, formerly religious “doers,” and never religious “nones.” Correlational and network analyses revealed positive associations between SY and SS, with stronger effects in nonreligious groups. Partial correlations showed links between specific domains (e.g., moral guidance yearnings with moral struggles), but other associations varied by group. Religious participants showed stronger ties between spiritual experience yearnings and belief struggles, while nonreligious, especially doers, linked inner peace yearnings to meaning struggles. Network analyses identified doubt struggles as central overall. Among the religious, yearning for spiritual experience was key; for nonreligious, moral guidance was central. These findings show how SY–SS connections vary by background, highlighting existential questions about how people search for and struggle with meaning, identity, and moral direction.

Life-Course Migration and Personality Across Cities, Towns, and Villages

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Hope is central to many religious traditions, yet dominant psychological models - especially Snyder's theory emphasizing agency and pathways toward goals - fail to fully capture its existential depth. In Studies 1 (U.S. representative sample, N = 1,426) and 2 (convenience sample, N = 229), we find only small associations between religiosity and hope when using Snyder's definition. However, when hope is measured without a pre-set definition, the association grows moderate to large. This suggests religious individuals may define hope differently, i.e., less as goal pursuit. In Study 3 (N = 190; diverse in religious identity and background), we replicate these patterns and analyze qualitative definitions of hope across high- and low-religiosity participants. Our results highlight the need to revise psychological models of hope to reflect lived experience, especially among highly religious populations. This work broadens the conceptualization of hope and centers voices often overlooked in scientific research on hope.

Can people accurately perceive prejudiced places?

9:30 AM – 10:40 AM

NORMS AND SOCIAL INFLUENCE

Hope is a key emotion for experiencing meaning in life (MIL; Edwards et al., 2025). Hope is specifically relevant to difficult circumstances that ultimately challenge MIL. As such, hope may more strongly predict MIL among people high (vs. low) on individual differences that reflect a challenge to MIL. In Studies 1-4, participants completed measures of hopeful feelings, MIL, and varied individual differences, including neuroticism, despair (Studies 1 N = 912; and 2 N = 973), mental health symptoms (Study 2), insecure attachment (Study 3, N = 288), and loneliness/social relatedness (Study 4, N = 586). As predicted, hope was a stronger predictor of MIL among those high (vs. low) in psychological misery (Studies 1-2) and poor social functioning (Studies 3-4). In Study 5 (N = 665), experimentally induced hope (vs. hopelessness) led to greater purpose (but not coherence and significance, specific facets of MIL) only among those with high adverse childhood experiences. Positive affect did not show the same moderation effects, suggesting this is unique to hope's relation to MIL. Overall, we demonstrate that hope is a stronger predictor of MIL among those who need it most.

The Moral Machine: How Digital Platforms Amplify Moral Conflict

9:30 AM – 10:40 AM | Location: E270, Level 2

MORALITY

The human mind is fundamentally moral, but what happens when this ancient psychology meets the scale and speed of modern social media? This symposium examines how platform design interacts with moral psychology—from intuitive judgments to social learning and punishment. Using field experiments, text analysis, and surveys, these talks dissect the mechanisms that amplify moral conflict online.

Talk 1 (Puryear): a decade-long analysis of 2B posts shows moral language surging online, driven by users learning to moralize and extreme users dominating discourse. Talk 2 (McLoughlin): analysis of 30M media texts reveals low-quality sources use villain-centric narratives to spread falsehoods. Talk 3 (Solomon): representative surveys find that critics of "cancel culture" also endorse punitive speech restrictions, a contradiction magnified by social media. Talk 4 (Brady): a field experiment on Bluesky during the 2024 U.S. election finds a "diversified-extremity" algorithm reduces toxic, moralized content.

These talks show that users adapt to modern platforms by using simplistic, punitive moral frames that fracture shared reality. We outline paths to more reflective moral discourse online.

Moralization has Risen in Social Media Discourse

9:30 AM – 10:40 AM

MORALITY

This study provides the first multi-platform, longitudinal evidence that moralization—the process of connecting issues to moral right and wrong—has sharply increased on social media from 2013-2021, outpacing traditional media. Using advances in natural language processing, we developed two new measures of moralization in natural language and applied them to posts from Twitter (9.7M), Reddit (2.1B) and ~5 million traditional media texts (COCA, News-on-the-Web). We found that moralization consistently rose on social media while remaining relatively flat traditional media. Moral language not only intensified in already moralized topics but also spread into previously neutral discussions. Two distinct user-level patterns drove these trends: (1) users became more moralizing over time and (2) highly moralized users became disproportionately active. Our findings highlight how platform design and user dynamics jointly shape public discourse, revealing key mechanisms behind online polarization and suggesting interventions—such as algorithmic curation and community structure—through which designers might mitigate runaway moralization without stifling civic engagement.

Misinformation Portrays More Villains Than Trustworthy News

9:30 AM – 10:40 AM

MORALITY

Misinformation—defined as false or misleading information—spreads in part by evoking moral outrage. We reasoned that a frequent source of that outrage is the villain-victim instantiation of the moral dyad: a fundamental cognitive template underlying moral judgments. As agents who intentionally harm vulnerable victims, villains often evoke strong moral condemnation. And since misinformation need not verify intentionality or avoid condemnation, we expected it to portray villains more often than trustworthy news. In Study 1, participants (N=909) annotated villains in a set of headlines (N=4000) uniformly distributed over a measure of source quality. Headlines from low-quality sources (misinformation) had 5.49 times the odds of portraying a villain compared to headlines from high-quality sources (trustworthy news). We fine-tuned an open-source large language model (OLMo-2) on these annotations. In Study 2, we will use the model to replicate and extend Study 1 by classifying villains in datasets spanning multiple news archives and social media platforms (N=30,116,380). These studies shed light on the moral narratives that typify misinformation and may be amplified by online platforms.

What is(n't) Free Speech? Conflating Censorship with Cancel Culture

9:30 AM – 10:40 AM

MORALITY

This research reveals a widespread misunderstanding of free speech in American society, regarding misinformation, toxic speech, and cancel culture on social media. In a preregistered, nationally representative conjoint survey experiment (N = 1,603; evaluation N = 25,648), we find few Americans differentiate between government censorship and editorial discretion by private social media companies, across varying low- and high-stakes punishments. In two additional preregistered studies (Ns = 1,504; 1,535), we examine misinterpretations of criticism and counterspeech as censorship in the context of cancel culture. Drawing on theories of group identity and motivated reasoning, we find that the most vocal critics of cancel culture—those who view it as a threat to free speech—are most likely to support punitive measures that undermine and obscure the true boundaries of free speech, demonstrating a pattern of inconsistency and hypocrisy. We show that these patterns are amplified by the dynamics of social-media environments, which intensify polarization, moral outrage, and public-private boundary blurring, shaping perceptions and applications of democratic principles in digital discourse.

Redesigning Algorithms to Intervene on Social Norm Misperceptions During a National Election

9:30 AM – 10:40 AM

MORALITY

For the first time in history, civic discourse commonly occurs in digital environments where algorithms influence how we are exposed to social information. It is increasingly important to understand whether and how these algorithms impact our politics. Here, we build custom feedranking algorithms with full control over their features and randomly assign 1,600 participants to use one over the 8 weeks before the 2024 U.S. presidential election. We test whether an engagement based algorithm (used on major social media platforms) amplifies ingroup, moralized and emotional information in ways that skew perceptions of social norms around political dialogue, and whether it leads to increases in perceptions of partisan animosity. We also tested a novel 'diversified extremity' algorithm feed that aims to reduce perceptions of partisan animosity compared to the engagement-based feed. Results show that engagement based feeds inflate toxic, moralized content, whereas our "diversified extremity" algorithm reduces it. Although there was limited evidence in algorithm impact on norm perceptions, the diversified-extremity algorithm reduced engagement with toxic content.

The Nuances of Empathy: Biases, Barriers, and Building Better Interventions

9:30 AM – 10:40 AM | Location: E353A, Level 3

SOCIAL COGNITION

Empathy is fundamental to social functioning, yet recent research reveals it operates in far more complex ways than often assumed. This symposium explores the nuanced nature of empathic responding across four distinct but interconnected projects. First, we examine systematic biases in emotion perception, showing that people consistently overestimate others' negative emotions— a bias that may serve adaptive functions in relationships. Second, we investigate how cognitive load differentially impacts empathic versus factual reasoning, uncovering resource allocation trade-offs under mental strain. Third, we explore how meta-stereotypes can undermine empathy-based prejudice reduction efforts, highlighting critical limitations of traditional approaches. Finally, we demonstrate how "wise empathy" training improves well-being during social media use, illustrating that empathic responses can be skillfully regulated for better outcomes. Together, these findings challenge simplistic views of empathy as uniformly beneficial or harmful, revealing instead a sophisticated psychological process shaped by pre-existing biases, cognitive constraints, social context, and intervention. This work advances our understanding of both the boundaries and promise of empathy, offering insights for more effective and accurate empathic responding in everyday social life.

Emotion Perception Overestimation Bias in Neurotypical

9:30 AM – 10:40 AM

SOCIAL COGNITION

The ability to accurately understand others' emotions forms the cornerstone of effective social interaction. Despite extensive research on emotion recognition, little is known about how people assess emotional intensity or whether these perceptions are accurate or systematically biased. Across nine datasets ($N \approx 2,600$), we found that while people perceived themselves as accurate and believed others underestimate their emotions, they actually systematically overestimate others' negative emotions. This bias occurred with both strangers and romantic partners, and across modalities (text, video, live interaction). Moderate overestimation may serve adaptive functions: for strangers, it predicts higher empathic responses; in romantic relationships, moderate

overestimation of negative emotions predicts higher relationship satisfaction. We further examine this bias in relationship to clinical populations including ADHD, depression, and anxiety. Together, these findings fill a crucial gap in understanding

emotional perception biases, highlighting their potentially adaptive roles and giving insight into how they shape our social world and relationship outcomes.

Under Pressure: How Cognitive Load Shapes Empathic Processing

9:30 AM – 10:40 AM

SOCIAL COGNITION

Accurate and rapid judgments of others' mental and emotional states are essential for effective social interactions. However, these judgments can be compromised when cognitive demands are high and mental resources are strained. To investigate the impact of cognitive load on empathizing, we adapted the EmpaToM task to include both high and low cognitive load conditions. In the task, participants watched emotionally negative autobiographical video narratives. After watching, participants were asked either a mentalizing (cognitive empathy) or a factual reasoning question. In our study ($N = 125$), we found that, regardless of load condition, participants displayed greater accuracy on cognitive empathy questions compared to factual reasoning questions. However, participants took significantly longer to answer mentalizing questions compared to factual reasoning questions under high load, whereas this finding was reversed under low load. These findings suggest that cognitive load differentially affects the processing demands of social reasoning versus factual reasoning, potentially revealing a trade-off in resource allocation when executive capacity is taxed.

Meta-Perceptions as Barriers to Empathy-Based Interventions

9:30 AM – 10:40 AM

SOCIAL COGNITION

Empathy & perspective-taking are commonly used to reduce prejudice, but recent research suggests the effectiveness may be limited. This research explores how meta-stereotypes—beliefs about how one's group is viewed by another group—may interfere with empathy interventions. In Studies 1 and 2, White participants reported trait empathy, trait perspective-taking, stereotypes of Black Americans, and meta-stereotypes—how they believed Black Americans viewed White Americans. Perspective-taking was significantly related to both stereotypes and meta-stereotypes (p 's $< .04$), while empathic concern was related only to stereotypes ($p < .01$). Study 3 replicated Vorauer & Sasaki's (2009) work on empathy & meta-stereotypes. Participants viewed a video on struggles Black Americans face & were instructed to either take the perspective of the person in the video or remain objective. They were then told they would discuss the video with either a Black or White peer. Results showed no effects on meta-stereotypes or prejudice reduction. These findings suggest limits to empathy-based interventions and underscore the importance of studying meta-stereotypes in relation to psychology-based interventions.

Wise Empathy Improves Well-being on Instagram

9:30 AM – 10:40 AM

SOCIAL COGNITION

Most of the global population now spends significant time browsing social media, making it critical to understand how to improve emotional experiences online in ways that support well-being. In this presentation I show a brief intervention training individuals to use wise empathy on Instagram can improve users' well-being. In an ecological momentary intervention, I trained half the sample (N = 260) to skillfully regulate empathic responses to positive and negative posts. Using experience sampling (Nobs. = 5,902), I tracked empathy and well-being during real-world Instagram use. The intervention increased wise empathy online—boosting appreciative joy, positive emotion sharing, and compassion for negative emotions—while reducing negative emotion sharing, upward social comparisons, and personal distress. Critically, when participants had recently browsed Instagram, those in the wise empathy condition reported higher well-being than those in the control, an effect mediated by changes in wise empathy. These findings position wise empathy as a psychologically powerful, trainable skill that can enhance well-being in digital contexts.

The Political is (Inter)Personal: Relationships and Politics Impact One Another

9:30 AM – 10:40 AM | Location: E351, Level 3

POLITICS

We combine insights from political psychology and relationship science to highlight the mutual influence between interpersonal relationships and politics. The first three talks focus on how politics impact interpersonal relationships. Talk 1 finds that partisans care about the impressions they make on out-party coworkers, striving to disconfirm negative stereotypes they assume out-partisans possess. Talk 2 examines more intimate relationships, showing how political dissimilarity is linked to lower romantic relationship quality. Talk 3 finds that adult children feel less connected to and respected by their parents the more they disagree about politics, with daily diary data from Thanksgiving 2024 suggesting political conversation might especially undermine father-child relationships. Finally, Talk 4 focuses on how relationships impact political behavior, showing that political conversations with others—even those that focus extensively on negative feelings—are associated with both day-to-day and longer-term increases in political engagement and participation. Taken together, these talks illustrate how close relationships shape, and are shaped by, political beliefs and behavior.

Making an Impression: Political Metastereotypes and Interactions in the Workplace

9:30 AM – 10:40 AM

POLITICS

Republicans and Democrats increasingly segregate themselves, so when circumstances force them to interact (e.g., in the workplace), we might expect indifference and hostility. We tested the effect of political disagreement on partisans' impression management goals with (hypothetical) coworkers. To our surprise, partisans reported being equally eager to make a good impression on in-party and out-party co-workers. The specific impression they sought to make depended on the expected duration of their relationship and on their political metastereotypes (i.e., beliefs about which stereotypes the other side had of their group). When the imagined working relationship spanned years rather than weeks, participants were especially motivated to disconfirm negative metastereotypes. Positive metastereotypes also mattered; participants cared less about projecting positive traits (to in-party and out-party members alike) when they believed the other side already viewed them as having those traits. Our results suggest that political disagreement does not nullify people's desire to make favorable impressions on each other, and that partisans especially strive to disconfirm negative expectations.

Love across the Aisle: Political Differences in Romantic Relationships

9:30 AM – 10:40 AM

POLITICS

As political polarization in the United States rises, many feel the strain in their close relationships. However, we know little about the frequency of romantic couples' political disagreement and its consequences for relationship quality. Across 11 studies with a combined sample of over 4,000 participants, we assessed how often couples disagree about politics, both in terms of perceived and actual disagreement. We found that political disagreement between romantic partners is rare: Only 23% of couples belonged to different parties, and fewer than 8% were made up of one Democrat and one Republican. However, does the disagreement we do observe predict relationship problems? We tested whether couples' political similarity is associated with their relationship quality cross-sectionally and in their daily lives. Across studies, we observed a small but robust association between political dissimilarity and lower relationship quality. However, other relationship factors, such as appreciation, are stronger predictors of relationship quality—politics isn't everything. This work sheds light on how national patterns of political polarization play out in people's intimate relationships.

Daily Impacts of Political Disagreement on Family Relationships and Belonging

9:30 AM – 10:40 AM

POLITICS

Many parents and young adult children disagree about politics. Does this affect their relationships? Study 1 found that college-aged children reported worse relationships with their parents (i.e., lower perceived regard, felt security, and closeness) and less belonging at home to the extent that they believed their political views to differ from their parents' (all p 's $\leq .016$). Study 2 used daily diary surveys over Thanksgiving 2024 to test the impact of political issue disagreement and daily political conversational features, such as intensity and frequency, on daily relationship quality and belonging for college-aged children. Main effects from Study 1 replicated (all p 's $< .01$), and greater political issue disagreement between participants and their fathers (but not mothers) predicted lower feelings of belonging on days with political conversations ($p < .001$). On days when participants and their fathers agreed more than usual on politics, longstanding political issue disagreement impacted belonging less strongly ($p = .024$). This suggests political disagreement can undermine family relationships, but the impact of disagreement may depend on who disagrees with whom - and how.

Examining Political Co-Rumination with Close Others During the Election

9:30 AM – 10:40 AM

POLITICS

Across two studies surrounding the 2024 US presidential election, we tested competing hypotheses regarding whether increased co-rumination about political stressors would be related to more or less political action. Study 1 capitalized on a 4-wave assessment of the three months surrounding the election, providing preliminary evidence that increased co-rumination – at both the between- and within-person levels – is associated with more political action. Study 2 examined co-rumination and political action with a 28-day diary (2-weeks leading up to and 2-weeks after the election). Replicating the findings from Study 1, Study 2 showed that on days when individuals talked about social and political issues with others, they engaged in more political action. And, on days when those conversations were more co-ruminative than was typical for them, they got an additional boost in political action at the daily-level. Importantly, the relation between co-rumination and political action is significantly mediated by increased daily motivation to stay engaged with political issues, offering insight into the processes by which co-rumination might increase political action are positively related.

Unpacking Weight Bias: Intersectionality, Impact, and Intervention

9:30 AM – 10:40 AM | Location: E271, Level 2

STEREOTYPING/PREJUDICE

Weight bias is a widespread and harmful form of stigma that undermines psychological, social, and physical well-being. Yet the complexities of weight stigma remain understudied. This symposium brings together four talks using diverse methods, including natural language processing, experiments, and ecological momentary assessment, to examine how weight stigma operates across perception, interaction, and behavior. Presenters explore how stereotypes vary by gender, race, and class in naturalistic text; how stigma shapes judgments about others' physical and social pain; how anticipated discrimination affects health behavior and provider communication; and how everyday experiences of stigma influence eating behavior in real time. Together, these talks show that weight stigma is multifaceted and deeply entangled with other social biases. By capturing both societal perceptions and lived experiences, these studies center the voices of intersectionally marginalized individuals and highlight the urgent need for more inclusive interventions.

Ecological Momentary Assessment of Weight Stigma and Eating Behavior in Everyday Life

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

Weight stigma is pervasive and linked to adverse health outcomes, yet little is known about its real-time effects on eating behavior. This study used ecological momentary assessment (EMA) to examine how weight stigma unfolds in daily life and influences eating. Ninety-one adults with BMI ≥ 25 reported stigmatizing events and subsequent eating behavior over 14 days. Participants were not more likely to eat after stigma events compared to control periods, but when they did eat, they consumed significantly more—on average 1.45 times more servings. Gender moderated this effect, with men showing a stronger increase in consumption. Internalized stigma and identity centrality amplified this relationship, while anticipated stigma attenuated it. These findings challenge the notion that stigma motivates healthier behavior and instead suggest it may perpetuate a cycle of weight gain and further stigmatization. Addressing weight stigma is thus critical for both social justice and public health.

Self-Affirmation and Black Women's Receptiveness to Physical Activity Messaging

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

Physical activity reduces chronic illness and extends life, yet Black women, who often face racial and weight stigma in healthcare, are among the least active groups in the U.S. While doctor recommendations can boost activity, especially from racially concordant providers, most U.S. doctors are White, and Black patients often anticipate discrimination, undermining their messages. This research tested whether self-affirmation (i.e., affirming self-worth) reduces defensiveness and improves message receptiveness. Across 2 studies, 716 Black American women completed either a self-affirmation or control writing task, then read a health message from either a Black or White doctor about Black women's need for exercise. In both studies, the White doctor was perceived as more discriminatory, less trustworthy, less persuasive, eliciting more anger. In Study 1, self-affirmation heightened perceived gender discrimination, reduced message persuasiveness, and increased anger. However, these effects did not replicate in Study 2. Thus, provider race strongly affects message reception and self-affirmation may not always reduce defensiveness in racialized, stigmatized health settings.

Examining How U.S. Adults Evaluate Higher Weight Individuals' Pain

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

Adults with higher body weights are undertreated for physical pain, which has severe implications for their health. However, research has yet to test (a) whether this relationship extends to social pain, and (b) the mechanisms underlying these relationships. Across two online experiments, we examined how U.S. adults from Prolific evaluate experiences of physical and social pain for White male targets who varied in body weight (lower vs higher). Across studies, participants believed that the higher (vs lower) body weight target would report more physical and social pain in response to various life experiences. Moreover, they believed that the higher weight target would report needing more resources (medical treatment and mental health support) to cope with this pain. Study 2 demonstrated that these relationships emerged via participants' beliefs that the target was exaggerating his pain. Additionally, we ruled out mechanisms (e.g., dehumanization) that have been established for other social groups. Together, this work shows that laypersons perceive that higher weight individuals exaggerate their physical and social pain, which can have implications for sensitivity in this domain.

Body Weight Stereotypes Across History and Intersectional Identities

9:30 AM – 10:40 AM

STEREOTYPING/PREJUDICE

Larger bodies are widely stereotyped in ways that reinforce weight-based prejudice and discrimination. However, less is known about how these stereotypes vary across intersecting identities such as gender, race, and class. Using a corpus of over 800 billion words of contemporary Internet text, we employ a natural language processing technique to examine associations between intersectional identities and 2,798 traits. Analyses of body weight alone showed that thinness, compared to fatness, was associated with greater competence, conscientiousness, attractiveness, and health. BodyXrace and bodyXclass intersections revealed a double jeopardy effect, with stereotypes worsening when paired with Black (vs. White) or Poor (vs. Rich) identities. Interestingly, gender modulated weight-based stereotypes such that fat women were linked to low conscientiousness and competence, while fat men were linked to low attractiveness and high neuroticism. These findings show that weight bias is not monolithic, but rather shaped by other social biases.

What Do We Value in Leaders?

9:30 AM – 10:40 AM | Location: E258, Level 2

PERSON PERCEPTION/IMPRESSION FORMATION

Who should lead us? Across four talks, we identify key characteristics that people value in leaders and the individual and contextual moderators that make these characteristics more or less desirable. The first talk shows that, contrary to the stereotype of a male, dominant leader, people actually slightly prefer female, and strongly prefer prestigious, leaders. The second talk identifies political orientation as a critical moderator of who values dominant leaders: Liberals, compared to conservatives, dislike dominant leaders more, and as a result, underestimate dominant leaders' success more. The third talk identifies an important contextual feature that influences the value people place on integrity in a leader: When an organization is in crisis, compared to when it is not in crisis, people value integrity relatively more. Finally, the fourth talk documents the importance of maturity in leaders. This work identifies the nature of the leadership position (e.g., degree of interpersonal interaction) as an important moderator of the relative importance of maturity. Taken together, this symposium advances our understanding of important leadership traits and when they matter most.

Revisiting Stereotypes versus Preferences for Alpha Male Leaders

9:30 AM – 10:40 AM

PERSON PERCEPTION/IMPRESSION FORMATION

According to the "think manager-think male" model, one reason women are underrepresented in leadership in politics and business is that leaders are stereotyped as male (and dominant), which leads people to prefer such traits in leaders. However, the results of five studies suggested that such stereotypes do not necessarily translate into preferences. In Study 1A (N = 148), undergraduate students spontaneously imagined both dominant and prestigious (i.e., skill/competence-based) leaders as men (Study 1A, N = 148)—across occupational domains (Study 1B, N = 220)—but preferred women and prestigious leaders over men and dominant leaders. In Study 2 (N = 2,692), a nationally representative sample of U.S. respondents from the Pew American Trends panel also showed no preference for male over female leaders. Study 3 (N = 461) provided an experimental replication of a preference for prestigious (female) over dominant (male) leader candidates. Finally, in Study 4, MTurk participants judging facial photographs similarly showed a slight preference for women, which may have been partially due to the inference that women leaders are more likely to use prestige relative to dominance.

Why Liberals Underestimate Dominant Leaders More Than Conservatives

9:30 AM – 10:40 AM

PERSON PERCEPTION/IMPRESSION FORMATION

The success of dominant leaders often evokes surprise and dismay. This paper offers a psychological explanation beyond partisan reasoning, positing a systematic tendency among liberals to underestimate the appeal and efficacy of such leaders compared to conservatives. Integrating moral foundations theory with the similarity-liking principle, we propose that liberals' heightened emphasis on harm avoidance and fairness values yields reduced liking of dominant leaders, subsequently causing them to underestimate such leaders' prospects of success more than conservatives do. We test this hypothesis using large-scale archival data (N = 212,607), a pre-registered time-lagged field study with full-time employees (N = 202), and six pre-registered experiments (N = 3794; two in SI). Across diverse organizational and political contexts, liberals consistently perceive dominant leaders as less likely to succeed than conservatives—even when the leader's political affiliation is irrelevant, unknown, or aligned with the participant's own. Intriguingly, our findings also suggest that these diminished expectations from liberals might paradoxically enhance the success trajectories of dominant leaders.

Organizational Crises and Trust in Leaders

9:30 AM – 10:40 AM

PERSON PERCEPTION/IMPRESSION FORMATION

Extending the Uncertainty Management Theory to organizational crises, we study whether, how, and when organizational crises affect members' reliance on leader integrity in trust decisions. We also explore whether leaders are aware of the change and whether leader integrity predicts crisis-time performance increase. Studies 1a-1b, two experiments immersing business professionals from diverse cultures in the simulation of a security breach crisis or a non-crisis, find that crisis experiences increase members' reliance on leader integrity. Study 2a-2b, two online experiments with full-time American employees in the scenario of a factory explosion crisis or a non-crisis, replicate the effect and find fairness concern a mechanism. Study 3 finds leaders' crisis-specific vs. general ability a boundary condition. Study 4 shows that leaders are unaware of such a change to members' trust process in crisis times. Combining survey and archival data in a pre-post test of performance change at a multi-national company undergoing COVID-19, Study 5 finds that member-rated leader integrity associates with an increase in leader-rated member performance; leader ability or benevolence does not.

Perceptions of Maturity in Leaders

9:30 AM – 10:40 AM

PERSON PERCEPTION/IMPRESSION FORMATION

We identify maturity as a critical trait that people value in leaders. Across three studies, we show that maturity has two key components: socio-emotional maturity (e.g., ability to regulate emotions and be prosocial) and cognitive maturity (e.g., ability to maintain responsibilities and engage in long-term thinking). We then link perceived maturity with leadership selection: In another study, we show that people are more likely to confer power to a person who is mature, even when that person has less expertise than another potential candidate. Importantly, we show that the importance of maturity in leadership selection is moderated by the extent to which a leadership role involves interpersonal interaction. Taken together, our findings advance our understanding of leadership, and of maturity, by introducing a novel conceptualization and measure of maturity.

Who Benefits from First Amendment Rights? A Social Psychological Perspective

9:30 AM – 10:40 AM | Location: Lakeside Ballroom E354B, Level 3

LAW

The First Amendment of the U.S. Constitution guarantees the rights to religious freedom, protest, and free speech. The four talks in this symposium aim to illuminate how—even though these rights are meant to be universal—they can be weaponized to serve ideological and group interests. Talk 1 shows that ideological biases can override the neutral application of law when people reason about religious freedom claims. Talk 2 reveals how Christians and Muslims (but not Jews) selectively interpret religious freedom rights as applying more to their ingroup than outgroups, with all three groups believing that politicians who express concern for religious freedom really care about Christians. Talk 3 leverages survey data from 20 countries, as well as large-scale geospatial data from the United States, to model how moral concerns about social equality and social order explain when people support, condemn, or express protests. The final talk demonstrates that free speech arguments can sometimes divert attributions of bias. Collectively, this symposium showcases the social psychological processes underpinning the conferral and weaponization of First Amendment protections.

Ideological Biases Shape Americans' Reasoning About First Amendment Religious Rights

9:30 AM – 10:40 AM

LAW

Four studies examine how Americans reason about what political beliefs count as sincerely held and deserve First Amendment religious freedom protections. Study 1a (N = 99) and 1b (N = 151) find that conservative and liberal Americans schematically associate conservative (and not liberal) stances on culture war issues with sincerely held religious belief. Study 2 (N = 402) finds that conservatives and liberals are more likely to grant exemption requests from state anti-gay discrimination laws when claimants defend requests with religion (vs nonreligion), however, strong ideology effects show that liberals discount the deservingness of such requests and conservatives are willing to grant such requests even when nonreligious. Study 3 (N = 400) finds mirroring patterns when liberal religious beliefs (and freedom from religion arguments) are used to request exemptions from anti-abortion laws, this time with conservatives discounting the deservingness of liberal beliefs' legal protection. Results from both studies further show that liberals and conservatives prioritize granting ideologically aligned requests even when they think such requests are not justified under the First Amendment.

Religious Freedom May Not Mean Religious Freedom for All

9:30 AM – 10:40 AM

LAW

Americans broadly endorse religious liberty, but for whom? In four studies (N = 1,098), we asked American Christians, Muslims, and Jews about their support for the freedom of religious expression of different religious groups and their perceptions of a political message related to religious freedom. Concerning people's own views, Christians and Muslims, but not Jews, were most supportive of religious liberty for their own faith than for other faiths. That is, both Christians and Muslims showed ingroup bias in supporting freedom of religious expression. What, then, do people make of politicians who appeal for religious freedom? Do they believe these politicians value religious freedom just for their ingroup or for all? Christians, Muslims, and Jews all believed that politicians emphasizing religious freedom were likely Christian and (compared to a control condition) more concerned with protecting Christian rights but not religious minority group rights. Thus, while some groups prioritize religious liberty for themselves, all perceive political messages about religious freedom as especially geared toward Christians. Results suggest religious freedom might not mean liberty for all.

A Dual Process Model of How Observers Respond to Protests

9:30 AM – 10:40 AM

LAW

Protests are met with either tolerance or repression. Two studies tested whether two processes jointly explain how we respond to protests. S1 provided cross-cultural evidence using stratified samples (N = 4,217) from 20 countries across all inhabited continents. Respondents completed survey measures of moral concerns and judged whether seven controversial actions (e.g., disrupting traffic) were acceptable means of protest for redistributive policies in their country. S2 provided geospatial evidence. Combining data on >60,000 protest events with survey data on the moral concerns of >50,000 Americans, we tested whether county-level differences in moral values predicted rates of protests (and their suppression). Moral concerns about social equality predicted observers considering more protest actions acceptable (S1) and higher county-level incidence rates of Black Lives Matters protests (S2). Moral concerns about social order predicted observers considering fewer protest actions acceptable (S1) and lower rates of protests and higher rates of police intervention (S2). Moral concerns about social equality and social order jointly explain when we support, condemn, and suppress protests.

Does Claiming Free Speech Reduce Perceptions of Prejudice?

9:30 AM – 10:40 AM

LAW

Over the last few decades, Republicans have increasingly embraced free speech principles, as Democrats condemn hate speech as offensive and prejudiced. But little is known about the effects of asserting free speech rights on social perceptions. Therefore, we conduct a series of survey experiments to test the effects of a speaker asserting free speech rights on third-party perceptions of the speaker's prejudice. We find that assertions of free speech rights have different effects depending on the perceivers' racial attitudes: Free speech claims reduce perceptions of racism among those who are higher in modern racism but have a backlash effect among perceivers who are lower in modern racism. These findings suggest that endorsing free speech principles has mixed effects on social perceptions depending on the audience.

Diversity and Climate Committee Undergraduate Mentoring Event

11:00 AM – 12:00 PM | Location: E259, Level 2

Pre-Registration Required. [SIGN UP HERE](#)

About the Session

Come join us for an opportunity to network with inspiring graduate students and faculty and gain insider insights into academic and career paths. The event will feature a 30-minute Q&A session with graduate student panelists, followed by mingling and informal discussion with graduate student mentors and the members of the Diversity Climate Committee (DCC). This is a first-come, first-served event exclusively for undergraduate student attendees.

Meet our Mentors

Colin Li, University of Toronto

Colin is currently a PhD candidate in Social-Personality Psychology at the University of Toronto. He received his bachelor's degree from the University at Buffalo, SUNY, and a master's degree from Wake Forest University. His research focuses on prejudice at both the individual and regional levels, as well as its connections to structural outcomes and well-being. He has experience finding postbac research positions, choosing between master's and PhD programs, and navigating life as an international student in both the United States and Canada.

Uğur Özküsen, University of Pittsburgh and Harvard University

Uğur is a PhD student at the University of Pittsburgh and a research fellow at Harvard University. He earned his bachelor's in psychology from Özyeğin University in Türkiye and his master's in psychology at New York University as a Fulbright Scholar. His research investigates how people perceive others (e.g., people with conflicting identities) and how different social-psychological interventions can reduce group-based disparities and intergroup conflict. As a first-generation student, he has received several awards and grants during his undergraduate years for his research and internships abroad.

Tyler Salley, University College London

Tyler is a doctoral candidate in the Department of Experimental Psychology at University College London and a Visiting Scholar in the Organizations and Innovation Group at the UCL School of Management. Before beginning his PhD, he spent nearly a decade in industry, most recently leading Future of Work and Team Effectiveness programming for 70,000+ employees at Meta. He earned his MSc in Applied Behavioral Sciences / Industrial-Organizational Psychology from the University of Baltimore and his BSc in Psychology from Illinois State University. His research examines how political identity shapes collaboration, especially when people with opposing ideologies must rely on one another to succeed. Having experience both in corporate America and bridging the Psychology and Management worlds in academia, he is happy to provide his perspective to undergrads on topics ranging from project management and goal setting to key considerations when deciding between a career in industry, academia, or pursuing a terminal master's degree.

Jinli Wu, Georgetown University

Jinli is a final-year doctoral candidate at Georgetown University under the mentorship of Dr. Yulia Chentsova Dutton. He is trained as a cultural psychology generalist, with an interdisciplinary professional training in public policy, public health, and social work. His research examines the cultural shaping of human experience across a wide range of domains, such as theory of mind, morality, social networks, motivation, emotion, and human development. Jinli was born and raised in a rural town in Southeast China, and his personal experience in under-resourced environments makes him passionate about bringing a non-WEIRD perspective to the field of psychology and mentoring undergraduate students who might be the next generation of cultural psychologists.

Zi Ting Louisa You, University of Toronto

Louisa is a 5th year PhD student at the University of Toronto in Toronto, Canada. She studies intergroup relations and ingroup identities, including its boundaries, context, and motivations. Her research spans data simulation, app programming, qualitative research, and experimental methods. Louisa is also happy to chat about gaining internship and professional development experience, navigating hidden curriculums, collaborating with different advisors, and anything else you might be curious about!

PUI Committee Sponsored: Discussing and Addressing Anti-DEI Attitudes in Academia

11:00 AM – 12:00 PM | Location: E252, Level 2

This session continues the conversation from SPSP's last Annual Convention on the growing resistance to diversity, equity, and inclusion (DEI) in higher education. We will explore how this backlash shapes student experiences, impacts classroom dynamics, and threatens faculty job security while sharing strategies to navigate these evolving challenges.

Mindworks: The Science of Thinking, A Chicago-only Experience During SPSP 2026

11:00 AM – 5:00 PM | Location: Offsite

Mindworks is a public-facing discovery center and active behavioral research lab in downtown Chicago, approximately a 15-minute ride from the convention center. Operated by the Roman Family Center for Decision Research at the University of Chicago Booth School of Business, Mindworks invites visitors to explore how people think and decide while participating in real studies that advance behavioral science. Participation in these studies helps researchers better understand human behavior, while participants earn prizes and contribute to advancing science.

Drop in on your own (hours listed here: <https://www.chicagobooth.edu/mindworks/visit>). A visit to Mindworks lasts about 30 to 60 minutes, depending on how many studies you'd like to take.

What to expect on the journey of writing a book for a popular audience

11:00 AM – 12:10 PM | Location: E451A, Level 4

Over the past decade the number of books by researchers writing for a popular audience has proliferated enormously. You may be

thinking of writing one yourself, or have already begun your journey.

This workshop tries to provide a clear sense of what the book-writing journey entails -- explaining the potential challenges and rewards to help you decide whether the journey is right for you and how to navigate the process if you decide to embark upon it.

Because most SPSP members are trained as researchers and not writers there is a great deal of implicit knowledge that needs to be learned about the world of writing a book. This workshop hopes to introduce you to some of that implicit knowledge to help you write a book that will be engaging without compromising scientific integrity -- or to help you decide that it's not the right journey for you at the moment.

Writing Back: Authoring and Responding with Agency in Peer Review

11:00 AM – 12:10 PM | Location: E450A, Level 4

Navigating peer review is essential to scientific success, but it remains part of the "hidden curriculum." This session seeks to provide trainees and early-career scholars with concrete and practical strategies for responding to manuscript reviews. Such knowledge and tools can be especially important when experience is limited, institutional resources or knowledge are scarce, or authors contend with belonging concerns. This session includes resources from Reviewer Zero (reviewerzero.net), a collective working to shift peer review culture towards more inclusive practices. We will provide an overview of the mechanics and culture of peer review, including potential sources of bias. Then, we focus on decoding editorial decisions and reviews, and we offer strategies for responses. Throughout, we welcome interactive discussion and questions. Our goal is that participants will leave with greater knowledge of the peer review system and greater efficacy to implement response strategies.

Individual and Social Processes Underlying Goal Pursuit and Behavior Change

11:00 AM – 12:10 PM | Location: E351, Level 3

This symposium examines how people pursue goals and change behavior through individual and social processes. Across four talks, presenters show how regulatory scope shapes multiple-goal management, how mental contrasting transforms fear into preventive action, how anxiety shifts reliance from individual to social pathways of behavior change across cultures, and how social actions facilitate goal-oriented self-talk and behavior. The presenters will discuss the dynamic interplay between individual and social processes in goal pursuit and behavior change.

Beyond and Within the Box: Individual Differences in Goal Regulatory Scope and Their Role in Multiple Goal Management

11:00 AM – 12:10 PM

INDIVIDUAL DIFFERENCES

In multiple-goal pursuit, people can pursue goals more or less intensely depending on factors such as properties within the scope of the goal, or on relations among goals. We define single-goal scope as focusing on one current goal at a time, where goal-specific properties (e.g., value) receive exclusive attention. In contrast, multiple-goal scope is the broad regulatory scope on multiple goals where both goal relations (e.g., facilitation) and properties become one's consecutive concern. A 24-item scale was validated (Study 1) and applied to examine goal selection and striving patterns across diverse goal contexts. In two validation studies on New Year's resolutions, it was hypothesized and found that both types of scope are associated with showing concerns about and selecting goals of favorable goal properties (higher value and attainability), while multiple-goal scope is uniquely associated with concerns about and selecting goals of favorable goal relations in the form of goal facilitation. Consequently, favorable goal properties and relations predicted goal motivation. Study 3 replicated and extended this by assessing the five most important established goals, while a longitudinal Study 4 on course goal management, which encompassed both goal selection and striving, explored long-term implications. In sum, this work highlights the importance of individual differences in regulatory scope and goal selection processes in understanding successful management of multiple goals.

From fear to action: mental contrasting enhances preventive behavior through changed meaning of reality

11:00 AM – 12:10 PM

MOTIVATION/GOALS

People often anticipate negative future events such as illness, failure, and conflict; still little action towards preventing the feared futures follows. Recent studies, however, show that mental contrasting of people's feared futures with the positive, endangered reality it would jeopardize induces preventive action more effectively than merely imagining the threat. Yet, the psychological mechanisms behind this effect remain unclear. In four longitudinal experiments, we examined how mental contrasting of a feared future with the current reality transforms the current reality into something more precious, and how such a shift in evaluating reality drives preventive action. Compared to reverse contrasting, mental contrasting led participants to view their reality as more valuable and precious, which in turn predicted greater preventive action over the following four weeks (Studies 1 and 2). It also altered implicit evaluations of reality in the same direction, with these changes similarly predicting preventive action (Studies 3 and 4). Our findings identify a key mechanism by which mental contrasting converts fear into action: by increasing the perceived value of what is at stake.

Individual and Social Processes of Behavioral Change: Anxiety as an Individual and Cultural Driver of the Use of Social Influence

11:00 AM – 12:10 PM

MOTIVATION/GOALS

From eating healthier to saving more money, people everywhere seek to change their behavior—but how do they go about it? Do they prefer individual or social processes of change, and what drives these decisions or their beliefs about the efficacy or cost of making a change? Six studies (total N = 7,289; three preregistered) investigated preferences for and beliefs about individual and social behavior change processes, as well as the forces shaping these preferences. Findings demonstrated a large and robust reliance on individual (vs. social) processes, which consistently emerged in explaining past behaviors and planning for future changes, across participants from 11 different countries. Nevertheless, heightened anxiety led participants to use more social (vs. individual) processes. In other words, anxiety acted as a "social switch" that promoted leveraging close others, social norms and cultural beliefs, and other external resources, including laws and policies, as tools for behavioral change. This effect was observed at both the country and individual levels of anxiety, using both correlational and experimental methods.

The Connection between Individual and Social Processes of Goal Pursuit

11:00 AM – 12:10 PM

MOTIVATION/GOALS

Researchers have examined goal pursuit as an individual process, as well as goal pursuit within groups, but less is known about the connection between individual and social processes of goal pursuit. We hypothesized that social actions, such as telling others about a goal, would trigger goal-oriented inner dialogue that facilitates goal-oriented behavior. Further, we sought to observe and analyze inner dialogue through audio recordings of free speech about a goal. In five studies, (N = 4,814) two correlational and three experimental, social actions (i.e., sharing one's goal, asking for help, sharing difficulties, surrounding oneself with new people) predicted goal-oriented self-talk and behavior (i.e., setting a goal, implementing steps, and monitoring progress) with others. Additionally, LLM (Large Language Model) analyses of participants' self-talk revealed that belonging predicted confidence and motivation, especially in participants who had previously engaged in a social (vs. individual) action. These potential mechanisms advance our understanding of how how relationships influence individual goal pursuit.

Novel Insights into Power, Ideology, and Political Participation: Psychological Perspectives on Civic Engagement and Institutional Bias

11:00 AM – 12:10 PM | Location: E353A, Level 3

SELF/IDENTITY LAW POLITICS

This symposium features four single-presenter talks on political psychology. One talk presents a large-scale megastudy that tests 10 behavioral interventions designed to increase voter registration ahead of the 2024 U.S. election. Another traces daily activism during the election period, highlighting identity-based differences in civic engagement before and after Election Day. A third introduces and validates a new measure of coloniality as a political ideology, examined across both Global North and South contexts, demonstrating its importance for understanding support for global inequalities. A final talk examines predictors of racial bias in policing, showing that regional psychological context can be more predictive of search bias than individual officer characteristics. Together, these studies highlight the psychological processes through which individuals engage with and are affected by political systems.

A Tournament of Behavioral Interventions to Increase Voter Registration Ahead of the 2024 U.S. Election

11:00 AM – 12:10 PM

POLITICS

Voting in elections is one of the most consequential forms of political participation in a democracy. However, voter registration and turnout in U.S. elections are chronically low. Decades of intervention research have identified promising strategies for increasing political participation, but few have tested these interventions against each other in a single experiment. To address this gap, we adopted a megastudy approach to evaluate 10 expert-crowdsourced, theoretically-based psychological interventions on a large sample (N=13,600) of eligible, yet unregistered, U.S. voters on registration intentions and behavior ahead of the 2024 Presidential election. We found that Escalating Commitment, an intervention that includes social norms, values, and accountability appeals, was most effective at increasing visits to the official voter registration website (by 2.14%) and intentions to vote (by 8.11%), compared to the control condition. Several other interventions also boosted intentions; however, none statistically increased actual voter registration. Future research should identify scalable strategies to promote voter registration that increase both intentions and behavioral outcomes.

Coloniality as a Political Ideology: Psychometric Assessment and Political Significance of a Novel Ideological Construct

11:00 AM – 12:10 PM

POLITICS

This work advances a formal operationalization of coloniality as a political ideology—defined as the prescriptive belief that non-Western and Indigenous (a) cultures, (b) knowledge systems, and (c) societal structures are “outdated” and hinder societal progress. Drawing on decolonial theory and political psychology, we reconceptualize coloniality not only as a historical remnant but as an active belief system that justifies contemporary global inequalities. Across three studies, we develop and validate the Coloniality Beliefs Scale (CB). Study 1 (US, n = 936) confirms a hierarchical second-order factor structure across cultural, epistemic, and political dimensions (CFI = .970; RMSEA = .064). CB shows construct and incremental validity, correlating with conservatism, system justification, and social dominance orientation, and uniquely predicts support for Western foreign intervention and legitimization of global inequalities. Study 2 (Puerto Rico, n = 351) and Study 3 (Netherlands, n = 448) replicate the scale’s structure and assess political correlates in colonized and formerly colonizer contexts. CB is linked to both context-specific attitudes (e.g., political status, colonial monuments) and shared outcomes (e.g., support for reparations). Lastly, Latent profile analyses identify subgroups marked by cross-ideological endorsement of CB (e.g., Neocolonial Liberals and Conservatives), highlighting the prevalence of CB beyond conservatism, group status, and geopolitical context.

Moved to Data Blitz #1 on Friday: Person or the Situation? Predicting individual officers' search bias.

11:00 AM – 12:10 PM

LAW

In a pre-registered study, we compare widely used measures of police bias to a novel bias measure that accounts for the unknown contraband rate. We use data from 18,870 officers across 9 U.S. states and 10 municipalities. Surprisingly, in South Carolina, officer race and age are not predictive of racial bias. Instead, county level regional bias (as captured by the IAT) is predictive of police bias. In South Carolina the average race discrepancy between White and Black community members on the IAT predicts an officer's propensity for searching more innocent Black drivers than innocent White drivers in that county. This effect holds when controlling for an individual officer's department, age, and race. Importantly, the weapons version of the IAT predicts the discrepancy between recovery rates of contraband (including weapons) for drivers of different races. Neither IAT predicts a police officer searching one race of drivers over another. These findings suggest that measures of police bias capture different psychological processes.

Social identity and daily activism trajectories during the 2024 election

11:00 AM – 12:10 PM

SELF/IDENTITY

The 2024 presidential election was a focal point for political activism in the United States. For many, perceived threats to rights increased engagement in activism as a form of resistance and self-advocacy. Using 21 daily diaries (N = 313), this study examines changes in daily activism before and after Election Day, and how these patterns vary by race, gender identity, sexual orientation, and political affiliation. A multilevel piecewise growth model will estimate activism trajectories across the pre- and post-election periods, testing whether social identity predicts different growth patterns. We hypothesize that activism increased in the days leading up to the election and decreased in the days following. For individuals belonging to a minoritized status or the losing party, we expect this rise and fall to be more extreme. Data collection is complete, and pre-registration of analyses before data access is in progress. In addition to showing how daily activist behaviors shift during moments of political tension, this study will inform our understanding of how social identity shapes civic engagement in response to anticipated and realized threats to marginalized communities.

Pursuing the Good Life: From Individual to Social Welfare

11:00 AM – 12:10 PM | Location: E353B, Level 3

MORALITY SELF/IDENTITY NORMS AND SOCIAL INFLUENCE

What constitutes the good life, and how do pursuits of well-being operate across levels of analysis? This symposium traverses from individual ideals through dyadic moral judgments to community cohesion and social welfare. At the individual level, the first talk investigates the motivational foundations of “good life” ideals, examining how self-concept clarity and trait self-expansion promote preferences for hedonic versus eudaimonic ideals. At the dyadic level, the second talk explores how engagement in self-care, framed as self-improvement versus self-indulgence, shapes moral perceptions of individuals. At the community level, language analysis of over 880,000 people following crises reveals that natural disasters temporarily reduce divisive language while mass shootings do not, though both increase prosocial expression. At the societal level, the final talk proposes that welfare program participation is hindered by miscalibrated perceptions of public stigma, driven by overly pessimistic beliefs about how negatively welfare recipients are perceived. Together, these talks advance our understanding of how identity, social perception, and personal values influence the decisions we make about our well-being and societal welfare.

Beyond Pampering: The Impact of Self-Care on Moral Judgments

11:00 AM – 12:10 PM

MORALITY

The wellbeing industry has grown to \$5.6 trillion, reflecting a profound transformation in individuals' values. While the importance of self-care in people's lives is projected to continue growing, academic research on its interpersonal consequences remains scant. This paper begins to address that gap by examining how engaging in self-care, defined as “activities that improve and maintain one's physical and psychological wellbeing”, shapes observers' morality perceptions. Across six pre-registered experiments (N=1776) using different manipulations and an incentive-compatible DV, we provide converging evidence that engaging in self-care enhances observers' perceptions of a target's morality and impacts their partner selection decisions. We further demonstrate that this effect persists regardless of the target's financial status or time availability, but is limited to self-care activities that emphasize self-improvement rather than self-indulgence. Our findings contribute to the moral judgments and well-being literatures and offer novel insights into the moralization of self-care from a social cognition perspective.

Do Collective Crises Bring Us Together or Tear Us Apart?

11:00 AM – 12:10 PM

SELF/IDENTITY

How do collective crises, such as natural disasters or mass violence, shape collective identity and intergroup relations? We analyzed the natural language of over 880,000 people across city or regional online communities surrounding 63 extreme weather events and 57 mass shootings that occurred in the United States between 2016 and 2024. Across both mass shootings and extreme weather events, individuals in affected regions expressed greater collective identity (e.g., we, us) and prosociality (e.g., care, help) in the days following the event. Further, there was a drop in language indicating the salience of outgroups (they, them) and social divisions (e.g., words about conflict, polarization) after natural disasters, but not after mass shootings. That is, while both types of crises induced solidarity, only natural disasters undermined division. The observed shifts typically lasted a week before returning to baseline, and they were observed even in discussions unrelated to the crisis or region. These findings suggest that different large-scale crises may differently shape the nature of people's relations with social others, but these changes may be short-lived.

Pluralistic ignorance of stigma impedes take-up of welfare benefits

11:00 AM – 12:10 PM

NORMS AND SOCIAL INFLUENCE

The U.S. spends hundreds of billions on welfare programs, yet over 30% of eligible individuals do not participate. We propose that a key barrier is miscalibrated perception of public stigma—people’s overly pessimistic beliefs about how negatively others view welfare recipients. Study 1 categorizes spontaneous reactions to someone being SNAP-eligible: stigma, negativity about help-seeking, pity, envy, willingness to help, happiness, and admiration. Studies 1 and 2 show widespread pluralistic ignorance: participants believed they held more positive, less negative views than their peers or the public. Studies 3A and 3B use incentive-compatible methods to confirm this discrepancy between personal and perceived public attitudes. Study 4 shows that experimentally increasing perceived public stigma reduces participants’ willingness to apply for or refer SNAP. Study 5, conducted with a SNAP-eligible sample, tests an intervention that reduced perceived stigma but did not significantly increase near-term application or referral intentions.

Self-Concept Clarity and Self-Expansion as Predictors of Well-Being Ideals: A Dual-Path Model

11:00 AM – 12:10 PM

SELF/IDENTITY

A “psychologically rich” life—varied, complex, perspective-shifting—complements hedonic (happy) and eudaimonic (meaningful) ideals. We propose a dual-path model: self-concept clarity (SCC; stable self-beliefs) promotes preference for happy or meaningful lives, whereas trait self-expansion (SE; motivation to grow through novelty) promotes preference for psychological richness. Five preregistered studies (total N=5 500) evaluated this claim. Across three surveys, multinomial logistic regression showed SCC uniquely predicted choosing happy or meaningful over rich lives, while SE uniquely predicted choosing rich over happy or meaningful lives; an SCC×SE interaction amplified effects. A large archival survey replicated the SE–richness link. An experiment manipulated SE via growth-vs-stability primes; heightened SE increased selection of a rich life (d=.50). SCC and SE correlated modestly (r = -.21) yet jointly explained 30 % of variance in ideals, confirming distinctiveness. Findings reveal how self-stability and self-growth motives guide divergent visions of the good life, informing tailored well-being strategies.

Bridging Divides: New insights into promoting constructive engagement across social and political differences

11:00 AM – 12:10 PM | Location: E265, Level 2

PROSOCIAL BEHAVIOR SOCIAL JUSTICE FIELD RESEARCH/INTERVENTIONS INTERGROUP RELATIONS

Understanding how to foster prosocial behavior and constructive dialogue in the face of inequality and social division is a critical challenge. This symposium presents innovative research examining psychological barriers to prosocial engagement and testing interventions to overcome them.

A Values-and-Norms Intervention Promotes Intellectual Humility and Open-Mindedness in Adolescents

11:00 AM – 12:10 PM

FIELD RESEARCH/INTERVENTIONS

In today’s pluralistic societies, people are apt to encounter those who disagree with them about important social issues. If managed poorly, these encounters can exacerbate conflicts, while wasting opportunities to learn from each other. Here, we explored what might promote adolescents’ constructive engagement across difference. Study 1 identified a need for intervention, showing that adolescents (N = 961) were only slightly willing to engage with perspectives that disagreed with them about a relevant polarizing issue (i.e., whether cellphones should be allowed in class). In Study 2 (N = 392), youth randomly assigned to a brief values-and-norms intervention showed a more constructive response to disagreement by reading more opposing opinions (0.25 SDs), more research findings supporting the opposing view (0.45 SDs), and perceiving more limitations in their own position (0.20 SDs) relative to a control group. Results suggest that brief values-and-norms exercises can promote youths’ intellectual humility and open-mindedness, hinting at a potentially scalable approach for increasing constructive discourse among members of the next generation.

Does unfairness help or hurt prosocial behavior and trust in authority?

11:00 AM – 12:10 PM

SOCIAL JUSTICE

A group reward account has identified procedural fairness as related to better attitudes towards authority and prosocial behavior, through group cohesion. Conversely, a group repair account has experimentally demonstrated that procedural unfairness spurs prosocial behavior. To adjudicate between these accounts, I examined how low, compared to high, procedural fairness is related to trust in national authorities and prosociality, via cohesion. A unique survey of 3,416 residents in Lebanon fielded immediately after the 2020 Beirut blast was used. Counterintuitively, perceiving procedural unfairness was related to prosocial intention and behavior, by seeing that the country was not united and cohesive. The indirect relationship between procedural fairness and trust, via cohesion, in a government agency—Lebanon’s Council for Development & Reconstruction—was also demonstrated, regardless of the level of procedural fairness. There was a direct relationship between procedural fairness and trust in political parties. Results are discussed in the context of Lebanon’s sectarian political system and in terms of contributions to the group repair and reward accounts of procedural (un)fairness.

Economic Inequality Undermines Pro-Environmental Behavior: The Roles of Perceived Fairness and Identification with All Humanity

11:00 AM – 12:10 PM

PROSOCIAL BEHAVIOR

Environmental issues require urgent global attention, underscoring the need for widespread pro-environmental behavior (PEB). This research examined how economic inequality influences PEB, along with the mediating role of perceived fairness and the moderating role of identification with all humanity (IWAH). Study 1 (N = 3,520) used national survey data and found that objective inequality negatively predicted PEB. Study 2 (N = 816) replicated this with subjective inequality. Study 3 (N = 180) experimentally manipulated subjective inequality and found that reduced fairness mediated the negative effect on PEB. Study 4 (N = 272) confirmed this mediation and showed that the indirect effect of inequality on PEB was weaker among those higher in IWAH. These studies provide evidence that economic inequality, both objective and subjective, negatively impacts PEB in China, with perceived fairness serving as a key mediating mechanism. The findings highlight the importance of addressing economic inequality and fostering a sense of global identity to promote environmental sustainability.

When Perception Meets Reality: How Moral Metaperceptions Shape Intergroup Relations in Political Divides

11:00 AM – 12:10 PM

INTERGROUP RELATIONS

This research investigates moral metaperceptions across political divides and their impact on intergroup relations. Through a multi-method approach combining computational analysis of 10 million tweets and three experimental studies, we examine how individuals believe they are morally evaluated by political outgroups. Our findings reveal systematic discrepancies between how outgroups actually perceive a group’s morality and how that group believes they are perceived. For instance, pro-life individuals believe pro-choice people rate them significantly lower on care and equality than pro-choice individuals actually do. Similar metaperceptual inaccuracies emerge in gun control debates. Critically, these inaccuracies predict intergroup trust and threat perceptions. Individuals who believe outgroups view them less moral than they actually do report higher threat and lower trust. Our intervention study demonstrates that correcting these misperceptions by providing accurate feedback about how outgroups actually evaluate one’s moral positions significantly increases trust and reduces perceived threat. These findings suggest that addressing metaperceptual inaccuracies offers a promising pathway for reducing political polarization and improving intergroup dialogue in contentious moral debates.

Careful What You Say: The Psychology of Speaking Under Scrutiny

11:00 AM – 12:10 PM | Location: E253AB, Level 2

PERSON PERCEPTION/IMPRESSION FORMATION

Everyday communication is anything but casual when we are judged not just on what we say, but also on how—and why—we say it. This symposium brings together four talks that examine situations where this is the case and, in doing so, uncover how people navigate the psychological stakes of speaking under scrutiny. Whether job candidates weigh the risks of revealing financial motives, employees pitch social issues to powerful decision-makers, conflicted individuals decide whether to return blame, or conversational partners leak social class through language, each case highlights how listener inferences about power, norms, identity, and motivation shape how one’s words are received. Together, these talks offer a deeper understanding of impression formation in communication, revealing how speech is filtered through complex social lenses and used to infer traits, values, and intentions. Spanning diverse domains—including hiring, advocacy, interpersonal conflict, and everyday conversation—these papers share important implications for how people navigate reputation, credibility, and influence, particularly within organizational life.

The Effect of Expressing Financial Motives on Recruiter Perceptions

11:00 AM – 12:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Although compensation is a primary concern for job seekers, candidates who express financial motives in interviews often face negative evaluations. Why does articulating a common, legitimate motive still lead to penalties? Across three preregistered studies, we test a novel interpersonal inference account: expressing financial motives violates impression management norms and prompts inferences of low self-monitoring, a key social skill reflecting situational awareness and adaptability. Two pilot studies showed that (1) financial motives are normatively discouraged in interviews, and (2) those who express them tend to score lower on self-monitoring. In Study 1, a field study, financial motive expression predicted inferences of norm violation and lower self-monitoring, but only when nonfinancial motives were absent. In Study 2, an experiment, financial motives reduced performance expectations and hiring intentions via self-monitoring inferences. Study 3 showed that even when candidates were described as high in self-monitoring, expressing financial motives still harmed evaluations, suggesting that behavioral cues carry diagnostic weight even alongside countervailing trait information

Power Dynamics and Perception Gaps in Social Issue Advocacy

11:00 AM – 12:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Amid pressure on organizations to address social and environmental challenges, employees selling social issues to decision-makers is a critical pathway for change. However, research often overlooks the perspective of social issue buyers—the decision-makers employees aim to persuade. We address this gap by examining seller-buyer differences in evaluations of image risk and success likelihood in social issue selling. Drawing on the approach/inhibition theory of power, we predict greater buyer (vs. seller) optimism and a reduced gap when employees sell laterally (vs. upwardly) or with an ally. Across four studies, including matched employee-supervisor dyads and online experiments, issue sellers perceived more image risk and lower likelihood of success than buyers, partially due to sellers' lower rank. Selling with an ally or laterally to same-ranked coworkers, and informing sellers of sell-buyer perception gaps increased seller optimism about success, but not image risk. This research introduces buyer psychology to the issue-selling literature, calls attention to buyer-seller differences in perception gaps, and suggests several strategies for aligning buyer and seller expectations.

More Than Tit-for-tat: Blaming As a Battle Over Beliefs

11:00 AM – 12:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

When conflicts involve shared blame, how people communicate about responsibility shapes whether conflicts resolve or escalate. Two initial studies found that disputants often blame and think blaming can elicit apologies. Research on conflict communication supports this intuition, suggesting direct blame clarifies misunderstandings, but reciprocity theories predict it will trigger defensiveness. We reconcile these perspectives by finding that, contrary to lay intuitions, blame begets blame in live interactions (Study 1), not just out of retaliation but because people want to correct the blamers' beliefs about responsibility division. A live conversation study with 126 pairs discussing real-life conflicts (Study 2) finds that return blaming increases when one thinks the blamer assigns them too much blame. By manipulating perceived self-blame (Study 3) and whether the counterpart is on the same page (Study 4), we find that blame division beliefs causally impact return blaming. When correcting the narrative about blame matters less, fewer people return blame (Study 5). These data highlight the importance of second-order beliefs in conflict resolution beyond reciprocity.

Using language to understand status in team conversations

11:00 AM – 12:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

The dynamics that unfold during conversations provide a wealth of information about relationship processes, and how traits like social class shape those processes. Here, we use a LLM (large language model) approach to examine transcribed conversations from over 700 in-person dyadic conversations, across several social contexts, to test the question: What elements of the conversation are most important for accurately signaling social class? With self-reported social class data, we designed a model that guesses the social class of each partner and provides confidence estimates and reasonings. To test for accuracy, we alter what the LLM is given: in one version, the LLM has the full dyadic back-and-forth; in another, the LLM has one partner's text; and in a third, features like hedge words are masked. We then compare accuracy across these models. We provide answers to questions like: Is the model less accurate in predicting class for lower class partners because these people adapt their language to their partners more than higher class partners do, making their class harder to predict? We provide an overview of how this model can be applied to other studies of conversational dynamics.

Countering Deficit-Based Narratives in Universities and Workplaces Through Strength-Based Perspectives

11:00 AM – 12:10 PM | Location: E270, Level 2

SELF/IDENTITY

Deficit-based approaches to research and policy attribute the challenges marginalized groups face to individual shortcomings, deflecting attention from structural inequities. In contrast, strength-based narratives shift the discourse by highlighting the resilience, knowledge, and assets that marginalized people possess in the face of adversity. Talk 1 explores how marginalized students navigate paradoxes in meaning-making as they transition to college, revealing structural tensions and strength-based possibilities for belonging. Talk 2 shows that strength-based messages from Latine families promote student confidence and counter deficit-based narratives about academic potential. Talk 3 tests an intervention to reframe adversity as a source of strength to improve motivation and achievement among refugee and low-SES students. Talk 4 embeds strength-based approaches in the workplace to enhance belonging, reduce bias, and improve the likelihood of promotion for low-income employees. Together, these talks challenge deficit-based thinking by expanding how we consider marginalized people in research and also redirect interventions to focus on changing contexts.

Paradoxes and Possibilities: Centering Feminist Wisdom in Strengths-Based Psychological Research

11:00 AM – 12:10 PM

SELF/IDENTITY

The transition to college provokes a paradox for students from historically marginalized backgrounds as they navigate both new exciting possibilities and challenging realities shadowed by histories of exclusion. Students make sense of these transition experiences through three meaning-making processes advanced by social psychologists: the need to understand, the need to maintain self-integrity, and the need to belong. Guided by feminist theory and wisdom, we propose that paradoxes lurk within these core processes, and that these paradoxes illuminate how structural forces and conflicting tensions characterize students' pathways as they transition to college, including how students collectively resist marginalization and build new possibilities for their futures. Unearthing paradoxes contextualizes students' psychological meaning-making within their structural realities, making room for strengths-based theorizing that honors the fullness and complexity of student experience. We discuss how strength-based investigations that attend to paradoxes chart new pathways for building more humanizing psychological theory, research, and interventions focused on the student experience.

Using Strength-Based Narratives for Stereotype Reduction of Latine Students

11:00 AM – 12:10 PM

SELF/IDENTITY

Strength-based narratives acknowledge that while marginalized social identities may be associated with educational hardships, they can also serve as sources of resilience and motivation for academic success. Latine students are stereotyped as unintelligent and lazy, but their families use strength-based narratives to remind them of how resourceful and hardworking they are. Across two preregistered studies, we explore how strength-based narratives can support Latine students' educational endeavors. Study 1 (N=149) used a mixed-methods approach to demonstrate that the educational messaging Latine students receive is more supportive and more likely to be strength-based when conveyed by families compared to schools. Study 2 (N=238) employed an experimental approach to show how strength-based messages increase Latine participants' confidence in a college writing course through reducing their perceptions of being negatively stereotyped by an educator. Our research demonstrates that strength-based approaches counteract commonly emphasized negative perceptions of Latine students and create affirming educational environments that promote positive academic outcomes.

The Importance of Acknowledging Individual Strength in the Context of Adversity

11:00 AM – 12:10 PM

SELF/IDENTITY

In responding to adversity, people commonly show strength. Yet, victims of adversity are commonly portrayed as weak, passive, and broken. These narratives frame individuals, not just the adverse situations they are in, as deficient. Such narratives can become self-fulfilling and may limit the extent to which these individuals can show their strength. We developed an intervention that reverses these narratives, highlighting the strengths individuals have shown specifically in contending with the adversity they face. We hence acknowledge, both, context-level adversity, and individual-level strength. We tested this approach in three large longitudinal randomized-controlled field-experiments – two pre-registered – among three distinct populations and settings. Across studies, the identity-reframing intervention supported individuals' goal pursuit: it boosted the learning-engagement of refugees entering an online-university over one year, improved the grades of low-SES students over one semester, and helped individuals with experiences of depression to more successfully complete a self-selected goal over two weeks.

Creating Strength-Based Company Cultures to Facilitate Marginalized Employees' Workplace Opportunities

11:00 AM – 12:10 PM

SELF/IDENTITY

Workplaces' efforts to promote diversity and inclusion have come under intense scrutiny in recent months within the U.S. Beyond reactionary criticisms, these efforts have been met with mounting empirical evidence that their effects have been, at best, limited. Thus, the current studies test the potential of preparing workplaces to adopt alternative strength-based approaches that highlight the valuable skills, knowledge, and resources that people gain from their otherwise marginalized identities. Study 1 uses large-scale data from Glassdoor.com to demonstrate that workplaces' current diversity and inclusion efforts rarely feature these approaches and are not related to the experiences of their marginalized employees. Nonetheless, experimentally manipulating a workplace's efforts to center strength-based approaches led employees—particularly those from low-income backgrounds—to feel more comfortable and invested in the workplace (Studies 2-4). Furthermore, embedding these approaches across company practices reduced supervisors' biased evaluations of employees from low-income backgrounds which in turn increased their likelihood of being recommended for a promotion by 38% (Study 5).

Navigating Equality in a World of Tradeoffs

11:00 AM – 12:10 PM | Location: E271, Level 2

JUDGMENT/DECISION-MAKING

People value equality, yet inequality is pervasive. In an effort to promote equality and pursue fairness, people often have to consider tradeoffs between allocation principles they care about. In this symposium we explore how people make such tradeoffs and evaluate others for making them. The first talk examines how efficiency considerations can escalate income inequality between partners in romantic relationships, as they increasingly prioritize the higher earner's career. The second talk investigates when people are willing to redistribute resources in ways that reverse social hierarchies, showing greater willingness to overturn rank when doing so benefits a Black versus a White target. The third talk reveals that decision makers are less willing to use random procedures (e.g., lotteries) to solve equality-efficiency tradeoffs, when distributing losses than gains. The final talk explores the developmental origins of inequality reasoning, showing that by age six children expect others to endorse self-serving distribution rules but only when those rules seem persuasive to others. Together these talks offer new insights into the psychology of distributing resources and (in)equality.

Escalation of inequality in close relationships

11:00 AM – 12:10 PM

JUDGMENT/DECISION-MAKING

Romantic partners often face tradeoffs between income equality and collective financial gain. Across six studies, we examined how existing income disparities in dual-earner couples shape their willingness to accept further inequality in pursuit of greater total household income. We find that greater income disparities predict a greater willingness to prioritize the higher earner's career and financial gain, further widening the income gap. This escalation of inequality over consecutive decisions emerges not only in income-related tradeoffs (e.g., salary cuts and raises) but also in decisions that indirectly affect income (e.g., chore delegation). The effect is causal: experimentally induced disparities increase acceptance of inequality, and prior decisions to accept inequality make individuals more likely to accept larger inequalities in subsequent decisions. This pattern arises partly because, as disparity grows, partners become less concerned with achieving equality. Perceptions of joint financial ownership amplify this tendency. Our findings reveal how everyday decisions, motivated by efficiency and shared benefit, can unintentionally escalate inequality within romantic partnerships.

Rank Reversal & Inequality: Willingness to Overturn Hierarchies Depends Social Identity

11:00 AM – 12:10 PM

JUDGMENT/DECISION-MAKING

Across two pre-registered studies (N=1,709), we demonstrate that individuals' choices to redistribute resources depend on: (a) whether doing so reverses targets' ranks in a hierarchy, and (b) the identities of the targets who lose and gain resources. Both experiments utilized a 2 (rank reversal: yes, no) x 2 (target race: White, Black) design. Participants saw a scenario where resources could be transferred from a (White/ Black) manager to a different (White/ Black) manager; in the rank reversal conditions, transferring resources overturned the hierarchy, such that the target that began with more resources now has fewer.

An ANOVA examining the impact of rank reversal and target race on transfer rates found a significant main effect of rank reversal (Study 1: $F=214.49$, $p<.001$; Study 2: $F=53.72$, $p<.001$), a significant main effect of target race (Study 1: $F=4.68$, $p=0.003$; Study 2: $F=3.62$, $p=0.01$), and a nonsignificant interaction (Study 1: $F=0.91$, $p=0.43$; Study 2: $F=2.19$, $p=0.09$). The most notable difference emerged when rank reversal involved a Black manager and a White manager; participants were more willing to overturn a hierarchy if resources were transferred to a Black target.

Divergent Endorsement of Lotteries in allocating Gains and Losses

11:00 AM – 12:10 PM

JUDGMENT/DECISION-MAKING

When allocating resources, equity and efficiency can conflict. For example, a manager with a single company car may have to choose between giving it to one of two equally deserving employees (efficient but inequitable) or to neither (equitable but inefficient). Decision-makers often resolve such dilemmas by using random procedures (e.g., a coin flip, a lottery). Random procedures are often used for allocating benefits, but what about losses? We tested this question in four studies (N=819), including both scenario-based experiments and a consequential task. Across all studies we found that participants were more hesitant to use lotteries to solve equity-efficiency dilemmas involving losses (e.g., pay cuts) than gains (e.g., bonuses). Participants chose more wasteful allocations for losses than for gains, which is not predicted by loss aversion. Mediation analyses supported our suggested mechanism: decision-makers expected more negative reactions if they created inequality in losses than in gains. They also viewed lotteries as less fair when used to allocate losses. We discuss the findings in light of fairness theories and consider implications for management, policy, and daily life.

Who should get more?: Kids expect strategic moral rule endorsement

11:00 AM – 12:10 PM

JUDGMENT/DECISION-MAKING

Adults often advance self-serving moral arguments—e.g., better workers advocate merit rather than equality and vice versa (DeScioli et al., 2014). Still, one must balance this self-interest with what might convince others. Slackers might suggest equality, but probably not to get the lion’s share. Here, we examine whether children expect others to navigate this tradeoff. Do they believe people will float arguments that are self-serving yet persuasive? To test this, 4- to 9-year-olds (N = 72) saw two characters in conflict over a snack, each with a legitimate claim to it—one was hungry, and one owned it. With age children thought each would advocate for a self-serving rule—the hungry one would propose the hunger rule, and the owner would propose the ownership rule. Further, by around age six, children predicted that the characters would eschew rules that were self-serving but arbitrary (e.g., wearing a blue shirt). These results suggest that by age 6-7, children believe others will propose self-serving rules but are constrained by what sounds persuasive. We are currently testing whether children think people will propose different rules based on the potential audience present.

Parenting and Flourishing: Emotions, Goals, and Self-Expansion in the Family

11:00 AM – 12:10 PM | Location: E350, Level 3

CLOSE RELATIONSHIPS

Despite nearly 90% of adults being or planning on becoming parents (Gallup 2023), work on parents’ own outcomes is scarce and tends to focus on parents’ challenges (e.g., stress or coping). However, in light of the US Surgeon General’s urgent call for supporting parent’s health (Murthy 2025), it’s more crucial than ever to examine how parents and families can flourish. This symposium shifts the typical paradigm with novel research on how parents’ positive experiences—their emotions, goals, and self-expansion—can help them and their families thrive. Our first talk reveals how compassionate parenting goals can be beneficial for parents and their family. Our second talk uncovers how parenting self-expansion—personal growth in parenting—is personally and relationally rewarding. Our third talk unpacks the types of parental love (compassionate, companionate, attachment) and their benefits. Our last talk highlights the rewards of interparental gratitude on a child’s prosociality and perceived warmth. Across rigorous designs (e.g., daily diary, intensive longitudinal) and over 11,000 parent observations, our work shifts the conversation by elucidating how parents and families can flourish.

Compassionate and Self-Image Goals in Parenting: Associations with Parental Well-Being

11:00 AM – 12:10 PM

CLOSE RELATIONSHIPS

Pursuing compassionate goals (i.e., to improve others’ well-being) has generally been linked with greater well-being, whereas self-image goals (i.e., to enhance how one is perceived by others) tend to show the reverse. Yet limited research has examined these goals in the context of parenting. In this 9-day diary study (N = 270), we investigated whether compassionate and self-image goals in relation to children were related to parental well-being and family functioning and whether empathic and negative emotions mediated these associations. Results showed that parents who pursued compassionate goals reported more empathic emotions and fewer negative emotions, which were in turn associated with optimal well-being (e.g., greater satisfaction) and more positive family functioning (e.g., more supportive parenting,) both overall and across the week. Conversely, self-image goals were associated with greater negative emotions, which was in turn negatively associated with several indicators of daily and global well-being and family functioning. These findings suggest that parents’ efforts to support their children’s well-being are associated with their own well-being and family functioning.

Parenting Self-Expansion: The Personal and Relational Benefits of Parenting Growth

11:00 AM – 12:10 PM

CLOSE RELATIONSHIPS

The birth of a child presents the start of a profound parenting journey. Although marked by hardship, much of this journey also fuels parent's growth and self-expansion. In a mixed method study with couples measured longitudinally across the first year of parenthood (N=431; 1724 observations), we identified key themes of parenting self-expansion (i.e., new, exciting parenting experiences) and examined how it can strengthen parents' personal and relational well-being with their spouse. Reflexive thematic analyses revealed that parents experienced self-expansion in diverse ways: from enhanced family bonds, changed perceptions of the world, awe from child development, greater internal growth, and shifted life values and priorities. Next, using growth curve modeling, we found that parents who felt greater parenting self-expansion had improved satisfaction with life, marital satisfaction, and marital commitment across the first year of parenthood. These held when controlling for child temperament and care difficulty. Thus, we find that parenthood begins with an array of new experiences and perspectives that signal growth and strengthen parent's well-being and marital relationships.

How Do I Love Thee? Parents' Love for their Children

11:00 AM – 12:10 PM

CLOSE RELATIONSHIPS

In her famous poem, Barrett Browning asks the question: "How do I love thee?", followed by the statement: "let me count the ways". Social psychologists tend to focus on the ways in which romantic partners love one another. Little is known about the kinds--and levels--of love that parents experience for their children. Parents in North America (recruited via Prolific) completed measures of compassionate, companionate (friendship-based) and attachment love for either a young child (Study 1, N = 275) or an adult child (Study 2; N = 197). In both studies, there was a significant effect for Type of Love, such that ratings of compassionate love for a child were highest, followed by companionate love, and then attachment love. Generally, gender of parent and gender of child effects were nonsignificant. All three kinds of love were moderately correlated with parents' satisfaction with their relationship with their child. It is concluded that parents' love for their children is variegated, such that they are most likely to report experiencing an other-focused, selfless kind of love for their child—more so than other kinds.

Interparental Gratitude Predicts Greater Child Prosocial Behavior via Parental Warmth

11:00 AM – 12:10 PM

CLOSE RELATIONSHIPS

Interparental interactions are an important contributor to child outcomes, including to social outcomes. However, research primarily examines the influence of interparental conflict on children, meaning the influence of interparental positive interactions on children remains unexplored. Interparental Positivity Spillover Theory (IPST) proposes that interparental positive interactions spill over into children's experiences, and therefore uniquely enhance numerous child outcomes, however this theory remains largely untested. In this work, we tested the hypothesis that, both cross-sectionally, and across time, greater interparental gratitude would be associated with enhanced child social outcomes, via the mechanism of enhanced child perceptions of parent warmth. Using 10 waves of the Pairfam study (N = 2,403 parent-child dyads; k = 7,746 observations), and multilevel analyses, results were partially consistent with predictions. At the between-person level, greater interparental gratitude was associated with greater child prosocial behaviour, and this was mediated by greater child perceptions of parent warmth. These findings remained significant when controlling for parental conflict.

Persuaded by the Prompt: How AI Shapes Attitudes and Beliefs

11:00 AM – 12:10 PM | Location: E253CD, Level 2

APPLIED SOCIAL PSYCHOLOGY

As reliance on generative AI as a source of information and as an aid for writing and thinking increases, it is crucial to understand how interacting with AI systems affects people's attitudes and beliefs – and the moderators that shift them. We first show that exposure to creative content labeled as AI-generated, such as humor and visual art, boosts individuals' confidence in their own creative abilities through downward social comparison. We then present a covert influence AI has on people - biased autocomplete suggestions that can nudge users' writing and self-reported opinions toward the AI's stance without their awareness, beyond the influence such suggestions have when presented as non-AI static text. We then test whether influence – in the form of AI debunking of conspiracies - persists when participants are explicitly told the AI is trained on partisan data. Surprisingly, political identity does not overwhelm (or undermine) the positive impact of strong evidence. Lastly, we will explore the personal dispositions required for persuasion, finding that both intellectual humility and trust in AI are required to adopt factual, counter-attitudinal information delivered by ChatGPT

Artificial Intelligence Can Cause Artificial Confidence at Creative Activities

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

As generative artificial intelligence (gen-AI) becomes more prevalent, it becomes increasingly important to understand how people psychologically respond to the content it explicitly creates. We demonstrate that exposure to gen-AI produced content can affect people's self-confidence at the same task through a social comparison process. Anchoring this research in the domain of creativity, exposing people to creative content ostensibly created by gen-AI (vs. a human peer) increases people's self-confidence in their own creative abilities. This effect emerges for jokes, stories, and visual art, and it can increase people's willingness to attempt the activity—even though the greater confidence behind it might be unwarranted. These effects emerge because gen-AI is perceived as a lower social referent for creative endeavors, bolstering people's own self-perceptions. Thus, for domains in which gen-AI is perceived as an equal social referent (i.e., in fact-based domains), the effects are attenuated. These findings have significant implications for understanding human-AI interactions, antecedents for creative self-confidence, and the referents that people use for social comparison effects.

Biased AI Writing Assistants Shift Users' Attitudes on Societal Issues

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

AI writing assistants powered by Large Language Models (LLMs) are increasingly used to make autocomplete suggestions to people as they write text. Can these AI writing assistants impact people's attitudes in this process? In two large-scale preregistered experiments (N=2,582), we exposed participants writing about important societal issues to an AI writing assistant that provided biased autocomplete suggestions. When using the AI assistant, the attitudes participants expressed in a post-task survey converged towards the AI's position. Yet, a majority of participants were unaware of the AI suggestions' bias and their influence. Further, the influence of the AI writing assistant was stronger than the influence of similar suggestions presented as static text, showing that the influence is partially due to AI writing assistants leading people to incorporate biased viewpoints into their own writing. Lastly, warning participants about assistants' bias before or after exposure does not mitigate the influence effect.

Does political identity undermine AI debunking?

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

Recent research finds that even entrenched conspiracy theorists will change their minds when an AI debunker presents them with counterevidence that is specific to their unique beliefs. We argue that the effect is strong and durable because the AI provides such strong evidence-based counterarguments. However, in this adversarial collaboration, we set out to test the potential influence of political identity on belief updating. Participants were told that they were to interact with an AI that was trained on Republican [Democrat] news sources prior to engaging in a dialogue about conspiracy theories. Importantly, the bot itself presented evidence in a neutral and informative way. Because of this, surprisingly, we found that political identity had no effect whatsoever. That is, participants in the politically-inconsistent condition (i.e., Republicans conversing with an ostensibly Democratic bot, and vice versa) updated their beliefs to the same extent as the participants in the politically-consistent and politically-neutral conditions. These results indicate that, in the face of strong and compelling evidence, political identity may play a weaker role than previously thought.

Minds Meets Machines: Intellectual Humility, Trust, and Attitude Change

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

Traditional efforts to change attitudes face psychological barriers (e.g. motivated reasoning, groupthink). Recently, AI agents' success in changing participants' opinions on various topics offers great promise. We focus on the traits that characterize those who significantly changed their opinion following a conversation with ChatGPT. In two studies (N= 312), we measured participants' intellectual humility and trust in AI, and invited those with a negative attitude towards legal immigrants to converse with ChatGPT. We find that a unique interaction between intellectual humility and trust in AI predicts a lasting change in one's opinion about legal immigrants. Specifically, it is the specific combination of being open to new information and trusting the information's source that allows for acceptance of factual, counter-attitudinal information. This study offers novel insights into the mechanism underlying opinion change, beyond highly tailored and persuasive AI agents, complementing existing research into the importance of factual claims, and highlighting the recipients' mindset as a driver of change.

Situating Racial Justice Intervention Research within the Translational Research Framework

11:00 AM – 12:10 PM | Location: E451B, Level 4

APPLIED SOCIAL PSYCHOLOGY

Racism and racial injustice persist globally across every social domain—education, justice, employment, healthcare, and more. While psychology has long studied racism and can offer adequate scientific insights into it, these insights have rarely improved outcomes for minoritized groups. A key barrier to the translation of our psychological knowledge of racism into the development and implementation of effective interventions is the failure to emphasize the reciprocal link between individuals and systems. This symposium introduces the Translational Research Framework (TRF), adapted from the Clinical and Translational Science framework—gold standard in biomedical research, to center this relationship between individual-level factors and systemic racism at every intervention stage—from design to dissemination. Four presentations illustrate TRF application to studies that aim to promote racial justice society in general (Presentation 1), criminal justice (Presentations 2 and 3), and workplace (Presentation 4). Each presenter also discusses challenges faced when conducting intervention research grounded in the TRF and innovative strategies used to address those challenges.

Breaking the Silence: White Privilege Intervention in the Netherlands

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

In the Netherlands, Diversity, Equity, and Inclusion efforts often focus on cultural differences, not racial inequalities. Our project tested a framework to reduce color-evasive racial attitudes and foster ethnocultural empathy among White Dutch participants. We tested a video intervention aimed at reducing color-evasive attitudes and explored whether a self-compassion writing exercise could enhance ethnocultural empathy. Specifically, we examined whether the intervention reduced White fear and increased guilt and empathy when learning about racism. In an online, within-between-subjects experiment, 301 White Dutch participants completed a writing task. In the experimental condition (n = 151), participants reflected on a marginalized identity and practiced self-compassion; in the control condition (n = 150), they wrote on a neutral topic. All participants then watched a video of racialized individuals discussing the harms of color-evasive attitudes. A paired-sample t-test showed the video intervention reduced color-evasive attitudes in all participants. However, general linear model analyses found no direct or indirect effect of the writing intervention on ethnocultural empathy.

Racial Disparities in the Discretionary Context of Traffic Stops: Organizational Practices Shape Institutional Interactions

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

Efforts to change the tenor of police stop interactions may discount their discretionary context—the degree of choice in an officer's decision to stop a citizen—and how organizations influence those circumstances. We examine racial disparities in the discretionary context of traffic stops (Study 1), their disparate impact on community members' impressions of police interactions (Study 2), and the power of departmental guidance to close them (Study 3). In traffic stop data, we first find that stops of Black (versus White) drivers are more likely to be for high-discretion equipment violations, with these disparities most pronounced in urban police departments. A community field experiment demonstrates that Black community members evaluate body camera recordings of high-discretion, but not low-discretion, stops more negatively than Whites. We also identify organizational levers of change, finding that racial gaps in discretionary stops shrank in an agency after a directive to curtail stops for minor offenses. These data illustrate the influence of institutional interactions, and the importance of organizational policies in contributing to—and combatting—racial disparities.

Can Deep Canvassing Promote Anti-Carceral Attitudes? A Field Experiment

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

Advancing racial equity policies requires public support, but interventions designed to cultivate this support often falter, especially on racialized issues like incarceration. Explicitly discussing racism can further complicate this, triggering backlash. Our pre-registered, placebo-controlled field experiment utilized deep canvassing conversations—an intensive intervention that shifts views on highly salient issues. Half of conversations explicitly addressed anti-Black racism within the criminal legal system; the other half used a race-absent approach. Outcomes were measured through three follow-up surveys. Both deep canvassing conditions increased support for jail decarceration and other anti-carceral policies. These effects were clear one week post-intervention but showed limited durability. In contrast to prior research demonstrating null or backlash results from discussing racism, these findings suggest effective ways to discuss racism that can build support for racial equity policies and shift related attitudes. Deep canvassing isn't a cure-all but understanding the trade-offs of both race-explicit and race-absent approaches is vital for organizers, advocates, and scholars.

Bridging the Belonging Gap: An Institutional Intervention to Support Faculty of Color and Women in Academia

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

Faculty of color and women faculty often face significant barriers to tenure and promotion, including isolation, marginalization, and tokenism. In this study, we draw on social psychological research—specifically the contact hypothesis and the concept of belonging—to design and implement an institutional-level intervention aimed at improving faculty belonging and retention. Adapting successful strategies from other universities, we evaluated the impact of our intervention using faculty climate survey data and institutional demographic records. Over a three-year period following the intervention, faculty (time 1 $n = 305$, time 2 $n = 307$, time 3 $n = 355$) reported stronger perceptions of institutional support for diversity, and we observed reduced disparities in both feelings of belonging and tenure rates among historically marginalized groups. We discuss how social psychologists can play a key role in translating basic research into practical interventions that advance racial justice and equity in academia. Our findings highlight the promise of targeted, evidence-based efforts to foster greater inclusion and representation—benefiting faculty and the broader academic community.

Solitude in a Social World: Context Matters

11:00 AM – 12:10 PM | Location: E258, Level 2

SELF/IDENTITY

Solitude is an integral part of daily life: U.S. adults spend between 30-60% of their waking hours alone. Historically, psychological research has emphasized the risks of solitude, often conflating it with loneliness and social isolation. Yet, emerging evidence paints a more nuanced picture: solitude is a complex, multifaceted experience with diverse consequences depending on the cultural, social, and psychological context in which it occurs.

This symposium spotlights key contextual factors that shape how solitude is experienced, including cultural norms, social cognition, and digital communication. Drawing on diverse perspectives and methodologies—from qualitative interviews to experimental evidence to archival data—the talks examine solitude across multiple levels of analysis. They span macro-level patterns (e.g., links between solitude and health across cultures), micro-level processes (e.g., individuals' thought content during solitude), and theoretical considerations (e.g., redefining solitude in the digital age).

Together, this symposium positions solitude as a rich yet underexplored domain in social-personality psychology and charts a path forward for understanding its varied forms, meanings, and implications in people's lives.

Culture Shapes the Health Risks of Living Alone and Loneliness Across 58 Nations

11:00 AM – 12:10 PM

SELF/IDENTITY

Rising rates of living alone and loneliness are recognized as serious public health threats. Yet, little is known about their links to health in non-Western contexts, and it is unclear whether culture shapes these links. Here, we combine five large-scale datasets (N = 352,556 across 58 countries) to examine the associations between living alone, loneliness, and a range of self-reported mental and physical health outcomes. We find that loneliness significantly predicts worse mental and physical health in all countries ($[r_{pooled}] = .123 - .492$), whereas living alone is weakly or not at all associated with worse health across countries ($[r_{pooled}] = <.001 - .084$). Critically, these links are moderated by country-level collectivism: In more individualistic societies (e.g., U.S., U.K.), living alone is more strongly linked to loneliness and worse health. In more collectivistic societies (e.g., Mexico, Tanzania), living alone is less strongly linked to loneliness and is weakly linked to some metrics of better mental health. Together, these findings suggest that the potential risks of living alone vary meaningfully across cultures and encourage us to consider the role of culture when developing initiatives to address social isolation.

How Does Real-World Social Isolation Affect Spontaneous Thought?

11:00 AM – 12:10 PM

SELF/IDENTITY

Despite an infinite number of possible thoughts to explore, from everyday observations to fantastical daydreams, spontaneous thought overwhelmingly features social content. Here, we try to understand why the mind gravitates toward other people by studying thought content during solitude. We arbitrate between two hypotheses: (i) social processing, where the mind reviews social content provided by the environment, or (ii) social needs, where the mind seeks out social content when deprived of it by the environment. In Study 1, a large, representative sample collected during COVID-19 lockdowns supported the social processing hypothesis: the more time people spent in solitude, the less social thought they engaged in. In Study 2, archival analysis of texts from authors who experienced either voluntary (e.g., seclusion) or involuntary (e.g., imprisonment) solitude provided evidence for the social needs hypothesis: social thought increased specifically during involuntary isolation. This suggests that social content in spontaneous thought reflects the sociality in the environment, but that social needs can shape thought if there is a significant, unwanted disruption to one's social world.

Re-conceptualizing Solitude in the Digital Era: From “Being Alone” to “Noncommunication”

11:00 AM – 12:10 PM

SELF/IDENTITY

This presentation re-conceptualizes solitude to help address conceptual, methodological, and practical challenges of the digital era. Solitude has been conceptualized within a number of different research traditions, resulting in disconnected streams of theory. As a result, solitude is oftentimes conflated with loneliness, privacy, and other distinct concepts. Furthermore, foundations for scholarship on solitude were laid before the possibility of anytime-anywhere connectivity through digital media. As a result, solitude is commonly, if not most commonly, understood and measured as being physically alone. This presentation re-conceptualizes solitude as “noncommunication” to offer a more contemporary and inclusive perspective, one that uproots it from ideations of physical aloneness and replants it in social aloneness. Whereas previous theory in this area often ignores mediated interaction, we recognize it as a meaningful way for people to connect, with important implications for solitude. Empirical findings from new research underway will be presented to show that even being ambiently accessible can “shade” the experience of solitude.

Solitude and Collectivism: Examining Person-Culture Fit in Costa Rica

11:00 AM – 12:10 PM

SELF/IDENTITY

Research on solitude has oversampled individualistic cultures and overlooked collectivistic societies in Latin America. Drawing on the person-culture fit hypothesis, this mixed-methods study examined how trait preference for solitude intersected with norms of collectivism. In the first phase, 17 Costa Rican adults were interviewed after completing the Spanish translation of the Motivation for Solitude Scale. Qualitative analysis showed that solitude benefits (e.g., restoration, emotion regulation) and effects of solitude deprivation (e.g., irritability, exhaustion) were consistent with WEIRD samples. Two novel insights were revealed: 1) desire for solitude was stigmatized, interpreted as social rejection and a violation of interdependent norms, though family/friend validation offered some protection; and 2) such stigma necessitated defensive strategies for accessing solitude (e.g., evasive communication). Findings have informed the hypothesis-testing phase of the study, currently ongoing, which surveys Latino/a samples from Mexico, Costa Rica, and the U.S. to explore the relationships between individualism-collectivism, trait preference for solitude, and psychological adjustment.

The Lifecycle of Norms: Novel Insights from Around the World

11:00 AM – 12:10 PM | Location: E352, Level 3

NORMS AND SOCIAL INFLUENCE

What gives rules their grip on human life, and how does this vary across cultures? This symposium traces the full lifecycle of social norms – from formation to enforcement, transgression to transcendence– across global contexts spanning Asia, Africa, North and Latin America, and Europe. Talk 1 shows how stable versus mobile ecologies shape context-specific versus universal etiquette, using surveys and a field analysis of subway signage in Japan and the U.S. Talk 2 examines who enforces norms – state or society – revealing divergent regulatory systems via novel NLP and survey methods across seven countries. Talk 3 maps the global spread of rule bending norms, exploring how (un)acceptance of regulatory circumvention predicts outcomes beyond classic cultural dimensions. Talk 4 tests the limits of obligatory norms: across the U.S., China, and India, actions framed as supererogatory rather than dutiful evoke greater meaning and happiness. Together, these talks offer an integrative, culturally grounded perspective on the development and manifestations of normative life across diverse societies, with broad significance for understanding cooperation and behavioral change worldwide.

Residential Stability and the Construction of Placeful Norms

11:00 AM – 12:10 PM

NORMS AND SOCIAL INFLUENCE

How do divergent mobility patterns—historic global migration versus declining domestic mobility—shape social norms? This research introduces "placefulness," psychological embeddedness in physical environments, to explain how residential histories construct normative behavior. A novel method measures residential stability (RS) via the harmonic mean, capturing the psychological impact of disruptions missed by traditional move counts. A multi-level U.S.-Japan investigation provides converging evidence. Individually, Study 1 (N=401) shows RS uniquely predicts place-based identity formation. Collectively, Study 2's analysis of public etiquette signage (N=176 signs) in Tokyo and NYC subways reveals how these patterns manifest. Tokyo's stable ecology produced context-specific behavioral rules, while NYC's mobile ecology favored universal principles. This difference amplified during COVID-19, as each system intensified its dominant regulatory style rather than converging. Together, the findings establish residential history as a fundamental organizing principle shaping both individual identity and collective norms

Who Enforces Rules? Cultural Tightness and State vs. Society Regulation

11:00 AM – 12:10 PM

NORMS AND SOCIAL INFLUENCE

A key insight of tightness-looseness theory (Gelfand et al., 2011) is that the strictness of norms varies systematically between cultures. However, the scope of this variation should not be limited to the tightness or looseness of a nation alone, but must also consider the agents who enforce these norms. Specifically, norms vary in who creates and enforces them, regulated by state actors and/or societal agents (communities). In Study 1 (n = 741), participants from the USA, Colombia, Nigeria, India, and the Philippines listed five social behaviors regulated within their country. We analyzed these responses using a novel NLP technique, the BERTopic model (Grootendorst, 2020), clustering them into distinct conceptual themes. In Study 2 (n = 150), participants from the USA, Mexico, and Kenya rated each norm as to whether they were regulated by state or societal agents. Results revealed a negative relationship between state and societal regulation in all sampled countries, suggesting norms are enforced by either state or societal agents, with the US showing the least variation. In contrast, Mexico and Kenya exhibit a bimodal pattern: norms are either minimally or intensely regulated.

Global Variation in Rule-Bending Norms

11:00 AM – 12:10 PM

NORMS AND SOCIAL INFLUENCE

Across cultures, rule-bending occupies a fraught “gray” area: sometimes celebrated, condemned, or both. Yet, we lack knowledge of how and why norms about rule-bending vary across cultures. Here we document, for the first time, how cultures vary in their norms around the acceptability of rule-bending, and analyze why rule-bending might be more prevalent in some cultures than others. In Study 1, we map words related to rule-bending in over 40 countries around the world, showing the many ways rule-bending practices are conceptualized cross-culturally. In Study 2, surveys conducted in six nations (Argentina, Brazil, Mexico, Italy, the UK, and the US) reveal substantial cross-national variation in beliefs that rule-bending is pervasive. We find that rule-bending is perceived as most normative in countries with civil-law legacies, while showing little variation in normativity of rule-breaking, and little variation in personal endorsement of rule-bending. Integrating insights from emic constructs with cross-cultural survey data, we reveal novel dimensions of cultural variation with implications for policy and theories of cultural evolution.

Limits of Obligatory Norms: Finding Meaning and Happiness in Supererogation

11:00 AM – 12:10 PM

NORMS AND SOCIAL INFLUENCE

Obligatory norms help maintain social order and are often used to promote behavioral change. But do they have psychological limitations? Six studies in the U.S., China, and India examined how framing moral actions as obligatory (fulfilling duties) versus supererogatory (beyond duty) shapes perceptions of meaning and happiness. In the U.S., people attributed greater meaning and happiness to self-generated examples of supererogatory actions, even when rated equally ethical and impactful (Study 1). Societal perceptions of actions as supererogatory predicted higher meaning and happiness (Study 2). Studies 3 (within-subject) and 4 (between-subject) experimentally showed this effect, mediated by perceived choice and moral goodness (Studies 3–6) and moderated by participants’ own moral expectations (Studies 5–6). Participants in China and India similarly attributed high meaning and happiness to supererogation, with consistent mechanisms observed across cultures (Study 6). These findings reveal the psychological limits of obligatory norms—sometimes going beyond duty may be more rewarding for both society and the self.

The Psychology Behind (and Implications of) Support for Climate Technologies

11:00 AM – 12:10 PM | Location: E353C, Level 3

APPLIED SOCIAL PSYCHOLOGY

Climate change mitigation is a wicked problem requiring an energy transition that cannot be accomplished by one policy, technology, or behavioral shift alone, but rather by many working in tandem. Technological innovation will play an important role in decarbonization, but only if we understand and leverage the factors that lead people to support and implement such technology. Our first talk lays out a framework of the range of psychological and contextual factors—e.g., perceived risk, trade-offs, and fairness—that affect public engagement with energy technologies. Next, we dive into two case studies of support for or rejection of novel climate technologies: 1) our second talk discusses techno-optimism and the US and German public’s positive bias toward hydrogen energy and feedstock use, despite very low knowledge about its nuanced potential benefits and challenges; and 2) our third talk explores how individual differences in identity and concerns about tampering with nature affect US public perception of carbon capture technologies. Finally, our fourth talk demonstrates how learning about technological eco-innovation can in turn increase individuals’ pro-environmental behavior.

The Psychology of Public Engagement in the Energy Transition

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

As the world accelerates efforts to mitigate climate change, technological innovation alone will not secure a sustainable energy future. Equally vital is understanding how people respond to these technologies—both as individuals making decisions about household adoption (e.g., solar panels, EVs) and as members of communities confronting large-scale developments. These responses are shaped not just by what people know, but by how they think, feel, and relate to the world around them. Psychological processes—such as how people perceive risk, make trade-offs over time, and interpret social cues—play a central role, often in subtle ways. Judgments are filtered through identity, emotions, and mental shortcuts that help people navigate complexity but can also lead to hesitation or resistance. At the same time, these responses are embedded in broader social and structural contexts that shape what feels possible, desirable, or fair. Drawing on research across psychology and the social sciences, this talk identifies key insights for understanding how public engagement with energy technologies takes shape—and why understanding these processes is crucial for a successful energy transition.

Positive Bias towards Climate Technology even with Mixed Environmental Benefits

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

People's varied support for different climate change solutions matters, affecting behavior change, philanthropy, policymaking, and investment in new technology. We investigated whether support for climate solutions would depend on whether solutions are perceived as bold and innovative versus steady and incremental. In Study 1, we find that climate solutions perceived as bolder by US participants are also perceived as more effective and worth financially supporting. Further, we find that participants are more likely to rate solutions as bold, effective, and worth financial support if they involve cutting-edge technology. In Studies 2-4, we assess US and German attitudes toward a set of technologies emerging in the public discourse (hydrogen energy use in transportation, buildings, industry, power grids). We find that despite having very low knowledge about hydrogen energy and its uses, participants have positively biased attitudes toward hydrogen technology and believe it to have environmental and economic benefits. However, the realities of hydrogen's risks and benefits are complicated, highlighting the need to communicate nuanced information about new eco-technology to the public.

Public Perceptions of Carbon Technologies: Risks, Benefits, Identity, and Naturalness

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

In the face of climate change, researchers are increasingly exploring techniques to capture carbon either from the atmosphere or to prevent emissions. Yet how does the public feel about these technologies? Across two studies, we explore U.S. public perceptions of carbon capture technologies. First, in a nationally representative survey, we explore public perceptions of the risks, benefits, and acceptability of carbon capture and utilization (CCU), finding that these vary across the aspect of CCU being considered, demographics such as gender and race, and by people's level of environmental identity and concern about tampering with nature. We find similar insights in an experiment testing public support for carbon dioxide removal (CDR). Namely, support for any CDR technology varies both by how much the technology is perceived to tamper with nature and by people's individual level of comfort for tampering. Together, these studies show that individual level differences in nature beliefs and identity are key drivers of carbon technology support.

Understanding Decisions Underpinning Pro-Environmental Travel

11:00 AM – 12:10 PM

APPLIED SOCIAL PSYCHOLOGY

This study explores how climate messaging (status quo 'doom and gloom' compared against eco-innovative optimistic futures) impacts pro-environmental behaviors. We included 'cost' to a transport choice task requiring participants to choose between car or bike journeys where a bike journey required exercise bike pedaling. We assessed impacts of climate messaging videos and personality on transport choice, mood and feelings of climate hopelessness. Climate optimism stimuli increased positive mood when compared to status quo stimuli but there was no effect on climate hopelessness. Behavioral results show a significant interaction between transport choice and stimuli; the status quo video increased car use in longer trials, suggesting a licensing effect. Those who watched the eco-innovative optimistic video showed more bike use in longer trials, suggesting a mechanism (that may include hope) increases pro-environmental behavior. Personality results suggest that honesty-humility and conscientiousness are positive predictors of bike choices, whereas extraversion was a negative predictor. The paradigm developed here shows promise in understanding real-world behavior and further research.

Trans Rights in Crisis: Correlates and Consequences of Policy Support

11:00 AM – 12:10 PM | Location: Lakeside Ballroom E354B, Level 3

GENDER

In the US and abroad, policies restricting trans rights have risen sharply in recent years. This symposium brings together research examining the underpinnings of opposition to trans rights and policies—including both individual (Speakers 1 and 2) and cultural differences (Speaker 3)—as well as the consequences of these policies for trans youth and their families (Speaker 4). Speakers 1 and 2 examined correlates of policy attitudes in the US, finding—for example—that beliefs that gender identities are distinct predict more support for anti-trans policies (Speaker 1). Speaker 3 examined both attitudes and the legal context more globally, finding that while Western countries tend to have more favorable laws and attitudes toward gay (vs. trans) people, the opposite is true in the non-Western world. Speaker 4 found that trans youth and their parents are directly and indirectly affected by anti-trans laws, reporting worry and interest in moving. Together, these talks identify a) correlates of anti-trans policy support that could be targets for future intervention and b) why intervention is needed, illustrating how these policies are related to negative consequences for trans people.

Bathroom Bills and Gender-Affirming Care Bans: Understanding People's Attitudes Toward Different Types of Transgender Policies

11:00 AM – 12:10 PM

GENDER

Policies restricting transgender rights have proliferated across the United States in recent years, yet little research has examined attitudes toward different types of transgender-related policies or psychological correlates of these attitudes. Across four studies, we address these questions. Factor analyses and an analysis of real-world transgender-related policies proposed in 2022 identified six policy types: (1) discrimination, (2) physical spaces, (3) degendering, (4) gender-affirming care for adults, (5) sports and (6) gender-affirming care for minors. We largely found that the same psychological constructs predicted anti-trans policy support across policy types. The belief that people with different gender identities form distinct groups predicted more support for anti-trans policies, and including transgender people in their superordinate gender category predicting less support. Through these studies, we aid both a theoretical understanding of attitudes toward different types of transgender policies and illuminate potential avenues for intervention for researchers and activists looking to decrease support for anti-trans policies and increase support for pro-trans policies.

Perceived Norm Support and Personal Support for Trans Rights Following the Presidential Election

11:00 AM – 12:10 PM

GENDER

In recent years, transgender rights have become increasingly politicized in the U.S., with presidential elections serving as key inflection points. This talk examines how personal and perceived norm support for transgender rights shift in response to political change, focusing on the 2024 U.S. presidential election. Study 1 (N = 589) used a longitudinal design to explore how support for gender-affirming care (GAC) and general transgender rights changed before and after Trump's election, capturing shifts in both personal attitudes and perceptions of broader social norms. Across studies 2 (N = 840) and 3 (N = 407), we investigated the roles of information sources (e.g., news, social media) and personal relationships with transgender and gender diverse (TGD) individuals in support for trans rights, and explored mixed-methods reflections about public responses to anti-trans policies and opinions on punishing those who seek GAC. Together, our data illuminate how political climates interact with social context to shape support for trans communities.

Greater Bias Toward Transgender People Compared to Gay Men And Lesbian Women is WEIRD

11:00 AM – 12:10 PM

GENDER

The greater acceptance of gay, compared to transgender, people in Western countries may be a result of a specific trajectory—where queer rights was centered by and around White, middle class, gender-conforming gay men—and may not generalize to other places. Two surveys of respondents in 23 countries (N's~500 or 1000 per country) showed that bias toward gay and transgender people is lower in Western (vs. non-Western) countries, but that the relative bias changes as a function of region: there is greater acceptance of gay (vs. transgender) people in most Western countries, whereas the reverse is true in most non-Western countries. Analyses of legal frameworks (N=193) show that recognition of same-gender unions is prevalent in Western countries but virtually nonexistent elsewhere, whereas recognition of gender marker changes is prevalent throughout the world. Overall, in the most intolerant places, transgender people are relatively more accepted than gay people.

Worries About Anti-Trans Legislation and Desire to Move Among Trans Youth and Their Families

11:00 AM – 12:10 PM

GENDER

The U.S. has seen a rapid increase in legislation aiming to restrict trans rights. Using a convergent mixed methods approach with survey data from a sample of 230 families across the U.S. in 2023, we examined trans youth and their parents' worries about the impact of anti-trans laws and their interest in moving due to this legislation. Though the majority of participants lived in states that had not yet passed these laws, they showed worry for the youth's safety and distress about anti-trans rhetoric in public discourse. Many participants reported feeling safe in the present but worried about the future and concerned for other trans youth in the country. Youth and parents' levels of worry were positively correlated, though parents reported more worry than their children. Families' worries about the impact of legislation and their state's level of political conservatism were significantly associated with higher interest in moving due to anti-trans laws. These results demonstrate that even families who predominantly lived in states where anti-trans laws had not been passed were quite worried about these laws, and some were considering moving, if and when that became necessary.

Achievement in Context: The Role of Families, Communities, and Nations

11:00 AM – 12:10 PM | Location: E353B, Level 3

MOTIVATION/GOALS

This session highlights sociocultural variation in the form and function of aspirations and achievement. The first talk proposes models of success as a framework to explain differences in achievement motivation between Asian and European Americans, and finds that U.S. teachers tend to favor an independent model of success. The second talk focuses on parent-child relationships in Latino/a working-class families and finds that the achievement of higher education can create a clash between children and parents. This clash results from the difference between a Tough Love model (emphasizing family, responsibility, resilience) common at home and a Gentle Love model (emphasizing self, expression, affirmation) promoted in college. The third talk examines fear of financial insecurity at the national level and finds that this insecurity can hinder innovation and achievement. Countries where more students plan to pursue financially safe careers tend to be less innovative. The fourth talk focuses on increasing the formal education of girls in Nigeria and finds that framing education as a legacy that grandparents can leave their children promotes greater parental support for girls' education.

Success Models Shape Asian and European Americans' Education and Career

11:00 AM – 12:10 PM

MOTIVATION/GOALS

Models of success are assumptions about what "success" means and what a "successful" student should do. They provide meaning and motivation for students' success. A default success-is-mine model, common in European American (EA) families and institutions, construes success as an independent pursuit of personal happiness and well-being. A less-recognized success-is-ours model, common in Asian American (AA) families, construes success as an interdependent pursuit of the family's financial stability. Three studies compared these models and identified the default in U.S. education. In Study 1, AA (vs. EA) students evoked their parents more on an index of achievement-oriented attributions, affective experiences, aspirations, and intended actions. In Study 2, the success-is-ours model mediated AA (vs. EA) students' intent to pursue high achievements (e.g., high-paying STEM jobs). In Study 3, K-12 teachers perceived less potential in students who endorsed the success-is-ours (vs. success-is-mine) model, regardless of students' race/ethnicity. The success-is-ours model motivates students from many interdependent contexts, warranting greater recognition in U.S. education.

A Clash of Tough and Gentle Love Models of Relationships

11:00 AM – 12:10 PM

MOTIVATION/GOALS

We propose a theory of multiple models of relationships to explain the impact of upward mobility through higher education on parent-child relationships in Latino/a working-class immigrant families. Here, we propose that two models of relationships can clash during college—(1) a Tough Love model (emphasizing family, responsibility, and resilience) that first-generation (FG) students are socialized with at home; and (2) a Gentle Love model (emphasizing self, expression, and affirmation) that students encounter at college. To examine this clash, Studies 1 and 2 employed interviews with Latina immigrant mothers (N = 21) and Latino/a FG students (N = 24). Mothers and students described familiarity with Tough Love and parent-child clashes during college. Study 3 is an experimental scenario study (N = 602) that examines Latino/a FG students' perceptions of peers either receiving a Tough or a Gentle Love message from parents after an academic setback. Witnessing Tough Love reduced FG students' expectations of family closeness and support-seeking. A theory of multiple models of relationships provides a framework to examine clashes in parent-child interactions across sociocultural contexts.

Scientific Innovation Can Suffer When People Fear Financial Insecurity

11:00 AM – 12:10 PM

MOTIVATION/GOALS

Disruptive innovation, or important discoveries that push science in new directions, has declined over the past several decades in some countries (Park et al., 2023), despite recent breakthroughs in areas like AI. Four studies support the idea that disruptive innovation can suffer more when people have a greater fear of financial insecurity. In Study 1, a country-level index was constructed using data on career expectations from more than 500,000 students across 63 countries. Countries in which more students pursued financially safe careers produced fewer patents per capita, even after controlling for other important predictors of innovation. Studies 2a and 2b provided experimental evidence that a fear of financial insecurity can lead people to choose, and to encourage others to choose, career paths that are financially more secure, even though they knew it meant a lesser potential for important scientific innovation. Study 3 replicated these findings with STEM PhD students. In a decision scenario, they were less likely to pursue riskier, groundbreaking research ideas in favor of safer, more incremental research ideas that could better guarantee their financial security.

Framing Education as a Legacy Increases Parental Investment in Girls

11:00 AM – 12:10 PM

MOTIVATION/GOALS

Nigeria has a large number of out-of-school children most of whom are girls (UNICEF, 2022), and gender gaps in median years of school attendance can be as large as 6 years (DHS, 2018). Parental support is crucial for improving educational outcomes for girls, yet many Nigerian parents believe that pursuing an education clashes with girls' future roles as a wife and/or mother. Across three studies with a total of 1,200 participants in Nigerian settings, my colleagues and I developed and tested an intervention which aligned education with cultural values and represented education as a tangible and communally valuable legacy which could be bequeathed to one's grandchildren through one's children. We found that aligning education with this Nigerian cultural value increases parents' reported intentions to support and financially invest in their daughters' education. Results suggest that the desire to leave a legacy is a resonant cultural value in Nigeria—and potentially many other interdependent contexts—that can be leveraged to increase the continued enrollment of girls in school.

Getting Started with Registered Reports in Social and Personality Psychology

12:30 PM – 2:30 PM | Location: E255, Level 2

A registered report is a multi-stage publication format in which peer review occurs prior to data collection and analysis, helping to eliminate publication bias and reduce questionable research practices. Several prominent journals in social and personality psychology—including Journal of Personality and Social Psychology, Personality and Social Psychology Bulletin, Journal of Experimental Social Psychology, and Nature Human Behaviour—accept registered reports. While this approach strengthens the credibility of findings, researchers may have concerns about feasibility, journal fit, and navigating the process. This workshop will introduce the structure and rationale of registered reports, help researchers identify appropriate journals, locate successful examples, and provide guidance for drafting Stage 1 submissions and responding to reviewer feedback. We will also address issues especially relevant to social and personality psychology, including multi-study designs, use of pilot data, and working with secondary data. Finally, we will discuss practical strategies for time management, integrating trainees into the process, and aligning registered reports with existing publication and career advancement incentives.

[1] "Who Are You Fighting For?": Black Americans' Perceptions of Allyship and Solidarity from White Gay Men

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Solidarity may cultivate intra-minority coalitions in the fight for equity, but how are those who leverage solidarity perceived? We explore how leveraging solidarity with the Black community may influence perceptions of a potential ally's motives and behaviors. Generally, Black-gay solidarity statements from a White gay man had elicited more perceived disingenuous motives and less racial privilege acknowledgement (Study 1-3) compared to when he made Black allyship statements. Further, Black Americans anticipated greater identity-credentiating, an expectation that gay targets would use their marginalized gay identity to buffer against claims of being racist, with solidarity statements than allyship statements (Study 2-3). When solidarity or allyship statements came from a gay man of color, statement type (i.e., solidarity versus allyship) did not differentially impact ally perceptions (Study 3). Implications for intra-minority coalitions are discussed.

[2] "Damn, capitalism got hands!": Anti-capitalist memes depict working-class defeatism

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Today, internet memes are a popular way of conveying political critique through humor. This study examines how anti-capitalist memes use humor to depict the working class and class conflict. Humor styles may influence such depictions. Specifically, we focus on humor that uses self-deprecation to make light of economic uncertainty and wealth inequality (gallows humor) and humor that belittles an outgroup such as the rich (disparagement humor). We sampled 193 memes posted online by real users. Using a k-means cluster analysis and data from an independent sample of raters (N = 500), we classified the stimuli based on their use of gallows and disparagement humor styles. A qualitative analysis indicated that gallows and disparagement humors were both prominent in anti-capitalist humor and that anti-capitalist humor depicted mostly negative traits of the working class. This was particularly true of gallows humor, which depicted the working class as depressed, hopeless, and stuck. Overall, results suggest that the working class is predominantly portrayed as defeated. We discuss the implications of this work on the development of working-class identity according to Social Identity Theory.

[3] "I Like to be in America!": Cambodians on Feeling American

12:45 PM – 1:45 PM

SELF/IDENTITY

Past research investigating how U.S. citizens identify with the nation and negotiate their identities with the perception of discrimination, typically homogenize Asian Americans if they are included at all. Our project identifies the nuances between subgroups which compose the Asian American category. We perform secondary data analyses on the 2016 National Asian American Survey (NAAS) Pre and Post-Election Surveys illustrating how Cambodians interface national, racial, and ethnic identities relative to other Asian American groups and whites. Findings for the 2016 Pre-Election NAAS demonstrate significant differences as Cambodians show relatively higher levels of national, racial, and ethnic identification compared to 'higher status' groups. We replicate analyses with the 2016 Post-Election Survey and investigate the influence of perceived discrimination on national, racial, and ethnic identification. Results illustrate variability between Cambodian and other subgroups' national identification. Implications are drawn for the Cambodian experience of belonging to the U.S. relative to 'higher' status groups (e.g., Japanese, whites) and the impact on perception of discrimination.

[4] “I Swear I’m Happy for You”: The Link Between Malicious and Benign Envy and Prosocial Behavior

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Prosocial behavior is largely thought to be motivated by empathy, but some research suggests selfish motivations also exist. Similarly, envy is often seen as a malicious emotion, but a small body of research hints that a more positive, “benign envy” also exists. A link between envy type (benign vs malicious) and prosocial behavior has never been investigated. This study hypothesizes that benign envy will more strongly predict prosocial behavior and will correlate with altruistic motivations for prosocial behavior, while malicious envy will correlate with selfish motivations. 100 undergraduate participants will complete a Qualtrics study assessing their levels of benign envy, malicious envy, and tendency for prosocial behavior. Participants will also be shown vignettes depicting social situations, choose whether to help the person in the vignette, and report their motivation for helping or not. Results of this study will advance our understanding of envy and refine the literature on prosocial behavior by demonstrating that altruism can be motivated by selfishness. The study is pending IRB approval; data collection will begin by October 2025.

[5] “Singaporean with an Asterisk”: Racial Categorisation and Its Implications for National Belonging among Malay and Indian Singaporeans

12:45 PM – 1:45 PM

SELF/IDENTITY

Singapore offers a compelling case study of state-endorsed multiculturalism, marked by a strong emphasis on the nation’s multiracial composition—particularly the inclusion of Chinese, Malay, and Indian communities. Its racial classification system aims to promote social harmony by preserving the distinct cultures and languages of these groups and positioning them as representative of the nation. However, how this system shapes the negotiation between national and racial identities among ethnic minority Malay and Indian Singaporeans remains unclear. Drawing on 31 semi-structured interviews with Malay and Indian participants, we found that (i) embedding multiculturalism within national identity affirms minority representation while creating normative expectations for intercultural integration; (ii) the classification system facilitates both positive intergroup contact and the reinforcement of racial stereotypes; and (iii) bi- and multiracial individuals often report feelings of exclusion within Singapore’s rigid racial framework. These findings highlight the ambivalent role of institutionalized racial categorization in both enabling and constraining national identification. Reimagining multiculturalism through more fluid and polycultural understandings of identity may better accommodate the complex realities of belonging in diverse societies.

[6] “Your Participation Unlocks Greater Resource Integration”: The Effects of Unconditional Giving, Standard Matching, and Contingent Matching on Collective Action

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Addressing the climate crisis requires effective resource integration among exogenous stakeholders—including citizen collectives, corporations, and governments. However, prior literature presents inconsistent findings. This research investigates the efficacy-based psychological mechanisms through which individuals perceive their contributions as meaningful in achieving collective performance (i.e., total resources integrated). Specifically, we focus on Perceived Behavioral Impact (PBI)—the belief that one’s own actions contribute meaningfully—and how it influences Collective Outcome Expectancy (COE), ultimately affecting collective action. Across five studies involving various types of collective action and a range of stakeholders, we compared three resource integration schemes: unconditional giving, standard matching, and contingent matching. Our findings reveal that contingent matching schemes significantly increase collective action by enhancing PBI and COE. In contrast, unconditional giving undermines participation, and standard matching yields no impact improvement. These results underscore the critical importance of strategically designing resource integration approaches that empower individuals and highlight the tangible impact of their contributions.

[7] A Crisis of Belief: A Pilot Study on the Tolerance of Uncertainty in Individuals in an Amish Community

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

The purpose of this case study is to analyze the potential relationship between tolerance of uncertainty and religious affiliation within an Old Order Mennonite community in Tennessee. Using an in-depth, mixed methods case study, data was collected through the observation of participants in their religious and home settings over two months (June and July 2025), a structured interview process to collect direct information from participants, and the use of a quantitative Intolerance of Uncertainty Scale to survey participants and evaluate their relationship towards uncertainty. Results are still being analyzed, with a specific interest in whether the rigid environment is correlated with more or less comfort in situations of uncertainty for individuals. This study can be used as a springboard to continue to study different religious communities and then to compare and contrast the relationships to uncertainty within those religious communities. The implications of studies such as these are valuable in predicting who will enter into specific religious communities and who has a higher probability of leaving structured religions.

[8] A Mixed-Method Examination of Linked Fate in the Black Community

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Linked fate—the degree that African Americans perceive their self-interests as linked to the interest of the race—has been used to study Black people’s political behavior (Dawson, 1994). Less is known about who, why, and when linked fate is endorsed and what it means for the experiences of marginalized members of the Black community. In this mixed-method study, Black participants (N=400; via Prolific) will complete validated measures of linked fate, system justification, in-group shame and anger, race centrality, community connectedness, and critical consciousness. They will provide justification for why they do (not) endorse linked fate, to whom they feel their fate is linked, and when they do (not) feel that link. Using regression and reflexive thematic analysis, we will test our hypotheses: (1) linked fate will be greater among those with more positive perceptions of the Black community, and (2) people will feel their fate is more linked to normative members of the Black community and less linked to deviant members (e.g., transgender people). Our study takes an intersectional lens to linked fate to explore its potential to facilitate intragroup relations among Black people.

[9] A Pilot Vignette Study on Left-Wing Authoritarianism, Social Media Influence, and Support for Geopolitical Conflicts

12:45 PM – 1:45 PM

POLITICS

Motivations regarding geopolitical conflict (e.g., Gaza War) support are underexamined. Left-wing authoritarianism (LWA) and social prestige influence, including that facilitated by social media (SM), are relevant given links to politically-primed threat-sensitivity and self-enhancement. Via a SM vignette paradigm, this ongoing study examined whether LWA and the popularity of various conflicts (as shown by number of post “likes”) may influence support for said issues.

College students (N = 105) filled an online survey with a 6x2 vignette paradigm of fake SM posts. Each post promoted one of six entities across three conflicts, including one faux war (i.e., Israel or Palestine; Russia or Ukraine; “Bucharastan” or “Estamese”), as well as a high or low like count. Individuals viewed one post for each conflict (three total), responded to support items, and completed measures.

2x2 repeated measures ANOVAs were used to explore impacts of the design. LWA was a strong predictor for Russia-Ukraine and Israel-Palestine conflict support. It interacted with the high-low condition in shaping Russia-Ukraine conflict support. There was a 3-way effect for LWA, the high-low condition, and support for the faux conflict.

LWA expounds geopolitical conflict support. It may be influenced by prestige (i.e., “like”) pressure in some cases. Limitations include the small sample and nascent vignette design.

[10] A Targeted Prosociality Intervention for Previously Incarcerated Populations

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Personality interventions for recidivism and re-offense continue to be scarce, with many interventions focusing on clinical counseling or forms of punishment. However, prior research shows the importance of prosocial behavior in personality change models, which could be of use in reducing the well-known link between negative personality traits (e.g., Dark Triad) and (re)offending. In a single six-wave longitudinal study, we examined the effect of a set of prosocial behavioral tasks (e.g., holding the door for someone) and the motivations to change on shifts in Dark Triad traits in previously incarcerated individuals (N = 245; control n = 84; experimental n = 161). When comparing changes in self-reported personality traits between the experimental group and a control group, results from the study found that, within the experimental group, participants reporting higher motivation to change their “darker” personality traits had significantly lower Dark Triad scores compared to their scores at the study’s onset. This study gives promising preliminary evidence for a low-cost behavioral intervention to support the reduction of antisocial traits which contribute to recidivism rates.

[11] A two-stage Model of Intergroup Conflict: How Unjustified Confidence Influences Leader Behavior and Follower Support

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Intergroup conflict is widespread and destructive. It has long been recognized that leaders play a crucial role in instigating conflict, with extant research proposing that holding a position of leadership increases people’s propensity to engage in conflict. Here, we investigate another mechanism: namely that followers support conflictual members as group leaders. We propose that to understand why groups might support conflictual members as leaders, it is necessary to identify leader characteristics which increase i) the propensity of conflictual behavior, and ii) the support that leaders will get. We examine one such characteristic, namely, unjustified confidence, defined as confidence that is clearly higher than warranted given the parameters of the situation. We develop a two-stage ecologically valid experimental design to examine these questions. In the first stage, we find that unjustified confidence increases conflictual behavior, which is partially explained by myopic self-focus. In the second stage, we find that leaders who exhibit unjustified confidence receive stronger support when followers experience higher fear and greed, two emotions frequently observed in intergroup contexts. This work provides new insights into the persistence of intergroup conflict by examining the interplay between leader behavior, follower emotions, and group support.

[13] Across the Aisle & Over Time: Media, Risk Perceptions, and Psychological Strain During an Unfolding Contentious Election

12:45 PM – 1:45 PM

POLITICS

The 2024 U.S. Presidential election generated enormous uncertainty, media attention, and emotional strain, particularly before the outcome was known. This 3-wave study used a probability-based national sample from NORC’s AmeriSpeak panel to examine whether media exposure was linked to worry and emotional exhaustion, possibly through risk perceptions, and whether associations differed by timing (pre/post-election) and candidate support (of the winner/loser). Respondents were randomly assigned to complete the survey just before (10/11-11/4/24; n=2137) or after (11/8-12/2/24; n=2091) the election. Candidate support and survey timing formed a 2x2 group variable. Using a 4-group generalized structural equation model, correlations were directionally consistent but varied by group. Media exposure’s positive indirect associations with worry were strongest for losing candidate supporters pre-election, while the positive indirect link with media and emotional exhaustion was strongest for supporters of the winner post-election. Findings inform communication, clinical, and policy strategies for mitigating psychological strain before and after contentious events across the political divide.

[14] Actual Versus Perceived Impact of Prosocial Lies on Social Judgments of Honesty and Kindness

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Prosocial lying—or lying to spare feelings—is considered socially beneficial, but its perceived versus actual impacts are understudied. In Study 1, participants (N = 161) chose to tell a prosocial lie or a blunt truth about a confederate's poor essay and estimated how the confederate would rate their honesty and kindness. Truth tellers predicted higher honesty ratings than prosocial liars but similar kindness scores. Participants also made counterfactual predictions (e.g., how the confederate would have rated a lie instead of the truth). Truth tellers thought lying would make them seem kinder but less honest, whereas prosocial liars thought the truth would make them seem less kind but not more honest. In Study 2, participants (N = 103) completed a hard essay task and got confederate feedback that was either a harsh truth, genuinely positive, or positive but revealed to be a lie. Genuine positive feedback scored highest on honesty and kindness, but truth tellers and liars differed only on honesty. Comparing studies, prosocial liars and truth tellers underestimated kindness ratings and prosocial liars overestimated honesty ratings, illustrating the complex impacts of prosocial lies.

[15] Adaptive authenticity: How bisexuals respond to LGBTQ+ vs. heterosexual prejudice

12:45 PM – 1:45 PM

SELF/IDENTITY

Bisexuals are the largest subgroup within the LGBTQ+ community, yet they are routinely stigmatized by heterosexuals and fellow LGBTQ+ members. While harmful outcomes of prejudice are well-documented, less is known about how social identity and intergroup dynamics affect bisexual identity expression. This study (N = 263) explored the role of inter- and intragroup sources of prejudice, identity centrality, and relative ingroup prototypicality on bisexual identity expression. Results revealed a three-way interaction. When prejudice came from gay and lesbian individuals, identity centrality predicted greater authentic identity expression regardless of whether bisexuals felt that bisexuality is representative (prototypic) of the LGBTQ+ community. When prejudice came from heterosexual individuals, identity centrality predicted authentic identity expression only when bisexuals perceived themselves as representative of the LGBTQ+ group. These results suggest that when facing external prejudice, bisexual individuals may need both identity centrality and a sense of group legitimacy to respond with authentic identity expression; otherwise, dominant group stigma may suppress expression.

[16] Addressing US partisan animosity: An intervention targeting political media consumption

12:45 PM – 1:45 PM

POLITICS

Animosity toward individuals with opposing political views has rapidly grown in the US, making Americans less willing to connect with political out-partisans and further widening the social divide. A major driver of this animosity is media content (e.g., news stories) that promotes outrage towards out-partisans. Such content generates immense engagement, making it highly profitable despite its harmfulness. We designed an intervention that sought to shift Americans' construal of this content toward being inflammatory rather than informative. In a preregistered laboratory experiment (current n = 84; target n = 150), we randomly assigned young adults to receive this intervention or a control activity before completing a set of self-report measures. Participants then discussed politics with a confederate posing as a supporter of the opposing political party and, subsequently, rated the confederate. The intervention increased intent to disengage from polarizing media by .63 SD (b = 0.63, p = .003) and perceived importance of finding common ground by .61 SD (b = 0.61, p = .005). The intervention also increased openness to friendship with the confederate by .58 SD (b = 0.58, p = .008).

[17] Affirmation in Action: How Being Seen Shapes Transgender and Nonbinary Identity and Well-Being

12:45 PM – 1:45 PM

SELF/IDENTITY

Erikson's psychosocial model suggests that identity development precedes relationship formation, but this sequence may not fully apply to transgender and nonbinary (TGNB) emerging adults. For TGNB individuals, gender identity development may occur in tandem with or as a result of supportive relationships (e.g., friendships, online communities, romantic partnerships, intrapersonal reflection (Cronesberry & Ward, 2024; Hainsworth et al., 2024; Kuper et al., 2018). These relationships often provide "safe spaces" for exploration, affirmation, and identity solidification. This mixed-methods study challenges traditional developmental frameworks by investigating how both interpersonal and intrapersonal relationships shape TGNB gender identity development. It also explores the role of gender identity affirmation, a process shown to positively influence well-being (Galupo et al., 2019). In addition to examining identity formation, the study considers broader positive outcomes such as pride, community connectedness, gender identity acceptance, romantic and sexual satisfaction, as well as well-being. By centering strengths over pathology, this research contributes to a more inclusive understanding of TGNB development. Findings offer practical insights for TGNB individuals, their friends, partners, online communities, and mental health professionals. In a time of increasing socio-political debate around TGNB rights and inclusion, this study advocates for affirming, evidence-based support systems that empower TGNB individuals.

[18] Affirming the Moral Self: People Prefer Transgression Explanations that Support Compassion Rather than Unmitigated Blame

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Prior theorizing suggests people "love blame" and engage in motivated information processing to maximize perceived blameworthiness of others. We explore a different possibility: People are motivated to forgive and may prefer information that enables them to respond with compassion to transgressors because such responses affirm their moral self-image. Participants (N=402) learned about Robert Harris's double homicide and were randomly assigned to read either a blame-supporting explanation (describing Harris's clear intentions to make others suffer) or a blame-mitigating historical explanation (detailing his abusive childhood). Then, participants reported their satisfaction with the explanation they received. They also reported compassion and blame toward Harris and their feelings of moral self-approbation. Results suggested mitigating explanations were associated with greater compassion and less blame, which, in turn, brought higher moral self-approbation, which, in turn, was associated with greater explanation-related satisfaction. People appear to like blame-mitigating explanations because they facilitate feeling like a good person.

[19] Agentic AI Simulations of Intergroup Conflict

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Intergroup conflict is difficult to study due to logistical and ethical constraints. We simulate conflicts using LLM-driven agents with distinct personas in interactive environments, producing 200 K+ conversations and 1 M+ plans, reflections, and questionnaire responses. Agents in minimal groups underwent manipulations of threat (symbolic vs. real), geographic segregation, and moral profiles (binding vs individualizing). Both threats uniquely increased hate, aggression, moralized language, and negative sentiment, while reducing overall cross-group interactions. Segregation magnified these effects, and moral values modulated responses. Longitudinal probing of agents revealed increasing identity fusion, out-group bias, and dehumanization alongside declining trust and collaboration under threat, highlighting how context and values drive conflict processes. Our analyses show that agentic AI frameworks can enable scalable, ethical experimentation and generate deeper insights into conflict mechanisms (e.g., uncover temporal dynamics of identity fusion, bias, dehumanization, and conflict behavior). This approach may support the development of interventions to mitigate intergroup hostility.

[20] Am I Better or Am I Enough? Self-Compassion and the Better-than-Average Effect

12:45 PM – 1:45 PM

SELF/IDENTITY

People, especially those high in self-esteem (SE), engage in a wide variety of self-enhancement strategies. But as Crocker and Park (2004) noted, self-enhancement goals undermine learning, relationships, and both mental and physical health. Might self-compassion (SC; being supportive of oneself during times of suffering) be an antidote to unhealthy SE striving? In the current study, we investigated whether the tendency to see oneself as superior to others (the Better-than-Average Effect, or BTAE) would be positively associated with SE, but not SC, as SC is about accepting one's imperfections rather than needing to outdo others. In an online survey on Prolific Academic, we asked college students (N = 249) to rate themselves relative to the average college student on 20 positive and 20 negative traits. As predicted, once SE was controlled for, SC no longer predicted the BTAE across most traits, although SE did. The findings suggest that SC may attenuate people's engagement in SE striving, though the study is correlational, so experimental work is needed. Future research should also examine additional domains in which this attenuation occurs.

[21] Amplifying Benefits of Storytelling with Generative AI: Evidence from Storybook

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

As AI becomes part of daily life, can it be leveraged to enhance well-being and foster prosocial behavior? Across two experiments (total N = 805), we test whether AI can amplify the psychological and social benefits of storytelling. We developed Storybook, an AI-powered tool that lets users describe themselves in natural language, create avatars, and write AI-illustrated stories. In Experiment 1 (N = 207), people were more likely to offer advice to a stranger struggling in their career when reading the story on the AI-enhanced platform (i.e., Storybook condition) compared to a SPSP 2026 Annual Conventions [spsp.org/events/annual-convention](https://www.spsp.org/events/annual-convention) standard text-based interface. In Experiment 2 (N = 598), pre-post analyses revealed that people in both conditions experienced increases in self-efficacy—i.e., belief in their ability to handle challenges—after providing advice, but gains were greater in the Storybook condition. Language analyses revealed higher-quality, more affirming advice in the Storybook group. These participants also reported greater ease empathizing with the storyteller, which predicted better advice. Results suggest that creative use of generative AI can improve self-efficacy and supportive behavior in anonymous online settings.

[22] The Relational Costs of Goal-Directed Listening in Workplace Conversations

12:45 PM – 1:45 PM

SOCIAL COGNITION

Everyday conversations often demand that listeners balance accuracy with empathy. These competing motives reflect what Yeomans et al. (2022) describe as informational motives (exchanging accurate information) versus relational motives (building connection). We examine this tension in professional contexts. In an experiment ($N = 196$; $Mage = 38.66$, 50.5% female, 49.0% male, 0.5% other), participants listened to standardized audio from an ostensible coworker describing a workplace challenge. Participants were randomly assigned to a relational goal or a non-relational goal (informational or control). Relationally assigned listeners who felt goal conflict (torn between accuracy and support) reported lower authenticity ($b = -0.24$, $p < .001$), less willingness to reengage ($b = -0.46$, $p = .004$), and more emotional exhaustion ($b = +0.53$, $p < .001$) than those in the non-relational conditions who felt similar levels of goal conflict. Notably, Johnson–Neyman analysis indicated that this last effect on emotional exhaustion emerged even under low conflict values, affecting approximately 71% of the sample. These findings suggest that relational listening goals can leave employees depleted and less willing to reengage with colleagues, offering important insight for workplace interventions focused on interpersonal cohesion.

[24] Antiracism: A Mixed-Methods Approach to Mitigating Threat to Self

12:45 PM – 1:45 PM

SELF/IDENTITY

Across three studies ($N=731$) and a qualitative analysis ($N=187$), we explored how utilizing an antiracist framework (Kendi, 2019) can neutralize the inherent self-threat of the term "racist" while motivating actions toward a more just society.

Participants were randomly assigned to read passages that asked participants to engage with Kendi's antiracist framework or engage with a neutral passage (S1 & 2) or a passage that essentialized antiracism (S2 & S3). After reading, participants summarized the passage (S1-S3) or answered multiple choice questions about the passage (S3) to examine how engagement may affect threat to self. Following, participants indicated how much they agreed with statements of inequity in American society and measured self-related threat through self-related need fulfillment (self-esteem, belonging, meaning, and control; Zardo et al., 2003).

Results discuss two patterns: (1) How engagement with an antiracist framework allows individuals to endorse statements of inequity while reducing the threat of the label "racist"; (2) giving participants the ability to voice their ideas about antiracism results in themes around growth and fixed mindsets (Dweck, 2006).

[25] Assessing Stereotype Content and Accuracy of the Upper Economic Class: Interpersonal Warmth and Social Competence Dimension

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

This study examined how individuals from non-upper and upper economic classes perceive the upper economic class in terms of interpersonal warmth (IW) and social competence (SC), using implicit (Single Category Implicit Association Task) and explicit (stereotype ratings) measures, along with self-report questionnaires. Both groups rated upper-class individuals significantly lower on implicit measures than explicit ones. Regardless of the measure, participants rated the upper class higher on SC than IW. Implicit and explicit measures were not significantly correlated for either SC or IW. Stereotype accuracy analysis showed limited alignment between perceptions and self-reports, especially for IW, where participants underestimated upper-class individuals. However, upper-class participants accurately perceived SC on explicit measures. There were no actual differences in IW between the two groups, but upper-class individuals scored higher on SC. Findings offer insights into stereotype content and have implications for addressing class-based bias through diversity and inclusion efforts.

[26] Attorney Recommendations and Anti-Intellectualism in Settlement Decision-Making

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Anti-intellectualism (i.e., feelings of distrust toward experts) has been widely studied in relation to vote choice and medical decision-making. However, a past study found that attorneys were perceived as among the least credible experts. Here, we examined how attorney recommendations and anti-intellectualism influenced legal decision-making. Online participants (N = 260 adults) were presented with a hypothetical civil lawsuit in which the opposing litigant proposed a settlement. Using a 2x2 factorial design, participants were randomly assigned a litigant role (plaintiff or defendant) and an attorney recommendation (to accept or to reject). Attorney recommendations, but not litigant roles, significantly influenced decisions to accept the settlement. Regression analyses revealed that perceptions of attorney credibility moderated the effect of attorney recommendations on settlement decisions. These perceptions were further associated with anti-intellectualist attitudes, but there was no direct effect of anti-intellectualism on settlement decisions. Future work needs to assess how the interaction between anti-intellectualism and attorney credibility affects legal decision-making.

[27] Authentic Online Presentation and Self-Brand Congruity

12:45 PM – 1:45 PM

SELF/IDENTITY

Social media profiles can be useful for autobiographical curation of the self, allowing people to organize and connect with others. Following the Dramaturgical perspective, people may use social media as a public platform to express themselves in a performative way—and this performative self may or may not authentically align with their actual, offline self. This research aims to explore: (1) the source of the performative self on social media (ideal, actual, or ought self; imagined others; various temporal selves); (2) if people perceive this performance as an authentic representation of their self; (3) consistency of the performative self over time (personal-brand congruity) and across contexts (online and offline); and (4) motivations for this online, dramaturgical self-presentation (e.g., status, affiliation, mating, escape, etc.). This study may contribute to the growing literature regarding personality and social psychological development in an increasingly digital age, where social media is highly valued as a reference for social status and a tool for self-presentation.

[28] Authoritarianism Predicts Authenticity as a Function of Ideological Norms in the Environment

12:45 PM – 1:45 PM

SELF/IDENTITY

Building on research and theory linking authenticity to the experience of fit in one's environment, we tested whether right- and left-wing authoritarianism differentially predicts authenticity as a function of the political leanings of one's environment. In Study 1, we found that left-wing authoritarianism correlates negatively with trait authenticity, while right-wing authoritarianism positively correlates with trait authenticity, among students on a conservative leaning campus. In Study 2, we conceptually replicate these patterns and further reveal that left-wing (right-wing) authoritarianism negatively (positively) predicts the experience of "fit" at the university. In Study 3, left-wing (right-wing) authoritarianism negatively (positively) predicted authenticity most strongly among U.S. participants who perceived that their community was substantially more (vs. less) conservative. These findings suggest that strong authoritarian beliefs differentially connect to the experience of authenticity as a function of how well they align with the normative views of others in their environments. This could have implications for understanding political polarization and current patterns of migration based on political concerns.

[29] Avoidance of altruistic punishment in cross-cultural contexts

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Altruistic punishment is one powerful tool for maintaining cooperative norms. Classic third-party punishment games have consistently shown that observers are willing to incur personal costs to punish selfish actors. However, a recent study demonstrates that such punishment occurs less frequently when observers can avoid exposure to the selfish act, with avoidance driven both by reluctance to witness unfair treatment and by aversion to administering punishments. Building on this insight, the present study conducted a cross-cultural comparison in Japan and the United States to examine whether avoidance of altruistic punishment generalizes across cultures. Two hundred participants engaged in the situation-selective third-party punishment game (SS-TPPG) in which observers could choose situation that reduced the likelihood of encountering selfish monetary allocations, thereby creating opportunities to forgo costly punishment. The results showed that the avoidance tendency emerged regardless of culture, highlighting that the reluctance to witness unfair treatment and engage in costly punishment is a robust human tendency that transcends cultural boundaries.

[30] Awe Promotes Pro-Environmental Views, Shifting Focus Beyond the Self

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Awe has been associated with pro-environmental outcomes. It is unclear why experiencing awe might make people more pro-environmental. We report the results of a pre-registered field experiment in Lake Tahoe that assessed whether a series of environmental attitudes might explain the link between awe and pro-environmental outcomes.

Participants (N=157) were recruited at the base of the Heavenly Gondola and were randomly assigned to take in the awe-inspiring viewpoint at the top of the gondola ride for 2 minutes [awe] or spend that time in the gondola gift shop [control]. Participants reported connectedness to nature, environmental efficacy, ecospirituality, and moralization of nature. Participants in the awe condition reported significantly greater awe than the control condition, which indicated that the manipulation was successful. Participants in the awe condition and the control did not differ in report connectedness to nature nor environmental efficacy. However, the awe condition reported significantly greater ecospirituality and moralization of nature. Results suggest that experiences of awe might contribute to pro-environmental outcomes by shaping the way people view nature.

[31] Beliefs about voting and racism shape voting policy preferences

12:45 PM – 1:45 PM

POLITICS

Some White Americans fear illegal voting, which they assume is happening among racial minorities. Other White Americans want more access to voting. What is unknown is whether desires for restrictive or accessible voting would be less favorable than a "perfect policy" - one that prevents all voter fraud while allowing all eligible voters to vote. This study investigates support for a "perfect policy" and whether perceiving voting as a privilege, or symbolic racism may moderate support for different types of voting policies. White participants (N = 1,200) were randomly assigned to one of three voting policy conditions: (1) a "perfect policy" that prevents all voter fraud while allowing all eligible voters to vote, (2) an "overly inclusive policy" that allows all eligible voters to vote but also allows some illegal voting, or (3) an "overly restrictive policy" that eliminates all illegal voting but also excludes some eligible voters. Findings indicate that participants preferred the perfect policy overall. Furthermore, those rejecting the idea that voting is a privilege favored the perfect and inclusive policies equally. Those high in racist beliefs supported the perfect and restrictive policies equally. These findings highlight how beliefs about voting and racism shape policy preferences.

[32] Between the Divide: The Role of Existential Isolation in American Political Polarization

12:45 PM – 1:45 PM

POLITICS

Cognitive misperceptions often underly political polarization. Existential isolation, the perception that your experiences and worldview are not shared by others, may precede the formation of these misperceptions, thereby perpetuating political divides. This research, across four studies (N = 924) sampling undergraduate students and adults online, examined the role of existential isolation in American political polarization. Results show that individuals report greater existential isolation towards political opponents than political peers, which was then associated with dehumanization of, and less willingness to engage with, political opponents. Further, greater existential isolation towards politically liberal or conservative others was associated with less support for a political policy proposed by these groups. Lastly, feedback that liberals or conservatives share our subjective perceptions attenuates our feelings of existential isolation towards these groups. Together, these findings demonstrate the importance of addressing existential isolation as a social cognitive factor underlying and perpetuating political polarization in the United States.

[33] Beyond Ideology: The Sexually Strategic Logic of Abortion Opposition

12:45 PM – 1:45 PM

POLITICS

Why do some people oppose abortion? Most accounts focus on religion and politics. We test an alternative grounded in evolutionary social science: Individuals with committed mating orientations (CMO)—who often marry and have children earlier—may be reproductively disadvantaged by casual sex. As such, people may support policies that, even nonconsciously, shape the social world to align with their own fitness interests. We predicted that individuals high in CMO who also believe that abortion access lowers the costs of casual sex (“deterrence belief”) would show the strongest abortion opposition. Supporting this, in three U.S. samples (N = 2,711)—including one preregistered and one pre-Dobbs—CMO and deterrence belief interacted to predict abortion opposition. This effect held when controlling for religiosity and political ideology. Results challenge the view that political attitudes are unrelated to self-interest and highlight an under-recognized driver of abortion attitudes with broad implications for women’s health, well-being, and equality.

[34] Beyond Job: AI as Perceived Threat to Self-Identity

12:45 PM – 1:45 PM

SELF/IDENTITY

Artificial intelligence (AI) is often portrayed as a threat to employment. However, this assumption might overlook a deeper mechanism: the threat that AI poses to self-identity. We propose job loss threat as a trigger, while the ultimate source of fear might be the potential loss of uniqueness. When individuals perceive AI as a threat to their role, they are not only afraid of unemployment but also of the erosion of a part of their identity.

Based on research on ego-defensiveness and self-identity, this study outlines the model where AI salience → Job loss threat → Identity threat - Defensive attitudes towards AI. For those who have work-identity centrality, this causation could be much stronger.

We outline a study design in which participants would be randomly assigned to read vignettes describing AI implementations with (a) job loss with income loss, and (b) job loss without income loss. This design would allow us to test whether AI fear persists even when income is guaranteed. If yes, it might suggest that the driver is an identity threat.

This model frames AI anxiety as an existential rather than purely economic concern and points to new directions for theory and communication.

[35] Beyond Left and Right: Who Truly Welcomes Refugees?

12:45 PM – 1:45 PM

POLITICS

Considerable research asserts that the "rigid" political right is more anxious about immigrants and more likely to support exclusionary policies than the political left. However, such "personality" effects may depend on sociopolitical and historical context. While the right may generally be more hostile to refugees, sociohistorical factors may cause them to perceive some outsider groups as "us" rather than "them", buffering their feelings of threat or hostility. Aligned with this hypothesis, in four samples collected in Turkey in 2017 (3 studies; Total N = 1,347) and 2025 (N = 634), we do not find right-wing Turks to be more hostile to Syrian refugees than left-wing Turks. In fact, left-wing participants reported greater levels of perceived threat and anti-refugee attitudes than the right-wing individuals in 2025. Preliminary analyses suggest that the right-wing's lack of hostility against Syrian refugees may be explained by a perception of shared values with Syrian refugees. These findings illustrate that the effects of political ideology may be context-dependent. The "rigid" right may become open to outsiders who are viewed as value-aligned or beneficial to the ingroup.

[36] Bittersweet Belonging: The Affective Signature of Nostalgia in Gen Z

12:45 PM – 1:45 PM

SELF/IDENTITY

The purpose of this study is to further explore how inducing feelings of nostalgia can influence an individual's affective state. Nostalgia can best be described as a sentimental longing for past experiences. It is well understood that nostalgia can elicit mixed emotions, most often described as "bittersweet" feelings. Previous research has affirmed that nostalgia is best described as bittersweet, however, many previous studies in this area have focused mainly on the positive affective state that people report to be in after feelings of nostalgia arise. The current study is looking to explore if individuals are also left with a negative affective state after feeling nostalgic. The current study will utilize a recently validated measure of inducing feelings of nostalgia while reducing possible participant bias through a short video composed of images and music. Through use of this method, we are exploring the affective signature of nostalgia when experienced by members of Generation Z, a population not previously explored in this context.

[37] Black girls' same-race social media exposure and self-objectification

12:45 PM – 1:45 PM

SELF/IDENTITY

While social media has been found to have an adverse effect on Black girls' body image through sexualizing and discriminatory content, the potential benefit of affirming content is understudied. Gahler et al. (2023) found positive links between same-race social media exposure (SRSME) and body appreciation in women of color. Ethnic-racial identity (ERI) commitment, a relevant protective factor, may amplify the benefits of affirming online content. Adolescents are more sensitive to online and identity-related experiences, yet these associations remain unclear among youth. The current study examined SRSME (percentage of same-race accounts followed) and self-objectification in a sample of 154 Black early adolescent girls (Mage = 13.1), and tested ERI commitment as a moderator. We ran a saturated path model to maximize data inclusion. Higher SRSME was associated with lower self-objectification ($b = -.01$, $SE = .004$, $p = .001$). ERI commitment did not significantly moderate this association. ($p = .96$). Results indicate SRSME may be protective for Black girls. Future research can identify specific features of same-race content that benefit their body esteem and identity development.

[38] Blame in Autonomous Vehicle Accidents - The Role of Passenger Attention and Seat Location

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Are passengers in autonomous vehicles (AVs) blamed for accidents that occur while they ride, and does it matter whether they're on their phone, or where they sit? As AVs continue to develop and become more common worldwide, how people assign blame in AV accidents remain an important topic. In this study, we examined how attention and seat choice influence blame attribution in AV accidents. U.S. adult participants (N = 357) evaluated scenarios in which a person was either attentive to the road or distracted by their phone and sitting in one of three seats (driver, passenger, or rear) during an accident caused by their AV. Participants rated the extent to which the rider and the pedestrian were blamed. Distracted passengers were blamed more than attentive passengers, while blame did not vary significantly across seat positions. The finding that riders - who lack the ability to control the autonomous vehicles in which they ride - are blamed for accidents if they are on their phones suggests a mechanism for moral blame in this context that is distinct from any casual chain.

[39] Blind Agreement: A Content Analysis on Fear Appeal and Post Interactions on Truth Social

12:45 PM – 1:45 PM

POLITICS

Many politicians have utilized social media to enhance political discourse by connecting with those who share their ideologies. In the present study, we examine the communication style of the current President of the United States, Donald Trump, on Truth Social as a primary approach to promoting his Make America Great Again (MAGA) campaign through a quantitative content analysis. One hundred seventeen text posts were analyzed from Truth Social from Donald Trump's personal account. Coding variables included appeals to fear, in-group/out-group language, White nationalist rhetoric, and typographical emphasis on Trump's post interactions. A Pearson's correlation was used to determine a positive relationship between the interaction options "likes" and "ReTruths." A point-biserial correlation analysis was conducted and found a positive relationship between the number of post interactions and typographical emphasis. Finally, a multiple regression analysis indicated that fear appeal predicted higher interactions. These findings provide insight into how modern politicians may optimize persuasive rhetoric using social media to gain endorsement from targeted audiences.

[40] Breadth and Depth in the Search for Meaning : Development and Validity Test of Dual Existential Meaning Search Scale

12:45 PM – 1:45 PM

SELF/IDENTITY

How do people pursue meaning in life? Existential psychology suggests that individuals construct meaning through diverse sources, yet prior research has focused largely on the content of these sources rather than the ways people search for them. We propose a dual-dimensional framework of meaning search: seeking breadth (exploring a wide variety of sources) versus seeking depth (immersing in a few sources). Across three studies, we developed and validated the Dual Existential Meaning Search (DEMS) scale and examined how these search styles shape meaning experiences. In Study 1 (N = 323), exploratory factor analysis of candidate items yielded a 12-item DEMS with two factors: breadth (e.g., "I often feel motivated to discover new meaning in new experiences") and depth (e.g., "I sometimes feel a strong urge to pursue deeper meaning in my life"). In Study 2 (N = 317), confirmatory factor analysis supported the two-factor structure, and differential associations emerged: depth was linked with religiosity and need for closure, while breadth related to extraversion, curiosity, and openness. In Study 3 (N = 273), participants rated meaning across 16 life domains (e.g., family, achievement, spirituality). Depth search predicted concentrated meaning in select domains, whereas breadth search predicted distributed meaning across multiple domains. Together, these findings highlight the necessity of distinguishing search styles, offering a more nuanced framework for understanding how people construct life meaning.

[41] Campus Economic Inequality May Shape Feelings of “Falling Behind” and Reduced Student Well-Being

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Past research suggests that White-wealth stereotypes in the U.S. lead the average White American to feel as if they are “falling behind” most White Americans (i.e., low within-group status). And, these perceptions of low within-group status predict worse health over time. In the present study, we extend this work to test whether campuses with high economic inequality might be contexts where students, on average, feel as if they are “falling behind” the typical student who is stereotyped as wealthy. In a daily longitudinal design, students (N = 103) from one of the most economically unequal campuses in the country completed nightly surveys about their health, feelings of “falling behind,” and daily status comparisons. On average, students reported feeling significantly lower status than most other students at their university who were stereotyped to be wealthy. Low within-group subjective status then predicted worse mental/physical health via increased negative emotions and number of daily upward status comparisons (controlling for objective status). We conclude that contexts of high inequality may foster feelings of “falling behind” with important consequences for well-being.

[42] Can Objects Be Self? Implications for Moral Judgment, Identity, and Perceived Significance

12:45 PM – 1:45 PM

SELF/IDENTITY

Belk (1988) proposed that possessions can serve as extensions of the self, yet direct empirical evidence for this claim has been limited. Across four experiments (Studies 1, 3 and 4 preregistered), we test whether sentimental objects are treated as self-extensions and whether their violation evokes moral concern. In Studies 1–2, altering an individual’s sense of self through transformations of belief systems (e.g., adopting Buddhist non-attachment) reduced perceived value of sentimental objects, whereas mere masking of the self (e.g. experiencing depression) did not. Study 3 showed that losing sentimental objects was judged to disrupt personal identity, suggesting that such possessions sustain perceived self-continuity. Study 4 demonstrated that harms toward sentimental objects were judged as more immoral than identical harms toward non-sentimental ones, an effect mediated by perceived object centrality to the self. Together, these findings provide convergent experimental support for the notion that sentimental possessions constitute part of the self-concept and shape moral cognition due to their centrality to personal identity.

[43] Choosing Not to Debunk: Political Bias in Responses to Online Misinformation

12:45 PM – 1:45 PM

POLITICS

Online political misinformation presents one of the greatest challenges to contemporary political discourse. Indeed, misinformation is often cited as one of the largest contributors to political polarization (Van Bavel et al., 2025), and concerns about online “fake news” are now common among the American public (Pew Research Center, 2025). For this reason, much literature has examined the causes of the proliferation of online misinformation. While many scholars explain the increase in online misinformation as a product of predictive algorithms or deliberate spreading by political actors (Chan et al., 2017), this research explores another approach, hypothesizing that a reluctance to debunk online misinformation is a common phenomenon. The study presented found that participants (n = 603) were significantly more likely to avoid debunking misinformation when the misinformation portrayed their political outgroup members negatively, even when the participants themselves believed the information was false. In addition, an average of 44% of participants refrained from correcting misinformation, with 39% doing so even though they believed the information to be false.

[44] Cleaning Up the Underbelly of Society: Disentangling the Effects of Ingroup Attachment and Glorification

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Societies face pressing internal problems, such as crime targeting vulnerable populations or drug addiction, that harm their members. Yet authorities and the public often fail to address these issues. When, then, are people willing to take ingroup corrective actions—efforts to address their own group's flaws? Across four studies, we examine how two modes of national identification, attachment and glorification (Roccas et al., 2006), shape such actions. Three surveys with South Koreans (N = 500) and Americans (N = 163) consistently showed that glorification, but not attachment, predicted greater collective guilt, which in turn increased intentions to take corrective actions (e.g., donating to addiction programs, protesting for awareness). This finding complicates prior work, as glorification has typically been linked to negative outcomes such as collective narcissism. Furthermore, an experiment (N = 240) showed that enhancing glorification (vs. individuation) heightened collective guilt, which predicted corrective action intentions. We discuss this seemingly paradoxical effect and its implications for how glorification can motivate repairing societal flaws.

[45] College Students' Solidarity with Palestine/Israel: An application of the Theory of Planned Behavior

12:45 PM – 1:45 PM

POLITICS

Grounded in the Theory of Planned Behavior, this study investigates the psychological drivers of allyship amid the ongoing genocide in Gaza. We conceptualized allyship through four key constructs: social justice attitudes (beliefs and values related to justice), perceived behavioral control (confidence in one's ability to act), subjective norms (perceived social pressure to engage), and behavioral intentions (plans for future action). Using structural equation modeling (N = 250 U.S. college students), we examined how these constructs predicted support for three political outcomes: solidarity with Palestine, solidarity with Israel, and support for a ceasefire.

Across models, social justice attitudes and subjective norms emerged as significant predictors of behavioral intentions. Notably, only solidarity with Palestine was robustly predicted by both attitudes and intentions, while perceived behavioral control was negatively associated, suggesting that strong ideological commitment can drive allyship even in the face of low perceived efficacy. In contrast, solidarity with Israel was predicted positively by attitudes and intentions but negatively by subjective norms, indicating possible social discouragement of this form of solidarity. No significant predictors emerged for ceasefire support.

These findings reveal how motivations for allyship vary across political targets, shaped by context, ideology, and perceived social pressure. We believe this work offers timely insights for researchers, educators, and policymakers concerned with social action, political identity, and intergroup solidarity in times of crisis.

[46] Conflict or Harmony: Outcomes and Integration For Holding Multiple Marginalized Identities

12:45 PM – 1:45 PM

SELF/IDENTITY

Previous literature about individuals with multiple minority identities has predominantly focused on race and gender (e.g., Hecht et al., 2001; Yampolsky et al., 2013). However, little work has examined how other combinations of identities integrate with each other (Cheng et al., 2008; Jackson et al., 2012). We purposely sampled participants across minoritized race, gender, and sexuality: racial and gender minorities (e.g., straight women of color), sexual and gender minorities (e.g., queer white women), and sexual and racial minorities (e.g., queer men of color). We were interested in the degree to which these various combinations of marginalized groups report integrating their identities. Our findings indicated that queer white women reported greater identity integration as compared to both queer men of color and straight women of color. Additionally, participants' identity integration was related to the degree to which they felt self-overlap with their identities. These findings have critical implications for how individuals with multiple marginalized identities navigate their identities and the strategies used to reduce conflict between them.

[47] Confucian Patriarchy and Identity Negotiation Among Chinese Immigrant Women

12:45 PM – 1:45 PM

SELF/IDENTITY

This study explores how Chinese immigrant women raised under Confucian patriarchy reconstruct identity, gender roles, and intergenerational relations post-migration. Guided by acculturation theory (Berry, 2005) and role theory (Georgas & Charles, 2004), we examine how cultural transition enables new forms of selfhood. Ethnographic interviews and observations were conducted with 20 women born before the mid-1990s. Data were analyzed using flexible coding to identify patterns of role negotiation. Findings show that migration disrupts traditional life scripts and enables redefinition of gendered expectations. Participants report returning to an "emerging adulthood" phase, navigating inherited norms and emerging agency. Fang struggles with her daughter's rejection of traditional femininity; Zhongrui prioritizes mental health over filial obedience. These narratives reveal processes of "degendering" and intergenerational reorientation, highlighting how immigrant women negotiate conflicting cultural schemas. The findings deepen understanding of gendered identity reconstruction in migration contexts.

[48] Social Network Access and Growth: Building Relational Resilience for Street Crew-Involved Men through a Community-Based Intervention

12:45 PM – 1:45 PM

FIELD RESEARCH/INTERVENTIONS

To address gun violence disproportionately affecting New York City's poorest neighborhoods, community violence interventions (CVI) often target high-risk individuals through holistic programming. Project Restore (PR), a 12-month CVI serving 30 men from rival street crews, concluded without any new participant violent arrests and an overall 28% reduction in community shooting incidents. The current research examines the role of social network transformation on PR participants' violence reduction outcomes. Using mixed methods, Study 1 employed qualitative content analysis of post-intervention interviews with 25 of the 30 PR participants to examine relationship changes across three Social Brain Hypothesis levels: Support Clique (family), Sympathy Group (peers, mentors), and Active Network (professional connections). Study 2 conducted social network analysis with a purposively selected subset of six participants—influential crew leaders from both rival groups—examining structural network changes pre- and post-intervention. Results demonstrated substantial network expansion and transformation that may help explain PR's previously documented success.

[49] Cross-cultural value orientation and environmental behavior - A study from university students of Nepal and United States of America

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Existing studies exploring individual values and environmental behavior have established that self transcendent values have a positive association and self-enhancement values have a negative association with pro environmental behaviors. However, few studies have asked whether this relationship between values and pro environmental behaviors varies based on culture. We tested the link between egoistic, altruistic and biospheric value orientation and environmentally relevant behaviors in two contrasting cultures: the USA and Nepal. The results showed that in the USA, biospheric value orientation positively predicts and egoistic value orientation negatively predicts pro environmental behaviors. On the contrary, in the case of Nepal, we found that egoistic value orientation predicts pro environmental behaviors like purchasing sustainable products, donating and volunteering for environmental causes. Likewise, in comparison to the US, biospheric value orientation in Nepal has a weaker association with environmental behavior. These results demonstrate culturally-specific relations between value orientation and environmentally relevant behaviors.

[50] Crowding out Systemic Change: The Appeal of Individual-Level Interventions

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Systemic reforms (e.g., taxes, regulations) are often key drivers of meaningful change, yet behavioral science has historically focused on individual-level nudges (Chater & Loewenstein, 2023; Hagmann et al. 2019; 2023). Across three experiments (N=1,766), we examined how U.S. adults evaluate "i-frame" nudges versus "s-frame" reforms across a variety of issues (e.g., cell-phone use in schools, climate change, online privacy). First, we saw that systemic policies attract less public support than individual-level nudges, partly due to cost-benefit perceptions. Second, people systematically misjudge public opinion: they underestimate others' support for both i- and s-frame policies, even on a politically neutral issue. Because systemic reforms often require broad coordination and buy-in, these misperceptions can create a false social reality, suppress advocacy, and hinder structural change. Our ongoing work examines interventions to correct these social perception gaps, demonstrating that aligning perceived and actual public opinion is vital for more effective, large-scale policymaking.

[51] Cuing Social Media Disrupts Perceived Self-Knowledge.

12:45 PM – 1:45 PM

SELF/IDENTITY

Social media use is widespread among young adults in the United States, yet little is known about how it shapes self-understanding, despite growing research on its psychological consequences, particularly among individuals exhibiting signs of social media addiction (SMA). Study 1 (N = 235), a daily diary study, found a positive association between social media addiction and self-alienation (i.e., sense of disconnection from the self) at the daily level. Building on these findings, Study 2 uses a within-subjects, social media cue-reactivity paradigm. Participants will be exposed to two cue sets [social media vs. automobiles (control)] in randomized order. Following each set of cues, participants will answer questions regarding the cues, then complete self-report items assessing the urge to use social media/drive an automobile and self-alienation. We hypothesize a main effect of cue condition on perceived self-knowledge, such that social media cues will increase self-alienation. Additionally, we expect the effect of cue exposure on self-alienation will be highest for those who express an urge to use social media.

[52] Deception as Self-Protection in High-Risk Contexts: A Naturalistic Study

12:45 PM – 1:45 PM

SELF/IDENTITY

High-stakes, naturalistic contexts provide a rare opportunity to examine deception as it unfolds under intense cognitive and emotional pressure. Televised pleas for help in missing persons cases offer a valuable setting for identifying reliable behavioral markers of dishonesty, as some are delivered by perpetrators themselves under exceptionally strong motivation to deceive. In this study, 100 missing person plea videos (50 from honest individuals and 50 from deceptive individuals) will be coded by trained judges who are blind to the speakers' veracity, using the newly developed Plea for Help Q-sort. This measure captures mid-level behavioral domains often overlooked in prior missing person deception research, including emotional display (e.g., exaggerated or flat affect), verbal and nonverbal behaviors (e.g., contradictions between words and demeanor), and self-presentation (e.g., defensiveness or efforts to appear sympathetic). Findings will aim to clarify which cues are most consistently associated with dishonesty in emotionally charged, high-risk contexts, with implications for forensic and clinical assessments.

[53] Deep conversations, stronger selves? The impact of self-disclosure extent on sense of identity

12:45 PM – 1:45 PM

SELF/IDENTITY

Close relationships are cognitively intertwined with sense of identity, or one's sense of who they are, purpose in life, and clear goals (Collins & Beike, 2025; Lounsbury et al., 2005). Sense of identity is also correlated with the degree to which people report engaging in self-disclosure. The present study is designed to test whether manipulating the extent of self-disclosure enhances sense of identity. In four lab sessions over two weeks, each participant in a planned sample of 150, will engage in one-sided self-disclosure, reciprocal self-disclosure, or a non-disclosing control with an experimenter and complete measures of sense of identity. Self-disclosure will be structured by having participants respond to increasingly deep questions (Sedikides et al., 1999) over the four sessions. We predict those in the reciprocal disclosure condition will report a stronger sense of identity, than those in the one-sided or control condition, and an increase in sense of identity across time in both disclosure conditions. Engaging in regular, reciprocal self-disclosure may provide a solution for a weak sense of identity and a means by which close others are influential to the self.

[54] Defensive processing and the acceptance of misinformation on social media

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

This poster presents preliminary findings from an experimental study on the role of mistrust in misinformation acceptance. Participants from a student sample ($n = 58$) and a Prolific sample ($n = 126$) evaluated 15 mock social media posts on psychology topics (e.g., depression, trauma, or family) and rated their truthfulness and accuracy. Participants were randomly assigned to an accurate condition (80% accurate, 20% misinformation) or a misinformation condition (20% accurate, 80% misinformation). Posts also varied within-subjects, including credibility claims (e.g., "Don't believe me? Here's Pincus & Lukowitsky (2010), cited 1300 times...") or danger-everywhere themes (e.g., "It applies to a lot of different situations. Watch out for these people!").

We focused on a sub-factor of inequality-driven mistrust, specifically defensive processing (e.g., "If you put too much faith in what people tell you, you are likely to get hurt", $\alpha = .74$). Multiple regression analyses showed that defensive processing predicted greater misinformation acceptance. For danger-everywhere posts, this effect was significant ($b = .26$, $p = .017$), though condition did not moderate the effect ($p = .272$). For credibility-claim posts, defensive processing was again a significant predictor of misinformation acceptance ($b = .32$, $p = .005$), and participants in the misinformation condition showed higher acceptance ($b = .77$, $p = .040$). Moderation analyses suggested mistrust may play a stronger role when misinformation is less frequent. These results highlight defensive processing as a key factor in susceptibility to misinformation, particularly when posts employ credibility cues.

[55] Defensive Reactions to Prejudice as a Function of Feedback about Self and Ingroup

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Anti-bias training is often unsuccessful (Devine & Ash, 2022) because feedback that self or ingroup are prejudiced likely prompts defensiveness (Legault et al., 2011). We examine how White Americans who vary in internal motivation to control prejudice manage their identity in response to feedback that they and/or their racial group harbor anti-Black prejudice. We hypothesize that: (1) in the absence of feedback, motivated persons will endorse dismantling systems of discrimination; (2) when feedback is about the ingroup (but not self), motivated persons will distance self from ingroup; (3) when feedback is about self, motivated persons will deny and defend their prejudice particularly when feedback co-occurs about the ingroup. To test these ideas, we pre-measure motivation to control prejudice, have White participants complete a race IAT, randomly assign them feedback in a 2(self: no-feedback, anti-Black) x 2(white-Americans: no-feedback, anti-Black) design, and have them complete the 4-D (Defend, Deny, Distance, and Dismantle) scale (Shuman et al., 2024). We have thus far collected 454 of the planned 500 observations.

[56] Defying Stereotypes: Identity Transformation Through Photography in Adults with Congenital Visual Impairment

12:45 PM – 1:45 PM

SELF/IDENTITY

Societal stereotypes often define blindness in terms of limitation, constraining both identity and perceived capability. Little research examines how contradicting such assumptions through lived experiences—succeeding in activities deemed “impossible”—shapes identity and purpose. We interviewed five adults with visual impairment who completed a professional photography course that challenged assumptions about vision-dependent skills and asked them about their identity, purpose, and meaning-making. Analysis revealed three patterns: (1) redefined self-knowledge, as participants reassessed their capabilities; (2) counter-narrative identity construction, as they developed new stories resisting disability stereotypes; and (3) expansive purpose development, marked by reimagined goals and futures. Participants described photography as transformative both through creative expression and the dissonance of succeeding at an “impossible” task, producing identity “breakthroughs.” Findings suggest structured experiences confronting disability stereotypes can catalyze identity and purpose transformation, offering new directions for disability psychology and rehabilitation.

[57] Developing an Expanded Dimensional Measure of Trust

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Trust is crucial for fostering interpersonal cooperation and social harmony, but misplaced trust can lead to devastating consequences. Financial scams disproportionately target older adults, likely due to excessive trust. Although research suggests that older adults are more trusting than younger adults, the underlying reasons remain unclear—possibly due to limitations in existing trust measures. The present study addresses this gap by developing an Expanded Dimensional Measure of Trust (EDMT), which extends the existing Multi-Dimensional Measure of Trust—comprising Capacity and Moral Trust—by adding a third factor: Socioemotional Trust. Participants (n = 41) provided socioemotional words that characterize the people they trust. The top 30 most frequent words were rated by additional participants (n = 75). An iterative principal component analysis revealed the top four items in the socioemotional trust factor: caring, supportive, understanding, and considerate. By incorporating socioemotional dimensions, the EDMT enables a more nuanced understanding of trust that may offer critical insights into the unique vulnerabilities of older adults in today’s fraud-prevalent environments.

[58] Development of Integrated Leader and Follower Identities: A Qualitative Exploration

12:45 PM – 1:45 PM

SELF/IDENTITY

In modern work contexts, one is often required to simultaneously be a leader and a follower (e.g., middle-level managers who must lead their subordinates while following executives). Leadership and followership are inherently interdependent and often conceptualized as opposites, as they each carry their own set of schemas and expectations. Thus, holding the identities of both leader and follower may present a sense of identity tension. The identity literature establishes that individuals may see their distinct identities as either “compatible” or “oppositional”, and that they may construct a third, unique sense of identity that integrates characteristics of both (Benet-Martínez & Haritatos, 2005). The present study examines whether and how individuals come to an integrated sense of self as leader and follower. This qualitative study includes interviews with 56 working adults, and aims to answer the question: What are the stories individuals tell themselves about who they are as leaders/followers and how they have come to an integrated leader-follower identity? Using both thematic and structural analysis, this study will identify common themes in leader identity development narratives and examine how the structure of these narratives may differ between those with integrated vs. partitioned (oppositional) leader and follower identities. Findings will contribute to a greater understanding of leader identity development, specifically the emerging concept of follower-leader identity integration, and provide a basis for creating leader development interventions based on personal narratives.

[59] Differences in self-perceptions between college students who do and do not vape: An online cross-sectional study

12:45 PM – 1:45 PM

SELF/IDENTITY

Vape use is a public health concern among young adults, and often differs from other forms of nicotine use. Thus, interventions will need to be tailored to best support individuals in their journey towards cessation, such as considering the role of identity-related concerns that may be tied to vape use. We hypothesized that individuals who vape, compared to those who do not, would report lower self-esteem, higher self-alienation (i.e., disconnection from the self), and increased likelihood to report a concealable stigmatized identity (CSI). Undergraduates (N = 380) filled out measures of self-esteem, self-alienation, CSI status, and vape use. Participants who self-reported vape use were also asked to write about their journey of vape use (e.g., initiation, continued use). Results show that participants who vape reported higher self-esteem, lower self-alienation, an increased likelihood to self-report having a CSI, and described social reasons as a primary motivation for vape use. Taken together, the social connection tied to vape use, which may inform a person's view of themselves, may be a driver of vape use and should be a point of leverage in developing future interventions.

[61] Digital media use, loneliness, and exploration in a reward task among late adolescents

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Digital media is an essential aspect of our social lives, but its associations with loneliness and exploration are still not fully understood. We sought to clarify these effects by examining acute loneliness and behavior in a monetary reward task following a period of smartphone inaccessibility. Participants (N=54, 50% female; aged 19.7 ± 1.2) completed a loneliness questionnaire and a reward learning task once after a 24-hour period of digital media abstinence and again after using digital media as normal. A linear mixed-effects model assessed differences in state-level loneliness and win-shift behavior during the abstinence versus media use conditions.

Participants engaged in more exploration during the reward task in the media use condition compared to the abstinence condition ($\beta=29.40$, $p=.018$). Additionally, higher state-level loneliness was associated with greater exploration during the abstinence condition, but with decreased exploration during the media use condition ($\beta=-0.60$, $SE=0.24$, $t(58.83)=-2.45$, $p=.017$). We suggest that a lack of compensatory social stimulation among lonely individuals provided by smartphone use may drive increased explorative behavior.

[62] Disconfirmation bias: Do people ever seek out disagreement?

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Cognitive reflection problems are those for which most people come up with an answer that is intuitively compelling (but wrong) but some people come up with an answer that is counterintuitive (but correct). Trouche et al. (2014) asked participants to solve a cognitive reflection problem first on their own and then in groups. Most participants headed into group discussions with the wrong answer, but they listened to the other side's explanation and eventually changed their minds. It appears that "truth wins" when people who disagree about cognitive reflection problems are forced to come together, but it is not clear whether people would choose to come together. Thanks to confirmation biases, people may instead avoid those with whom they disagree. We will ask undergraduates to solve a cognitive reflection problem on their own, then ask them to choose whether to discuss the problem with another participant who agreed vs. disagreed with them. In addition to investigating whether most people seek out disagreement, we will explore the factors that drive them to do so. We speculate, for instance, that intellectually humble individuals will be most likely to seek out disagreement.

[64] Do Different Mechanisms Drive Partisan Animosity towards the Left vs. Right?

12:45 PM – 1:45 PM

POLITICS

Partisan animosity is bad, but why partisans hate each other is unclear. Since the left is more demographically diverse, we thought the reasons the left and right hate each other would differ. Threat and competition drive hatred of minoritized groups, suggesting these may be why the right hates the left. Because liberalism is defined as egalitarian and progressive, we expected perceptions of the right as powerful and harmful may drive animosity towards them. In a nationally representative sample (N=403), political ideology was strongly linked with animosity (r 's=.74, and .70, $ps<.001$). Threat, competition, and power exacerbated the link between politics and animosity (interaction β 's =.09 to .19, $ps<.001$). Harm mediated the politics-animosity link (indirect b (se)=.26(.03)95% CI [.19, .33]) for conservatives, and (indirect b (se)=.16(.02)95% CI [-.21, -.12]) for liberals. Thus, these group perceptions shape partisan animosity, but the reasons the left and right hate each other are the same. Follow up analyses probe whether patterns differ for ideological vs. cultural targets linked to the left and right. Ongoing studies test whether reducing harm perceptions reduces animosity.

[65] Do I Fight with You Because We're Alike—or Because It's Right? Identity vs. Morality in Interminority Solidarity

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

People of different marginalized identities have come together and brought about lasting change to the American landscape in instances such as the labor rights movements and Black Lives Matter. So far, these interminority coalitions are thought to arise from shared identity and shared discrimination experiences. When shared experiences, however, are not apparent, how can we foster interminority solidarity? In this study, we test the effectiveness of shared discrimination and moral violation as two distinct mechanisms to foster interminority solidarity. Asians Americans will be exposed to vignettes about recent Latino deportations framed in different ways. We tested the hypotheses that i. framing a minority outgroup's struggle as similar to the minority ingroup's struggles will foster interminority solidarity, and that ii. framing the outgroup's struggle as a moral violation will foster interminority solidarity even when the outgroup's discrimination is presented as dissimilar to the ingroup. We also explored the relative strength of the shared identity and the morality intervention.

[66] Do social goals moderate the effect of brief mindfulness instruction on compassion and prosocial behavior?

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Research on secular mindfulness practices has grown exponentially over the last three decades, finding benefits for personal and social well-being. Contemplative scholars have argued, however, that for the social benefits of mindfulness to be realized, meditation practices should be grounded in their original ethical framework. This study attempts to clarify if mindfulness itself promotes social well-being or if mindfulness interacts with ethics (i.e., one's current social goals) to predict social well-being. Undergraduates ($n = 274$) will listen to a real or sham mindfulness instruction prior to observing an ostensible person being ostracized in an online game. To manipulate social goals, the victim will be at fault for their own ostracism. For half the participants the ostracism victim will be excluded for no apparent reason. Participants will be invited to write emails to the ostensible Cyberball players, scored for helping and hurting. Three 2×2 factorial ANOVAs will be computed. If mindfulness predicts compassion and helping only for the non-burdensome victim, this will highlight the importance of grounding mindfulness in ethics to enhance social well-being.

[67] Do they have your best interest in mind? The effect of advice in risky decisions.

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Uncertainty plagues many everyday decisions, and social influence is often a common denominator. Social decision-making research has contributed key findings about self-other decision-making, particularly in monetary allocation tasks. However, less is known about the role of other social behaviors, such as advice giving/taking; in cases where uncertainty is high and a poor decision may have dire consequences, seeking advice is often encouraged. The current study uses eye-tracking to investigate how uncertainty and heuristics shape decision-making behavior. In this manipulation, advisors are given numerical information about the gambles, and provide advice on some trials for future advisees, who receive incomplete information about the gambles. Effects of the advice condition will be explored with the use of maximum likelihood estimates to approximate subject and group-level risk parameters for regression models. Further exploratory analysis will be conducted to determine whether individual differences modulate behavior. This paradigm entwines prior research in the fields of neuroeconomics and social psychology, and offers an expanded lens for thinking about everyday decisions.

[68] Do we really want our politicians to be intellectually humble?

12:45 PM – 1:45 PM

POLITICS

In the current work, we examined whether people think politicians should exhibit intellectual humility (IH) in two preregistered studies. Study 1 was a repeated measures experiment where participants reported their ideal level of IH for ingroup and outgroup politicians across different contexts. Participants thought outgroup politicians should be more intellectually humble than ingroup politicians, and thought ingroup (and to a lesser extent outgroup) politicians should be more intellectually humble in cooperative than competitive contexts. In Study 2, we randomly assigned participants to read about high or low IH politicians and measured warmth, competence, and voting intentions. We found that there was a significant impact of IH, but this was larger for outgroup politicians than ingroup politicians. We also asked participants to report their ideal and perceived IH of Joe Biden and Donald Trump, finding that people perceived higher IH for their ingroup than outgroup politician. These perceptions then predicted voting intentions. This work reveals the importance of IH as a component of political person perception.

[69] Does Ingroup Superiority Explain the Effects of the Internalized Model Minority Myth on Asian Americans' Attitudes Toward Black Americans?

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

The Model Minority Myth is a social construct that presents Asian Americans as intelligent, successful, and hard-working. Past research has shown that Asian Americans' internalization of the Model Minority Myth has negative implications for their mental health (e.g., Yoo et al., 2015). More recently, researchers have shown that the Model Minority Myth also has negative implications for Asian Americans' intergroup attitudes toward Black Americans, as well (e.g., Yi & Todd, 2021). However, this work is correlational and does not account for theoretically plausible covariates. We propose that the relationship between the internalized Model Minority Myth and anti-Black attitudes is rooted in a more basic psychological process: Ingroup superiority. In an exploratory study with 104 monoracial Asian American participants, we found that ingroup superiority was associated with Achievement Orientation, a component of the internalized Model Minority Myth. After accounting for ingroup superiority, which was positively associated with anti-Black attitudes, there was no relationship with the internalized Model Minority Myth. The Model Minority Myth may serve to validate some Asian Americans' beliefs in ingroup superiority.

[71] Dual Forms of Teleological Reasoning in Judgements of Authenticity

12:45 PM – 1:45 PM

SELF/IDENTITY

Teleological reasoning holds that entities exist for specific purposes, suggesting a link between perceived purpose and perceived authenticity. The present study tested whether judgments of authenticity in others rely on two distinct forms of teleological reasoning: a perceived individual telos, relating to skills and passions, and a perceived universal telos, relating to the moral ideal of being a good human being. In a within-subjects experiment, 269 undergraduates read vignettes in which characters either maintained or abandoned a unique passion and acted either morally or immorally. After each vignette, participants made both "shallow" and "deep" authenticity judgments of the character. Results revealed main effects of both consistency and morality, as well as a three-way interaction: shallow authenticity judgments were shaped more by self-consistency information, whereas deep authenticity judgments were shaped more by morality information. These findings provide initial evidence for a layered model of teleological reasoning in which authenticity judgments draw on both individual and universal conceptions of human purpose.

[72] CANCELLED:

12:45 PM – 1:45 PM

SELF/IDENTITY

Dysfunctional individuation describes the maladaptive outcomes for identity, autonomy and relatedness following the separation-individuation processes, which is an iterative developmental process that is initiated by biographical transitions. Identity, autonomy and relatedness are the three domains of individuation. These domains are interrelated and work together to support psychological wellbeing. Minimal research has explored the presentation of dysfunctional individuation for adults after emerging adulthood. This study used qualitative and quantitative methods to develop knowledge into how adults (N=148) over the age of 30 describe their identity, autonomy and relatedness, and how these descriptions vary by levels of dysfunctional individuation. Identity, autonomy and relatedness were described through statements related to the participants' meaning making, outcomes of prior processes, traits and skills. As levels of dysfunctional individuation increased, participants tended to offer more negative descriptions of domains, increased statements about domain non-achievement and reported more references to maladaptive inter-relatedness amongst the domains.

[73] Echoes in the Chat: Conformity in AI-Simulated Political Majorities

12:45 PM – 1:45 PM

POLITICS

Do people conform when surrounded by a dominant political stance in a chat group with colleagues? We conducted an experiment with American participants (N = 180) assigned to a simulated workplace group chat populated by a few AI colleagues consistently expressing either liberal or conservative views on contentious political topics (e.g., guns, abortions, gender). Each participant engaged in several rounds of real-time text-based conversations. Stance alignment was coded by GPT-5 zero-shot stance detection and human rater on a unified scale from -2 (strongly liberal/strongly agree) to 2 (strongly conservative/strongly agree). Results revealed clear conformity: participants in liberal rooms expressed more liberal positions, while those in conservative rooms expressed more conservative positions. Coding agreement between GPT-5 and human ratings was observed to be reliably high. These findings provide evidence that in chat group-based social settings, when everyone around them voiced one side, participants echoed it, potentially creating a misleading impression of where the true majority lies in public opinion.

[74] Educating for Empathy: A Cross-Cultural Analysis of Empathy Pedagogy in the US, Italy, Germany, and Ecuador

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Empathy is a primary driver of prosocial behavior, and a foundational skill for building close interpersonal relationships. Empathy has the power to motivate altruism towards those in need, foster connection in the midst of conflict, and even bridge racial, political, and geographic divides. The problem is, we don't empathize with all "others" equally. The empathy we are born with is directed primarily towards our ingroup, and empathic bias towards racial outgroup members has been clearly documented. Fortunately, it's possible to expand our circle of empathy and develop more "inclusive" empathy towards diverse groups.

Empathy is a skill that can be fostered in the classroom, and preliminary research suggests empathy training can provide a host of positive outcomes. This paper presents the results of a cross-cultural qualitative study exploring how schools in the US, Italy, Germany, and Ecuador foster empathy. In particular, practices aiming to promote "inclusive" empathy—that which includes outgroups on various dimensions such as race, class, gender, sexual orientation, religion, ability, appearance, and species (ecological empathy)—are highlighted.

[75] Embodied Consequences of Identity Denial and Exclusion

12:45 PM – 1:45 PM

SELF/IDENTITY

Multiracial and Multicultural people hold two or more racial/ethnic/cultural identities and are seen as non-prototypical members of monoracial and cultural groups. Multiracial and Multicultural people often face challenges to their identity when their observable features do not match perceiver expectations for their groups (e.g., skin tone, accent; "You don't look Asian"; Albuja et al., 2019). Appearance is a multidimensional construct encompassing racialized features, and dissatisfaction with these features is linked to poorer appearance satisfaction and overall well-being (e.g., Bond & Cash, 1992). Little research has examined how identity denial and exclusion may fuel stress surrounding appearance. In an online survey of Multiracial and Multicultural individuals, $N = 331$, we asked whether experiences of identity denial and exclusion predict phenotypic dissatisfaction. Results showed that both experiences of exclusion and identity denial significantly predicted phenotypic dissatisfaction. This work demonstrates that invalidation diminishes belonging and manifests in embodied consequences.

[76] Emotion Regulation as a Pathway to Identity Formation in Emerging Adults

12:45 PM – 1:45 PM

SELF/IDENTITY

Developing a sense of identity is a central task of emerging adulthood, often shaped by negative experiences. One way people adjust with negative emotions is through cognitive reappraisal, a well-studied and adaptive emotion regulation strategy. Past research shows that reappraisal fosters purpose and coherent life narratives, key aspects of identity development. However, little is known about how reappraisal relates to identity development over time. To address this gap, we examined whether trait cognitive reappraisal use predicts identity development in a two-wave cross-lagged panel model. 1,628 undergraduates participated in a longitudinal online study, and completed two waves of surveys nine months apart, reporting on their emotion regulation strategy use and identity statuses. Results showed that reappraisal use at T1 predicted more adaptive identity outcomes at T2, specifically greater commitment making, identification with commitments, and exploration in breadth. These findings suggest that emotion regulation plays a key role in fostering healthy identity formation and may inform interventions that support adolescents and young adults in navigating identity development.

[77] Emotional predictors of political attitudes in a zero-sum context

12:45 PM – 1:45 PM

POLITICS

Starting in 2012, people are disliking their political outgroup more than they are liking their political ingroup. Does this asymmetry in behaviors extend to emotions? Are people's emotional responses to ingroup losses the same as an outgroup wins? Participants were recruited after the 2022 Midterm elections before it was known which political party would control the House and Senate. Participants indicated 14 emotions in response to their preferred party losing control in the House/Senate in 2 prompts: How would it make you feel if [your party LOST/ the [Outgroup party] WON]? Participants felt significantly more bitterness, anxiety, fear, as well as less empathy and compassion, when thinking about their political outgroup winning compared to their political ingroup losing, $F(13, 3367) = 52.79$, $p < .001$. Furthermore, feeling more violence when thinking about political outgroups winning compared to the ingroup losing was related to less trust, forgiveness, and interest in cooperation as well as more violence and hindrance. I replicated these results in a follow-up study with participants imagining the 2028 presidential election.

[78] Emotions and Action around the 2024 Election – Explanations and Future Predictions

12:45 PM – 1:45 PM

POLITICS

Substantial research has examined people's support for certain forms of activism in the context of social movements and the role of emotions in shaping political preferences (Thomas et al., 2009; Iyer et al., 2007; Shuman et al., 2022). The present research elicited written narratives and responses to survey measures from 146 undergraduate students to examine their appraisals of the results of the 2024 US presidential election. Democratic identification predicted a decreased faith in the American public's ability to act as an engaged and informed citizenry ($r = -.61, p < .001$); increased anger toward the Republican party, its candidate, non-voters, and the American public ($r = .77, p < .001$); and support for all types of protest tactic, with the relationship between liberal identification and support for non-normative tactics being slightly stronger ($r = .52, p < 0.001$) than normative tactics ($r = .22, p = .007$). Republican identification predicted increased faith in the American public's voting habits ($r = .62, p < .001$); increased hatred toward the Democratic candidate and Democratic voters ($r = .36, p < .001$); and decreased support for normative protest action ($r = -.48, p < .001$). These and other findings will be examined in relation to personal narratives about participants' emotional and rational analyses of the election and their beliefs about the future.

[79] Empathy, Loneliness, and Political Identity

12:45 PM – 1:45 PM

POLITICS

This research aims to better understand the relationship between empathy choice, loneliness, and political identity and policy preferences, which we do through an original survey experiment with four conditions. We utilize the empathy selection task and vignettes to test and measure empathy choice, and to elicit loneliness. We also test attitudes towards politicians, political groups, and support for different policies. At the time of submission, we have yet to finish data analysis, but data collection is nearly completed. We expect to find increased levels of isolation will increase willingness to empathize with others; willingness to empathize will predict stronger partisan identity; and stronger artisans will be more supportive of anti-democratic legislation.

[80] Environmental Predictors of Delay Discounting: Results from a correlational study in Chicago

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Individual variations in impulsive decision-making stem from a combination of genetic, biological, and environmental influences. Delay discounting (DD), the devaluation of future outcomes, is one of the critical components of decision-making. Lower SES has consistently been linked to steeper discounting, reflecting a stronger preference for immediate, smaller rewards over delayed, larger rewards. Emerging evidence suggests that environmental exposures, such as heat, limited greenery, and air pollution (PM2.5), may impair cognitive function and increase impulsive choice. Further, some studies have shown that higher PM2.5 exposure predicts steeper DD. However, whether this is the case with other environmental factors remains unclear. This study investigated how SES and multiple environmental factors jointly predict delay discounting. Participants were recruited for an EMA study in Chicago ($n = 395$) in which discounting was assessed using the Kirby Delay Discounting Scale, with the percentage of immediate rewards chosen out of total trials used as the outcome variable. Predictors included participant-level income bracket and home heat exposure, as well as neighborhood-level measures of heat, air quality/PM2.5, and greenspace. Regression analysis revealed that SES significantly predicted discounting: a higher income bracket was associated with a lower proportion of immediate reward choices ($\text{Beta} = -0.15, p < .01$). However, analyses of environmental factors (heat stress, air quality, and greenspace) showed no significant associations with delay discounting. The unexpected absence of direct effects from environmental factors such as greenery, heat, and air quality suggests complex, context-dependent influences. Future research should explore potential mediating factors or alternative measurement approaches.

[81] Epistemic Hypervigilance: When do we scrutinize others' motives for sharing information?

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Accompanying the rise in US partisan polarization is a rise in misinformation. People must practice epistemic vigilance: paying cautious attention to new information. One mode of epistemic vigilance is goal attribution: strategically wondering, why did this person share this information? But the decision to make an effortful goal attribution may be motivated by political group affiliations. If people are more inclined to make effortful goal attributions for outgroup (versus ingroup) information sharers, this may endanger epistemic vigilance, as they may be more accepting of misinformation from their ingroup, and skeptical of true information from their outgroup. In Study 1 (n=594), using fake Twitter/X profiles, we found that people made more effortful goal attributions for outgroup (versus ingroup) sharers of identical politically-neutral information. Study 2 probed 176,800 Reddit posts from 32 weeks prior to the 2020/2024 presidential elections; using natural language processing, we found that outgroup goal attributions increased as elections approached. This work reveals an underexplored attributional bias with implications for intergroup threat, censorship, and misinformation.

[82] Evaluating Non-Moral Passions and the Experience of Authenticity within the Integrity-Fluency Model

12:45 PM – 1:45 PM

SELF/IDENTITY

Previous research on perceptions of the true self and authenticity has largely emphasized morally valenced activities or traits. Does engaging in non-moral passions, particularly harmonious passions, also foster authenticity? The Integrity-Fluency Model (IFM; Hicks et al., in press) posits that two cues, self-integrity (i.e., acting consistently with deeply held values) and experiential fluency (i.e., ease in a situation), elicit the feelings of authenticity. In this study, participants will be randomly assigned to one of three conditions in which they will reflect on and write about a harmonious passion, obsessive passion, or a simple routine (control), followed by a series of measures of authenticity and relevant constructs. We hypothesize that harmonious passions, those autonomously chosen and integrated into one's self-concept, will lead to greater experiences of subjective authenticity and self-integrity compared to obsessive passions and routines, while both passion conditions increase experiential fluency. This study contributes empirical support for the IFM and extends the understanding of authenticity to non-moral domains, an area lacking currently in the literature.

[83] Examining an Important Assumption in the Faultline Literature

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Group faultlines are defined as hypothetical dividing lines that split a team into subgroups based aligned attributes. While early research examined dormant or potential faultlines, recent work has highlighted perceived subgroups. Yet most studies still emphasize between-subgroup relationships, assuming that "team members form homophilous ties on either side of a faultline by associating with others in the team who have similar attributes" (Ren et al., 2015, p. 390)—an assumption that remains untested.

Drawing on social comparison theory's "similarity hypothesis," we argue that subgroup members may compare more with each other than with outsiders, and that such comparisons can generate within-subgroup conflict (rather than between subgroups, as is typically assumed). Extending faultline research that distinguishes between identity-based and knowledge-based subgroups, we propose that members of identity-based subgroups are especially likely to compare popularity with one another, whereas members of knowledge-based subgroups more often compare competence. These within-subgroup comparisons can trigger within-subgroup competition and conflict.

Using multi-wave, round-robin data from 142 full-time employees across 27 work teams, we found support for our predictions: perceived subgroups fostered within-subgroup competition and conflict. We conclude by outlining implications for future faultline research.

[84] Examining Suboptimal Decision-Making in High-Stakes Resource Allocation

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

How do people navigate complex trade-offs when allocating scarce resources, and when do they avoid deciding altogether? In a preregistered study, participants allocated organ transplants across patient profiles that varied in deservingness and health responsibility. Participants could also opt out of deciding, which delayed allocation and increased the risk for the patients. Using behavioral choices, eye-tracking, and cognitive modeling, we test how attention and decision processes shape both allocation choices and decision deferral. Conjoint analyses estimate the weight participants assign to patient features, while regression models link choice-set characteristics and individual differences (indecisiveness, maximization) to opt-out behavior. Our results aim to illuminate the psychological processes that underlie decision-making in high-stakes contexts when people defer difficult trade-offs.

[85] Examining the Relations Between Educational Censorship Laws Affecting High School Curricula and the Ethnic-Racial Identity Development of Youth of Color

12:45 PM – 1:45 PM

SELF/IDENTITY

Research shows that when schools affirm students of color's racial and cultural identities through inclusive curricula, it promotes stronger ethnic-racial identity (ERI) and greater well-being. However, in recent years, over 30 U.S. states have introduced or passed educational censorship laws that restrict what public schools can teach about race, gender, and sexual orientation. This study examined whether censorship laws shape students' experiences of school racial climate and ERI development. Participants were 299 18–19-year-olds of color who recently completed high school in states with active censorship laws, proposed but failed censorship bills, or no such proposed legislation. They completed measures of school racial climate and ERI. Results showed no significant differences across policy contexts. However, students who were more aware of the spread of educational censorship laws reported experiencing greater stereotyping from teachers and in their school materials, lower positive ERI regard, and more engagement in critical action. Since these laws are recent, future research should track the development of awareness and its implications.

[86] Exploring backlash effects to rising gender equality among Gen Z men around the globe

12:45 PM – 1:45 PM

POLITICS

Gains in gender equality have been made in recent decades in many regions. Concurrently, increasing attention is being paid to rising gaps between young men and women in sexist attitudes and political conservatism. Drawing on system justification theory and intergroup threat theory, we hypothesize that increasing opportunities for women may trigger backlash among young men due to zero-sum perceptions that their own professional prospects have been reduced. Our analyses of nationally representative surveys of more than 90,000 individuals from 66 countries support this hypothesis, particularly in more gender-equal societies. However, it remains unknown whether gaps have increased over time and are more pronounced in countries with more rapidly improving equality. To address this, we conducted multilevel analyses across five waves of data collected in more than 100 countries dating back to 1995. We also tested whether young men with greater psychological and material resources may be more resilient to backlash responses. Our findings provide global cross-level insight into ironic reductions in egalitarianism among those who perceive themselves to be victims of improving societal conditions.

[87] Exploring ethnic identity, racialization, and psychological well-being among US-born Arab Americans

12:45 PM – 1:45 PM

SELF/IDENTITY

Bicultural identity development in Arab Americans, who must manage sometimes conflicting cultural expectations, is understudied. Even less is known about Arab Americans born in the United States (US-born AA), who are American by birth yet are alienated from society due to differences between their 'white' racialization and their cultural identities. The current study aimed to examine the relationship between bicultural identity, racialization, and psychological well-being at the intersection of co-existing identities. Eight adult US-born AAs (M=28 years, SD=4) were recruited for semi-structured interviews analyzed with interpretative phenomenological analysis. Participants reported being misperceived by mainstream America, feeling erased by racialization, and being hypervigilant due to physical and psychological safety concerns. They also described their cultural values as protective against the negative effects of discrimination and often leveraged their ethnic visibility to find community. Findings illustrate the complexity of biculturalism and contextualize how participants make sense of their bicultural identity. Interventions tailored to this population may benefit from strategies aimed at increasing bicultural identity integration.

[88] Exploring Power, SES, and Attribution

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

People tend to take credit when they feel powerful (Lammers & Burgmer, 2019). However, subjective socioeconomic status (SSS) may shift how individuals perceive who gets credit. To test this idea, we preregistered an experiment to test whether a memory recall of power or powerlessness changes internal attributions, and if this effect is dependent on SSS. After individuals self-report their SSS using MacArthur's ladder (Adler et al., 2000), participants will be randomly assigned to recall a specific, high or low influence episode in their life. They will then indicate "who contributed more" and "who had more influence" on the outcome, and rate how positive or negative the outcome of the situation was. We will analyze results using moderated regression procedures and predict an interaction such that high-power (vs. low-power) recall yields greater internal attribution at higher SSS, but little to no increase at lower SSS. We aim to target the gap of how low SSS individuals, who, on balance, tend to explain outcomes through external constraints, encounter a state of high power where people, on average, make more internal attributions on outcomes.

[89] Exploring the Connection Between Self-Criticism, Self-Concealment, and Belonging Among Black Women at an HBCU

12:45 PM – 1:45 PM

SELF/IDENTITY

Black women (BW) face societal pressures to appear strong, resilient, and flawless, often leading to self-critical tendencies. Self-criticism, a personality trait involving negative self-evaluation, is related to interpersonal concerns and reduced belonging. Cognitive-evolutionary frameworks suggest self-concealment may mediate the relationship between self-criticism and belonging. Although BW at Historically Black Colleges and Universities (HBCUs) report more social support than at Predominantly White Institutions (PWIs), they still face gendered racial microaggressions, which can impact self-criticism and belonging. The relationship between these variables among BW at HBCUs has not been explored. This study analyzes secondary data from Black female students (n=259) at an HBCU using Andrew Hayes' PROCESS to test self-criticism as a predictor of belonging and estimate mediating and moderating effects of self-concealment. Findings will determine whether HBCUs mitigate maladaptive patterns of self-criticism or clarify if these patterns persist for BW even in racially affirming spaces. Implications will inform theory and culturally responsive interventions that support BW's well-being at HBCUs.

[90] Exploring the structure and predictors of political ideology in the United States

12:45 PM – 1:45 PM

POLITICS

Researchers in political psychology have long debated whether ideology is sufficiently conceptualized as a unidimensional continuum or whether multiple dimensions are needed. To this end, using data from the 2000, 2004, and 2006 ANES data sets, Feldman & Johnston (2017) demonstrated that one dimension was insufficient and that two dimensions (social and economic) provide a better explanation for political ideology in the U.S. Furthermore, these researchers also demonstrated the utility of these two dimensions by showing that each is predicted by different personality level variables such as need for cognition, authoritarianism, and religiosity. A question remains, however, about whether the conclusions of this work hold up given the changes in the political environment in the U.S. since the original data was collected. Specifically, given the increase in polarization since the early 2000s, has the structure of ideology changed to more closely fit the unidimensional conceptualization? If so, how have the predictors of this continuum changed? The current research seeks to answer these questions by replicating the analyses of the original work using more recent years of the ANES.

[91] Extreme Partisanship, Political Violence, and the Denial of Human Rights

12:45 PM – 1:45 PM

POLITICS

Democracy relies on the protection of human rights. However, public willingness to restrict these rights has become increasingly visible, and violations continue to be observed in the U.S. Our previous data, collected from Trump Inauguration attendees (N=164), Kansas Solidarity Fest attendees and KU Feminists (N=173), and representative samples (N=2,319), show that individuals on the right of the political spectrum are most willing to deny human rights. However, we find associations between extreme partisanship and the denial of certain rights (e.g., left-leaning vs right-leaning rights) on both sides of the political spectrum, as well as some support for political violence. We continue our research in a new representative sample (N=600), further exploring extreme left and right partisanship, human/civil rights denial, and support for political violence (e.g., regarding abortion clinics, tesla dealerships, Charlie Kirk). We consider whether approval of violence is associated with chaos/nihilism or partisan ideology.

[92] FOLK THINKING, FAST AND SLOW: INTUITIVE PREFERENCE FOR DELIBERATION IN HUMANS AND MACHINES

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Influential models conceive human thinking as an interplay between intuition and deliberation. Yet,

it's unclear how people actually perceive these types of reasoning. Across 13 studies (total N = 3066), we examined whether humans—and large language models (LLMs)—favor intuition or deliberation. Participants rated individuals' reasoning quality in short vignettes that varied by reasoning type (fast-intuitive vs. slow-deliberative) and past accuracy (high, low, unspecified). Consistently, participants rated deliberative reasoning as superior to intuition, regardless of accuracy. Deliberative thinkers were seen as smarter and more trustworthy—a preference that held even under time pressure and cognitive load, suggesting it arises intuitively. Studies with LLMs (ChatGPT 3.5 and 4) replicated the human preference pattern, indicating that AI language models capture human folk beliefs about reasoning. These findings suggest a strong intuitive link between deliberation and reliability, with critical implications for public trust in human and AI recommendations.

[93] Free Speech Matters... Until My Boss Says Otherwise

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

This study examined the effect of moral versus pragmatic goals, perceived peer support, and personal free speech attitudes on individuals' decisions to cancel a controversial campus speaker. Participants were told a potentially controversial speaker was coming to campus. Before the event, participants read the speakers opinions and decided whether to allow the event to continue. Participants were told either to do what they felt was morally right or to make the controversy go away. Then, participants were told either 90% or 10% of the student body were in favor of the event being cancelled. Participants read opinions on the following four topics: Transatheletes, Israel Hamas War, DEI hiring, and Red Pill Philosophy. Participants then indicated how offensive, psychologically harmful, physically harmful, and misleading they viewed the opinions to be. Finally, participants filled out the Freedom of Speech Index from Zakharin & Bates (2024). Results showed main effects of goals, perceived peer support, and free speech attitudes. These main effects were qualified by interactions between goals and perceived peer support as well as between goals and free speech attitudes.

[94] From Black Box to Blueprint: A Scalable Text Analysis Pipeline for Identifying Active Ingredients in Affirmation Writing

12:45 PM – 1:45 PM

LANGUAGE

Self-affirmation interventions, particularly values affirmation writing exercises, have demonstrated potential for improving well-being, reducing stress, and narrowing achievement gaps across diverse contexts. However, the psychological mechanisms underlying their effectiveness remain poorly understood, in part because most research treats the content of affirmation writing as a "black box," relying solely on condition-based comparisons rather than systematically analyzing what participants actually express. This project addresses this gap by developing and validating a scalable text analysis pipeline that leverages large language models (LLMs)-based natural language processing (NLP) and advanced to extract and quantify key psychological constructs and "affirmativeness"—from affirmation essays. By applying this pipeline to new and existing datasets, we identify the active components of affirmation writing that predict positive outcomes such as stress reduction, identity protection, and context-dependent "dampening" effects. The pipeline is designed to be accessible to researchers with varying technical backgrounds and adaptable to different languages and cultural contexts.

[95] From Comparison to Action: The Consequences of Exposure to History

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Proposed legislation claims exposure to U.S. history that outlines systemic racism causes psychological harm to privileged groups for actions committed in the past by other members of the same race. This study investigated how White people are personally affected when exposed to depictions of racial inequity from the perspective of a Black person. To test potential outcomes, the concepts of social comparison and collective action were applied, specifically focusing on how assimilating to an outgroup member who has experienced a negative historical outcome may lead to attitudes that endorse justice for outgroup members. Using a 2 (social comparison: assimilation vs. contrast) x 2 (outcome: positive vs. negative) design, White participants primed to assimilate to a Black target who experienced a negative outcome reported greater self-esteem, lower perceptions of injustice, and greater prosocial intentions than those primed to contrast to a target who experienced a negative outcome. Findings suggest that feeling similar to an outgroup member who is perceived as resilient in the face of injustice may paradoxically benefit the self and individual others while failing to benefit society.

[96] From Identity to Inequality: How Appraisals Inform Social Judgment

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

How we appraise our racial identities, as sources of strength or sources of stress, can shape how we see ourselves, others, and society. This study examined how racial identity appraisals influence perceptions of inequality and intergroup dynamics, as well as evaluations of individuals in professional contexts. Black (N = 296) and White (N = 300) Americans first reported on identity appraisals, perceived income inequality, discrimination, and intergroup anxiety. SEM analyses showed that for White Americans, resource appraisals predicted greater awareness of inequality and discrimination, while demand appraisals were unrelated. Then, participants evaluated a job applicant who was randomly identified as either Black (Jamal Jenkins) or White (James Sullivan) through a letter of recommendation. Identity appraisals once again shaped participants' responses. Among White Americans, higher resource appraisals were associated with more favorable evaluations of the Black applicant. In contrast, among Black Americans, higher resource appraisals were linked to less favorable evaluations of the Black applicant. For demand appraisals, White Americans who viewed their racial identity as more demanding evaluated the Black applicant more negatively. Findings highlight how cognitive appraisals of social identity can shape both perceptions of intergroup processes and interpersonal judgments.

[97] Generational Historical Reflexivity: A psychometric, experimental and applied examination

12:45 PM – 1:45 PM

POLITICS

Generational Historical Reflexivity (GHR) is the recognition of oneself as historically situated within a generational lineage, shaped by inherited social conditions and positioned to transform future realities. Across three studies, we examine its theoretical, empirical, and practical significance. First, a psychometric study (N=1000) supports a two-factor structure: historical causality and generational responsibility with strong reliability and validity. Second, an experiment (N=500) tests GHR's role in predicting problem-based views of inequality, expansive political vision, and attitudes toward diverse social actions. Third, a collaboration with a racial justice group explores how shifts in GHR relate to political engagement. Together, these studies suggest GHR is a powerful tool for understanding and fostering critical consciousness, political imagination, and intergenerational solidarity in both research and practice

[98] Generativity, Loneliness, and the Mediating Role of Prosocial Behavior

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Despite research showing that older adults engage more frequently in prosocial behaviors and report lower loneliness than younger generations, the underlying mechanisms remain unclear. Drawing from Erikson's developmental theory, this study investigated whether prosocial behavior mediates the relationship between generativity—concern for establishing and guiding the next generation—and loneliness among middle-aged and older adults.

This cross-sectional study utilized data from an online survey conducted in September 2024. The analytic sample comprised 334 participants aged 40 and above who completed validated measures of prosocial behavior frequency, generativity concerns, and loneliness levels. Structural equation modeling was conducted using R's lavaan package.

Results revealed that prosocial behavior frequency was negatively associated with loneliness and significantly mediated the relationship between generativity and loneliness, suggesting that generativity fosters helping behaviors that subsequently reduce loneliness. These findings indicate that achieving generativity and engaging in prosocial activities may help alleviate loneliness and promote social integration in later life.

[100] Getting Involved in a Society Breaking Down: The Link Between Anomie and (Non)Normative Political Actions

12:45 PM – 1:45 PM

POLITICS

Recent studies indicate a link between anomie, i.e., the perceived breakdown of society, and nonnormative, e.g., illegal, political actions. However, less is known about how anomie relates to normative political actions and what explains its relationship with political engagement more broadly. In three experiments (U.S., total N = 492) and a nationally representative sample from Germany (N = 1,624), we tested how anomie may have consequences for normative political actions. As hypothesized, anomie decreases intentions to engage in normative actions via perceived (1) political uncontrollability and (2) ineffectiveness of normative political actions. Second, anomie increases the perceived effectiveness of nonnormative political actions, predicting greater readiness to engage in them. Finally, we find some, but inconsistent, evidence that the link between anomie and nonnormative action may be better explained sequentially by lack of control and political uncertainty, indicating that such actions may reflect a quest for significance and meaning.

[101] Happy to help: Feeling successful and self-efficacious at helping prompts attention to sad faces

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Attention to sad faces has been described as characteristic of sad emotional states and in particular of depression. In contrast, non-sad observers appear to avoid allocating attention to sad faces presumably because it feels aversive to look at them. Will non-sad observers then never pay attention to sad faces? Here we suggest that feeling positive about and capable of helping others will cause an attentional bias to sad faces because it makes people motivated to and capable of looking at others' suffering. To investigate this possibility, we asked participants to recall an instance where they helped another person or where they failed to help (a control condition). Before and after this manipulation, participants performed a dot probe task measuring attention to sad faces in comparison to neutral faces. Replicating previous research, participants in both conditions were inattentive to sad faces at baseline. After the manipulation, only participants who had recalled successful helping behavior and felt self-efficacious raised attention to sad faces. These findings suggest that activating prosocial motivations increases attention to other people in need, but not when reminding people of their shortcomings in prosocial behavior. This approach opens a new avenue for research looking into the role of attentional processes in prosocial actions highlighting the role of feeling positive and able to help and to look at others' suffering.

[102] Harmful Bystander Intervention? Predictors of Bystander Harm in Sexual Assault Situations

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Research on bystander intervention has long shown that bystanders often fail to help others (Latané & Darley, 1970), but less is known about whether they actively contribute to harm. This study investigated predictors of harmful bystander behavior in sexual assault situations. We hypothesized that adherence to toxic masculine norms, past objectification and sexual assault perpetration, and hostile sexism would predict harmful bystander behavior. Participants were 162 men who completed baseline measures of masculine norms (e.g., power over women), perpetration history, and hostile sexism, then entered a virtual house party. Participant's verbal responses to men's unwanted sexual advances toward women were coded for harm (0 = absent, 1 = present). Bivariate analyses showed positive associations between masculinity, perpetration history, hostile sexism, and harm; however, binomial regression revealed that only hostile sexism uniquely predicted harm. These findings suggest that men's misogynistic attitudes, rather than general masculinity or perpetration history, most strongly escalate sexual risk situations.

[103] Harmony in Earnings, Bliss in Love?: Social-class Stereotypes within context of close relationships

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Do people believe that similar financial situations matter in relationship decisions? The debate between love and money has been endless, yet some literature implies that the rising perception that not only financial resources itself, but also the similarity of them are essential for a happy relationship may prevent people's relationship transitions. The major concern is that this social perception can conflict with actual desires. People, including romantic partners, have a basic need for connection (Baumeister & Leary, 1995), and intimate relations play a crucial role in well-being (Myers & Diener, 1995). Additionally, despite relationship status becoming conditional, people are reluctant to break-up once they are in one, given the emotional pain accompanied with dissolution (Rhoades et al., 2011). In light of this, the perpetuating belief that money equals happy relationships can carry potential disadvantages to modern people in two ways. First, it can lead to unwanted breakups due to extra hesitation for major relationship transitions (i.e., marriage). Second, it can contribute to singles' low well-being by closing the door for potential chances of relationships. Nevertheless, there has been little attempt to investigate social-class-based stereotypes within romantic contexts and how they influence people's relationship decisions. Thus, the present research aims to take the very first step. That is, the current study will be a holistic exploration of people's stereotypes regarding a couple's socioeconomic status, with a primary focus on the inequality and level of SES. Gender differences, and their interaction with SES, will also be examined.

[104] Honesty Online: How Self-Concept Clarity Shapes Self-disclosure and Well-Being

12:45 PM – 1:45 PM

SELF/IDENTITY

Individuals with high self-concept clarity (SCC)—a stable, consistent self-view—tend to show greater psychological adjustment and well-being. Self-concept and self-disclosure are closely linked, as people shape their self-views by sharing personal information and observing others' reactions. While online self-disclosure is especially abundant and flexible today, few studies have examined how it may transmit the effects of SCC on psychological outcomes, such as well-being. This study explores whether self-disclosure valence, honesty, and amount are mechanisms that help explain the association between SCC and well-being. Analyses of correlational data (N=804 Cloud Research) show that honesty significantly mediated this association: higher SCC was linked to more honest online self-disclosure, which in turn predicted greater life satisfaction and well-being. We also found that lower SCC was associated with perceiving Facebook as a safer and more beneficial space for self-disclosure than in-person settings. Thus, although individuals with low SCC may gravitate toward online self-disclosure, they may not fully reap its psychological benefits due to lower honesty in their disclosures.

[105] How Accents Alter Sentence Meaning

12:45 PM – 1:45 PM

LANGUAGE

Since the Industrial Revolution, people have been moving for work more than ever before, making societies increasingly racially and ethnically diverse. More recently, the COVID-19 pandemic prompted changes in the economy and work arrangements, enabling many to work remotely, even from abroad. As a result, our communities will continue to diversify, and opportunities to interact—both in person and virtually—with people from different cultures will increase. Research indicates that accent is a fundamental and unique dimension of social perception, similar to sex and age. Accents carry more weight than race in shaping children's social preferences and exert a stronger influence than physical appearance in determining adults' ethnic categorizations. Unfortunately, some studies suggest that non-native accents may trigger broad negative stereotypes, irrespective of specific ethnic or national associations. These findings raise an important question: how does hearing someone speaking with an accent different from our own influence the way we think? To explore this, I turn to Construal-Level Theory, a theory that explains psychological distance. This theory suggests that the further or less similar something or someone is to us, the more abstractly we construe them. Conversely, when something is closer or more similar, we form a more concrete understanding of it. To begin answering my question about accents, I aim to test whether they influence our interpretation of language. Does hearing a sentence spoken in a non-native accent alter the way we interpret it?

[106] How do group-oriented traits relate to college students' democratic attitudes?

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Typically, research suggests that age relates to political ideology such that youth are more liberal than older people (Glen, 1974). However, recent research suggests that the COVID-19 pandemic and social media increased the popularity of right-wing ideology among European college students (Vinocur & Goury-Laffont, 2024). The present research measured a similar phenomenon among American college students with attention toward democratic attitudes and group-oriented traits including social dominance orientation (SDO) and collective narcissism. SDO describes the belief that one's societal group surpasses other groups, and collective narcissism describes extreme belief in the superiority of one's group. The survey recruited 102 students through SONA from April 3rd to April 15th, 2025. Participants completed a random order of predictor variables, like SDO, followed by a random order of outcome variables. We found that National Collective Narcissism positively correlated with political efficacy and voting interest, but SDO negatively correlated with civic attitudes and willingness to engage with government officials.

[107] How Ethnic-Racial and Socioeconomic Identities Intersect to Affect College Student's Well-Being

12:45 PM – 1:45 PM

SELF/IDENTITY

This research investigates the effects of how Black and Latinx students conceptualize their intersectional identities on well-being. While a positive ethnic-racial identity (ERI) can support well-being, this study examines how ERI may interact with or depend on positive or negative feelings about one's socioeconomic identity. Study 1 (N=108) found an association between a positive ERI and well-being, especially for students with a positive socioeconomic identity. Study 2 (N=54) randomly assigned students to cue positive or negative aspects of both their ERI and socioeconomic identity. An interaction effect revealed desirable effects of a positive socioeconomic identity on well-being, but only for those who were also cued to a positive (rather than negative) ERI. Qualitative reflections within the experiment revealed that students often described race and socioeconomic status as deeply intertwined. However, interpretations and effects of one dimension depended systematically on how students experienced the other.

[108] How Group Member Role and Personality Impact Reactions to Success and Failure

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Individuals and groups tend to attribute successes to themselves and failures to external factors. These self- and group-serving biases help protect and boost one's self-esteem. This study aims to replicate and expand upon previous research by investigating how group biases and self-esteem relate to two variables: one's role within the group (follower or leader) and one's personality traits.

Each participant was assigned to be a leader or follower within a group of three. They worked in-person on a puzzle task. The success or failure of a group was determined by the manipulation of puzzle difficulty.

Leaders and followers gave one another roughly equal credit for success; however, followers blamed leaders more for failure. Leaders and followers experienced similar increases in SSES (self-esteem) after experiencing success; however, leaders had a larger drop in SSES than followers in the failure condition.

In the success condition, individuals with more neuroticism rated external factors as more important to the outcome. Meanwhile, individuals higher in conscientiousness attributed success more to their leaders and the group.

Implications for work teams will be discussed.

[109] How History Shapes Perception: Understanding Different Conceptualizations of Native American Identity

12:45 PM – 1:45 PM

SELF/IDENTITY

Due to settler colonial endeavors, Native American people have faced a history of removal from ancestral lands and attempts at total elimination. The impacts of these endeavors have led the general US population to have varying exposure to authentic contemporary Native American people, depending on the sociopolitical histories of the geographic region. This research explored how these unique histories impact non-Natives' perceptions of Native American identity. A total of 137 participants were collected from Indiana (a removal state), Arizona (a reservation state with low Native/non-Native overlap), and Oklahoma (a reservation state with high Native/non-Native overlap). They were asked to complete a two-item free-response survey regarding their expectations about Natives. Using thematic analysis, we were able to compare prevalent themes from each state. Our findings indicate that while no state is truly unique, each state's responses were indicative of its relationship with natives, each offering a different perspective. Oklahoma's themes revealed the integrated nature of the communities, whereas Indiana had more superficial perceptions, often drawing from cultural narratives and media. Arizona's themes had much more variance, thus serving as a bridge between Indiana and Oklahoma.

[110] How Small Belief Shifts and Trusted Voices Alter Polarized Minds

12:45 PM – 1:45 PM

POLITICS

Beliefs do not exist in isolation but are interconnected within structured networks, where peripheral beliefs connect to and influence core convictions. Leveraging belief network theory, the BENDING model, and insights into parasocial influence, we investigated whether targeted contradictions from a beloved authority figure — Donald Trump — could alter political belief systems among conservatives, specifically on immigration and abortion.

Trump's contradictions led to significant belief reductions in both treatment conditions. Network analyses revealed condition-specific effects: immigration contradictions strengthened within-cluster ties but weakened links to core MAGA beliefs, while abortion contradictions reduced MAGA connections to abortion beliefs without altering internal coherence. These disruptions cascaded inward, weakening more central beliefs, especially on immigration. Although strong parasocial bonds enhanced epistemic trust, trust did not mediate belief change, likely due to ceiling effects. These findings reveal how contradictions from trusted figures can strategically disrupt belief networks, offering new tools for reducing ideological rigidity and polarization.

[111] How the Spectrum Framing of Sexual Orientation Impacts Sexual Minorities

12:45 PM – 1:45 PM

SELF/IDENTITY

Sexual orientation is increasingly being considered in more open and fluid ways, but highlighting its continuous nature also could be perceived as dismissing the importance of discrete sexual identities. Across two studies (total N = 920), we investigated whether sexual minorities perceive the spectrum framing of sexual orientation (i.e., sexual orientation lies on a continuous spectrum from exclusively straight to exclusively gay) to be dismissive of the importance of sexual identities. In Study 1, sexual minority participants perceived a straight person who endorsed a spectrum framing (compared to a categorical framing) positively (e.g. increased perceptions of LGBTQ+ allyship), regardless of participants' level of ingroup identification. Study 2, on the other hand, found that when the spectrum framing was used specifically to distance from a sexual minority identity, the speaker was perceived negatively (e.g., identity-blind), especially by highly identified sexual minority participants. Overall, this research highlights that the spectrum framing can be perceived positively or negatively by sexual minorities, depending on how it is used.

[112] How Varying the Tone of Political Disagreement Shapes Cross-Partisan Attitudes and Relations

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Although political discourse in the U.S. is typically contentious and hostile, little work has focused on improving cross-partisan relations (Voelkel et al., 2023). Referencing the vicarious contact literature (Wojcieszak & Warner, 2020), this research considers whether observing civility in partisans' political communication can foster supportive cross-party attitudes. Altogether, 317 Democrat and 453 Republican adults (meanage = 55.3) watched a video of two trained actors (White, middle-aged men) posing as political partisans (one Democrat, one Republican), expressing differing opinions about the 2020 U.S. Presidential election. After an introduction from the experimenter, participants were randomly assigned into one of three experimental conditions; they observed the partisans engaging in civil disagreement, or uncivil disagreement, or did not observe any partisan disagreement (control condition). Next, 3 (condition: civil/uncivil/control) x 2 (participant partisanship: Democrat/Republican) ANOVAs revealed main effects of partisanship. Relative to Republicans, Democrats found the disagreement more stressful to watch, $F(1)=9.67$, $p=.002$ as well as expressing greater hope for the future of partisan relations, $F(1)=9.97$, $p=.002$. Importantly, we also observed significant main effects of condition. Both Democrats and Republicans conveyed greater hope for the future of partisan relations in the civil disagreement condition ($M = 0.15$), relative to the uncivil and control conditions ($M = -0.07$; $M = -0.02$), $F(2)=3.98$, $p=.019$. Moreover, participants from both parties reported greater stress when watching the uncivil disagreement ($M = 1.98$), compared to those in the civil disagreement and control conditions ($M = 1.68$; $M = 1.64$), $F(2)=7.70$, $p<.001$. Implications of these findings will be discussed.

[113] I Don't Want no Kings: Protest as a Pathway to Meaning in Life for Liberals

12:45 PM – 1:45 PM

POLITICS

Existential theories suggest political beliefs and behaviors should promote meaning in life (e.g., by reducing mortality anxiety). However, past research shows only right-wing beliefs actually serve this function. Because liberalism is defined, in part, as dissatisfaction with the status quo, it may be that these beliefs need to be combined with value-congruent behaviors (i.e., protest) for them to enhance meaning in life (MiL). In Study 1 (2020, $N=517$), liberalism and Black Lives Matter (BLM) support were negatively correlated with MiL. BLM support bolstered meaning in life among liberals, interaction $\beta=.15$, $p<.001$. Study 2 ($N=515$) attempted to replicate this pattern in the context of the Pro-Palestinian protests in 2023/24, but we found no significant evidence of moderation. Null results may be due to the concentration of these protests on college campuses, and our sample consisting of representative adults who may have had little exposure. In Study 3 ($N=629$), we tested these predictions during the 2025 No Kings protests. Liberalism and protest participation were negatively related to MiL. No Kings protest participation bolstered MiL among liberals, interaction $\beta=.14$, $p<.001$.

[114] Identifying Group Alignments in Culture War Politics

12:45 PM – 1:45 PM

POLITICS

Partisans in the United States have become increasingly polarized in recent years, particularly over "culture war" issues. Traditional theories in social psychology argue these divides reflect deep-seated moral or psychological differences between liberals and conservatives. Emerging perspectives, however, suggest they are better explained by group alliances, with both sides motivated to support allies and oppose rivals, but identifying different groups in those roles. The present study introduces a participant-driven measurement pipeline to adjudicate between these accounts. Using open-ended responses from participants recruited through Prolific, we elicit the social groups Americans perceive as most relevant to polarizing issues. Responses are coded to generate a crowdsourced taxonomy of politically significant groups and their perceived alignments. By mapping these perceptions, this study contributes to the growing literature on Alliance Theory of political systems, which views alliances and rivalries as the foundation of partisan dynamics, and provides new tools for assessing the psychological and social bases of polarization.

[115] Identifying individual identity through smile patterns

12:45 PM – 1:45 PM

SELF/IDENTITY

Smiles are the most common facial expression. While we intuitively recognize that people have distinctive ways of smiling, currently it is not known whether there are indeed unique individual smile patterns. To test this, first we characterized the smiles of 1,252 people from multiple countries and backgrounds to ecologically examine what the facial action unit (AU) signature of a smile is. We then created a smile dataset comprising 19,000 smiles (38 people × 500 smiles each) from a variety of setups, cultures, ages, angles and locations. Our findings show that for ecological data, all action units may play a role in a smile, and that people have unique, individual smile signatures. Using neural networks with AU intensity as features, and avoiding impact of facial appearance, we achieved 21.82% classification accuracy (chance level = 2.63%, $p < 0.0001$), eight times better than chance. Moreover, when running the classification analyses on all possible pairs, the accuracy was 80% (chance level = 50%, $p < 0.0001$). These results provide the first empirical evidence that smiles function as unique individual signatures, extending beyond mere expression to serve as identity markers.

[116] Identity Fusion Predicts Stronger Negative Relationships between Liking for the Two Main Political Parties even controlling for self-esteem, social dominance orientation, and authoritarianism

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

We examined the relationship between attitudes toward Democratic and Republican political parties, and how Political Identity Fusion with one's party moderates this relationship. Participants completed measures assessing their liking for Democratic and Republican parties and their level of political identity fusion. Regression analyses consistently demonstrated that the negative association between liking for one party and the other intensifies to the extent that people are fused with their party.

This effect proved robust to the addition of control variables such as Right Wing Authoritarianism (RWA), Opposition to Equality (OEQ), Group Based Dominance (GBD), and Rosenberg Self-Esteem (RSE). The finding that identity fusion intensifies the inverse relationship between liking for opposing political parties remained consistent and significant even after controlling for these established psychological constructs. This research underscores the powerful role of identity fusion in exacerbating partisan divides.

[117] Identity Fusion, Belonging, and Protest Violence among Trump and Harris Voters

12:45 PM – 1:45 PM

POLITICS

Identity fusion (i.e., feeling of oneness with ingroup members; Swann et al., 2009) is associated with extreme pro-group positioning and collective action. Between 2016 and 2019 elections, fusion with Trump was associated with political violence (Kunst et al., 2019). More broadly, political ideology found to predict protest support when protests reflect one's political values (Peacock & Biernat, 2021). The present study ($n = 149$) examined the relationship between pre-2024 identity fusion and post-election protest violence endorsement. Difference tests revealed Trump supporters ($n = 104$) were found to be more fused than Harris supporters ($n = 45$), but all participants were similarly rated their ingroup belonging and protest endorsement. However, a mediation analysis revealed an indirect effect of candidate affiliation on protest endorsement through identity fusion. Supporters' fusion with Trump drives post-election protest endorsement whereas fusion with Harris does not. While endorsement for protest violence may not differ, electoral candidates' ingroup values may account for when and why conservatives support collective action.

[118] Identity Match Preference in Gender-Affirming Voice Therapy

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Preferences for client-clinician identity match in psychotherapy is well-established across minoritized populations. However, this phenomenon is rarely explored in other behavioral health fields like speech pathology, where therapeutic alliance corresponds to improved adherence and outcomes.

This mixed-methods investigation explored preferences of gender diverse individuals seeking a gender-affirming voice modification (GAVM) clinician. Via online survey, 132 gender diverse individuals completed a delayed-discount task to weigh the relative importance of clinical features (e.g., empathy/acceptance) compared to match features (e.g., gender match, LGBTQ+ match) when selecting a GAVM clinician. Follow-up semi-structured interviews were conducted with 12 random participants.

Participants reported stronger preferences for clinical features, with the strongest preference for empathy/acceptance. Interviews revealed that all preferences were mediated by their perceived connection to empathy/acceptance. All interview participants revealed at least somewhat positive views of gender-matched clinicians, but preferences were not strong enough to sacrifice treatment efficacy. Gender centrality was the only statistically significant moderator of preferences, with higher gender centrality predicting stronger preference for match factor

[119] Identity-Fusion Reduction in Common-Bond and Common-Identity Groups

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Identity fusion (i.e., a visceral sense of oneness with a social group) promotes a willingness to engage in extreme sacrifice for the group. Consequently, scientists have begun examining means of reducing fusion. Research suggests that degrading either attachment to group members (relational ties) or the group as a whole (collective ties) reduces fusion. The current study examines whether weakening relational vs. collective ties differentially reduces fusion to common-bond groups (formed from interpersonal connections) vs. common-identity groups (formed from shared aspects). We randomly assigned participants (N = 598) to: (1) think about a group to which they belonged that was either common-bond or common-identity; (2) describe two instances that made them question their connection to a group (weakened collective ties), connection to group members (weakened relational ties), or neither (control); (3) and, rate their fusion. Weakening relational (but not collective) ties reduced fusion regardless of group type.

[120] Ideology and Motivated Perception of Sociopolitical Images

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Ideologies—shared systems of political or religious beliefs—serve as powerful psychological lenses that shape how people interpret information. Even when presented with the same content, individuals may reach different conclusions depending on their ideological beliefs and motivations to maintain them. The present work examined whether ideology influences how people visually perceive sociopolitical imagery. In a study conducted in the days before the 2024 U.S. presidential election, we tested how people perceived the size of political rallies. Using a novel visual matching tool, participants estimated how many people they saw in a photograph described as either a Trump or a Harris rally. We found evidence for ideologically-motivated visual perception; when participants thought the photograph depicted their preferred candidate's rally, they perceived more people than when they thought the photograph depicted the opposing candidate's rally. Such findings reveal polarization at early stages of information processing. Ongoing data collection is investigating these effects in other polarizing sociopolitical topics, including immigration policy, research funding cuts, and LGBTQ+ rights.

[121] Four Guiding Principles for Understanding Human-AI Relationships: An Authenticity Lens

12:45 PM – 1:45 PM

SELF/IDENTITY

Social psychology, across its psychological and sociological branches, offers a powerful lens on how people make sense of and use artificial intelligence (AI). Authenticity is a concept that bridges those foundations and lends insights into when human-AI exchanges feel "real," trustworthy, and socially meaningful. We propose four guiding principles about how humans engage with AI. (1) Origins Principle. Judgments of authenticity are dependent on perceived authorship and intent, with disclosure about origins and process shifting perceived authenticity and trust. (2) Negotiation-in-Interaction Principle. Human-AI interactions are authentic because they are dynamic, evolving through continuous exchange that mutually transforms both AI and the user. (3) Symbolic Alignment Principle. Shared language, labels, and meaning frameworks signal "realness." (4) Situated Subjectivity Principle. How we experience AI is subjective and constructed through experience, shaped by authenticity, and mediated by identity, role, and status through the definition of the situation. These principles are supported by secondary analyses of data collected from Elon University's Imagining the Digital Future Center. This framework reframes human-AI relationships as identity work and offers a testable roadmap for aligning human values, roles, and AI affordances to reduce identity labor and support flourishing.

[122] Immediate Habituation to Excess Wealth; When Money is Never More Than Enough

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Despite historic levels of economic inequality, people oppose redistributive policies- particularly high earners. In the current work, we document a novel psychological barrier to redistribution: People fail to recognize when they have excess money, even when their income far exceeds their needs. Across seven experiments ($N = 2,022$), we show this trend using a financial game where we manipulated income while holding spending constant. Sufficiency judgments increased when more income helped to meet more needs. But, when income exceeded what was needed, more money failed to increase sufficiency judgments. This adaptation has direct behavioral consequences. Charitable giving mirrored sufficiency judgments, plateauing when participants had excess money. This experimental evidence shows that there is immediate habituation to excess wealth. We also replicated these findings in two correlational studies ($N = 3,167$). Overall, our results suggest that those with the greatest capacity to give may be unable to recognize their excess. We discuss implications for understanding opposition to economic redistribution and policy interventions.

[123] Impact of group status on children's thinking about structural inequality

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

When learning history, children often confront their own group's role in inequality, identifying with either aggressors or victims. This study examined how perceived group status shapes children's views of historical group-based inequality. 5–10-year-olds ($N = 243$) heard a historical narrative about two fictional groups, in which one of the two was favored. In a 2×2 between-subjects design, we manipulated (1) whether participants were assigned to be a member of the high- or low-status group, and also (2) the framing of the cause of the status differential (causal framing, where the high-status group was explicitly named as responsible for making the rules; versus ambiguous framing, where the rulemaker was left unspecified). Children assigned to the low-status group judged the inequality as less fair ($p = .021$), liked the high-status group less ($p < .001$), and supported rectification more ($p = .033$). Causal framing also reduced liking for the high-status group ($p = .002$), especially among children assigned to the low-status group. These findings show that both perceived group status and framing influence children's learning about and responses to structural inequality.

[124] Individual Differences in the Utilization of Cues in Truth Judgments of Political News

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Why do some people fall for misinformation more than others? While people differ in terms of their knowledge, they might also differ in terms of the cues they use to judge information as true or false. Two pre-registered studies (N = 810) investigated whether four individual-difference dimensions that have been found to be related with accurate discernment between true and false information (Hubeny et al., 2025) are associated with systematic differences in the utilization of information-related cues in judgments of truth. Balanced samples of Democrats and Republicans rated 20 political headlines (randomly drawn from a pool of 400+) regarding 15 cues (e.g., evaluative connotation, familiarity, moral undertone, amusement, shock) as well as their veracity. Bullshit Receptivity and Actively Open-minded Thinking (AOT) were systematically associated with differences in the utilization of cues (i.e., the relation between cue ratings and truth judgments). The relation between truth discernment and AOT (but none of the other individual-difference dimensions) was partially mediated by the utilization of valid cues (i.e., cues for which cue ratings were related to actual truth status).

[125] Insecurity and Authority: The Role of Self-Esteem in Autocratic Leadership Support

12:45 PM – 1:45 PM

POLITICS

Self-esteem plays a critical yet underexplored role in shaping leadership preferences, particularly in uncertain contexts. This study investigates how self-esteem influences support for autocratic leadership during uncertainty. We hypothesize that individuals with low self-esteem will show greater support for autocratic leadership under high uncertainty, while those with high self-esteem will be unaffected. To test this, we will conduct a survey-based quantitative study, randomly assigning undergraduate students to low- or high-uncertainty conditions using a self-uncertainty prime developed by Hogg (2007). Participants will read a scenario featuring a hypothetical autocratic leader and then rate their support using a six-item questionnaire by Rast (2012). We expect that uncertainty will increase support for autocratic leadership among individuals with low self-esteem, while those with high self-esteem will remain stable in their preferences. Findings will enhance our understanding of how personality traits shape preferences for political and organizational leadership, offering valuable insights for leadership development and decision-making strategies in the workplace.

[126] Insurance stigma in healthcare among physicians: A mixed methods investigation

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

In the US, obtaining health insurance depends on individual qualifications. Based on these qualifications, patients are grouped into one of three categories: uninsured, privately insured, or publicly insured (i.e. Medicaid). To inform medical decision-making and treatment, this categorization is recorded in patients' electronic health records (EHR); however, past research shows that certain labels may inadvertently induce stigma, adversely influencing the care provided. Yet unexplored is if patient insurance type is another such stigmatizing label. To test this, we collected data from 20 physicians during 850 patient encounters in an emergency department where we measured real-time variables including physician self-reported emotions and physiological response (e.g., skin conductance). We are linking these data with data scraped from patients' EHRs (i.e. patient insurance type, demographic information, and treatment decisions). Data analysis may uncover a relationship between patient insurance type, a controllable and system-related variable, and physician's emotions, behavior, and decision-making, which will inform the development of interventions to mitigate possible biases.

[127] Intellectual Humility as a Deterrent for Planning Fallacy: Exploring Narcissism's Moderating Role

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

This study aims to assess whether interventions promoting state-level intellectual humility can impact healthy college students' extent of planning fallacy, and whether the effect of the intervention may be moderated by individuals' levels of normal narcissism. In our online study, participants will be asked to estimate the date they expect themselves to complete an actual semester-long project, as well as providing imagined scenarios of them working to complete the task. In the experimental condition, before generating the estimates, we attempt to raise participants' state-level intellectual humility by asking them to recall previous similar experiences and their completion time of those tasks. Participants will also take the Narcissistic Personality Inventory as an assessment for their levels of normal narcissism. To compare the discrepancy between the estimated completion time and actual behaviors, we will access participants' actual completion status and time via the university course system. We will then use ANCOVA and regression models to measure the effect size of the intervention, as well as its interaction with normal narcissism.

Findings from the present study hold promise in contributing to understanding the interplay between planning fallacy and intellectual humility, and how this relationship is moderated by levels of normal narcissism.

[128] Interdependence in Political Campaign Messaging

12:45 PM – 1:45 PM

POLITICS

Political language can serve as a powerful tool for mobilizing and uniting voters. The present work examines partisan differences in the use of interdependent language—language that emphasizes connection, collective goals, and cooperation—in US Congressional campaign emails during the 2024 general election. Using computerized text analysis (LIWC), we analyze over 15,000 emails from 378 Senate and House candidates to assess the prevalence of interdependent language, as measured by first-person plural pronouns, references to affiliation, and social language. Our findings suggest that, on average, Democratic candidates employ significantly more interdependent language than their Republican counterparts. However, we observe pronounced shifts in this pattern over time, with Republicans' use of interdependent language increasing to match Democrats as Election Day approaches. Given prior evidence that framing issues in interdependent terms can foster cooperation and collective action, understanding how political candidates engage with the language of interdependence can provide insight into the rhetorical tools used to rally support and motivate political engagement.

[129] Interpreting Microaggressions: Effects of Discourse Context, Race, and Political Orientation

12:45 PM – 1:45 PM

LANGUAGE

We conducted an experiment to examine factors predicted to influence perceptions of an utterance as a microaggression.

Participants read four randomized vignettes depicting conversational exchanges and rated their perceptions of potential microaggressions. Discourse context and recipient race were manipulated, resulting in four scenario versions. Participants' political orientation and Theory of Mind were assessed.

As predicted, the target remark was more likely to be perceived as a microaggression when there was no clear context for its occurrence and when the recipient was Black. Additionally, these effects were larger for those with a more liberal political orientation and higher Theory of Mind capabilities. Discourse context indirectly predicted perception of microaggressions via perceptions that the remark did not make sense.

Participants were more likely to perceive microaggressions with fewer contextual cues and when the recipient was Black. Liberal participants were more sensitive to these effects, suggesting they were more attuned to discourse context and race of recipients when perceiving remarks as microaggressions.

[130] Interwoven Identities: Examining U.S. Multiracial Women's Experiences

12:45 PM – 1:45 PM

SELF/IDENTITY

Multiracial women navigate complex, intersecting identities, yet their experiences remain underrepresented in psychological research. This mixed-methods study explores how U.S. Multiracial women (ages 18–35) integrate their racial and gender identities and negotiate discrimination across academic, professional, and social contexts. Participants (N = 316) completed an adapted Multiracial Identity Integration (MI) Scale and the Bem Sex Role Inventory, along with measures of race- and gender-based discrimination. Most participants reported that their Multiracial background was a meaningful and positive aspect of identity (M = 5.42), yet 65% reported race-based and 63% gender-based discrimination. Many described shifting experiences of identity based on context. Follow-up interviews (N = 30) provided in-depth insights into strategies used to manage identity conflict and navigate invisibility. Guided by an intersectional framework, this research offers a more nuanced understanding of how Multiracial women construct identity within systems of racism and sexism in the U.S.

[131] Intra-minority Solidarity Through Critical Consciousness Raising

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Zero-sum beliefs among more privileged minority groups can deter interminority solidarity and collective action (Stefaniak et al., 2020). Minority groups may feel especially distant from each other when their experiences with discrimination are rooted in different components of oppression (Pérez et al., 2024; Zou & Cheryan, 2017). Research suggests that critical consciousness (Freire, 1974) is a mechanism that can increase rates of interminority solidarity (Burson & Godfrey, 2020). We aimed to experimentally assess the utility of critical consciousness for increasing interminority solidarity between Latine and Asian Americans via their shared discrimination on the dimension of foreignness. We predicted that for an Asian American sample, experimentally inducing critical consciousness would increase their sensitivity to detecting discrimination in Latine targets. Furthermore, we expected that inducing critical consciousness in Asian American participants would increase their intent to act in support of Latine issues in the U.S. This work provides a novel method of inducing critical consciousness in minority participants and examines its impact on discrimination detection and behavior intentions. Increasing interminority solidarity across minority groups in the U.S. is crucial for collective action against racism, and pinpointing effective interventions, such as education on critical consciousness is essential.

[132] Investigating Intersectionality: How the Race, Gender, and Perceived Deception of Victims Influences the Efficacy of the Trans-Panic Defense

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

The trans-panic defense allows defendants to claim that they panicked as a result of a victim revealing or allegedly being "deceitful" about their transgender identity. However, prior work has not investigated how intersecting identities (e.g., race and gender) of transgender victims impacts the efficacy of the trans-panic defense. Therefore, our study (anticipated N = 1100) will employ a 2 gender-identity(transgender versus cisgender) X 3 race(Black versus Latino versus White) between-subjects design to examine how the race and perceived deception of transgender victims affects jury-decision making. We predict that participants will report more pro-defendant (e.g., lenient sentencing, fewer guilty verdicts, and less defendant culpability) and anti-victim (e.g., more victim culpability, and perceived deception) outcomes for Black and Latino transgender victims in comparison to all other conditions. The results of this study will reveal criminal justice inequities and enhance our understanding of the trans-panic defense, which could inform future research on methods to mitigate cycles of victimization and coaxing defendant responsibility.

[133] Why Are You A Dog To Your iPhone: The Impact of Social Media on Emotional Regulation in Young Adults

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

We will investigate the relationships between smartphone and social media (SSM) use, sleep quality, and risk-taking in young adults. Prior research has established that SSM engagement is associated with both sleep deprivation (Exelmans, 2019; Li et al., 2022), and increased risk-taking (Durkee et al., 2016; Salfi et al., 2020). However, little is known about the cognitive and behavioral mechanisms that explain these relationships. Additionally, prior work relies almost exclusively on self-report data, often without distinguishing between risk types (e.g., positive vs. negative) or integrating diverse SSM metrics (e.g., objective vs. Subjective measures). We seek to clarify the pathway from SSM use to risk-taking by examining potential mediation by sleep, cognitive control, and sensation seeking. Ecological momentary assessment (EMA) will be combined with self-report and behavioral assessment to track daily shifts in sleep, self-reported executive functioning, and screen usage, thus providing a window into the (1) degree to which daytime vs. nighttime SSM use differentially relates to risk-taking, impulsivity, and sensation seeking, (2) associations between objectively measured smartphone use, sleep, and attention control, and (3) relationships between behavioral performance on tasks of reward, impulsivity, and risk-taking and objectively measured SSM use and sleep data in the days preceding task completion.

[134] Inviolable Value Expression and the Experience of Authenticity

12:45 PM – 1:45 PM

SELF/IDENTITY

Although many studies link moral behavior to subjective authenticity, less is known about how the inviolability or sacredness of values shapes this experience. Katsafanas (2022) argues that sacred values are treated as absolute, resistant to compromise or even consideration of violation. To test whether such inviolability relates to authenticity, we conducted two studies (total N = 682) in which participants were asked to imagine a close friend who was more qualified for a job they desired and then to generate novel ways to harm or help (within-subjects design) the friend's reputation to improve their own chances. About 30% of participants explicitly refused to generate harmful responses, indicating a behavioral marker of value inviolability. Across studies, writing about helping the friend elicited greater authenticity than harming. Notably, those who signaled value inviolability reported the highest authenticity across both prompts. These findings suggest that authenticity is experienced most strongly in moments when individuals uphold sacred relational values, even in the face of experimental demand.

[135] Is existential isolation always aversive? Exploring the role of similarity threat

12:45 PM – 1:45 PM

SELF/IDENTITY

Research on existential isolation (EI)—the sense that one is alone in one's subjective perception of reality—rests on two assumptions: that EI is inherently aversive, and that it operates independently of self-concept processes. We challenge both. Drawing on optimal distinctiveness theory (Brewer, 1991) and uniqueness motivation (Snyder & Fromkin, 1977), we hypothesize that when people perceive their self-concept as highly overlapping with others (a similarity threat), the sense that one's subjectivity is unique may feel neutral or even positive. To test this, participants will complete personality and lifestyle questionnaires and then be randomly assigned false feedback indicating high versus moderate similarity with others. They will then complete a validated EI measure and a new measure assessing attitudes toward EI. This preregistered study will make data and code publicly available. By testing whether EI can be experienced as affirming rather than uniformly aversive, the project reframes EI as a context-sensitive experience with both risks and benefits. Findings may broaden theoretical models and inform interventions that currently treat EI solely as a risk factor.

[136] It's only funny if it makes sense

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Humor requires incongruity—but too much incongruity makes jokes hard to understand and less funny. People often rely on their ease of processing (i.e., fluency) to judge meaning and coherence. Across six preregistered experiments (N = 1321), we test whether fluency enhances humor by increasing perceived coherence of incongruous content. Using diverse materials (standup comedy, memes, nicknames), we manipulated visual (e.g., contrast), auditory (e.g., background noise), and phonological (e.g., rhyme, alliteration) fluency. We also assessed familiarity with memes as a predictor of humor appreciation. Fluent jokes were consistently judged as funnier (p 's < .001; d 's = .23–1.54). Serial mediation analyses showed these effects were fully explained by increased subjective fluency and perceived coherence. These findings challenge current humor theories and identify a distinct fluency-coherence-humor pathway. This novel framework helps explain many previously documented humor influences (e.g., laugh tracks, native language, multimodal delivery) and suggests that anything that boosts processing ease—without dulling surprise—can make jokes funnier.

[137] Juror perceptions of grooming and chronological age among CSA victims

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Prior research suggests 99% of child sexual abuse (CSA) victims experience grooming behaviors (e.g., desensitization to sexual material) pre-abuse, and that these experiences negatively affect perceptions of a victim's credibility (Winters et al., 2024). Additionally, there is evidence mock jurors discount the credibility of older (i.e., over 12-years-old) compared to younger victims (i.e., under 10-years-old; Tabak & Klettke, 2014). Both grooming and victim age have been shown to predict conviction rates in CSA trials (Aliev & Burd, 2025). However, there is limited empirical research examining the interactive effects of grooming and victim age. The current study examined the effects of grooming and victim age on mock juror decision-making in a CSA trial utilizing a 2 (Victim age: 9 vs. 14-years-old) x 2 (Expert testimony: grooming-specific vs. general) between-subjects design. Participants read a mock trial vignette, rendered a verdict, and completed case-related measures (e.g., victim/defendant culpability). We hypothesized that general expert testimony paired with an older victim would increase negative attitudes towards the victim, leading to fewer guilty verdicts.

[138] Jury Instructions in Battered Woman Syndrome Cases

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Traditional self-defense law reflects male-centered models of sudden violence and often disadvantages women whose defensive actions occur between such violent acts. This study examines how lay-people interpret and apply self-defense instructions in cases where women kill their abusers after a cycle of intimate partner violence (IPV). There are two competing instructions, one that justifies the defendant's defensive action if it was "immediately necessary," and another if there was a threat of "imminent harm." We will test whether people recognize these instructions as meaningfully different, leading to higher acquittal rates under the "immediately necessary" standard (as lawyers suspect), or if these phrases are used similarly (as psychologists suggest). Using a 2 (immediately necessary vs. imminent harm) x 2 (present vs. impending threat) factorial design, 400 adults will go through jury selection, read a case summary and instructions, and render a verdict. By testing the effects of instruction type and threat timing, this study can inform legal standards and more equitable treatment for IPV survivors, particularly women, whose experiences don't fit stereotypes of self-defense.

[139] Just Be Authentic! Links between authenticity pressure, encouragement, and well-being across groups

12:45 PM – 1:45 PM

SELF/IDENTITY

Although authenticity is linked to many benefits, calls to “be authentic” may inadvertently place pressure on those who do not feel safe expressing their true selves, particularly members of marginalized communities. Across three studies (N = 1401), we find consistent evidence that participants reported feeling both supported and encouraged to be authentic, yet also pressured and judged to be authentic. These reactions, in turn, were linked to well-being outcomes; such that greater perceptions of judgment and pressure tended to negatively predict self-esteem, self-knowledge, and life satisfaction, while support and encouragement positively predicted these outcomes. This pattern emerged among both marginalized groups (i.e., lesbians, gay men, and bisexual participants, as well as Black and Latino/a participants) and majority group members (i.e., White and heterosexual participants). This research highlights the nuanced consequences of encouraging people to “be authentic.” Future research should further examine how the impact of authenticity messages varies across social groups and contexts.

[140] Knowing who you are, staying in your lane: Predictors of stepparent role clarity

12:45 PM – 1:45 PM

SELF/IDENTITY

Despite being a common role in society, stepparents and their families often experience difficulties. Stepparent role clarity (SPRC) is one key factor that predicts positive outcomes for stepparents, beyond overall self-concept clarity. The current work aims to identify predictors of SPRC as a window into stepfamily functioning. Our goal was to contrast personal, relational (romantic), and familial predictors of SPRC, as well as contrast objective demographic predictors versus cognitive/perception-based predictors in a sample of 408 stepparents. Predictors were grouped into personal-demographic, personal-cognitive, relational-demographic, relational-cognitive, and familial-demographic, familial-cognitive sets based on theoretical considerations and bivariate correlations between measures. Machine learning, employing a random forest model with k-fold cross-validation and repeated sampling, was used to predict SPRC from each predictor set. We also examined which individual predictors accounted for the most variance in SPRC. Cognitive factors emerged as stronger predictors compared to demographic factors, with personal-cognitive factors accounting for the most variance as a set.

[141] Large Language Models Exhibit Human-Like Bayesian Hypocrisy

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Humans solve Bayesian reasoning tasks quite well. For example, they accurately determine that given particular parameters a person who performed surgery is more likely to be male than female. However, they paradoxically condemn others who do so on both intelligence and moral grounds (Cao et al., 2019). Given the recent achievements of LLMs, it is reasonable to expect that these models will perform well on basic Bayesian reasoning tasks, at least as well as humans. It is also expected that LLMs, unlike humans, will not judge others who use Bayes' Rule harshly. In four studies involving over 1,200 trials, we first elicited statistical judgments from two models (GPT-4o and Claude Sonnet 3.7) and then assessed their evaluation of a hypothetical person making a Bayesian judgment. We found that both LLMs not only closely resembled human data in successfully employing Bayes' Rule, but also demonstrated the same hypocrisy as did humans in condemning others who followed Bayes' Rule. This surprising hypocrisy highlights a lack of consistency in LLMs, and cautions against using them for decision-making in domains where statistical accuracy and fairness norms may collide.

[142] Latent Profile Analysis of Collective Victimization Beliefs: Connections to Wellbeing

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Collective victimization is assumed to have detrimental consequences on group members' wellbeing. Studies on perceived discrimination and historical trauma support this view. However, because people make sense of such experiences in different ways (i.e., collective victimization beliefs), negative outcomes may not be inevitable and could depend on how the group's experience is construed. The current poster reports a latent profile analysis (LPA) of several collective victimization beliefs about historical ingroup victimization among Jewish Americans, N=256 (age: M=45.84, SD=20.59). Results indicated four latent groups characterized by different belief patterns with varying levels of these victimization beliefs: 1) Inclusive and Secure, 2) Threatened but Inclusive, 3) Siege Mentality, 4) Ambivalent. ANOVA indicated that while these groups did not differ in positive affect, participants in the Inclusive and Secure group expressed less negative affect about their group's collective victimization than participants with other profiles. This shows that psychological wellbeing after group trauma varies depending on how this history is construed.

[143] Liberty or Lockup?: How Algorithmic Risk Assessments Shape Trust in the U.S. Criminal Justice System

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Algorithmic assessment tools (AATs), such as COMPAS, have replaced human decision-making in predicting recidivism. Yet, there are growing concerns about the racial disparities, trust in the tools' capabilities, and the lack of human judgment. The current research aims to investigate how racial and decision-makers' identities shape humans' perceptions. U.S. adults, recruited via Prolific, rated the fairness of and trust in COMPAS-style decision vignettes in a 2 x 2 x 2 Latin Square design. Vignettes varied by defendant's race (Black vs. White), predicted risk level (high vs. low), and outcome accuracy (correct vs. incorrect). Analyses will include linear mixed-effects models to examine whether race and accuracy interact to shape participants' judgments. We predict that errors created by AATs disadvantaging Black defendants will elicit the lowest trust, whereas accurate predictions of low risk for Black defendants will enhance trust. Findings may clarify how algorithmic bias and error type influence perceptions of fairness and provide insight into the conditions under which AATs may reinforce or reduce racial disparities in trust in the justice system.

[144] Listening to Black Storytellers: Effects on Individual-Level and Group-Level Attitudes

12:45 PM – 1:45 PM

LANGUAGE

Across 5 experiments we investigate the attitudinal effects of White Americans' exposure to Black American storytellers. Participants were randomly assigned to a no-intervention control or experimental condition in which they listened to one or more first-person stories told by Black Americans. Explicit (self-reported) and implicit (IAT) attitudes toward the storytellers and Black vs. White Americans were then measured. At baseline, we observed pro-Black explicit and pro-White implicit attitudes toward both individual storytellers and the underlying racial categories. Exposure to the stories shifted individual-level attitudes in a more pro-Black direction, but group-level attitudes were unaffected. These results generalized across attitudes (explicit vs. implicit), story sources (Story Collider vs. TED Talks), designs involving single vs. multiple stories, and processing instructions (listen vs. generalize). Overall, these results suggest that first-person stories told by Black storytellers considerably improve White Americans' attitudes toward them, with no generalization to group-level racial attitudes. Ongoing work seeks to identify conditions to facilitate such generalization.

[145] Living between cultures: A mixed-methods study of immigrant youth's ethnic-racial socialization and identity

12:45 PM – 1:45 PM

SELF/IDENTITY

Little research has focused on how ethnic-racial socialization messages from inside and outside the home collectively impact immigrant youth's identity. Thus, in a mixed-method study we examine what profiles of ethnic-racial socialization exist among immigrant youth and how they impact their identity. We asked immigrant youth (N=672) between 14 and 18 years about the ethnic-racial socialization messages they receive at home, school, and from others. We find three profiles of ethnic-racial socialization amongst immigrant youth, which differentially impact their racial identification. Additionally, in follow-up semi-structured interviews (n=30) we asked immigrant youth what it means to be a member of their ethnic group in the U.S., the impact it has had on them, and how they feel about their identity. Our qualitative findings contextualize and highlight the complexity regarding how important and positively immigrant youth view their ethnic-racial identity in relation to their racialized experiences. Our findings offer a person-centered understanding of immigrant youths' racialized experiences that can be utilized to inform positive identity development among immigrant youth.

[146] Longitudinal Evaluation of the Prosocial Pain Scale Psychometric Properties

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Helping others often entails physical discomfort, yet individual differences in enduring such pain remain understudied. We developed the 10-item Prosocial Pain Scale (Pro-Pain) to assess trait-level tendency in physically effortful or painful helping. Across two waves one week apart, we examined its factor structure, temporal stability, and measurement invariance. Exploratory and confirmatory factor analyses supported a two-factor solution, reflecting daily helping (physically effortful acts in everyday contexts) and costly helping (rare or high-risk prosocial acts). The model showed acceptable fit across waves and evidence of configural and metric invariance. Test-retest reliability was moderate to strong. Item response theory analyses revealed that Pro-Pain provides greater information at moderate-to-high latent trait levels and a broader trait range than the widely used Prosocialness Scale for Adults (Caprara et al., 2005). These findings suggest that Pro-Pain captures a distinct facet of prosociality by focusing on physical costs and provides a valuable tool for studying embodied altruism and costly helping behaviors over time.

[147] Longitudinal Links between Identity Development and Materialism among Korean College Freshmen

12:45 PM – 1:45 PM

SELF/IDENTITY

This study explored longitudinal associations between identity development and materialism among first-year Korean college students. Data were collected from 641 participants (Mage = 19.13, range = 18–24; 48% female) across four time points over two academic semesters and analyzed using the Random Intercept Cross-Lagged Panel Model (RI-CLPM). According to the results of the RI-CLPM, significant cross-lagged effects appeared only in the path from materialism to identity development, specifically between Time 3 and Time 4. Increases in materialism predicted a subsequent increase in disturbed identity and lack of identity. These results suggest that when individuals are excessively preoccupied with material possessions than usual, they are more likely to experience uncertainty about who they are and feel an inner emptiness regarding their sense of self at the subsequent time point.

12:45 PM – 1:45 PM

SELF/IDENTITY

Increasingly, social media applications are designed to grasp the attention of the user in short bursts of content. We examine how extensive social media use affects how individuals feel about their sense of self compared to other forms of media. Additionally, we explore how these variables may be impacted by an individual's future time perspective (FTP; Lang & Carstensen, 2002). Participants (N=108) were randomly assigned to take the perspective of the protagonist in one of three 2-minute videos, where the protagonist is shown spending their entire evening engaging in social media, watching television, or reading. Participants in the extensive social media use condition reported lower levels of self-esteem and control, and higher levels of regret compared to those in the book reading condition. There were no interactions between FTP and the type of media. Our findings suggest extensive social media use negatively impacts sense of self-esteem and control and increases feelings of regret compared to other media types. These results emphasize the vulnerability of the self to social media and the need for interventions to mitigate these negative effects.

[149] Lost in Transcription: How Unexpected DNA Ancestry Results Can Impact Our Identities & Racial/Ethnic Attitudes

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

The widespread use of DNA testing reinforces the misconception of race as a biological concept, yet it has profound impacts on identity formation. Examining this effect in a heterogeneous population such as Mexican-Americans, perceptions of race/ethnicity may be volatile, as it is likely that ancestry results will often be unexpected and identity-shattering. Across two experiments, we explored whether unexpected (vs. expected) social identity changes would evoke greater social identity conflict and impact racial/ethnic attitudes in Mexican-Americans. Study 1 asked participants to imagine receiving different DNA breakdown results, while Study 2 utilized real DNA testing services, and their attitudes were assessed at multiple points in time. Initial evidence suggests that DNA expectations may influence racial attitudes in Mexican-Americans. Implications will be discussed.

[150] Cancelled;

12:45 PM – 1:45 PM

POLITICS

Political attitudes and behavior are shaped by lived experience. For example, personal crises often dampen voting turnout by diverting cognitive resources, but can motivate other forms of political participation perceived to offer tangible and/or emotional relief. Economic and emotional insecurity can heighten zero-sum beliefs and outparty blame. Thus, even ostensibly apolitical threats can become politicized as people attempt to understand and respond to them. In an analysis of the 2024 Cooperative Election Study (N = 837), we investigate the relationship between recent life changes (e.g., marriage, job loss) and political polarization (relative in- vs. out-partisan affect). We tested whether the strength of the association varies by event valence (negative vs. positive) and content (economic vs. personal), hypothesizing that negative economic changes are most strongly associated with polarization. Results supporting our hypothesis would suggest that reducing affective polarization may hinge on mitigating negative economic shocks (e.g., through social support) and disrupting politicized blame frames that translate private hardship into partisan hostility.

[151] Mapping Temporal Shifts and Partisan Differences in Moral Discourse on Capitol Hill from 1873-2024

12:45 PM – 1:45 PM

POLITICS

Recent research suggests that congressional language is becoming increasingly intuition-based rather than evidence-based over time. This drift toward intuition over evidence exemplifies the broader phenomenon of 'truth decay', wherein lawmakers rely less on rational discourse and more on normative claims, e.g., by appealing to the moral intuitions underlying policy proposals. In this study, we ask: How have U.S. lawmakers' appeals to moral values changed from 1873 to 2025, and how do those patterns differ by party affiliation? We have collected every floor remark by a legislator in over 100,000 hearings. We plan to use Contextualized Construct Representations (CCR), a computational method for deriving embeddings from surveys, to quantify the moral foundations of liberty, care, proportionality, equality, purity, authority, and loyalty. We will fit multilevel segmented-time regressions that detect yearly break-points and test party-specific slope changes in each moral foundation. Our results will shed light on how moral language has changed in Congress over time, both in terms of its overall prominence and the specific moral intuitions that the major parties differentially appeal to.

[153] Measuring purpose among adolescents from diverse racial-ethnic backgrounds

12:45 PM – 1:45 PM

SELF/IDENTITY

The Claremont Purpose Scale (CPS) is an increasingly popular scale designed to assess youth purpose. Yet, prior validation of this measure has relied on samples predominantly comprised of white respondents, leaving questions about its applicability among youth from other racial-ethnic backgrounds. In this study, multigroup confirmatory factor analysis supported scalar measurement invariance across Black, Asian, Hispanic/Latinx, and white adolescents (N = 506), indicating that the CPS measures a latent construct of purpose equivalently across groups. However, the beyond-the-self (BTS) dimension consistently exhibited suboptimal loading on the overarching purpose construct. No significant differences in CPS-based purpose levels were found across groups, but exploratory analyses suggested that purpose may serve as a stronger protective factor for Hispanic/Latinx youth than for Black youth. These findings support the CPS's use with racially and ethnically diverse adolescents, but raises questions about whether BTS is appropriate for conceptualizing youth purpose. Findings also invite exploration of how different sociocultural backgrounds shape purpose's role as a resource.

[154] Mind the Gap: Experiencing Privilege Leads to Decreased Sensitivity to Inequality

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Amid unprecedented inequality, understanding how privilege is maintained is critical yet challenging, given system-justifying beliefs and social identity confounds. We address this with a gamified field experiment designed to isolate the psychological effects of unearned advantage. In a between-subjects design (N = 201), participants played a modified cornhole game, randomly assigned to stand closer (advantaged) or farther (disadvantaged) from the target. Successful throws earned raffle tickets that could be kept or donated to the next player. Overall donation rates did not differ across conditions, but advantaged participants donated significantly more to other advantaged individuals and recommended weaker redistributive policies. These results suggest that experiencing privilege not only reduces prosociality toward disadvantaged others but also undermines support for policies aimed at reducing inequality. Increasing awareness of this dynamic may lead to a greater endorsement of redistributive policies in the United States.

[155] Misconceptions in the Media: White Women's Meta-stereotypes, Emotions, Vigilance, and Allyship After Viewing Negative and Positive Interracial Interactions

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

This research explores White women's cognitions and interaction outcomes after witnessing negative and positive interracial interactions in the media. Two studies examine video clips of interracial interactions depicting racist or allyship behavior, the social media comments in response to the behavior, and the race of their viewing partner. In Study 1, White women who imagined viewing a video clip with a Black woman experienced greater meta-stereotypes, coping strategies, and allyship. White women who witnessed a negative interracial interaction experienced heightened negative emotions and vigilance upon watching an ingroup member's racist acts. Study 2 expands upon this by evaluating the influence of social media comments that exhibit racism or allyship on White women's cognitions. Ongoing data collection predicts that White women who view racist comments with a Black woman will experience heightened meta-stereotypes, coping strategies, negative emotions, and impaired executive functioning. This work highlights how social media shapes White women's perceptions of themselves and Black women online, serving as a bridge or barrier to facilitating positive interracial interactions.

[156] Mitigating Cognitive Biases in Higher Education Contexts Through a Brief Video-Based Intervention: A Randomized Controlled Trial

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

This study introduces and evaluates a novel, scalable intervention using brief, scenario-based videos to reduce cognitive bias among adults in educational settings. We conducted a cross-national experiment (N=1038) with teachers and learners, targeting 21 distinct biases. Participants were randomly assigned to a control or experimental condition. Both groups viewed a video depicting a bias-eliciting scenario; the experimental group was then shown an additional "debiasing" segment containing supplemental, context-altering information. Results showed the debiasing videos significantly reduced biased decisions. This effect was substantially stronger for teachers (Cohen's $d = 0.51$) than for learners ($d = 0.11$). For students, the intervention was effective only when participants viewed the videos with subtitles in their native language. Teachers, but not learners, also demonstrated a "spillover" effect, showing reduced bias in subsequent, unrelated tasks, after receiving the debiasing intervention. These findings indicate that brief, narrative-based micro-interventions are a promising and scalable tool for cognitive bias mitigation. However, their effectiveness is moderated by audience characteristics like professional role and the language of delivery, underscoring the need for context-sensitive design and implementation.

[157] Modeling Identity Development Trajectories

12:45 PM – 1:45 PM

SELF/IDENTITY

The formation of a coherent sense of self is a central developmental task during the transition from adolescence to emerging adulthood. But how does the self develop during the transition to college? In this study, we focus on the development of personal identity during the college years by relying on the dual-cycle identity model (Luyckx et al., 2006), which conceptualizes two distinct cycles of identity formation and identity maintenance. To characterize the identity development process, we examine how identity processes among college students ($N = 2,722$; observations = 54,201) change across six academic quarters over two years. Using growth mixture models, we identified underlying longitudinal trajectories across the five dimensions of identity development. Our findings support a three-class solution: 1. Low exploration, weak stable commitment, 2. Moderate exploration, increasing identity commitment, 3. High exploration, unstable rapid commitment. The findings suggest that distinct patterns of identity development may be explained by individual differences (e.g., identity commitment, exploration, and rumination), which points to a promising direction for future research.

[158] Moral Judgment Pathways: Exploring the role of Locus of Control

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Locus of control refers to the extent to which individuals believe that their outcomes depend on their own actions (internal locus), or on situational forces or chance (external locus, Rotter, 1966). Research in moral psychology distinguishes between two judgment perspectives: consistency, in which people maintain behavior in line with their prior actions and outcomes, and compensation, in which people adjust their behavior to offset perceived disadvantages or past misconduct (Joosten et al., 2014). It is hypothesized that locus of control may influence which perspective becomes more salient in social judgement. Internals, who emphasize personal responsibility and individual agency, are expected to be more consistent, judging others primarily by their actions and outcomes. Externals, who take situational constraints and bad luck into account, are expected to adopt behavioral compensations, supporting corrective actions to balance past circumstances. This perspective links locus of control to a broader pattern of moral and social judgement, highlighting its role in shaping whether individuals respond to others with emphasis on personal accountability or situational sensitivity.

[159] Moral Misperceptions in Politics: Correlates of Perceived Outgroup Immorality

12:45 PM – 1:45 PM

POLITICS

Prior work suggests that partisans in the United States perceive the political outgroup to be deficient in their norm adherence tendencies in presumed responses to moral dilemmas. This tendency reflects an outgroup moral derogation effect, whereby the outgroup is viewed as morally inferior to the political ingroup and shared social ingroup of Americans. The current study (N = 446) examined correlates of this effect among Democrats and Republicans. Results indicate that ingroup identification and ingroup feelings are not associated with outgroup moral derogation. Instead, perceptions of the outgroup as prejudiced toward the ingroup, as posing symbolic and realistic threat, and as susceptible to non-normative influences are associated with greater outgroup moral derogation. Outgroup moral derogation is also associated with greater reports of affective polarization, greater social distancing from the outgroup, and fewer endorsements of cross-partisan empathy, reflecting disengagement from outgroup members at various levels. Finally, outgroup moral derogation is associated with greater willingness to endorse pro-ingroup undemocratic practices and candidates.

[160] More Domain-Relevant AI Limitations Reduce Perceived AI Capability

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Do people believe AI is capable of providing good recommendations for cases outside the scope of its training? Across 7 studies on real estate, participants discern that an AI is more capable for in-scope compared to out-of-scope cases, and for only one out-of-scope attribute compared to two. However, many believe AI is still somewhat capable for out-of-scope cases, depending on the relationship of its training attribute to the real estate domain. Specifically, participants judged AIs as very incapable of providing a good recommendation when the case was out-of-scope on income, slightly incapable when it was out-of-scope on age, but neutral in capability when it was out-of-scope on race. These inversely related to participants using that attribute in their own real estate decisions with 57% using income, 27% using age, and 4% using race. Overall, we find that participants' mental model of the domain relevance of an AI limitation predicts their perception of AI's capability to make a good prediction for a particular case. These findings suggest the interaction of AI and domain mental models, which highlights the value of explainable AI focusing on domain-relevant attributes.

[161] Multiracial Malleability and Race Concept Reflection

12:45 PM – 1:45 PM

SELF/IDENTITY

Multiracial individuals may experience malleability in their identities, meaning that the way that they racially identify can shift depending on the situation or environment. This study explores whether the experience of malleability is associated with greater reflection about the concept of race. Additionally, it explores potential downstream consequences of this reflection, such as being more likely to endorse socially constructed, rather than essentialist, conceptions of race and having greater social categorization flexibility. Participants (N=172) who identified as Multiracial completed a survey about their experiences with Multiracial malleability, reflection about race concepts and racism, and their belief that race is socially constructed. Findings revealed that greater Multiracial malleability experiences were positively correlated with greater levels of reflection about race concepts. However, race concept reflection did not predict belief in race as a social construct or flexibility in social categorization. These findings suggest that the malleability that Multiracial individuals experience in their racial identity may be connected with reflection about race itself, but the downstream consequences of this relationship should be further explored.

[162] Negative Meta-Perceptions as a Cause of Anti-Intellectualism: An Empirical Study

12:45 PM – 1:45 PM

POLITICS

Anti-intellectualism and its causes are still not well-understood. In the present research, we investigated a potential, proximal cause: negative meta-perceptions. If a group of people think intellectuals resent and look down on them, anti-intellectualism may increase via reciprocal disliking. To test this idea, we conducted an online study in which we manipulated Republicans' meta-perceptions of climate scientists. We then measured participants' anti-intellectualism, trust in climate scientists, a measure of attitudes toward science and a measure of climate change beliefs. Compared to a positive meta perception condition, participants in the negative meta perception condition expressed greater anti-intellectualism, as well as poorer attitudes toward science, greater climate skepticism, and less trust in scientists. Trust in climate scientists mediated the relationship between negative meta perceptions and anti-intellectualism, science attitudes, and belief in climate change. Ongoing research in our lab is exploring how these results may generalize for other groups and topics.

[163] Negative Reactions to Partisan Ingroup Dissent: The Role of Exaggerated Moral Stereotypes

12:45 PM – 1:45 PM

POLITICS

Despite the importance of ingroup dissent in preventing blind groupthink and promoting complex consideration of ideas, dissent within US politics is often met with hostility. Across two studies, we test three hypotheses regarding whether Democrats and Republicans differ in their harshness towards partisan ingroup dissent. Research from the ideological asymmetry perspective suggests that conservatives' greater levels of cognitive rigidity lead them to be more threatened by difference, and therefore should be more negative towards dissent. Research from the symmetry perspective suggests that liberals and conservatives should be equally intolerant, the level of intolerance simply depending on the degree of perceived value-conflict with the target. Finally, research on moral stereotypes suggests that Democrats especially exaggerate moral stereotypes compared to conservatives, which may make them harsher towards partisan ingroup dissent. Given that Democrats were harsher toward dissenters in the first two studies, we also test in a third study the efficacy of an intervention aimed to correct exaggerated moral stereotypes.

[164] Nostalgia Mediating Symbolic Threat on Identity Continuity

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

The two-party governing system of the United States lends itself to partisan polarization, creating a constant battle over which party truly represents the American identity. As a result, each party may experience symbolic threat (e.g., American values shifting) when faced with the outparty holding political power, thus affecting perceptions of the stability of the American identity over time (i.e., identity continuity). Previous research suggests that nostalgia (i.e., affection for a past era) is a mechanism for restoring positive self-regard after facing a threat. We predicted that rising symbolic threat would predict greater nostalgia, which in turn would predict decreasing perceptions of the continuity of the American identity. Using data collected before the US midterm election in 2022 (N = 336), results show that symbolic threat ($b = -.18, p < .001$) and nostalgia ($b = -.33, p < .001$) negatively predict identity continuity; however, there was no significant relationship between symbolic threat and nostalgia. Although the predicted mediation was not significant, we discuss the practical and theoretical implications of symbolic threat affecting identity continuity in America.

[165] Not One Story: Subgroup Differences in Asian American Identity and Attitudes

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

The position of Asian Americans (AA) in the United States is unique – though they have faced historical discrimination and are seen as perpetual foreigners, they are also regarded as higher status and thus often not perceived as people of color. The experiences of AA also vary across regional subgroups – East Asians (EA), South Asians (SA), and Southeast Asians (SEA) – due to distinct histories and physical appearance, though little research has examined these variations. In two studies, we investigated subgroup differences in personal experiences and attitudes towards other racial groups. In Study 1 (N = 420), compared to EA, SA and SEA identified more as people of color, reported personally experiencing more racial discrimination, perceived higher linked fate with Black and Hispanic people, and lower linked fate with White people. Study 2 (expected N = 800), which will replicate and extend on Study 1, will also examine subgroup differences in beliefs of the model minority stereotype, support of affirmative action, and how similar they find their own subgroup to be to other racial groups in the U.S.

[166] Occupation and Purpose in Life: The Moderating Role of Gender

12:45 PM – 1:45 PM

SELF/IDENTITY

A sense of purpose in life is critical for well-being, and occupation is one context through which individuals enact purpose in their daily lives. However, few studies have examined the impact of occupational profiles on a person's sense of purpose, and even fewer have considered how the gendered nature of occupations may amplify or weaken this association. This study (N = 1,523) will use the MIDUS dataset to examine the associations between occupational characteristics and purpose in life. Further, it will examine how gender moderates these associations. Based on self-reported job titles, occupational characteristics were pulled from O*NET. This resulted in each participant being assigned a continuous score for six dimensions: Realistic, Investigative, Artistic, Social, Enterprising, and Conventional. Purpose was measured using 7 items from the Psychological Well-being Scale (Ryff & Keyes, 1995). Data collection and coding are complete, and data analysis is in progress. This study will contribute to understanding how gendered career paths shape well-being in adulthood. Additionally, it provides support for more equitable career development and reducing barriers to meaningful work.

[168] On Consumers' Reactions to Tariffs

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Prices have reached record highs, and inflation remains the top concern for consumers worldwide. Among the many forces driving inflation, tariffs have increasingly come into the spotlight. However, little is known about how consumers react to tariffs. Across six pre-registered studies (N = 3,954), we show that consumers perceive price increases attributed to tariffs as less fair than identical increases attributed to other reasons. Moreover, when consumers learn that a company's costs have increased, they believe it is more appropriate for the company to absorb a greater share of the cost when the increase is due to a tariff (vs. other reasons). This tariff penalty arises because consumers perceive such price increases to impose greater restrictions on consumer freedom. This effect is stronger among left-leaning consumers and holds across countries (e.g., US, UK, Canada, Australia), demographic groups, product categories, and multiple fairness measures. Overall, the current research shows how tariffs shape perceptions of price increases, reveals when and why tariffs are viewed as less legitimate, and offers actionable insights for consumers, marketers, and policymakers.

[169] Partisan Identity, Ideological Orientations, and the Differential Threats Posed by Ingroup and Outgroup Leadership: An Examination of the 2024 U.S. Election

12:45 PM – 1:45 PM

POLITICS

Do partisans ever oppose their candidates during U.S. presidential elections? We explored this question across two studies (N = 1,106) using U.S. Republicans and Democrats in the context of the 2024 Presidential Election. We propose that partisan identity and ideological orientations related to different threat perceptions of in-group and out-group leaders, which differently relates to level of candidate support. For Democrats, we focused on the ideological orientation of left-wing authoritarianism (LWA). For Republicans, we focused on the ideological belief in democracy. Study 1 measured participants' perceptions of leadership threats, while Study 2 manipulated the salience of in-group (or out-group) leadership threat. Across both studies, stronger partisan identity related to lower perceptions of in-group failure, higher perceptions of out-group threat, and more leadership support. Importantly, the examined ideological orientation lead Democrats (but not Republicans) to oppose their in-group leader. Manipulating the salience of the threat did not impact these relationships.

[170] Patience under fire: How imagining a harsh future impact intertemporal choice

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Decision making can be influenced by imagining the future. Prior research shows that episodic future thinking (EFT) can reduce delay discounting (the tendency to devalue delayed reward). Imagining positive future events reliably reduces delay discounting, whereas negative future events yield mixed findings. The current study aimed to clarify the inconsistencies with negative EFT by moving beyond valence and examining negative emotions with distinct appraisal tendencies (anger vs fear). Following the Appraisal Tendency Framework, we predicted that anger and fear EFT differently impact delay discounting due to certainty and control appraisals. Participants (N = 395) were randomly assigned to anger, fear, or neutral conditions. All participants first completed a baseline delay discounting task with no imagination, then engaged in an EFT task wherein they imagined future events per condition and completed the delay discounting task for a second time. Results showed that all EFT conditions reduced delay discounting relative to no imagination. However, no differences emerged between conditions, suggesting that appraisal tendencies play little role in EFT's effect on delay discounting.

[171] Patiently waiting for your partner's turn: Children's expressions of patience

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Some children are more patient partners when playing games, such as Jenga. Within the process model of patience, this patience is understood as a behavioral response to the discrete emotion of impatience (Sweeny, 2025). The current study explored how school-aged children look when they are placed in a situation that requires patience. To answer this question, children (4-11 yrs, N = 300) played a game with an increasingly slow-to-act confederate. Research assistants then coded the videos for children's behavior and facial expressions and for overall demeanor. Children were rated as more patient when they showed fewer negative and more positive facial expressions, spent less time looking at the experimenter, moved their bodies less (particularly in the direction of the object in the game), and talked less. After controlling for ratings of boredom, cooperation, and calmness, two behaviors remained linked to patience: spending less time interacting with the game object and talking less. These findings suggest that, from an observer's perspective, patience in children is reflected in their ability to remain physically calm and verbally restrained.

[172] Perceived Group Cohesion Modifies Individual Decision-Making and Confidence in a Collaborative Memory Task

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

The motivation to conform to others can influence decision-making when retrieving memories with others. Specifically, in collaborative settings, participants may be influenced by informational cues, such as seeking accurate details, or normative cues, like appearing agreeable. While studies have suggested that normative cues take precedence in inducing conformity, less is known about the comparative influence of both informational and normative cues. Utilizing confederates, we conducted a collaborative recognition task to test for the impact of perceived competence and in-group proximity on the degree of participants' conformity with group/confederate decisions. In a novel feedback paradigm, where everyone's retrieval attempt was subject to agreement/disagreement (with confidence) from two confederates, we found that participants did not blindly conform to the highly accurate confederate and/or the in-group confederate. Rather, participants gave "middle ground" memory and metamemory decisions that didn't favor either confederate. Memory on a subsequent individual retest was also more likely to reflect initial responses before receiving feedback, suggesting a lack of reliability in confederate responses. In sum, participants did not cognitively offload to highly competent confederates; rather, memory decisions were made in efforts to maintain group cohesion.

[173] Perceptions of Political Doubters

12:45 PM – 1:45 PM

POLITICS

A record 42% of Americans now identify as politically independent (Gallup, 2024), suggesting that people may still reconsider those group memberships that are based on beliefs and attitudes, such as political ideology. Prior work (Bagherian et al., 2025) showed that participants view outgroup doubters more positively (black sheep effect; Pinto et al., 2010) and as more likely to convert than ingroup doubters (social projection; Allport, 1924). Extending these findings, the present study examines how perceptions of political doubters shape advocacy and persuasion (Bechler et al., 2020) using behavioral measures. In a 2 (conservative/liberal doubter) × 2 (conservative/liberal participant) design (N = 400), both liberals and conservatives perceived outgroup doubters as warmer, more competent, and more likely to switch parties. Participants also reported greater advocacy intentions toward outgroup doubters, including a stronger willingness to promote their own party and persuade the doubter to convert. These findings highlight pathways for reducing polarization and fostering bipartisan engagement.

[174] Perceptions of Psychological Abuse in Sport: Associations with Mental Health Outcomes and Shared Reality Theory

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Psychological abuse in athletics is increasingly recognized as a serious issue, though athlete and coach perceptions of what constitutes emotional abuse vary widely. Using a revised version of the Group Psychological Abuse Scale (GPAS-R, Chambers et al., 1994), we examined perceptions of abuse in sport and their relationship to mental health measures, including the PHQ-9, PCL-5, GAD-7, RSE, SWLS, and MLQ. Elevated GPAS-R scores correlated with the PCL-5 ($r = .34, p < .001$) and with the PHQ-9 ($r = .21, p < .05$) but showed no association with the SWLS, MLQ, RSE, GAD-7, or demographic variables. Specific GPAS-R subscales are aligned with distinct mental health outcomes, offering more nuanced insight into the impact of perceived abuse. Future analyses will investigate how motivations for and perceptions of potentially abusive behaviors predict or influence mental health outcomes. Shared Reality Theory could explain the varied interpretations of potentially psychologically abusive behaviors. If the athlete believes that the coach is acting in their best interest, thus creating a shared reality, they are likely to consider the coach's behavior as non-abusive.

[175] Policy Strength and Public Acceptance of Decontaminated Soil Disposal

12:45 PM – 1:45 PM

POLITICS

This study explored whether people would accept the final disposal of decontaminated soil and waste from the 2011 Fukushima nuclear accident near their own homes, within the policy framework for determining disposal sites. An online survey asked respondents to rate their acceptance in five types of policy scenarios: opinion-reflective process, distance from residence, number of sites, financial compensation, and soil reuse, each with increasing policy strength. We analyzed two linear mixed-effects models. One model predicted whether individuals would accept a final disposal site near their neighborhood based on the scenario type and intensity of the policy. Another model further analyzed the "NIMBY" (Not In My Backyard) problem, where individuals support a policy but oppose its proximity. The findings suggested that for lowest-strength scenarios, mayoral decision-making without resident input promoted acceptance. However, for higher-strength scenarios, increased compensation was most effective. Individuals with NIMBY attitudes were more influenced by stronger policy measures.

[176] Political Implications of Implicit and Explicit LGBT Conspiracy Beliefs

12:45 PM – 1:45 PM

POLITICS

LGBT Conspiracy Beliefs (LGBT-CBs) portray LGBT people as promoting a hidden agenda aimed at subverting traditional values and imposing a so-called "Gender Theory." Despite their growing proliferation in the U.S. socio-political context, they remain largely understudied. This study (N=194 U.S. participants) examined LGBT-CBs using both implicit and explicit measures, exploring their associations with political behavior. Specifically, we assessed support for LGBT versus heterosexual candidates, candidates who promote versus oppose LGBT rights, and participants' likelihood of voting for an anti-LGBT candidate in a simulated voting task featuring a realistic campaign flyer. LGBT-CBs emerged at both implicit and explicit levels, with larger effect sizes observed for implicit LGBT-CBs than for explicit ones. Higher endorsement of LGBT-CBs was associated with reduced support for LGBT candidates and those promoting LGBT rights, as well as a greater likelihood of voting for an anti-LGBT candidate. These findings suggest that both implicit and explicit LGBT-CBs play a critical role in influencing political behavior, paving the way for discriminatory candidates and harming LGBT rights.

[177] Political outgroups as monoliths: Evidence of perceived political outgroup homogeneity

12:45 PM – 1:45 PM

POLITICS

The outgroup homogeneity effect describes a tendency for people to perceive outgroup members as more similar to one another than ingroup members. This pattern has been found for various attributes (e.g., faces, preferences, and personality) and with respect to various outgroup types (e.g., gender, nationality, minimal groups). In two pre-registered studies (N = 1400), American Democrats and Republicans placed 20 ingroup members and 20 outgroup members on a five-point continuum representing liberal-to-conservative views on a randomly selected political topic (e.g., immigration, gun control). Replicating the basic effect, participants' placements of outgroup members showed less variance than their placements of ingroup members. Extending beyond previous findings, this effect was mediated by the belief that their political outgroup has less informed views than their ingroup. As well, participants who perceived their outgroups as more homogenous perceived them as more capable of taking coordinated action to further the group's interests. Political outgroup homogeneity could cause people to overestimate the threat posed by political outgroups, furthering political animosity.

[178] Presentation of research: The effects of experiencing gender identity-based stress on decision-making

12:45 PM – 1:45 PM

SELF/IDENTITY

While prior research shows stress affects decision-making, little is known about how identity-based stress may have distinct effects. Fear of stigma from one's social identity has cognitive (e.g., increased rumination) and affective (e.g., higher emotional distress) responses that vary in both nature and intensity from those elicited by general stress, which may impair one's decision-making performance. Based on dual-process theory, we assess the likelihood of heuristic use (Type I) versus reflective processing (Type II) under uncertainty. Using an adapted Trier Social Stress Task, participants (N = 130) will be randomly assigned to either a general or identity-based stressor. Heuristic use and shifts to reflective processing will be assessed using the Cognitive Reflection Test and the Iowa Gambling Task. We hypothesize that experiencing gender identity-based stress will reduce reflective processing and increase heuristic use compared to those under general stress. Cognitive and affective responses will mediate this relationship. Findings from this study may contribute to a deeper understanding of issues such as inequality, empowerment, and stigma perpetuation.

[179] Projective Embodiment in Tabletop Roleplaying Games

12:45 PM – 1:45 PM

SELF/IDENTITY

Tabletop roleplaying games (TTRPGs) have become central to many young adults' social, creative, and emotional lives. However, little is known about how players experience projective embodiment—projecting aspects of the self onto an inhabited character while also experiencing that character as a possible self. Drawing on projective identity and Cultural-Historical Activity Theory, this study takes a phenomenological approach to explore the lived experience of embodying a character in TTRPG play. A naturalistic game session of a pre-existing gaming group of young adults will be video/audio recorded and paired with an immediate post-game focus group to collect first-person reflections. Transcripts and field notes will be coded using six a priori embodiment indicators, social/rhetorical/ludic activity-system codes, and inductive themes. Findings are expected to expand embodiment theory beyond sensorimotor or avatar models, demonstrating how TTRPGs function as psychosocial sites for identity exploration, social-emotional learning, and collaborative meaning-making. A thematic analysis will be presented at the conference, with implications for education, therapy, and game design.

[180] Protecting the self from threat using authenticity judgements

12:45 PM – 1:45 PM

SELF/IDENTITY

Generally, most people have positive views of both their specific and global traits (Twenge & Campbell, 2008). However, when people encounter threats to positive self-views, they tend to engage in a variety of defense mechanisms. The current study sought to examine a novel way people may protect their self-views in the face of threat: deciding they were not being authentic at the time of threat. We hypothesize that people will report lower authenticity when reflecting on times of social rejection relative to times of social acceptance or recent social interactions. We used a between subjects design with participants randomly assigned one of three conditions where they completed either a control, acceptance, or rejection social interaction writing prompt. After responding to the assigned prompt, participants indicated how authentic they retrospectively perceived their past selves to be during the target social event. In line with our hypothesis, the results of our study show that people indeed saw themselves as less authentic during a past social rejection. The present findings are important because they suggest feelings of authenticity may sometimes be undesirable.

[181] Qualitative Analysis of Self-as-Doer Identities: Perceptions of Healthy Eater Identities Include Non-Eating Behaviors

12:45 PM – 1:45 PM

SELF/IDENTITY

Adherence to dietary guidelines remains far below recommendations with 60% of adults having one or more diet-related chronic diseases. Interventions rooted in self-as-doer identity, a construct where individuals perceive themselves as a doer of action (e.g. healthy eater) have increased healthy eating behaviors (HEB). However, less is known about how individuals define a healthy eater. That is, what does a healthy eater look like and in turn, do? Knowing how healthy eaters are conceptualized may promote engagement in HEB. Participants (N=383) responded to open-ended questions describing a healthy eater. Consensual qualitative research methodology was used to analyze themes. In addition to HEB, themes reflected identities that focused on non-eating approaches. Healthy eaters were those in good physical, mental and emotional health, and worked toward illness prevention. Healthy eaters were perceived as adopting a healthy lifestyle and not just a diet. Self-as-doer identities may uniquely promote active behavioral responses and thereby promote health behaviors that align with healthy eating. Future researchers can explore how social and cultural norms related to identity affect HEB.

[182] Racial Messaging, & Parent Nativity Impact Black Adults' Identity

12:45 PM – 1:45 PM

SELF/IDENTITY

While Black American parents often prepare their children for the realities of racial bias, less is known about how these conversations unfold in families navigating US racial dynamics for the first time. This retrospective study compares the racial socialization and identity of US-born Black adults (18–65 y) raised by US-born (US) or foreign-born (FB) parents. Participants (N = 178) completed the CARES scale to assess racial socialization and the MIBI scale for racial identity. Preliminary findings reveal that US and FB parents relay different racial messages that differentially impact their children's racial identity. More specifically, FB parents' messages encouraging conformity, respectability, and distance from stigmatized views of Blackness predicted their children's racial identity. Conversely, US parents' messages acknowledging racism and equipping their children with tools to navigate or resist discrimination predicted their children's racial identity. Taken together, these findings underscore cultural complexities within the Black community and the need for culturally responsive interventions that support healthy racial identity development for US-born Black youth.

[183] Racial Positionality and Minority support for Social Change

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Despite growing diversity, little research has examined how racial minorities' experiences shape their support for social change. We addressed this gap by focusing on Asian (AA) and Latino Americans' (LA) experiences through the racial positional model. Based on this model, AAs are high-status but foreign, while LAs are low-status and foreign. Using experimental manipulations, we examined Asian (N = 282) and Latino (N = 297) participants' support for challenging the status-quo based on their positionality (i.e., their foreignness, their status, or adult friendship [control]). AAs' support for social policies decreased when they read about their high-status relative to other conditions. In contrast, LAs' support for social policies is the same across all three conditions. A potential explanation for this divergence lies in AAs' unique racial position. They are perceived as forever foreigners relative to White Americans, yet too high-status to belong with other marginalized groups. Perhaps, to the extent that this unique position is reinforced, they may be less supportive of broader societal change, which may hinder the formation of multiracial coalitions.

[184] Reduced moral discounting in six populations of extraordinary altruists

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Are morally bad people less worthy of generosity, and does this belief guide behavior? Using a novel monetary decision-making paradigm, we examined how the moral status of potential recipients (selfish, fair, selfless) influenced giving. Results revealed a moral discounting effect: morally worse individuals were judged less deserving of monetary generosity. This decay followed a hyperbolic function, allowing comparison of discounting slopes across groups. Notably, this effect was diminished among extraordinary altruists who had previously provided costly aid to strangers (e.g., organ donors, rescuers, humanitarian workers; $n=173$) compared to demographically matched controls ($n=117$). Altruists' discounting curves were significantly less steep (logk [95% CI] = $-0.740 [-0.912, -0.568]$, $t = -4.31$, $df = 575$, $p < .001$), reflecting reduced differentiation based on targets' moral status. Consequently, altruists were more generous toward morally neutral and selfish individuals. These findings suggest that highly altruistic individuals extend generosity with less regard for recipients' moral worth, offering new insights into the psychology of helping.

[185] Relationship between Kinship, Intergenerational Future-Oriented Thinking, and Sustainable Perceptions

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

How sustainably people behave in the present will impact future generations and their environment, calling for pro-environmental sustainable behaviors in the present. Across two studies, this research investigates the relationship between intergenerational future-oriented thinking (IFOT) and perceptions of climate crises, as well as underlying factors within these relationships. Study 1 ($N = 1557$) found IFOT was a significant predictor of perceived urgency and severity of an ongoing drought among young adults who intend to have children in the future. Study 2 ($N = 400$) tests the effectiveness of two experimental manipulations aimed to increase IFOT and the effects on sustainable outcomes. Participants will imagine either (1) their own future children, (2) the upcoming Generation Beta, or (3) a control; then report their sustainable attitudes, perceptions, intentions, and resource allocations. We hypothesize intent to have children may moderate the relationships between IFOT and sustainable perceptions, intent, and predict more intergenerational allocations. The research has implications for better understanding perceptions of the distant future and predictors of sustainable intent.

[186] Resilience in the Stacks: Identity, Threat, and Commitment Among Library Professionals

12:45 PM – 1:45 PM

SELF/IDENTITY

Library professionals play a vital role in ensuring equitable access to information across academic and public library contexts. Despite this, they face severe challenges, including being seen as part of a “dying” profession (Mourdoukoutas, 2018) and being targets for discrimination due to their role providing equitable access to information. This study examined perceptions of threat to the profession (e.g., uncertainty about the future of libraries) among library professionals ($N=329$, recruited across the U.S.). We investigated how group identification as a library professional influences commitment to the field under such threats (Ellemers et al., 1997). Self-esteem derived from identifying with the profession (Bergami & Bagozzi, 2000) mediated the relationship between perceived threat and professional commitment. In contrast, organization-based self-esteem (i.e., self-worth tied to one's place of work; Bowling et al., 2010) did not. Findings suggest bolstering profession-based self-esteem may help mitigate negative impacts of threat and foster sustained commitment which is vital to the profession's survival and the wellbeing of its members.

[187] Rewards bias self-evaluations of ability

12:45 PM – 1:45 PM

SELF/IDENTITY

How do people learn about their own abilities? Often, people receive rewards that offer information about their performance level. Yet, even when two people perform equivalently on a task, they may receive disparate rewards. In these cases, could rewards still influence self-evaluations of ability? In two behavioral experiments, we asked whether people feel more capable and confident when they receive more rewards, even when their performance is held constant, and they know how they objectively performed. Participants played a perceptual game in which they received trial-by-trial accuracy feedback; a staircase procedure held their objective performance constant. However, participants were assigned to either a high or low reward condition, which varied the probability of receiving a reward for a correct answer. In Experiment 1 (N = 340), we found evidence that rewards bias overall self-evaluations of ability after the task—particularly estimations of objective accuracy. Next, in Experiment 2 (N = 342), we examined whether reward feedback would inflate participants' trial-by-trial expectations of their own accuracy before each round of the game. Results indicated that participants updated their expectations to a greater extent when a correct response was accompanied with a reward. These findings suggest that rewards enhance how much people integrate accuracy feedback into their dynamic self-beliefs.

[188] Risk aversion in prosocial decision-making: The role of early life adversity

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Childhood experiences calibrate psychological and behavioral responses to uncertainty, shaping adult decision-making. Risk-taking in social contexts depends on balancing loss aversion with perceived safety, and early adversity may bias individuals toward protective strategies that minimize uncertainty. This study examined how childhood maltreatment influences social risk-taking in the Public Goods Game (PGG) and Trust Game (TG). In the PGG, individuals with low childhood maltreatment were highly sensitive to social cues, increasing contributions when others cooperated and decreasing them when others defected, consistent with strategic, adaptive risk-taking. In contrast, those with high maltreatment maintained stable contributions across rounds, showing reduced responsiveness to social fluctuations. In the TG, individuals high in maltreatment became progressively more trustworthy over time, while those low in maltreatment grew more self-interested, retaining greater funds. These patterns suggest that low adversity fosters flexible, incentive-driven cooperation, whereas high adversity promotes cautious, risk-averse strategies that prioritize stability and trust maintenance. Together, the findings highlight how early life environments shape the motives and mechanisms underlying trust, cooperation, and social risk-taking.

[189] Seeing Ourselves in Real and Fictional Disliked Others

12:45 PM – 1:45 PM

SELF/IDENTITY

Prior research shows that we like similar others – both real other people and also fictional characters (e.g., from media). But does similarity still predict liking when others are similar to us in negative ways? We predict liking will diminish or even reverse when others share our negative traits. A minimum of 157 student participants (based on a sequential analysis and an a priori power analysis) will identify a disliked real person, a neutral acquaintance, and a disliked fictional character. Participants will provide liking ratings for these three targets and rate the self and the targets on positive and negative traits. Similarity between self and targets will be assessed using Euclidean distance. A within-subjects design will examine how similarity between self and targets on negative traits is related to disliking. By also drawing upon qualitative measures (e.g., paragraphs written about the targets) we will also explore whether disliked others may bolster self-esteem through downwards comparisons and clarify self-concept. This study challenges the idea that similarity invariably leads to liking and explores how individuals relate to disliked real versus fictional characters.

[190] Self-as-Doer Identity and Healthy Eating Behaviors: Differences between Online and In-Person Interventions

12:45 PM – 1:45 PM

SELF/IDENTITY

Self-as-doer identity, an identity construct describing one in terms of doing a behavior, increases healthy eating behaviors (HEB) in in-person interventions, but its effectiveness has not been tested in online mediums. Participants (N = 514), either online or in-person, received the self-as-doer intervention and identified the degree to which 10 doer statements (e.g., healthy eater, sugar avoider) described them. Demographics and HEB items were also completed. Online participants were older, had different education levels, completed the task faster and were more likely to be excluded for completing the survey incorrectly. ANCOVA analyses, controlling group differences, found that in-person participants had higher doer identities than those online. In hierarchical regression analyses, doer identity predicts HEB for both groups, albeit accounting for more variance for those in-person (12.1%) than online (6.8%). Self-identity interventions can be conducted online but may be more effective in-person. Results advance existing knowledge about participant differences and provide directions for future study in generalizing self-identity interventions across different mediums.

[191] Self-Clarity through Enmity: Demonizing Others as an Antidote to Self-Uncertainty Among Structure-Seeking Individuals

12:45 PM – 1:45 PM

SELF/IDENTITY

Becker (1973) proposed that people can define their moral identity by opposing an outgroup. Specifically, demonizing and raging against an "evil" outgroup solidifies one's own righteousness. A preregistered online experiment (N = 1174) tested whether inducing uncertainty (vs. certainty) about one's moral self, motivates those with high epistemic needs to vilify a disliked outgroup. We also examined whether exposure to an anger-eliciting outgroup bolstered self-certainty, moral self-regard, authenticity, and meaning in life. Results showed that for those high in Personal Need for Structure, reflecting on uncertainties (vs. certainties) about one's own moral goodness increased perceptions of the outgroup's immorality and heightened anger. Moreover, completing self-assessments after (vs. before) outgroup exposure reduced self-uncertainty and raised moral self-regard, authenticity, and meaning. These effects were not explained by state self-esteem and did not reflect general derogation of the outgroup. Findings suggest that for some, the desire to maintain a clear, morally grounded, and meaningful self, may contribute to intergroup hostility and perceptions of outgroup malevolence.

[192] Self-compassion and Willingness to Apologize

12:45 PM – 1:45 PM

SELF/IDENTITY

Although people's willingness to apologize is likely impacted by a number of factors, some evidence suggests that self-compassion (treating oneself with kindness in the face of suffering) might play a role. Past correlational research found that people higher (vs. lower) in self-compassion had a greater general tendency to apologize (Vazeou-Nieuwenhuis & Schumann, 2018). Additionally, a brief self-compassion intervention increased participants' feelings of remorse for a recalled wrongdoing (Breines & Chen, 2012). We used a hypothetical scenario in which neither party was explicitly at fault to examine whether self-compassion might predict not just guilty feelings, but also intention to apologize. We supported our hypothesis: Participants who wrote in a self-compassionate (rather than neutral) manner about the hypothetical ending of a friendship expressed greater willingness to apologize and less intention to avoid their former friend, as well as greater guilt. These findings suggest that self-compassion interventions may be effective in improving reconciliatory behavior, which could help in maintaining healthy relationships.

[193] Self-Expansion Predicting Changes in the Self After Family Relationship Dissolution

12:45 PM – 1:45 PM

SELF/IDENTITY

Self-expansion in intimate relationships is the level of self-enhancement a relationship provides. Previous research has shown that less self-expansion in romantic relationships is associated with positive changes in the self following a breakup. However, no study has associated self-expansion with potential affective changes in the self following the dissolution of family relationships. This research aimed to examine the impact of self-expansion provided by recently broken family ties on self-esteem, the ideal self, attitudes toward perceived changes in the self, and the valence of words people use to describe themselves in a post-dissolution context. Participants were 155 individuals who had recently experienced the dissolution of a family relationship. Data were analyzed using linear regression and sentiment analysis with a lexical approach. Results showed that lower pre-dissolution self-expansion predicted greater closeness to the ideal self, more favorable attitudes toward perceived changes in the self, and a more positive valence of self-descriptive words. We concluded that self-expansion is associated with how people perceive themselves after family relationship dissolution.

[194] Self-Love & Social Connection

12:45 PM – 1:45 PM

SELF/IDENTITY

Self-love, often misinterpreted as narcissism, is a vital yet understudied psychological construct linked to well-being. We argue narcissism is not self-love, as it has never been measured as such but only theoretically conflated. A 2019 pilot study introduced the Whole Self-Love (WSL) Scale, defining self-love as intrinsic, unconditional, and non-narcissistic acceptance of the self. This study further validates WSL through its associations with psychological, health, and social outcomes in a cross-sectional design. Contrary to assumptions that high self-love fosters hyper-independence and weak social ties, WSL correlated strongly with Positive Affect and Life Satisfaction, and moderately with Self-Rated Health, Cognitive Reappraisal, Big Five traits, and Social Network Index. Negative correlations emerged with Negative Affect, Depression, Loneliness, and Social Anxiety. Divergent validity was supported by weak associations with Narcissism, Neuroticism, and related constructs. Findings highlight WSL's potential in promoting emotional, psychological, and physical health.

[195] Self–Other Distinction and Empathy: The Role of the Bodily Self

12:45 PM – 1:45 PM

SELF/IDENTITY

Prior work has shown that self–other distinction is an essential component of empathy and that self-concept clarity promotes empathy and prosocial behaviour. This conceptual understanding of the self, however, does not speak to the underlying processes that support a coherent and stable self-representation. Here, a "bottom-up" understanding of the self that focuses on the integration of sensory cues (i.e., the bodily self) may be particularly relevant. This study assessed participants' (n = 98) bodily self malleability, quantified using the Rubber Hand Illusion task, and its relation to empathic accuracy. While watching a series of videos, in which targets describe negative experiences, participants provided continuous estimates of each target's emotional state, which was compared with each target's time-series self-reported emotional states to determine empathic accuracy. The results revealed that those with a more malleable bodily self were less accurate when judging a target's emotional state ($\beta = -0.044$, $p = .022$). These findings highlight the potential role of the bodily self in self–other distinction and empathy.

[196] Self-reflection in a clouded mirror: Integrating possible selves for expression under biased thought processes

12:45 PM – 1:45 PM

SELF/IDENTITY

Self-reflection occurs in two modes that guide attention to information in the self-concept: integration seeks incoherence, information that does not agree with its neighbors, to unify, while and expression seeks coherence, information that does agree with that around it, to use. It is proposed that integration is needed to maintain multiple coherent clusters representing flexibility and possible selves. To examine this, the focus (i.e. placement) of the attentional spotlight was made random at set intervals, with data collected on the ability of expression to create clustering and coherence in a random area following prior integration compared to continual expression. This study expands on that hypothesis by including a humanistic complication in the patterns of the model: manipulating bias in the valence of incoming information and the ratio of mode focus to represent effects of traits like self-esteem and tendency for rumination on the specificity and coherence of the self-concept structure. Findings are related to how biases in self-perception affect the adaptability of the self-concept in the formation and valence of current and possible selves.

[197] Shaped by Space: Ethnic-Racial Identity Profiles and Their Role in Black Americans' Responses to Environmental Threat

12:45 PM – 1:45 PM

SELF/IDENTITY

Black residents who inhabit predominantly White spaces grapple with the threat of being stigmatized, which may lead to isolation from one's racial/ethnic groups, and consequently, a distorted sense of self. This study examines the impact of built environments on the lived experiences of individuals who access and occupy them. We examined associations between the racial composition of past environments, racial identity profiles, perceived discrimination, and vigilance among Black Americans. Participants ($n = 328$) completed an online survey measuring the racial composition of schools attended and neighborhoods resided in, ethnic-racial identity (ERI), vigilance, and perceived discrimination. Latent profile analysis detected three unique profiles (59%, Ethnic-Racial Identity Focused, 35.7%, Assimilated, 5%, Undifferentiated). Hierarchical linear regression showed that ERI accounted for 8.7-17.8% of the variance in perceived threat, stigma, exclusion, discrimination, and vigilance. Environments accounted for 2.8% of the variance in perceived discrimination. This study identified profiles that are adaptive to environments with implications for space-induced identity formation.

[198] Shared Fandom as a Buffer: A Simulation Study of Politicual Sorting and Affective Polarization

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Political and cultural identities are increasingly intertwined, a process known as politicual sorting. This alignment intensifies affective polarization, or the tendency to view political out-groups with hostility and distrust. At the same time, shared cultural communities, such as fan groups, may provide cross-cutting identities that bridge partisan divides. The present study used a simulation design to examine whether shared popular culture identification moderates the relationship between politicual sorting and affective polarization among adolescents. A synthetic sample of 1,000 individuals was generated, each assigned a continuous measure of politicual sorting and a binary indicator of shared fandom. Affective polarization scores were modeled as a function of sorting, fandom, and their interaction. Results revealed three key findings. First, politicual sorting strongly predicted higher affective polarization. Second, shared fandom was associated with lower baseline polarization. Third, and most critically, the interaction was significant and negative: shared fandom attenuated the effect of politicual sorting on polarization. These results suggest that cross-cutting cultural identities can buffer the consequences of political sorting, highlighting the potential of seemingly apolitical spaces—such as fandoms—to reduce intergroup hostility in politically divided societies.

[199] Short-Form Video Induces an Inverse Relationship Between Believability and Retention

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Misinformation is spreading at an alarming rate, often by design. Short-form videos are now a prominent format for information consumption on social media platforms. Prior research suggests that visual media can promote cognitive laziness, with audiences relying on surface level cues instead of engaging in deeper analytical thinking. The current project examines how media format and exposure length influences the believability and retention of misinformation. In Study 1, U.S. adult participants ($N = 319$) were exposed to fake news stories, watching a video or reading an article for either 50 seconds or 3 minutes. Participants then rated the believability of the content and completed a retention test. There was a significant inverse relationship between believability and retention, but only in the short-form video condition ($r(61) = -.35, p = .006$); in all other conditions, the relationship was nonsignificant. Surface-level cues in short videos may trigger heuristic processing, increasing believability while undermining deeper memory encoding and/or retention. Study 2 examines a broader stimulus set and assesses the role of individual differences (e.g., reflective thinking).

[200] Should AI inform us when we're going to die? Framing life expectancy information as "life length" vs. "death date"

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

How we think about our future may affect our willingness to engage with information. In this study, participants (N = 248) were asked to imagine an artificial intelligence (AI) system that could accurately predict either their "death date" or their "life length", and asked whether they would access this information for themselves and close others. Participants also reflected on their mood and meaning in life after receiving either a "very soon" death date (or "very short" life length) versus a "very far" death date (or "very long" life length). Participants were significantly more willing to receive information when it was framed as "life length" compared to "death date." Moreover, even when the time horizon was identical (1-2 years from now), participants who were told to contemplate a "very short life length" reported a higher meaning in life compared to those who were told to contemplate a "very soon death date." These findings highlight how framing life expectancy alters openness to confronting future outcomes, with implications for health communication, decision-making, and information technology. Additional results (e.g., age, religiosity, health status) are also discussed.

[201] Signals of Exclusion: Student Perceptions of Campus Safety Amid Anti-DEI Legislation

12:45 PM – 1:45 PM

SELF/IDENTITY

Across the U.S., anti-DEI policies are reshaping higher education by dismantling programs designed to foster inclusivity and success for marginalized students. As these policies spread, they may signal identity-based threats, fundamentally altering students' anticipated sense of belonging, academic success, campus safety, and even their decisions about where to enroll. This talk presents empirical insights from a study of 220 students, using both quantitative and qualitative data to examine (1) how anti-DEI policies serve as threatening cues that shape students' expectations of campus belonging and success, (2) which specific campus mechanisms—such as reduced resources or shifts in multicultural values—drive these anticipated changes and (3) what positive and negative experiences students anticipate on anti-DEI campuses. Findings reveal that these anti-DEI policies have potential psychological and institutional consequences, highlighting the need for future research on signaling safety and fostering inclusive campus environments despite growing restrictions.

[202] Similarities in the Perception of the East Asian Group Across Identity Content and In-group Membership

12:45 PM – 1:45 PM

SELF/IDENTITY

People tend to perceive their in-groups more accurately and favorably than out-groups, but less is known about how the same group is perceived differently by its in- versus out-group members and how ethnic-racial identity (ERI) – specifically people's understanding of their ERI (ERI content) – plays a role. This mixed-methods project explored the perceptions of East Asians based on one's in-group status and ERI content. East Asian participants (n = 145) and White participants (n = 166) completed quantitative tasks capturing their visual and socio-behavioral representations of East Asians through the reverse correlation task and a description judgment task, respectively; additionally, they responded to two open-ended questions about their day-to-day perception and categorization of East Asians. Results demonstrated that while one's in-group membership afforded sensitivity to group-relevant behaviors and traits, it did not influence one's visual representation of their group. ERI content influenced perception primarily when perceivers had the cognitive bandwidth for deliberate reasoning.

[203] Social Change through Social Media: The Positive Role of Online Organizing in Armenia's Velvet Revolution

12:45 PM – 1:45 PM

POLITICS

In 2018, the Armenian Velvet Revolution, a series of nonviolent protests against the government, led to successful regime change and the sponsorship of democratic and anti-corruption reforms (Lanskoy & Suthers, 2019). Social media was a clear driving force of the movement's successful collective action (Kende et al., 2016; Muradian, 2019). In the current study, semi-structured interviews with 18 Armenian activists who participated in the revolution examined social media's role in supporting regime change, creating social pressure for participation, coordinating diverse protest tactics, and sustaining political pressure for continued reform. Using Qualitative Content Analysis (QCA), three main categories were developed from the data: social relationships online and offline, popular opinions on movement legitimacy, and perceived political outcomes of the movement. Study results connect activists' perceptions of social media usage to broader understandings of regime change legitimacy and sustainability within popular uprisings. This work offers insight into the understudied topic of social media's role in collective action and social change in politically restrictive environments.

[204] Social identity complexity as a buffer against political polarization under uncertainty

12:45 PM – 1:45 PM

POLITICS

Partisan social sorting – the alignment of social identities such as race, religion, and ideology with political partisanship – has been shown to strengthen partisan attachments, heighten emotional reactivity, and fuel animosity towards political outgroups. This phenomenon can be more deeply understood via social identity complexity, a construct that describes the degree to which individuals perceive their multiple ingroup identities as discrete rather than overlapping. Two studies investigated the effects of uncertainty and social identity complexity/partisan social sorting on affective polarization. In Study 1, participants were primed with high vs. low social identity complexity and high vs. low uncertainty. High uncertainty increased affective polarization among those primed with low social identity complexity, but reduced polarization among those primed with high complexity. Study 2, a secondary analysis of 2016-2020 American National Election Studies (ANES data), replicated these results both cross-sectionally and longitudinally. Uncertainty was associated with increased affective polarization among highly sorted partisans, but reduced polarization among the least sorted partisans.

[205] Social Identity, Relative Deprivation, and Collective Action Before the 2024 Presidential Election

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Politicized identities form the backbone of collective action, which includes behaviors such as signing petitions and attending protests on behalf of the group (Klandermans, 2014). Injustice, often feelings of relative deprivation, motivate these behaviors. Partisan identities were salient leading up to the 2024 U.S. Presidential Election and interparty conflict was high. The Republican nominee, President Trump, claimed that the 2020 election was "stolen from us," whereas the Democratic nominee, Vice President Kamala Harris, called for unification, stating, "in unity, there is strength." These platforms, along with research linking relative deprivation to right wing populism (Cena et al., 2022), suggest that Republicans may prescribe to a normative narrative of deprivation based on their political identities. A sample of 1521 Democrats and 1324 Republicans collected one week before the 2024 Presidential Election provides evidence that strength of party identification predicts collective action intentions on behalf of one's group, mediated by perceived relative deprivation (in comparison to the outparty). This relationship is stronger for Republicans than Democrats.

[206] Speaking of Emotions: Bicultural Identity, Mentalized Affectivity and Psychological Distress Among Spanish English Bilinguals

12:45 PM – 1:45 PM

LANGUAGE

While disparities in mental health care access for Hispanic individuals are well-documented, a deeper issue concerns how emotion and distress are experienced among bicultural, often bilingual, individuals. Using the frameworks of Mentalized Affectivity (MA) and Bicultural Identity Integration (BII), the current study examines whether Spanish-English bilinguals experience differences in emotion regulation and psychological symptoms across languages, shaped by cultural identity coherence and language-activated cultural schemas. 171 bilingual adults completed the Mentalized Affectivity Scale, BII Scale, and DASS-21. Results showed higher Identifying scores in English and higher Expressing scores in Spanish. Depression and Stress were also higher in Spanish; Anxiety did not differ. BII predicted cross-language differences in Processing and Expressing but not Identifying. Findings support cultural frame switching theories and suggest that language context shapes emotional experience. BII appears to foster emotional coherence, with implications for culturally sensitive mental health care.

[207] Specialization of Labor: A Game Changer for Collaboration

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Humans excel at collaboration, an ability shaped by evolution to solve problems with shared outcomes requiring joint effort. Children and adults prefer to share resources equitably when acquired by collaboration, but not other types of cooperation. Yet key structural features of collaboration remain unexplored. Collaboration offers benefits like achieving otherwise unattainable goals and increasing productivity, but also costs like vulnerability to free-riders. Thus, labor organization likely affects how desirable collaborations are to join. Specialization of labor may be critical. It can incentivize contribution by making roles essential, boost efficiency via task-specific skills, and deter free-riders by making them easier to detect. But do people intuitively understand this? To find out, participants imagined being stranded on an island, needing to prepare food collaboratively. They saw two plans: (1) Each person task-specializes or (2) they switch tasks. People expected more productivity and less free-riding with specialization, and preferred such collaborations. This suggests a well-designed decision-making system for collaborations, reflecting a psychology of collaboration.

[209] Spontaneous Self-Affirmation, Psychological Well-Being, and Health Behaviors

12:45 PM – 1:45 PM

SELF/IDENTITY

People may respond defensively when faced with self-relevant threats (e.g., health information), for example in the form of avoidance or reduced health behaviors. Reflecting on personal values and strengths (i.e., self-affirmation) may reduce defensiveness. People who spontaneously self-affirm (SSA) also tend to have better psychological well-being (e.g., more positive emotions and optimism, less negative emotions) and subjective health. The present study investigated associations of SSA with 1) indices of psychological well-being, including anxiety and depression, loneliness and life satisfaction, and 2) health behaviors (Clean and Contain scale) in two panels of participants (Panel 1: n=429, April 2021; Panel 2: n=568, May 2022). After accounting for sociodemographic factors, linear regressions found that greater SSA was associated with less psychological symptoms (Panel 1 only; $\beta = -.15$, $p = .002$) and loneliness ($\beta = -.15$, $p < .001$), as well as greater life satisfaction ($\beta > .09$, $p < .028$) and more cleaning behaviors ($\beta > .10$, $p < .016$) in both panels. Results support the association of SSA with psychological well-being and health behavior engagement, a potential avenue for intervention.

[210] Stay the Course or Make Amends: Consistency vs. Compensation in Decision Making

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Decisions involving the appropriate (fair) allocation of outcomes between two entities often center not only on the current behavior and qualification of the entities, but also on their past experiences. In the consistency perspective, outcome allocation is considered appropriate when it's in line with past success and failure; in the compensation perspective, the appropriate allocation of outcomes compensates for past hardships and mitigating influences. This distinction is observed in everyday situations as well as in institutional contexts (affirmative action). We employed a diverse set of scenarios to test whether political orientation and level of personal agency (Vallacher & Wegner, 1989) influence people's preference for consistency vs. compensation. We hypothesize that political conservatives will opt for consistency because of their emphasis on personal responsibility, while liberals will opt for compensation because of their emphasis on situational forces that hinder success, and that high-level agents will opt for consistency due to their emphasis on competence, while low-level agents will opt for compensation due to their sensitivity to impediments to effective action.

[211] Stealing home: Does social support moderate the effects of identity threats on concealment and demoralization?

12:45 PM – 1:45 PM

SELF/IDENTITY

Self-verification theory posits that individuals need to be seen by others consistent with how individuals see themselves. If individuals feel self-verified by a small number of friends who know and accept the individual, these friendships may provide a "home base" that mitigates the harm done by various identity threats in other settings. The proposed research will examine the direct effect of identity threats on the tendency to conceal identities and, in turn, the effect of identity threats and concealment on demoralization. These relations are expected to be moderated by perceptions of social support from a close set of friends who make the individual feel self-verified. Data assessing each of these constructs will be gathered from approximately 320 college students. Statistical analyses will include testing a regression-based moderated/mediational model as described above. The study will examine possible theoretical and empirical linkages between self-verification and attachment theories—exploring whether self-verification needs can be satisfied by means of a "home base" of securely attached relationships that extend protections outside of the confines of those relationships.

[212] Supporting Autocracy: The Impact of Ingroup Status on Leadership Preference

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Research on leadership style demonstrates a preference for democracy over autocracy; however, situational factors may undercut this predisposition. This study investigates the relationship between ingroup status and leadership style preference, specifically whether political ingroup leaders are evaluated more leniently for being autocratic than outgroup leaders. The hypotheses are: (1) an autocratic leader will receive less support than a non-autocratic leader, (2) an outgroup leader will receive less support than an ingroup leader, and (3) there will be an interaction between leadership style and ingroup status, such that the difference in support between autocratic and non-autocratic leadership styles will be greater for outgroup leaders. Participants will read a vignette about a candidate for political office. The candidate's platform will be manipulated such that the leader will be a member of the participant's ingroup or outgroup, and either autocratic or non-autocratic. Participants will then evaluate the candidate, measuring leader support. The expected results are that there will be greater support for ingroup autocratic leaders compared to outgroup autocratic leaders.

[213] Sympathy toward home owners versus renters displaced by gentrification

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

People believe they root for disadvantaged individuals, but empathy due to loss aversion could cause them to sympathize more with the advantaged (who have more to lose). Our experiment depicted a low-income resident who really enjoyed living for ten years in a rapidly-gentrifying neighborhood but could not afford to stay. We described the resident being displaced as either a homeowner or renter. Home-owning participants reported having more sympathy and rooting more for the owner than the renter. Participants experienced these feelings even as they understood the substantial profit the owner (but not the renter) could gain from selling their house. Participants thought the owner would feel worse about having to move than the renter, so they sympathized more with the owner despite stating that they would rather trade places in life with the owner than the renter. Renting participants displayed higher sympathy and rooted for the renter more than the home-owning participants.

[214] Teaching the System: Connecting People, Policy, and Racism

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Many Americans attribute racism to individual behavior and overlook policy as a crucial cause of racial inequality (Rucker & Richeson, 2021). We designed a novel intervention aimed at teaching people about how individuals and policies reinforce each other to produce racial inequality. In three experiments, participants read examples of racial bias in individuals and policies. Information about racist individuals and racist policies were either presented separately or described as inextricably linked and reinforcing one another. Compared to the 'separate' condition (and compared to a 'no information' control condition), the 'linked' condition increased participants' endorsement that policies and individuals influence one another. These results suggest it is possible to teach how individuals and policies interact to produce racial inequality.

[215] Testing a Self-Affirmation Intervention for Seeking Emotional Social Support

12:45 PM – 1:45 PM

SELF/IDENTITY

Although needing help is a common occurrence, many people do not seek the help they need. People may avoid seeking help because they anticipate it will be awkward or they fear they will be judged negatively. These negative feelings may become worse when needing to seek emotional social support (ESS) for a personal issue, as needing to seek help for such an issue can be self-threatening. The current study will test a value-based self-affirmation intervention to buffer against this self-threat. It is predicted that self-affirmation will protect against future threats to the self. In the present study, we hypothesize that participants who complete the intervention will report a greater likelihood of seeking ESS regardless of how uncomfortable they anticipate the experience to be. A behavioral measure will also examine whether more people in the intervention group sought support compared to the control group. The findings will reveal whether the self-affirmation intervention was effective in reducing emotional barriers to help-seeking and will contribute to the literature on eliminating help-seeking avoidance.

[216] Testing The Coddling of the American Mind: Measuring the Three Great Untruths and Their Correlates

12:45 PM – 1:45 PM

POLITICS

In *The Coddling of the American Mind*, Lukianoff and Haidt (2018) posit that maladaptive social, psychological, and cultural trends on American college campuses (and potentially Western society more broadly) stem from a growing belief in three "Great Untruths": Fragility (what doesn't kill you makes you weaker), Emotional Reasoning (always trust your feelings), and Us vs Them (life is a battle between good people and evil people). However, despite the book's popularity and impact on popular discourse, few efforts have been made to directly test these claims. We sought to generate and validate a scale and test some of the book's claims. Starting with an initial pool of 131 items, three studies validated a 30-item Measure of the Three Great Untruths (M3GU). Endorsement of the three Great Untruths positively predicted reported experience of helicopter parenting, mental health distress, support for censorship and political violence, political polarization, dangerous and competitive worldviews, a conspiracy mentality and authoritarianism. However, the M3GU was only weakly related or unrelated to education level and age, suggesting that these beliefs are not isolated to college campuses.

[217] That's Just My Opinion: Political Identity Threat in Virtual and In-Person Environments

12:45 PM – 1:45 PM

POLITICS

Given growing political polarization in the U.S., it is possible that Americans experience identity threat based on their political identity, in which they anticipate negative treatment from others based on their own political ideology. Moreover, political identity threat may be experienced differently in virtual versus in-person contexts. We randomly assigned 356 American adults to imagine hearing a negative political or apolitical comment from a coworker that was communicated either in-person or online. The coworker's negative political comment (pilot tested) voiced either opposition (for liberal participants) or praise (for conservative participants) for gender neutral bathrooms. In partial support of pre-registered hypotheses, participants experienced greater general and categorization threat when exposed to a political comment and greater distinctiveness threat when exposed to an apolitical comment. Setting did not moderate these effects. This study supports the existence of political identity threat and demonstrates that it may be elicited through negatively valenced politically-salient interpersonal interactions.

[218] The role of elite cues and endorsements of political violence in shaping individual attitudes

12:45 PM – 1:45 PM

POLITICS

This project analyzes the role of affect-based political cues, wherein different emotional valence produces different behavioral outcomes, provided by elite leadership and the subsequent transmission of these values onto the electorate. Given that there is a well-documented rise in charismatic politicians being elected to office and ultimately influencing a large swath of the electorate to adopt ideologically similar policy preferences, this study employs a survey experiment to observe whether rhetorical manipulations can result in greater political alignment between elites and their constituents. Using a three-way factorial design between elite ideological identity, elite-participant ideological matching, and the cue's rhetorical theme, participants were exposed to a sample political speech that manipulated the chosen cue, political violence, as either an agency-based call to action or a moral defense of ingroup identity. Early theories suggest the robustness of social influence processes as they play out in today's modern political climate, along with the need for assessing the malleability of individual behavior, particularly when originally positioned against elite preferences.

[219] The “No Alternative” Trap: Authentic vs Strategic Expressions of Fatalism

12:45 PM – 1:45 PM

POLITICS

Across three studies (N = 3,032), we examine the disconnect between dissatisfaction with societal conditions and political action. Study 1 uses longitudinal data from the American National Election Studies (ANES) and finds that between 2020-2022, 30% to 43% of participants remained politically inactive despite reporting an explicit dissatisfaction with the current state of the country. This “resigned” group is distinguished from ambivalent, system justifying, and system challenging groups. Study 2 replicated these results using a U.S. Prolific sample, while bringing to light an important issue for the study of collective resignation: the tendency for system justifiers to report hopelessness for social change and fatalism. Study 3 replicates and expands Studies 1-2 and demonstrates that system justifiers personally endorse feelings of fatalism in affectively neutral ways, potentially as a means to mute dissent. Relative to system justifiers, resigned participants personally endorsed fatalism less but perceived fatalism to be more negative and widespread. These studies underscore the importance and complexity of studying collective resignation.

[220] The Alliance Hypothesis of Race: A Replication Study

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Is categorization by race inevitable? The Alliance Hypothesis of Race posits that age, sex, and alliance—but not race—are “dedicated” or “primary” dimensions of social categorization (e.g., Pietraszewski, 2022). The Alliance Hypothesis of Race predicts that when alliance information is presented orthogonally with race information (such that race does not predict who is allied with whom), categorization by race will substantially decrease relative to when alliance information is absent. Importantly, the hypothesis also predicts that categorization by age and sex will be unaffected by alliance information. The current studies attempt to replicate the effects predicted by the alliance hypothesis of race using the ‘Who Said What?’ paradigm in a series of three 2(dimension) x 2(alliance information: present/absent) between-subjects experiments (Ns = 100/condition ; Total N = 600). Studies 1, 2 and 3 examine categorization by race(black/white), age(young/old), and sex(male/female), respectively. Categorization along each dimension is examined in contexts where alliance information, (operationalized as cues to targets’ political orientation), are present or absent. Results of all three studies are used to gain empirical leverage on the veracity of the Alliance Hypothesis of Race.

[221] The Cognitive Map of Politics: Measuring How Voters Organize and Perceive Political Coalitions

12:45 PM – 1:45 PM

POLITICS

Understanding how voters perceive political coalitions is key to explaining partisanship and polarization. While prior work focuses on how parties sort voters by ideology and demographics, less is known about how voters themselves mentally organize political groups. We first analyze nationally representative ANES data, using network and clustering methods on feeling thermometer ratings to uncover latent coalitions embedded in affective group evaluations from 1996 to 2024. We then validate this structure in an original survey (N = 602), where participants rated the perceived political alignment of a subset of social groups. Exploratory graph analysis reveals the same latent coalition structure, suggesting voters share a coherent map of party-aligned groups. Finally, we explore individual differences in this perceptual sorting, examining which psychological and demographic variables predict variation in how voters structure partisan coalitions. This work sheds light on how voters construct political meaning and how these mental maps shape polarization in the electorate.

[223] The Cost of Caring: How Mindfulness Impacts Motivated Compassion Avoidance

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Research has found that prosocial emotions are cognitively effortful. One way that people regulate prosocial emotion is by selecting into or avoiding social situations that require it. As an attention-based emotion regulation strategy, mindfulness may allow one to be more "present" in social emotion regulation contexts. Early work has found that mindfulness training increases prosocial emotion regulation. Here, we conducted three studies that tested if trait mindfulness and brief mindfulness instruction would predict motivated compassion avoidance (or selection). In Study 1 (n=189), trait mindfulness was not correlated with motivated compassion avoidance in a modified Empathy Selection Task. In Study 2 (n=148), Prolific workers and college students receiving brief mindfulness instruction unexpectedly avoided compassion situations over time as compared to sham mindfulness instruction recipients. Together these studies suggest that momentary states of mindfulness may be associated with motivated empathy avoidance. Study 3 (ongoing n=117/300) adds a no-instruction control to Study 2, to determine if the mindfulness or sham mindfulness condition is "active" in compassion selection.

[224] The Double-Edged Identity: How White vs. Ethnic Salience Shapes White Americans' Privilege Acknowledgment and Diversity Support

12:45 PM – 1:45 PM

SELF/IDENTITY

Prompting White Americans to consider their ethnic (vs. racial) identity increases support for multiculturalism. However, it is possible that an ethnic (vs. racial) identity focus absolves White people from acknowledging their racial privilege. We tested this possibility in two preregistered studies (N = 696). White American online participants were randomly assigned to consider their racial (i.e., White) or ethnic identity (e.g., Irish). In Study 1 (N = 276), the identity salience manipulation did not impact multiculturalism nor privilege beliefs, but qualitative analyses revealed that those in the ethnic (vs. racial) identity salience condition spontaneously mentioned privilege less frequently. Study 2 (N = 420) added an explicit privilege reminder to make unearned racial advantages more apparent. As hypothesized, ethnic (vs. racial) identity salience decreased personal privilege acknowledgment, but we failed to replicate the positive effect of ethnic (vs. racial) identity salience on multiculturalism support shown in past work. These findings suggest that emphasizing White Americans' ethnic identity may hinder privilege acknowledgment and complicate genuine allyship.

[226] The effects of I-sharing with same and opposite sex partners on sexist beliefs in men

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

I-sharing is the belief in an identical shared subjective experience between two individuals (e.g., sharing the same emotional reaction like fear when watching a movie). Shared subjective experiences play an important role in interpersonal contact and it can lead to increased liking between subjects. Interestingly, the liking that I-sharing builds can override in-group bias, leading individuals to prefer I-sharing dissimilar partners over non-I-sharing similar partners. While increased liking from I-sharing has been explored, intergroup perceptions, such as sexist beliefs, after I-sharing have not been explored. Unlike I-sharing, quality and quantity of time spent with women have both been linked to a reduction in sexist beliefs in men, which may suggest that I-sharing could have a similar effect (Vasquez, 2020). Since sexist beliefs are connected to violent behavior and acceptance of violent behavior towards women, any reduction of them is significant (Gutierrez, 2023). Participants will be subject to an I-sharing manipulation then surveyed on benevolent and hostile sexist beliefs. This study seeks to explore the relationship between men I-sharing with women and sexist beliefs.

[227] The Effects of Narrative vs. Expository Messages on Social Support-Seeking in First-Year College Students

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

College students experience increasing loneliness and isolation, with first-year students being particularly vulnerable due to environmental and social changes. We tested whether reading about peers' vulnerable experiences would improve social support-seeking and perceptions of peer empathy among first-year college students. Reading fiction has been shown to strengthen social cognition, and norm-setting has also been shown to increase social wellbeing. We examined how these formats—Narrative (1st-person storytelling, i.e. "fiction") vs. Expository (statistics, i.e. "nonfiction"/norm-setting)—could lead to changes in empathy perception and support-seeking. Study 1 findings (n=118) indicated that reading about student experiences in both styles did not consistently change empathy perception but significantly increased social support-seeking ($p < 0.01$). These results were partially replicated in Study 2 (n=85). Our findings suggest that such an intervention design can be potentially beneficial and effective in encouraging support-seeking in college students. This in turn can increase social outreach, connection-making, and sense of belonging, all of which promote wellbeing.

[228] The Effects of Racial and Ethnic Identities on Discrimination Perception

12:45 PM – 1:45 PM

SELF/IDENTITY

Race and ethnicity are often conflated in mainstream and scientific discourse, resulting in terminological confusion. This study defines race as a social construct categorizing people based on visible physical characteristics such as skin color, whereas ethnicity refers to a shared cultural heritage, values, tradition, and ancestry. This study examines the difference and the intersection of these concepts rooted in social identity within two groups in the Black population—Black Americans and Black immigrants. We believe racial identity is important to Black Americans due to the prevalence of racial discrimination in America; therefore, we make ethnic identity comparatively less central. We test this by evaluating naturally occurring racial and ethnic differences as well as by manipulating the salience of racial and ethnic identities. We propose that Black Americans will report more discrimination and attribute it to race. For Black immigrants, discrimination perception and attribution to race and ethnicity will be moderated by acculturation. These naturally occurring differences will be lessened in response to the salience manipulation. To assess these, a survey will be distributed to 400 Black Americans and 400 Black immigrants on Cloud Research Connect. Participants will be randomly assigned to an ethnicity or race social identity condition to prime either identity before administering the primary measure. Discrimination perception and attribution to race and ethnicity will be measured using ambiguous discrimination vignettes modeled from previous work.

By evaluating within-group differences and the intersection of race, ethnicity, and acculturation, this study will better inform our understanding of the discrimination experience. Findings are expected to inform culturally responsive counseling approaches and guide equity-focused policies tailored to the nuanced realities of marginalized populations.

[229] The Effects of Self- and Racial-Affirmation on Self- and Race-Relevant Outcomes among African Americans

12:45 PM – 1:45 PM

SELF/IDENTITY

Previous research has examined how self-affirmation affects ethnic minority samples within the context of stereotype threats and health-related threats. However, limited self-affirmation research has considered self-related outcomes (e.g., psychological well-being; resilience) and race-related outcomes (perceived discrimination; racial identity) among African Americans. Furthermore, little research has compared self-affirmation (promoting self-relevant values) to racial-affirmation (promoting racial group relevant values). We hypothesized that African Americans on an online Prolific sample in a self- or racial-affirmation condition will report lower discrimination and higher psychological well-being, resilience, and racial identity as compared to control participants. Further, we hypothesized that self-affirmation will have a larger effect on self-relevant outcomes and that racial-affirmation will have a larger effect on the race-relevant outcomes as compared to the other respective condition or control condition. Given the pervasiveness of racism in society, it is important to examine these identity and well-being constructs among African American samples.

[230] The Expectedness Gap: Socioeconomic Inequality in the Quality of Employment Self-predictions

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Who experiences more unexpectedness in life than others? My work measures and explains the extent to which socioeconomically disadvantaged people have less success in foreseeing a key life outcome: whether one will be employed in four months. Economists have emphasized that disadvantaged groups have more overoptimistic systematic bias. People predicting an x% chance of employment tend to have a less than x% chance of employment, especially among the less well-off. However, focusing on systematic bias allows positive and negative prediction errors to simply cancel out and yields few insights into the importance of systematic bias relative to other factors constituting unexpectedness. Using the Survey of Consumer Expectations, I show that those with more earnings and schooling can better foresee positive and negative employment outcomes. I decompose mean squared prediction errors to show that differences in systematic bias make up at most 15% of the expectedness gap between the top and bottom earning quartiles. Disadvantaged people have more unexpected outcomes mostly because they face greater variation in employment and lack the advance notice necessary for foreseeing nonemployment.

PROSOCIAL BEHAVIOR

Authors: Rozelin Vurgun, Ensar Acem, Firat Seker, Burak Dogruyol, Hasan G. Bahcekapili, Ozan Isler, Onurcan Yilmaz

Challenging the assumed religion–prosociality link, we present evidence that moral consistency—not just prosociality—is shaped by the interplay of religious identity and contextual factors among Christian and Muslim participants. Across two experiments, we examined how priming religious and secular authority (via a novel pseudo-CAPTCHA task) influenced prosocial behavior and behavioral moral consistency among religious believers and non-believers. In Study 1 (N = 1546, United States), Christians were not more prosocial than non-believers, but they exhibited greater moral consistency across domains. Although neither prime significantly increased general prosociality, priming secular authority enhanced moral consistency. In a replication with a Muslim sample in Türkiye (N = 971), religiosity was not correlated with either prosociality or consistency. However, secular priming increased prosocial behavior compared to the control condition and enhanced consistency relative to the religious prime. Overall, our findings showed that morality extends beyond religion, with both religious and secular systems adapting moral behavior depending on cultural context and activated norms.

[232] The Impact of Threats to the Democratic System on Psychological and Physical Health: From the Declaration of Martial Law to the Presidential Impeachment in South Korea

12:45 PM – 1:45 PM

POLITICS

Threats to democratic systems can be stressors that adversely affect individuals' mental and physical health. We examine the health consequences of two contrasting political events in South Korea: the declaration of martial law by the president (Dec. 3, 2024) and his impeachment through democratic procedures (Apr. 4, 2025). Data were collected from a nationally representative sample (N = 1,000) shortly after the impeachment. Participants reported mental and physical health during two distinct periods (pre- and post-impeachment). Controlling for covariates, participants reported worse mental and physical health in the pre- (vs. post-) impeachment period. Political orientation moderated these effects: liberals, compared to conservatives, experienced worse health outcomes before the impeachment, but better outcomes after. We collected follow-up data from the same participants before and after Korea's presidential election (Jun. 3, 2025) and will further analyze health changes over time. These findings suggest that political threats to democracy can harm public health, and individuals' political orientation plays a key role in shaping how they experience and recover from such crises.

[233] The impact of victim identity on true crime media consumption and the perpetuation of Missing White Woman Syndrome (MWWS)

12:45 PM – 1:45 PM

SELF/IDENTITY

MWWS is the tendency for true crime stories involving white, high SES, female victims to receive greater media attention and public interest compared to true crime stories involving minority-identifying victims (Slakoff & Fradella, 2019). This study investigated mechanisms of MWWS by testing how a victim's race and SES in a true crime podcast drove interest, perceptions, and attitudes toward the story. Participants (n = 248) read a description of a fictional true crime podcast in which an 18-year-old woman went missing. The victim's race (white or black) and SES (low or high) were manipulated, creating 4 between-person conditions. Contrary to MWWS bias, the low SES black victim's story was perceived to be more surprising and important compared to other identity conditions. Interest in the podcast did not differ based on race and SES. Aligning with MWWS, high SES white victims were perceived to garner greater concern and effort from police and community members compared to other conditions. Thus, MWWS bias may not be primarily driven by what listeners perceive as most important or engaging but what is perceived that other people—i.e., society at large—seem to care about.

[234] The Influence of Identity Priming on Evaluations of Kamala Harris

12:45 PM – 1:45 PM

POLITICS

The social identities of Democratic Party nominee Kamala Harris were noted frequently prior to the election. We examined how priming her marginalized identities affects perceptions of her. In study 1 (n = 592), a representative U.S. sample viewed a paragraph describing only Harris's qualifications or her qualifications along with her gender, race, or both. Mentioning her race led to less favorable perceptions regardless of participants' political orientation, suggesting subtle identity cues shape impressions. However, when compared to an unnamed candidate, political orientation moderated responses: only more conservative participants rated Harris less favorably. Study 2 (n = 588) disaggregated Harris's racial background. Results showed that her Black identity, not her South Asian or combined identity, drove the negative evaluations regardless of political orientation. As in Study 1, conservatives rated her more negatively than an unnamed candidate, but only when her Black identity was made salient. Together, these studies demonstrate that identity salience, particularly Black racial identity, can meaningfully influence candidate evaluations.

[235] The Influence of Mock Juror Attitudes, Beliefs, and Ideologies on Perceptions of Sex Workers in Criminal Trials

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Prior research indicates that terminology strongly influences perceptions of sex workers, with the term "prostitute" evoking more negative perceptions compared to "sex worker." Additionally, juror beliefs and ideologies may impact how the victim is perceived especially when they are sex workers who are victims of sex crimes. The current research utilizes a 2 (Terminology: Prostitute vs. Sex Worker) x 2 (Victim Ethnicity: Latina vs. White) between-subjects design to examine how terminology and mock jurors' preexisting beliefs and ideologies influence decision making in a case of sexual assault. Participants rendered a verdict and answered questions regarding their perceptions of victim credibility and believability. Additionally, they completed several individual difference measures (i.e., stereotypes towards sex work, moral foundations, political ideology, social dominance orientation, and rape myth acceptance). This research highlights how differences in terminology use, as well as perceptions of victims, can negatively impact the criminal legal system.

[236] The Interaction of Self-Concept Clarity and Advice Seeking in Decision-Making

12:45 PM – 1:45 PM

SELF/IDENTITY

People often face tough choices with no clear answer—such as choosing between job offers. While some decide easily, others seek input. Self-concept clarity (SCC), the extent to which people have clear and consistent beliefs about themselves, influences well-being and decision-making, but its link to advice-seeking is understudied. We hypothesized that people with lower SCC will seek more advice to reduce uncertainty, easing the decision process but increasing regret.

We surveyed 246 participants, measuring trait SCC, decision difficulty, regret frequency, and advice-seeking, and experimentally manipulated SCC before presenting a hypothetical relocation job offer decision. Participants reported who they would turn to for advice, varying by closeness and decision relevance.

The findings supports our hypothesis that higher trait SCC predicted lower decision difficulty, less regret, and less frequent but more comfortable advice-seeking. While the SCC manipulation effects were not statistically significant, trait SCC predicted advice-seeking behavior. These results highlight how SCC shapes not only whether people seek advice, but also who we turn to and how we feel about it.

[237] The Interactive Roles of Social Fit and Self-Alienation in Shaping the Experience of State Authenticity

12:45 PM – 1:45 PM

SELF/IDENTITY

The State Authenticity Fit to Environment model posits that individuals with devalued social identities experience fewer opportunities for state authenticity due to lower perceived fit (i.e., goal, self-concept, social) between their identity and the environment. This research examined which type of fit best predicts state authenticity and how self-alienation (i.e., felt disconnection from the self) interacts with fit to shape the experience of state authenticity. Study 1 (N = 235), a four-day daily diary study, found that social fit (i.e., feeling accepted by others) uniquely predicted state authenticity beyond goal and self-concept fit. Social fit interacted with self-alienation: For those with a strong sense of self (low self-alienation), social fit had little impact on authenticity; but, as self-alienation increased, social fit became more influential. Study 2 (N = 168) experimentally tested the role of social fit with LGBTQ+ individuals in a mock interview. Participants in the social fit condition reported greater state authenticity than those in the non-fit condition. Self-alienation again moderated this effect in a pattern similar to Study 1. This evidence suggests that, although environmental fit contributes to feelings of authenticity, the perception of knowing oneself may help people sustain a sense of authenticity even in environments that do not affirm their identity.

[238] The Limits of Religiosity as a Buffer for Immigration-Policy-Related Stress

12:45 PM – 1:45 PM

POLITICS

Recent changes in U.S. immigration policies are a potential stressor, particularly for people living in communities targeted by the policies. This stress is likely exacerbated when people have familial ties to people likely to be targeted. Still, these changes do not necessarily cause stress. For example, research suggests that religiosity can buffer people against negative stress responses, in part because it provides meaning to suffering (Masters, 2008). We investigated whether religiosity might buffer college students against stress regarding immigration policy changes, and whether familial attachment to someone potentially targeted by the policies (here having at least one parent born outside of the U.S.) might moderate this effect. We found religiosity was a stress buffer for those with both parents born in the U.S. (n=62) but was not for those with at least one parent born outside of the U.S. (n=275). This interaction was not significant for other national policies implemented at the same point in time (e.g., tariffs). Findings indicate that the assumed stress buffer provided by religion might vary based on contextual factors, such as personal relevance of the stress source.

[239] The Meaning of Seeking Help: The Effects of Ascribed and Achieved Status of the Help-Seeker on Observer Attributions, Expectations and Willingness to Offer Help

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Research indicates that sometimes people rely on limited sources of information when judging a person or group. Unable to see the 'whole picture', they, usually unconsciously, often fill in missing pieces of information themselves. Ascribed and achieved status dimensions assist in the process of social perception. Drawing on recent research on intergroup helping and focusing on evaluations of potential helpers, this research investigates inferences and attributions made by observers and their willingness to offer help while considering the effects of ascribed and achieved status dimensions of the help-seeker. We conducted a pilot study and two additional studies exploring the implications of this link in real-life settings. Our findings indicate that seeking help may be viewed as a sign of insufficient effort, particularly for individuals characterized by low ascribed and achieved status dimensions, and, thus, as stigma consistent behavior. Theoretical and applied implications are discussed.

[240] The Mental Separation of Church and State: Investigating the Relationship Between Religiosity and Support for Authoritarian Norms in American Politics

12:45 PM – 1:45 PM

POLITICS

How separated are church and state in the minds of Americans? While Americans may be becoming less religious in recent years, religion still remains linked with prevailing political attitudes that shape voter behavior. There has also been an increase in acceptance of authoritarian behaviors from political elites in the United States, which can be linked with the rise of White Christian Nationalism within the Republican Party. Given the similarities between religion and political ideology as belief systems that are linked to individuals' social identities, we ask to what extent does religious identity influence an individual's willingness to accept autocratic behavior from political leaders?

In the present research, we examine the extent to which religiosity is associated with perceptions of normalcy for political figures pushing the legal and moral boundaries of their powers. We analyzed data from a survey conducted by the UMass Poll of a nationally representative sample of 1,000 American adults. We expect to find that respondents who score higher on measures of religiosity will be more likely to consider government overreach politically normal. These findings can be used to inform our understanding of religious individuals behaving in ways that contrast their religious ideals in the realm of politics.

[241] The more you want to fit in, the more similar you become: How others' ideologies relate to our own intergroup attitudes

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Why people develop prejudice has been under the spotlight of many political and social psychological studies. The current contribution bridges the gap between individual and contextual perspectives and conceptualizes attitudes as joint products of personal ideologies and social norms, as such adopting a person-within-context approach. In two US samples (total N = 1150), representative in terms of age, gender, ethnic background (Studies 1–2), and political orientation (Study 2), we examined whether perceived levels of Right-Wing Authoritarianism (RWA) and Social Dominance Orientation (SDO) in one's close groups (family, friends, colleagues, and people in one's town) were related to outgroup warmth and avoidance through one's own RWA and SDO. We also included norm enactment as a moderator of close-group ideologies' effect on one's own ideologies. The results showed that close-group ideologies were positively linked to participants' own RWA and SDO, which, in turn, were associated with lower outgroup warmth and higher outgroup avoidance in both studies. Most importantly, these effects were strongest for those who have a high desire to enact close-group norms, and weakest for those who have a low desire for norm enactment. These findings highlight the significance of situating personal ideologies within their contextual plenum while studying intergroup relations.

[242] The More-Stressed-Than-Average Effect in US College Students

12:45 PM – 1:45 PM

SELF/IDENTITY

In some circumstances, people rate their traits and abilities less favorably than their average peer (worse-than-average effect or WTAE; Guenther & Zhang, 2024). Given that college is an especially stressful period (Barker & Howard, 2022), we tested whether college students exhibit a WTAE in perceptions of stress. We used data from the American College Health Association, which included responses from US college students in 2008–2019. Participants rated their overall stress in the last twelve months as (1) no stress, (2) less than average stress, (3) average stress, (4) more than average stress, or (5) tremendous stress. Overall, we found a robust WTAE in perceptions of stress ($M = 3.53$, $SD = 0.85$, $d = .63$). This WTAE was associated with lower well-being ($\log\text{-count} = 0.24$, $SE = .004$), a 20% greater chance of being diagnosed with psychological disorders ($OR = 1.92$, $SE = .02$), and a 15% greater chance of seeking counseling services ($OR = 1.72$, $SE = .01$). Altogether, these results suggest that US college students perceive their stress as worse-than-average and that such perceptions are associated with worse mental health.

[243] The Myth of the Unmoving Past

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Americans believe the past is different from the present. Previous research has already demonstrated that people believe the past was more conservative than it really was, a misperceptions of American attitudes going back to the year 1972. Here we extend this idea of misperceptions. First, we manipulate within subjects and within 39 attitudes what year in the past we ask Americans to estimate American attitudes from 2012 all the way back to 1822. We also manipulate whether we ask people at all about the past, or present, or future, across attitudes. Finally, we ask people to predict American attitudes in the future, within-subjects and within attitudes from 10 to 200 years in the future. Across 4,664 estimates about the past, present, and future—we replicate the finding that Americans believe progress has occurred. We also show, however, that Americans believe progress has occurred only relatively recently, and attitudes in the more distant past were stable and unchanging. We also show that Americans believe progress will continue into the future, although at a significantly slower rate than it had progressed from the mythical unmoving past. Overall, our findings show that stereotypes of the past lead people to misperceive attitude change, but largely because we misperceive how the past was. Americans see the past as a stable and unmoving place.

[244] The Need to Evaluate Predicts Greater Affective Political Polarization

12:45 PM – 1:45 PM

POLITICS

In recent years, a great deal of research has documented stark political polarization in the United States. Specifically, political partisans have become more affectively polarized, expressing strong preference and liking for their own party over the opposing party. In efforts to understand the antecedents of affective political polarization, very little work has focused on the influence of psychological or individual difference variables. Using data from the 2012 and 2016 American National Election Studies, the present study tests whether the need to evaluate (Jarvis & Petty, 1996) is related to polarization. The results indicate that the need to evaluate is associated with greater polarization. Contrary to expectations from prior research on the need to evaluate, this relationship was not moderated by respondents' level of political knowledge.

[245] The Pandemic has Aged Me: The Impact of Blocked Goals on Subjective Age

12:45 PM – 1:45 PM

SELF/IDENTITY

Many individuals report feeling aged by the COVID-19 pandemic, a sentiment widely expressed across social media and journalism. This study investigates what it means to feel aged by a life experience, integrating theories of subjective aging and adult development. I developed a novel self-report measure to assess perceptions of being aged by the pandemic and examined its relation to blocked personal goals. Results from the first wave of a longitudinal study (n=234) supported the validity of this measure, showing that participants who experienced greater goal disruption during the pandemic were more likely to report feeling aged. Furthermore, participants who felt aged, particularly those classified as languishing rather than flourishing, reported lower life satisfaction. These findings suggest that feeling aged by hardship may indicate not just stress but a more lasting shift, with significant implications for subjective aging and overall well-being.

[246] The perception of a source who advises while admitting to not knowing

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

We examine how people evaluate sources that say "I don't know." In three studies, participants imagined seeking online medical advice from either a physician, a layperson, or an AI, who either provided proactive advice or admitted not knowing. Across studies, physicians were rated more positively than laypeople. Additionally, sources who admitted not knowing were seen as more honest and benevolent. When advice was proactive, adding an explanation didn't affect perceived expertise. But among sources who admitted not knowing, those who explained were seen as equally expert as proactive ones, while unexplained admissions reduced perceived expertise. When AI replaced the layperson, results replicated with one exception: AI was seen as less expert when it didn't know, even with an explanation. Follow-up surveys revealed a discrepancy between perceived norms and evaluations: people perceive and expect others to perceive experts who say "I don't know" negatively, even when an explanation is provided. Shifting the perceived norm could encourage more willingness to say "I don't know," potentially reducing the spread of misinformation.

[247] The Price of the Status Quo: I'd Rather Pay More Than Change To Protect Environment

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Contemporary society faces unprecedented climate threats, yet progress toward decarbonization has been impeded by public resistance. From a rational choice view, this opposition may stem from concerns over economic costs, as climate solutions (e.g., renewable energy) are often believed to entail higher expenses than fossil fuels. In contrast, system justification theory suggests opposition may be driven by threats solutions pose to the status quo, since proposals often require changes to entrenched lifestyles. These perspectives raise an important question: Would people rather bear financial costs or change their lifestyle to protect the environment? Using U.S. General Social Survey (GSS) data from 1993 (N = 1662), we found that people reported greater willingness to pay higher prices to protect the environment than to accept cuts to their lifestyles. Notably, this pattern was not moderated by income, perceived financial situation, or subjective SES. Using multi-year GSS data, we will preregister and replicate the findings, and test if the pattern changes over time. These results underscore the role of status-quo defense in driving climate opposition, even more than economic costs.

[248] The racial categorization of Kamala Harris in the US Election

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Studies of racial categorization of Biracial people often focus on how people categorize those with a majority and minoritized background. How do people racially categorize Biracial people who have two minoritized backgrounds? The racial categorization of Kamala Harris, who holds two minoritized backgrounds, provides an important case study, as her racial identity was widely discussed during 2024 US presidential election. Using data collected before and after the election, we test how Black, South Asian, and White participants (N = 564) racially categorized Harris. Participants were much more likely to categorize Harris as Biracial than monoracial, though this varied by participant race and political orientation. White and South Asian participants were more likely to categorize Harris as Biracial if they intended to vote for Harris compared to Trump. Among Black participants, there was no difference by participants' voting intentions. The findings were robust to an acute identity salience manipulation and persisted two weeks after the election. These data suggest the category "Biracial" is widely applied for a high-profile person, with political and racial variation.

[249] The Relationship Between Celebrity Worship and Conspiracy Endorsement

12:45 PM – 1:45 PM

POLITICS

Conspiracy theories are increasingly prominent in politics and media. Schizotypal personality traits are the best predictors of conspiracy belief because they reflect cognitive styles that deviate from conventional logic. Cognitive deficits also make individuals more susceptible to celebrity worship. As celebrities increasingly influence political spheres, it is critical to examine whether attitudes toward celebrities relate to political cognition. 318 participants completed the Conspiracy Mentality Questionnaire, the Brief-Schizotypal Personality Questionnaire, and the Celebrity Attitudes Scale. Conspiracy mentality was correlated with schizotypal personality ($r = 0.23, p < .05$), and with celebrity worship ($r = 0.18, p < .05$). In individual linear regression models, schizotypal traits ($t(269) = 3.85, p < 0.001, R^2 = 0.05$), and celebrity worship ($t(265) = 2.98, p < 0.001, R^2 = 0.04$) were significant predictors of conspiracy mentality. When included together, both schizotypal traits ($t(257) = 3.40, p < .001$) and celebrity worship ($t(257) = 2.24, p = 0.03$) were significant ($R^2 = 0.08$), but did not have a significant interaction ($t(256) = 0.58, p = 0.56$). This suggests that celebrity worship is related to conspiracy belief. Understanding this link may help explain why some people are more prone to conspiratorial thinking.

[250] The role of moral foundations in recent US presidential elections

12:45 PM – 1:45 PM

POLITICS

Do moral foundations matter in elections? Using Prolific data from 337 Americans, with vote for presidential candidate as the outcome variable, I conducted three binary logistic regression analyses using, in two steps, political liberalism-conservatism and moral foundations as predictors. In 2016 and 2024, but not in 2020, the answer appears to be yes. Two of the right-associated moral values (loyalty and authority) were consistent predictors of voting behavior (or intentions), whereas the left-associated moral values rarely were, with fairness only predictive in 2020 and caring never being predictive. Furthermore, the moral foundations were predictive in 2016 and 2024 over and above political liberalism-conservatism, indicating their value as additional predictors of voters' preferences.

[251] The role of political stereotypes in climate-related second-order belief content and accuracy

12:45 PM – 1:45 PM

POLITICS

The present study shows how political stereotypes hinder policy support by shaping second-order beliefs (beliefs about others' beliefs) about support for carbon regulation. The study ($N = 896$) used a 2 (target of beliefs: Democrats vs. Republicans) x 2 (stereotypical policy cues: revenues to the poor—consistent with Democrat stereotypes and inconsistent with Republican stereotypes vs. revenues to the military—consistent with Republican stereotypes and inconsistent with Democrat stereotypes) x 2 (respondents' political identity) design. Conforming to stereotypes, Democrats were estimated to support the climate policy when revenues went to the poor more than when they went to the military, and the reverse was true for Republicans. However, political stereotypes influenced the accuracy of Democratic respondents' second-order beliefs more than those of Republicans: Democrats underestimated Republicans' support for policies with revenues for the poor and overestimated the political divide. The impact of second-order beliefs was evident in greater support for policies when both Democrats and Republicans believed their political ingroup supported it and their out-group did not.

[252] The Role of Source Attribution for Debunking Critical Race Theory Misinformation

12:45 PM – 1:45 PM

POLITICS

Previous research has shown that misinformation about critical race theory (CRT) can be corrected when a debunking technique is used (Devaney et al., 2025). The current study aims to extend the literature on debunking and CRT misinformation by investigating how source attribution impacts the accuracy of participants when misinformation is corrected. Based on a two-wave panel design with a nationally diverse U.S. sample, source attribution for a correction to CRT misinformation was varied between a liberal source (MSNBC), a conservative source (Fox) or no source attribution. Participants were randomly assigned to one of five conditions: (1) a control condition, (2) a misinformation-only treatment, (3) a misinformation + no source correction, (4) a misinformation + conservative-source correction, and (5) a misinformation + liberal-source correction. Contrary to predictions, there was not an increase in accuracy for participants in all three of the correction conditions compared to the misinformation-only condition. Accuracy was increased for participants in the no-source and liberal source conditions compared to the control condition but not for the conservative-source condition. The present set of findings is consistent with past research suggesting that source credibility has an inconsistent impact on the correction of political misinformation.

[253] The Role of the Behavioral Immune System in Welfare Chauvinism: Variation in Its Impact by Recipients' Nationality

12:45 PM – 1:45 PM

POLITICS

In recent years, growing attention has been directed to welfare chauvinism—the phenomenon in which foreign welfare recipients are seen as less deserving than natives based solely on nationality. While prior work has emphasized coalitional psychology, the present study tested whether the behavioral immune system—an evolved system to detect and avoid pathogen threats—contributes to welfare chauvinism. 484 Japanese participants read vignettes describing both Japanese native and foreign recipients (Brazilian, Chinese, or Vietnamese; between-subjects) and evaluated the benefits each should receive. A mixed-design ANOVA revealed that foreign recipients were evaluated as less deserving compared natives ($\eta^2 = .24$, $p < .001$). Generalized linear models showed that Pathogen Disgust significantly predicted welfare chauvinism toward Vietnamese recipients—regarded as culturally distant from Japan—beyond coalitional psychological factors ($B = 0.64$, $p = .002$). Higher Pathogen Disgust increased the likelihood of differentiating between natives and Vietnamese recipients. These findings demonstrate that the behavioral immune system contributes specifically to welfare chauvinism toward culturally distant outgroups, extending previous work on coalitional psychology and suggesting that distinct psychological mechanisms underlie responses to different foreign nationalities.

[254] Their Lives, Their Art: Participant-Led Multimedia Storytelling About Identity In Hawai'i

12:45 PM – 1:45 PM

SELF/IDENTITY

This study shares findings from a two-phase qualitative, community-based participatory action (CBPR) multimedia photovoice study conducted with $n = 15$ queer and disabled community members in Hawai'i. For the first part of the study, participants created art pieces expressing their identity/identities. In the second part, three focus groups engaged participants in dialogic interpretation of their work, exploring embedded stories, emotional resonance, and cultural values. Reflexive and iterative thematic analysis (conducted collaboratively by the researcher, trained research assistants, and the participants) highlighted themes of community, belonging, and support, as well as experiences of prejudice and marginalization. Participants acted as co-researchers, shaping the analytical process and final interpretations. The project demonstrates how photovoice and artmaking foster agency, reveal multidimensional self-concepts, and provide alternative modes for investigating queerness and disability as experiential, interpersonal, and context-dependent identities. The findings contribute to advancing decolonial and inclusive scholarship through community-driven, arts-informed methodologies.

[255] Then and Now: Capturing Socio-Political Values in a Time of Change

12:45 PM – 1:45 PM

POLITICS

Political ideology is often reduced to a liberal-conservative spectrum, yet current discourse reveals a more fragmented and multidimensional reality. This study revises and validates a values-based ideological orientation scale to better reflect the complexity of U.S. political attitudes. Drawing from a diverse item pool, a 16-item measure was developed with balanced liberal and conservative content. Factor analyses ($N = 586$) revealed two distinct value dimensions within each domain: personal autonomy and structural equity for liberal values; national strength and sociocultural traditionalism for conservative values. Results support the scale's reliability, internal structure, and discriminant validity. These findings offer a more nuanced understanding of ideological orientation and provide a tool for studying political identity, polarization, and value alignment in contemporary society. Implications for ideological measurement and future research on political values are discussed.

[256] Think Different? Consumer Identity and Reactions to Reports Child Labor in Apple's Supply Chain

12:45 PM – 1:45 PM

SELF/IDENTITY

How do corporate misdeeds affect Consumer Brand Identity? This study investigates how learning about child-labor practices influences authenticity and brand identification among cell-phone users. This study applies a 2 (Apple users vs. non-users) X 2 (Article about Apple [vs. Xiaomi] child labor practices quasi-experimental design, recruiting 304 U.S. adults from the Connect platform. Pre-registered hypotheses predict that Apple users exposed to an article detailing child labor practices by Apple will report lower state-authenticity than the other groups, while Apple users exposed to the Xiaomi article will report higher Apple brand consumer identity than the other groups. These findings can shine light on how corporate wrongdoing shapes consumer sense of authenticity and identification with favored brands, offering insight into identity processes and ethical consumption.

[257] Timing is everything: Unraveling the temporal dynamics of the cheerleader effect

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Facial attractiveness is one of the most immediate and universal sources of social information. However, current theories cannot fully explain its computational mechanisms, especially with regard to facial attractiveness in a group context. Recent studies have found that faces appear more attractive when presented in a group compared to individually (the cheerleader/friend effect). Does the presentation time of faces influence the magnitude of the cheerleader effect, as time factors have been shown to have a significant impact in many other studies on face perception? Here, we investigated the effect of presentation time on the cheerleader effect, dividing it into two segments: pre- and post-cue time (cue indicates the position of target face). We conducted five behavioral experiments (Exp), testing a total of 473 subjects, including both in-lab and online tasks (with pre-registration). We observed a negative, nonlinear effect of pre-cue time on the cheerleader effect (Exp 1 & 2), indicating that changes in overall group-face presentation time impact judgments of target face attractiveness. We identified the optimal pre-cue duration for peak effect (Exp 3), offering a reference for future research. However, we demonstrated that the cheerleader effect was not influenced by post-cue time (Exp 4 & 5). Our results suggested that the potential perceptual process involved in the "overestimation" of the attractiveness of the target face within a group occurs before cue appearing. In conclusion, our study offered a novel explanation for the cheerleader effect, demonstrating that the duration of face observation during group interactions significantly influences perceptions of facial attractiveness.

[258] Truth Discernment in Conspiracy Theories

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Although previous research has shown that analytic thinking, the importance given to being epistemically rational, and overconfidence predict (dis)belief in conspiracy theories, it remains unclear whether these factors predict actual truth discernment in conspiracy theories - the ability to discern between plausible and implausible conspiracies. In three studies, we examined whether these individual differences predict truth discernment rather than indiscriminate (dis)belief in conspiracy theories. Across all three studies, analytic thinking and valuing epistemic rationality predicted better truth discernment, while overconfidence impaired it. Notably, the association between analytic thinking and truth discernment was stronger among those who valued epistemic rationality more (vs. less). Future research should investigate causal mechanisms and potential interventions targeting overconfidence, motivation to be epistemically rational, and analytic thinking to enhance people's ability to evaluate the plausibility of conspiracy theories.

[259] Uncertainty Predicts Wish for a Strong Leader

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Strong leaders — those who promise to overcome society's difficulties by any means necessary, including through autocratic tactics and defiance of democratic norms — are on the rise globally, even in many long-standing democracies. This study tested the hypothesis that uncertainty is associated with a greater desire for strong leadership. Data for this study (total N = 2,839) came from a secondary analysis of 2016 - 2020 American National Election Studies (ANES) data, a nationally representative probability sample of U.S. eligible voters that is fielded to support analysis of public opinion and voting behaviour in U.S. national elections. For our analysis, we focus on measures relating to (a) uncertainty, and (b) wish for a strong leader using a pre-established index and a single-item measure, respectively. Additionally, political ideology, age, and gender were included as control variables. Hypothesis 1 was analyzed both cross-sectionally and longitudinally. As hypothesized, uncertainty significantly and positively predicts the desire for a strong leader even when controlling for demographics like political ideology, age, and gender both cross sectionally and longitudinally. These findings suggest that uncertainty itself is an independent driver of support for strong, potentially non-democratic leaders, implying that periods of widespread uncertainty may create an opportune environment for "strong-man", non-democratic leadership to rise.

[260] Under Pressure: Partisans Self-Censor In-Party Criticism in Response to Electoral Threat

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

In democratic societies, elections offer citizens an important opportunity to influence their representatives. Yet, in politically polarized societies, elections may heighten feelings of intergroup threat, producing a tradeoff between expressing critical opinions of one's party and supporting its success. Prior work shows that perceived threat leads group members to judge in-group critics more harshly and self-censor their own in-group criticism. Building on this work, we examine whether highly polarized elections, by increasing feelings of intergroup threat, promote self-censorship of in-party criticism. We conducted a two-wave panel survey with a U.S. representative sample recruited via Prolific in the two weeks before the 2024 U.S. Presidential election (N₁=822; N₂=741). We find that under higher electoral threat, participants are less likely to publicly criticize their party, especially when holding strong partisan identities. A pilot experiment (N=961) manipulating electoral threat provided converging evidence. These results suggest that rising polarization can stifle intra-party dissent, limiting citizens' political expression and potentially undermining democracy.

[261] Uniqueness and Cognitive Preferences Interact to Predict Conspiracy Beliefs

12:45 PM – 1:45 PM

POLITICS

Cognitive processing preferences have been shown to predict conspiracy theory (CT) endorsement. Faith in intuition predicts increases and need for cognition predicts decreases in CT endorsement. Separately, need for uniqueness predicts increased CT endorsement. We manipulated need for uniqueness while measuring trait uniqueness and cognitive preferences to observe the impact on CTs. In a preregistered study with paid online participants, we gave participants false feedback that they were highly similar or highly unique as compared to others. Need for cognition interacted with the uniqueness manipulation to predict CTs: those high in need for cognition told they were highly similar to others no longer showed previously observed protective effects of need for cognition, while uniqueness feedback maintained protective effects. Faith in intuition interacted with both the manipulation and trait uniqueness to predict CTs. Those high in faith in intuition and trait uniqueness given high uniqueness feedback displayed greatest CT endorsement, but this effect was attenuated with high similarity feedback. Findings suggest uniqueness interacts with cognitive preferences to predict CTs.

[262] Unmoved by Cues: Political Priming and Empathy in Liberals and Conservatives

12:45 PM – 1:45 PM

POLITICS

Stereotypes abound about empathy levels of both conservatives and liberals with liberals generally considered to be more empathic. But are there any truth to these stereotypes and do they present self-fulfilling prophecies? We expected that Americans would demonstrate stereotype-consistent empathy levels, and in line with a stereotype threat explanation, we hypothesize that this trend would be exacerbated when participants are reminded of their political affiliation beforehand. In Study 1, 290 participants from Wisconsin completed a performance measure of emotion recognition (RMET) and a questionnaire measure of empathy (IRI). Liberals scored higher than conservatives on the RMET ($p = .026$), Empathic Concern ($p = <.001$), and Fantasy ($p = .007$). However, contrary to our hypothesis there was no difference in empathy levels with those who were prompted to list their political affiliation beforehand ($p > .05$). In Study 2, we attempt to replicate this result with a stronger prime of political affiliation. We expect to confirm differences in empathy between groups, that are not explained by stereotype threat.

[263] Using mouse tracking to understand race-gender intersectionality

12:45 PM – 1:45 PM

SELF/IDENTITY

Interest in intersectionality – the ways in which multiple social identities (such as race and gender) intersect to shape individual experiences – has grown significantly in recent years. As psychological research continues to explore this important phenomenon, there is a growing need for valid tools to measure how individuals cognitively represent their intersecting identities. The present study investigates the utility of mouse-tracking as a novel, real-time method to assess the extent to which individuals perceive their racial and gender identities as integrated versus distinct. Participants completed a 200-trial forced-choice categorization task in which they were presented with two words – one related to the concept “woman” and one related to the concept of their self-identified race “race”. Participants were instructed to click on the word they identified with more strongly while their mouse cursor trajectories were recorded. Because the decision process and motor movement co-occur, these trajectories allow us to examine how the decision process unfolds in real time. Metrics derived from this data such as maximum deviation from the unselected option and area under the curve, as well as attribute processing times, offer insight into the implicit cognitive dynamics underlying intersectional identity integration and potential as a future tool in this emerging research domain.

[264] Value-Driven Vulnerability: Personal Values and Choice Overload in Online Dating

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

This study explores the phenomena of choice overload in the context of online dating. Specifically, we investigate the influence of underlying personal values on decision-making tendencies when exposed to many options. Two hundred and seventy three participants completed items assessing a range of personally-held values, ranging from more self-focused (e.g., achievement, hedonism) to more other-focused (e.g., conformity, benevolence). Participants were randomly assigned to select one online dating profile amongst a large set vs. a small set, before reporting their choice-related stress. Fitting previous choice overload research, individuals who selected from a large choice set reported greater stress than those who selected from a small choice set. When selecting from the large set, individuals who were high in social-focused values reported greater choice-related stress than did those who were 1) low in social-focused values choosing from the large choice set and 2) high in social-focused values choosing from the small set. For individuals with modest social goals, condition did not predict choice-related stress. Notably, further analyses revealed a three-way interaction between personal values, social values, and condition on choice-related stress. The findings suggest that individuals whose values prioritize others' needs ahead of their personal objectives were more likely to experience choice-related stress when exposed to the large set. The findings indicate that social goals and traditional beliefs influence individual decision-making tendencies and experiences in situations of choice overload.

[265] Verify or Challenge? Self-Motivations in Non-Human Feedback Preferences

12:45 PM – 1:45 PM

SELF/IDENTITY

People routinely seek feedback on their self-concept from their social environment. Classic and contemporary theories emphasize a preference for feedback that maintains the self-concept (self-verification) or enhances it (self-enhancement). Complementarily, information-seeking perspectives highlight the value of instrumental feedback—information that facilitates growth but potentially contradicts the self-concept. In a series of 3 studies and 2 replications (Total N = 262), we arbitrate between self-verification and self-learning motivations using feedback from a non-human source. In studies 1-2, a novel pay-per-view paradigm revealed that participants forwent money to disengage from questionnaires providing self-consistent information and to engage with self-violating information. In Study 3, participants displayed less conflict when choosing potentially self-violating information provided by AI than when choosing to receive self-verifying information. These results highlight an understudied motivation for self-learning and growth when the feedback provider is non-human. As LLMs use grows, unpacking the effects of non-human feedback on the self-concept becomes ever more important

[266] Violence From “Us” vs. “Them”: How Political Identity Shapes Moral Judgments

12:45 PM – 1:45 PM

POLITICS

Political polarization has intensified hostility between opposing political parties in America -- but has it intensified to the point that we might support political violence against the opposing party? We examined whether people judge political violence differently when it comes from their own side versus the opposing side. We surveyed 239 Americans via Prolific and provided scenarios of political violence at a rally for or against abortion, guns, and gender-affirming care. Our study found that individuals are more comfortable with political violence in support of their cause than the same act of violence in support of a cause they did not believe in. Participants were also more condemning of individuals who committed acts of political violence for the outgroup, suggesting two additional years of jail time for the offender on average. Importantly, these findings held for both Democrats and Republicans. In Study 2, we are investigating how individual differences, such as perceived victimhood and authoritarianism, predict willingness to support political violence. Regardless of political affiliation, these findings show that people's beliefs shape their moral evaluation; we are more comfortable with violence when we agree with its cause.

[267] Virtuous Hope Predicts Environmental Prosociality Beyond Individual Hope

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Hope benefits others and is related to prosociality (Schornick et al., 2023). Yet, traditional measures of hope are individual-oriented, insufficiently explaining the critical other-oriented and moral components of hope expected to be at play in prosociality (Thomas, et al., 2023). However, Thomas and colleagues (2025) have recently introduced a new measure to assess a more other-focused construct of hope -- virtuous hope.

The present work examined the predictive value of virtuous hope for environmental prosociality, a domain hypothesized to be uniquely explained by virtuous hope.

Our results attest to the predictive value of virtuous hope in this domain over and above traditional, individual-oriented, measures of hope and optimism. Our preregistered online study (N = 450) provides evidence for the role of virtuous hope across 3 spheres of environmental prosociality: (1) the private sphere (ps < .05); (2) the public sphere (ps < .001); and (3) the policy sphere (ps < .001). Virtuous hope was the strongest predictor across spheres, even when simultaneously including or controlling for individual-oriented hope and optimism.

Future directions include parsing how robustly virtuous hope predicts domains over and above individual-oriented hope.

[268] Voices of Judgment: Exploring Racial Bias Through Sound Alone

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

This project examines how racial and linguistic biases influence decision-making in audio-only contexts, including emergency calls, probation check-ins, and social service hotlines. In these high-stakes moments, responders rely solely on voice cues, such as accent, tone, and perceived racial identity, to judge credibility, urgency, and threat. Using an experimental design, participants will evaluate randomized recordings of 911-style calls, where the caller's content remains constant, but the race, accent, or gender of the caller shifts. This isolates how subtle variations in speech influence judgments. The study integrates theories of linguistic profiling, implicit bias, and racial formation to examine how systemic inequality is reproduced through communication. By connecting psychological processes of implicit bias with structural outcomes in the criminal legal system, this work highlights how “small” biases can produce disproportionate consequences. Findings aim to inform reforms in responder training and contribute to broader conversations about race, language, and justice in diversifying communities.

[269] Wearing one's heart on one's sleeve: Self-location and sociability

12:45 PM – 1:45 PM

SELF/IDENTITY

The head and heart regions of the body are most often identified when people are asked where the self is. A differential tendency to self-locate in one area or the other is likely to be consequential given that metaphor and folk theory ascribe very different attributes to these two bodily locations. In the current research, a new measure of perceived self-locations was created by asking people whether the self tends to be in head and/or heart regions while performing various activities. Three studies (total N = 444) pursued the idea that self-locations favoring the heart would be more conducive to social activity, given that the heart, and not the head, is the organ that folk theory links to love and joy. As hypothesized, two initial studies found that self-locations favoring the heart were linked to higher levels of agreeableness, extraversion, and warmth. These personality correlates were replicated in a peer-report study and peers also characterized heart-locators as socially skilled. This research links self and social-personality literatures while suggesting that conceptual metaphors can both characterize the self as well as constrain it to be a particular type of person.

[270] What Breaks the Balance? Intra-Individual, Cultural, Relational, and Structural Determinants of the Decision-Making Process among Chinese-Speaking Immigrant Women in Canada Who Have Experienced Intimate Partner Violence

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

This study explores what drives or deters the decision-making process of Chinese-speaking immigrant women in Canada who have experienced intimate partner violence (IPV), focusing on the turning point between enduring abuse and taking action. We draw on decision-making theories and acculturation concepts, using an intersectional approach to examine how personal history, cultural identity, immigration and family experiences, and social resources interact. In the context of decision-making, the investment model shows how external conditions and social resources keep women tied to relationships when leaving seems too risky. The psychological entrapment model explains how internal mechanisms delay action despite harm. Additionally, based on the concept of acculturation, we examine the impact of traditional Chinese cultural values and the norms of the host society on IPV survivors during the decision-making process. Fifteen participants from China and Taiwan, residing in four Canadian provinces, participated in in-depth interviews. Reflexive Thematic Analysis is underway, with the researcher's positionality as an IPV survivor deepening interpretation. Preliminary themes will be analyzed and presented at the conference. Overall, this study shows how decision-making among Chinese-speaking immigrant women is shaped by individual, cultural, relational, and structural contexts and bridges Western and Chinese perspectives. Findings inform culturally tailored services for IPV survivors.

[271] What Counts as a True Test of Ability? How Perceived Group Performance Patterns and Individual Differences Shape Task Evaluations

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

White Americans are disproportionately represented in academia and often serve in "gatekeeping" roles with power to determine which assessments of merit signify true ability. To test whether people favor ability tests that advantage their racial ingroup, we randomly assigned White participants (N=445) to view one of three conditions depicting performance patterns on a new reasoning task: White people outperforming Black people, Black people outperforming White people, or Equal High Performance. Participants rated the task a better test of real-world ability when a performance gap in either direction was present, compared to when there was no difference in performance across groups. Individual differences moderated the comparison between conditions featuring performance gaps: higher perceived intergroup threat and stronger White identity predicted more favorable evaluations of the task when the ingroup excelled, whereas lower levels predicted less favorable evaluations in that condition. Findings suggest that judgments of ability metrics are not neutral and are shaped by racial group performance and individual differences.

[272] What Is Corruption and Bribery? A Social Representations Study From the Views of Young Adults

12:45 PM – 1:45 PM

LANGUAGE

Public messages often treat corruption and bribery as the same, yet individuals may interpret them differently. These differences in perception can shape how anti-corruption initiatives are understood and received. To examine this, we investigated young adults' (N = 253, M_age = 21.32; 59.3% female) perceptions of "corruption" and "bribery" using Social Representation Theory as a framework, collecting data via an online survey. Prototypical analysis with IRAMUTEQ identified the core elements—terms deemed highly important and widely shared—of each concept. Findings indicated that participants commonly linked both corruption and bribery to "money," but distinguished them through moral judgment and the actors involved. Corruption was described with negative terms such as "bad" and "dishonest" and associated with "government," whereas bribery carried fewer moral connotations and was linked to the "police." The lack of perceived consequences in these social representations may help explain why corruption and bribery remain persistent societal challenges.

[273] What Might Have Been: The Effects of Counterfactual Availability on Agency Attribution

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Attributing blame and agency are fundamental aspects of moral reasoning and decision-making. While counterfactual thoughts are fundamental for moral judgements, specifically how counterfactual thoughts lead to attributing agency and blame remains unclear. We experimentally tested the individual contributions of number of counterfactuals and ease of counterfactual production on attributions of agency and blame. Participants (N = 291) were randomly assigned to one of four conditions in a 2 (obviousness: obvious vs. non-obvious) × 2 (number: one vs. three) design. They read a short narrative about a car accident and generated counterfactuals about how the driver could have acted differently. We found that participants attributed more agency, responsibility, and blame when there was a single obvious counterfactual, than when it was less obvious what the driver could have done otherwise. The number of counterfactuals generated did not significantly affect attributions of agency, responsibility, and blame. These results suggest that how obvious, or how easy it is to generate at least one counterfactual, may be the driving force behind attributions of agency and responsibility.

[274] When Helping Hurts: Trauma, Empathy, and Pathological Altruism

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

This study investigates how trauma exposure relates to prosocial behavior, distinguishing between adaptive (helping) and maladaptive (self-sacrificing) tendencies. Trauma can catalyze both post-traumatic growth (PTG) and pathological altruism, where overextension harms the self (Tedeschi & Calhoun, 2004; Staub & Vollhardt, 2008; Kaufman & Jauk, 2020). Participants complete a PTSD symptom survey (DSM-5 criteria) followed by validated measures of empathy (QCAE), mindful self-care, PTG, stress-related growth, meaning in life, religious coping (positive/negative), and helping behavior (Prosocialness Scale for Adults; Pathological Altruism). We hypothesize that PTSD symptoms predict increased prosocialness through PTG and empathy, but also greater pathological altruism when mindful self-care is low or negative religious coping is high. Positive religious coping is expected to support healthier prosocialness. Analyses will include correlations, regressions, and path models to test mediation and moderation. This correlational design clarifies when trauma-linked helping reflects resilient growth versus harmful over-giving, informing interventions that cultivate compassionate yet sustainable care.

[275] When In Doubt, Tune Out: Political Identity Avoidance at Work

12:45 PM – 1:45 PM

POLITICS

People are generally motivated to reduce uncertainty about the identities of others, especially when these identities are related to meaningful values, like politics. However, in the context of interdependent work, people may prefer uncertainty over learning about a coworker's political identity if they suspect the coworker is a political outgroup member. Across a series of high-powered experiments, we examine how liberal and conservative participants respond to cues that suggest, with some uncertainty, that their coworker is a part of their political ingroup or outgroup. We find that when participants respond to cues that suggest their coworker is an outgroup member (vs. an ingroup member) they report lower desire to learn more about the political identity of their coworker, higher information avoidance behavioral intentions, and higher regret about being exposed to their coworker's political identity. Effects are stronger for liberals than conservatives with unique mechanisms driving the responses of people on either side of the political spectrum. Consequences for organizations are discussed.

[276] When Leaders and Followers Misfit: Regulatory Focus Non-fit and Enhanced Team Performance

12:45 PM – 1:45 PM

GROUPS/INTERGROUP PROCESSES

Regulatory focus, a concept reflecting individuals' goal orientations, can also explain behavior within workplace groups. However, few studies have directly examined the interactive effects of leaders' and members' regulatory focus on team outcomes (Kark & Van Dijk, 2019). This study investigated such dynamics among 120 employees nested in 23 teams at Company A. Leaders' and members' regulatory focus in the workplace was measured, and team performance was evaluated by each team's immediate external supervisor. Analyses revealed a consistent pattern of regulatory non-fit. Specifically, when team members tended to act with a promotion focus (e.g., taking risks to achieve success), team performance was higher when leaders approached their role with a prevention focus (e.g., concentrating on avoiding mistakes). Conversely, when leaders acted with a promotion focus, team performance was higher when members carried out their duties with a prevention focus. These results suggest that leader-follower misfit in regulatory focus can be beneficial. Rather than similarity, regulatory non-fit between leaders and members enhanced team performance by balancing risk-taking and vigilance.

[277] When Personalized Ads Reduce Self-esteem and Brand Attitude

12:45 PM – 1:45 PM

SELF/IDENTITY

Personalized advertising can implicitly communicate the identity the brand thinks consumers have. We test the hypothesis that when this implied identity is undesirable, consumers will feel more offended by a personalized (vs. non-personalized) ad, leading to more negative views about both the self and the brand. Five studies (n = 4430) demonstrate that personalized (vs. non-personalized) ads implying undesirable identities such as an opposing political identity (study 1), low creditworthiness (studies 2, 4, and 5), and excess weight (study 3) decrease self-esteem and brand attitudes. Using moderation (studies 1 and 5) and mediation (studies 2, 3, and 4), we show that the effects of ad personalization on both self-esteem and brand attitude are mediated by perceived ad offensiveness. The effects hold regardless of the accuracy of personalization (studies 1 and 3), the blaming tone of the ad message (study 4), the nature of the firm (for-profit and non-profit; study 4), and whether the personalization is attributed to algorithms or humans (study 5). Finally, we identify a boundary condition: the effects attenuate when personalization is not salient (study 5).

[278] When Suffering Means Something: Difficulty-as-Improvement and the Willingness to Endure Pain

12:45 PM – 1:45 PM

SELF/IDENTITY

People often believe that enduring unbidden life difficulties improves their character - a belief coined the difficulty-as-improvement mindset. Previous research shows that those who endorse this belief experience more optimism and purpose in life, view difficult methods as more effective, express greater willingness to use them, and do things the hard way on any given day. But no research has explored whether people who score higher in difficulty-as-improvement are actually more willing to suffer pain. We address this gap. About 1500 students completed the difficulty-as-improvement (DAI) scale as part of their subject pool prescreening questionnaire (T1). At T2, based on a power analysis $N=250$ (expected; current 151) were randomly assigned to read that participating in the Cold Pressor Test (CPT) was an opportunity to improve their character by practicing endurance or a pain-inducing task, completed a round of the CPT, the Flanker Task, a second CPT, and the DAI scale again. We predict that the T1 DAI score will be positively associated with willingness to endure if task instructions suggest that pain is meaningful and that, in this condition, doing so will increase T2 DAI scores.

[279] Regional Personality Differences in Big Five Personality Traits and Their Societal Impacts in Colombia

12:45 PM – 1:45 PM

CULTURE

Prior research has shown that the Big Five personality traits cluster geographically and relate to key political, economic, social, and health (PESH) outcomes – at least in Western countries. Moving beyond the Western context, this study is the first to investigate within-country regional personality variation in Latin America, specifically in Colombia ($N = 27,313$). Results unveiled pronounced spatial differences across Colombia in Extraversion and Neuroticism, whereas the other traits showed more uniform distributions. In contrast with prior work, Colombia's capital and most urban city, Bogotá D.C., did not show high Openness. Notably, Openness was linked to poorer health and greater political conservatism, hinting at distinct cultural dynamics of Openness in Colombia. Meanwhile, Conscientiousness related to both greater conservatism and social deviance, suggesting a coexistence of traditionalism and defiance. These findings demonstrate that regional personality differences in Colombia meaningfully relate to important societal outcomes and highlight the importance of broadening the cultural scope of geo-psychological research.

[280] Cultural Frame Switching and Identity in Third-Culture Kids: A Theoretical Examination

12:45 PM – 1:45 PM

INTERGROUP RELATIONS

The focus of this poster is on Cultural Frame Switching (CFS) in Third-Culture Kids (TCKs) and the key differences between TCKs and multicultural kids, such as loss of identity and fluidity between cultural identities. TCKs are individuals who have spent a significant portion of their development in a culture other than their parents'. The "third culture" experience is rooted in mobility and displacement. CFS is the process by which bicultural/multicultural individuals adapt their mindset, behaviors, and self-perception to different cultural contexts in response to cues like language, icons, or social interactions. This theoretical analysis explores contextual triggers that may affect how a TCK reacts to their environment, based on physical location or the cultural identity of those with whom they interact. The poster reviews existing theoretical frameworks and how they can support future research into TCKs, including cultural priming. By focusing on CFS, this poster compares multicultural kids and TCKs in how they experience the world, develop their personality, and adapt socially. Finally, the poster suggests directions for future research to guide discussion of TCKs and help the research community engage with this growing population.

[281] Who Perpetuates Identity Denial Predicts Multiracial Asian Mental Wellbeing

12:45 PM – 1:45 PM

SELF/IDENTITY

The Multiracial population reports the highest rates of social exclusion and identity denial compared to other racial/ethnic groups. Yet, current research on Multiracial identity denial does not measure who (i.e., in/outgroups) is doing the denial and where (i.e., homogeneous contexts) that denial occurs. Multiracial Asian people from the US Mainland (less diverse context) and Hawaii (more diverse context) were recruited to measure whether identity denial from ingroup vs. outgroup members and if living in a more vs. less diverse context differentially predicted levels of stress (N = 500). Regardless of context, identity denial was perpetuated more by ingroup than outgroup members. However, higher stress was predicted only by outgroup identity denial experiences. Thus, Multiracial Asian people may better cope with identity denial from ingroup compared to outgroup members, suggesting unique encounters and psychological outcomes for distinct identity denial pathways regardless of the present racial diversity in one's context. These results contextualize that the source of the identity denial matters most for Multiracial mental wellbeing.

[282] Who Speaks; What's Seen? Identity in the 2024 Presidential Election

12:45 PM – 1:45 PM

POLITICS

People of color have long been stereotyped based on the single dimension of their race (Devine, 1989). Perhaps to avoid such framing, Kamala Harris, the first woman of color to be a major party nominee, typically pushed a race-blind message in her 2024 presidential campaign against Donald Trump. She often argued that "we have so much more in common than what separates us." However, we theorize that Americans relied on her racial identity to infer her political agenda. In Study 1 (N=100), in an online survey with White participants, 31% stated that electing Harris would improve race relations or that she would support people of color in the United States. In Study 2 (N=106), White Americans were paired to discuss how society might have changed under either candidate. One participant phrased the election in terms of "having a Black woman president versus Donald Trump." In future analyses, we anticipate that participants will cite Harris's racial identity more than her qualifications or proposed policies when discussing her political commitments. This work will highlight the narrow lens through which many prominent Americans of color are viewed regardless of how they represent themselves.

[283] Who Steps Forward? Agency, Communion, and Leadership Self-Selection

12:45 PM – 1:45 PM

SELF/IDENTITY

Agentic self-perceptions—beliefs that one is assertive, independent, and goal-directed—and communal self-perceptions—beliefs that one is warm, cooperative, and other-oriented—predict leadership self-selection. Individuals who see themselves as more communal and less agentic are less likely to self-select into leadership pathways than those higher in agency, despite evidence that communal qualities are valued in leaders (Ponce de Leon & Bailey, 2025). This reluctance may stem from stereotypes that equate leadership with agentic, masculine traits (Koenig et al., 2011). We test the causal role of these self-perceptions using an experimental approach: after completing vignette-based decision-making tasks, participants will receive randomized feedback emphasizing either agentic or communal strengths before choosing whether to assume a leadership role in a hypothetical group activity. We expect agentic, relative to communal, feedback to increase leadership self-selection. Because women are more likely to define themselves in communal terms and face stereotypes linking leadership with agency, this work offers insight into strategies to promote women's leadership emergence.

[284] Why Do Wealthy People Give? A Systematic Literature Review

12:45 PM – 1:45 PM

PROSOCIAL BEHAVIOR

Understanding why wealthy individuals give can help move resources toward worthy causes. Despite growing interest in the role of high-net-worth (HNW; $\geq \$1M$) and ultra-high-net-worth (UHNW; $\geq \$30M$) individuals in shaping society, the motivational landscape of elite giving remains poorly integrated across disciplines. We conducted a comprehensive literature search using wealth-related terms (e.g., "high net worth," "billionaire," "elite") and donor-related terms (e.g., "philanthropy," "altruism," "generosity"). From 2,194 records, 47 quantitative and qualitative sources were eligible. Using grounded theory, we iteratively coded donor-reported motivations, identifying three external (need, social, data-driven) and three internal (emotion, identity, impact-driven) motivations, spanning a Responsive–Deliberative dimension from spontaneous to planned giving. We then extracted quantitative endorsement rates, supported by qualitative interviews. Wealthy donors report diverse drivers, including family traditions, direct requests, passion, gratitude, and guilt. While deliberative giving dominates prior research, it appears as only one among many motivations.

[285] Why Does Predecisional Information Distortion Happen?

12:45 PM – 1:45 PM

JUDGMENT/DECISION-MAKING

Predecisional informational distortion (ID) occurs when evaluations of new information are more positive/negative than they otherwise would be depending on of if it pertains to the most preferred option in an upcoming decision. We explore two accounts for why ID may happen. In the Support-Preference-Ordering account, ID is the outcome of evaluating new information to maintain preference orderings. In the Gain-Choice-Confidence account, ID functions to gain confidence in choosing one option over others. To differentiate between these two accounts, one must evaluate contexts with more than two options. In the present study, we aimed to test which account better fits the pattern of information distortion across four decision making options. We tested 100 Prolific participants. We used a modified ID paradigm, where participants chose one rental home out of four options. They saw and rated attribute information (i.e., rooms) across six stages. We looked at ID across all four options ranked from most to least preferred. Overall, our data reflected a pattern similar to the Support-Preference-Ordering account. If ID does have a function, it is likely to support consistency in preferences.

What now? NGO, industry, and international resources for early-career researchers

2:00 PM – 3:10 PM | Location: E450A, Level 4

Many of the research resources early-career academics typically rely on are not currently available. This session will feature panelists who, having conducted research with industry or NGO partners, or creative uses of free resources, will share their experience with the process. After a brief PowerPoint presentation which outlines funding opportunities and research resources, panelists will answer questions that will be crowdsourced ahead of and during the session. A list of resources discussed by the panelists will also be made available after the session. Topics will include: NGO and industry partnerships, international funding sources that are available to any early career researcher, and free research resources. This session will be especially tailored to the needs of early career researchers, but will have something to offer to anyone who is in need of alternate funding sources beyond US federal sources. Five panelists are proposed, with three confirmed thus far.

I Wish I'd Known Sooner: Hidden Curriculum of Grad School

2:00 PM – 3:10 PM | Location: E451A, Level 4

Graduate school is filled with unwritten rules that shape students' success, rules that are rarely taught formally but are critical to thriving. This session will demystify the "hidden curriculum" of graduate education by focusing on practical advice for navigating key challenges like selecting the right advisor, building a supportive network, joining organizations, securing funding, and finding the right program fit. A diverse panel of scholars at various career stages, from current grad students to mid-career professionals will reflect on what they wish they'd known earlier and offer insights for those still navigating these systems. Attendees will gain concrete strategies and a better understanding of how informal norms shape academic progression, with time reserved for Q&A to ensure relevance across different backgrounds and institutional contexts.

Undermining Free Will Belief Increases Forgiveness of Self and Others

2:00 PM – 3:10 PM

MORALITY

There is growing philosophical and scientific rejection of the notion of free will, but the psychological implications of this shift remain underexplored. While prior work has emphasized potential negative outcomes of weakening free will belief, the present studies examine possible benefits. In two experiments, we tested whether exposing participants to deterministic arguments would increase forgiveness. In Study 1 (N = 260), participants who recalled a personal transgression and read pro-determinism texts reported greater self-forgiveness. In Study 2 (N = 262), participants who recalled being wronged by someone else showed greater forgiveness and less hatred toward their transgressor after the same manipulation. Extending these findings cross-culturally, we surveyed 8,917 participants across 44 countries and found that individuals with stronger belief in free will were more punitive in response to everyday moral transgressions. At the country level, stronger free will belief predicted support for the death penalty and higher incarceration rates. These results suggest that undermining belief in free will may foster forgiveness and reduce punitive attitudes.

Impressions of Chatbot Personality

2:00 PM – 3:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

People are increasingly using chatbots powered by large language models (LLMs) for tasks ranging from coding help to emotional support. Differences in algorithms and training data suggest chatbots will express distinct and stable personality profiles. In two studies, we examined impressions of Big Five personality traits of three popular LLMs: ChatGPT, Google Gemini, and Microsoft Copilot. In Study 1, N = 248 participants read chatbot responses to personality-relevant prompts (without knowing they were chatbot-generated) and rated the author's traits. In Study 2, N = 229 undergraduates interacted with each chatbot for 5 minutes, then rated the chatbot's personality; chatbots also rated their human partners. Participants agreed about chatbot traits and differentiated between them. When unaware responses were chatbot-generated, participants assumed similarity in traits at levels comparable to impressions of people—but not after direct interaction. Chatbots conveyed stable, distinctive personality traits and rated humans with moderate accuracy. We discuss how these impressions may shape trust, social judgments, and future human–chatbot relationships.

Tradeoffs between social media and other activities for adolescent well-being

2:00 PM – 3:10 PM

MENTAL HEALTH/WELL-BEING

Studies on social media and well-being have produced mixed results. One explanation is that the current approach does not account for the relative nature of time. According to the displacement hypothesis, increasing social media inevitably bears a cost on time that could be spent on activities like sleep or exercise and thus predicts worse outcomes. However, existing work has not directly accounted for these inherent tradeoffs in social media use. This preregistered study uses compositional data analysis to examine specific tradeoffs between social media and time spent on other activities for subjective well-being in a representative birth cohort panel of 2,340 UK adolescents. Preliminary analyses suggest that social media does not appear to be the key culprit in the negative association between screen time and well-being. Further analyses will be conducted to identify key activities against which social media use is more harmful, beneficial, or neutral. Our approach aims to illustrate the value of treating time as inherently limited and inform future social media interventions, recommendations, and policies to consider how time should otherwise be spent to lead a satisfying life.

How Research Value Hierarchies Shape Faculty Epistemic Exclusion in STEM

2:00 PM – 3:10 PM

DIVERSITY

In STEM, certain research values (e.g., qualitative, social justice focused) are marginalized more than others (e.g., quantitative, "generalizable"). We investigated how this hierarchy contributes to epistemic exclusion of women faculty and faculty of color. Specifically, we tested whether epistemic exclusion occurs because scholars hold marginalized research values and conduct marginalized research. We found that White men were least likely to endorse marginalized values or conduct marginalized research, while women of color were most likely to do so. The indirect path from race/gender to epistemic exclusion via marginalized values or marginalized research was significant. Finally, we explored how mismatch between faculty and departmental research values shapes epistemic exclusion. Response surface analysis showed that scholars who endorse marginalized values report greater epistemic exclusion in departments that do not support those values. These findings highlight the critical role of both individual and institutional factors in shaping epistemic exclusion and call for environments that value diverse scholarship.

Reduced Wellbeing in Parents of Transgender Youth Following the 2025 U.S. Presidential Inauguration

2:00 PM – 3:10 PM

GENDER

The recent spate of executive orders directed at transgender youth in the weeks following the 2025 U.S. presidential inauguration were a likely signal to these youth—and their parents—that the federal government no longer supported them. Using a longitudinal design spanning three years prior to the inauguration (2022-2024) and two months surrounding the inauguration (mid-January to mid-March 2025), we tested whether the wellbeing (depression, anxiety, and positive affect) of transgender youth and their parents declined relative to that of cisgender youth and their parents over this time period. Across two sets of preregistered analyses of youth and parents (total youth N=160, total parent N=167), we observed significant and robust declines in the wellbeing of parents of transgender youth compared to parents of cisgender youth, and we observed minimal differences over time between transgender and cisgender youth themselves—patterns we corroborate in analyses of participants' open-ended data. Altogether, our findings identify an immediate potential cost of the current political environment for supportive parents of transgender youth.

Parents consistently underestimate their children's prejudices

2:00 PM – 3:10 PM

SOCIAL DEVELOPMENT

To intervene on prejudice development, parents must acknowledge that their children hold prejudiced attitudes in the first place. Do they? The present study examined the accuracy of parents' estimates of their own children's prejudices. Specifically, I examined how accuracy varied across (1) diverse parents and (2) diverse forms of prejudice (race, class, weight, disability, and orientation). I also examined (3) why parents held the beliefs they did. A diverse national sample of parent-child dyads (n=130 dyads), six- to nine-year-olds and their parents, participated. Parents predicted their children's selections on a playmate preference task and then children completed the task. Results indicated that parents severely underestimated their children's prejudices overall (Cohen's d=.83). Underestimates were consistent across diverse parents (e.g., across political views, educational backgrounds, income brackets, & personal values) and across several forms of prejudice (e.g., class, weight, and disability, but were more limited for race and orientation). Finally, underestimates may reflect specific intuitive misconceptions parents hold about the processes driving prejudice development.

A Random Human Peer Is Better Than a Highly Supportive Chatbot in Reducing Loneliness Over Time

2:00 PM – 3:10 PM

MENTAL HEALTH/WELL-BEING

AI chatbots are increasingly embedded in social life, offering accessible companionship. While brief interactions have been shown to provide immediate benefits, it is unclear whether sustained, daily engagement with chatbots reduces loneliness. In this pre-registered study, we tested the effectiveness of an AI chatbot versus a human peer in reducing loneliness among 296 students in their first semester of university. For two weeks, participants either interacted with a chatbot or a human peer, or simply wrote a brief journal entry (control condition). Although our chatbot was designed to offer consistent support rooted in principles from relationship science, the psychological benefits it provided paled in comparison to a randomly selected first-year university student. The present study provides the first evidence that texting daily with a random human peer is more effective in alleviating loneliness than texting with a highly supportive chatbot.

The Digital Authoritarian: Smartphones reveal the everyday behavioral patterns of individuals with authoritarian tendencies

2:00 PM – 3:10 PM

PERSONALITY PROCESSES/TRAITS

Authoritarianism is rising around the world. It is therefore important to understand the nature and underpinnings of this trend. To this end, we develop a portrait of the fine-grained behavioral patterns individuals with authoritarian tendencies engage in on a day-to-day basis. We collected more than 280 million digital records of behavior over three to six months from 669 volunteers' smartphones (i.e., their app usage, music listening, keyboard typing, calling/texting, unlocking/locking, and GPS location). These digital records were processed according to psychological theories about authoritarians' behavioral attributes and then used in machine learning models to predict self-reported authoritarianism. Overall, results show that individuals with authoritarian tendencies behave differently in everyday life—their behavioral patterns revealed limited exposure to unknown people, places, and cultures; a preoccupation with status and hierarchy; and greater aggression and emotionality. Regarding specific behaviors, patterns of Facebook use emerged as the most important behavioral predictors of authoritarian tendencies. Our results were not reliably explained by demographic characteristics typically linked to authoritarianism. This research demonstrates how everyday behavioral patterns collected with smartphones provide rich insights into the micro-level underpinnings of authoritarianism in the 21st century.

Victim blame in the #MeToo Era: Raising awareness of social problems may trigger backlash by activating threat

2:00 PM – 3:10 PM

GENDER

The #MeToo movement was paramount in raising awareness of sexual assault. While most research suggests that such movements should heighten concerns for victims, literature on backlash suggests that they may instead heighten rationalization and victim blame. We investigate this possibility in the context of victim versus perpetrator blame for sexual assault following three moments in time in the United States: Before the #MeToo movement, after the #MeToo movement, and after the Brett Kavanaugh Supreme Court hearings, but before his confirmation. As hypothesized, men, conservatives, and those assessed following the Kavanaugh hearings were more likely to blame the victim and less likely to blame the perpetrator. The effect of study wave on blame was mediated by heightened feelings of threat. In conclusion, social movements may have unanticipated implications for blame attributions, particularly among threatened individuals. Future research should examine messaging strategies that heighten awareness of social problems while minimizing backlash.

Unseen and unseeing: Threats to belonging impair social monitoring and empathic accuracy

2:00 PM – 3:10 PM

BELONGING/REJECTION

Humans have an innate need to belong which drives us to seek positive social connections that are imperative for well-being. Past research has argued that when our belonging needs are thwarted (e.g., through rejection), we are motivated to restore a sense of acceptance. However, across three studies, we found consistent evidence that rejection impairs complex social monitoring. In Study 1, self-reported state feelings of rejection were negatively associated with empathic accuracy as measured by performance on the Reading the Mind in the Eyes Test (RMET), which was mediated by negative affect. In Studies 2 and 3, we experimentally manipulated feelings of rejection by giving participants false feedback that they would end up alone later in life. Compared to those in the acceptance and control conditions, rejected participants once again performed worse on the RMET (Studies 2 and 3) and struggled to interpret the feelings of others who told emotionally negative stories in a video task (Study 3). While threats to belonging may motivate us to seek acceptance, these findings suggest that rejection hinders sensitivity to complex social stimuli, thereby impairing empathic accuracy.

Eudaimonic Utility: When Environments Help You Become Who You Are

2:00 PM – 3:10 PM

SELF/IDENTITY

Between growing political challenges to inclusive education and unprecedented access to knowledge through artificial intelligence, young people are beginning to question why they should pursue education—a trend made salient by recent records in school absenteeism. Considering these challenges, expanding our understanding of the forces that push young people into learning opportunities is worthwhile. This study introduces eudaimonic utility (EU), or the perception that a given environment can help someone become the person they are meant to be. An environment with high EU helps one (a) pursue their purpose in life, (b) grow, (c) bring out their best, and (d) live authentically. We established the Eudaimonic Utility Scale through factor analyses (Study 1: N=146 / Study 2: N=170) among youth in an extracurricular program. We further show that program and school EU converge with context-matched motivation measures; school EU correlates with higher grades and well-being; and, when program EU outpaces school EU, distress is likely. Together, EU offers programs and schools a new way for tracking impact and aligning their mission with the young people they are built to serve.

Cognitive Skills, Values, and Social Interaction in Shaping Lived Experience

2:00 PM – 3:10 PM | Location: E451B, Level 4

PERSON PERCEPTION/IMPRESSION FORMATION SELF/IDENTITY SOCIAL COGNITION MOTIVATION/GOALS

This symposium brings together research examining how thought, memory, values, and perception influence our engagement with the social world. The first talk explores how specific cognitive capacities like critical thinking, perspective taking, moral metacognition, and locus of control predict social justice-related thoughts and behaviors. The second talk explores how sharing personal memories under validating versus non-validating social conditions affects how events are integrated into the self, feelings of connection, and future projections. The third talk examines how personal values guide preferences for particular situations and, through both value-congruent and value-incongruent paths, shape how situations are perceived. The final talk shows how voices, faces, and behaviors interact to update social impressions, emphasizing the surprising potency of vocal cues across intentional and spontaneous judgments. These projects illustrate how cognitive processes and social contexts continually influence our understanding of ourselves and others, thus pointing toward a dynamically integrated science of lived experience.

Cognitive Pathways to Critical Consciousness Development

2:00 PM – 3:10 PM

SOCIAL COGNITION

Our cognition and lived experience continuously inform each other. As a process involving reasoning, interpretation, and sociopolitical decision-making, critical consciousness is informed by cognition. Yet, critical consciousness has primarily been studied through developmental and experiential lenses. The present analysis explores whether cognitive skills like critical thinking, perspective taking, social intelligence, emotional regulation, metacognition, and locus of control predict CC's components. A multiple linear regression analysis showed that critical motivation was predicted by critical thinking and moral metacognition. Critical action was predicted by critical thinking, perspective taking, and internal locus of control. Gender and race also influenced CC, with men and white participants reporting lower CC. These findings suggest that fostering certain cognitive skills may be a promising pathway for developing critical consciousness, informing future educational and community-based interventions. The results also open new avenues for integrating cognitive perspectives into CC research.

Conversational Remembering about Life Experiences: Shared Reality and Autobiographical Reflection

2:00 PM – 3:10 PM

SELF/IDENTITY

Approximately 75% of conversations contain discussion of one's autobiographical memories (Beike et al., 2016). When describing autobiographical events to others, we operate at two levels: the outward-facing level in which communication is organized and interpreted for others, as well as the inward-facing level in which we mentally re-experience events for ourselves. As part of a highly-powered registered report, we examined how the experience of shared reality with one's communication audience affects the experience of these two levels. Participants were randomly assigned to disclose a positive or negative personal memory under high v. low shared reality conditions (i.e., in which audience validated communicator experiences or not). Results indicated that under high shared reality conditions rememberers were more likely to: (a) attach the disclosed event to their self-concept, (b) feel connected with their communication audience, and (c) use the recalled event when projecting future experiences, effects that were especially large for those disclosing negative experiences. This work highlights how social interaction affects the meaning we derive from remembered life experiences.

How Values Shape Psychological Situations: Congruent and Incongruent Paths

2:00 PM – 3:10 PM

MOTIVATION/GOALS

We examine how value-congruent and value-incongruent paths explain the role of personal values in shaping subjective perceptions of reality. Using a taxonomy of psychological situations (negativity, positivity, familiarity, demandingness, oddness, straightforwardness), we propose that values predict the situational attributes people prefer and tend to perceive. In Studies 1 (N=155, students) and 2 (N=708, general population), conservation, openness to change, and hedonism values relate to preferences for familiar, straightforward, and odd situations. Study 2 also used suppression analyses to illustrate how both congruent and incongruent value paths predict perception of a randomly chosen situation: Through situation preference, people perceive situations in line with their values, while the direct path suggests a contrasting effect. In Studies 3 (N=208, students) and 4 (N=502, 251 couples via Prolific), we examined when these values are linked to perceptions of familiarity, straightforwardness, and oddness. Optimism moderated these associations, and Study 4 revealed gender differences. These studies offer a first step toward understanding how values shape psychological situations.

Impression Updating from Multimodal Cues: Dynamics of Face, Voice, and Behavior Integration

2:00 PM – 3:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

A glimpse of a face or a few spoken words is often enough to form impressions. Yet, most research on impression updating has focused on behaviors, overlooking their inherently multimodal nature and ignoring this aspect of genuine social interactions. Across nine experiments (N = 1919), we demonstrated that impressions based on facial features, voice tone, and behavioral descriptions can be updated by cross-modal cues of opposing valence—particularly when initially negative facial impressions were followed by positive vocal cues (Experiments 1–4). Positive voices also reshaped negative face representations generated via reverse correlation, both under intentional and spontaneous impression formation conditions (Experiments 5–6). To explain these effects, we examined perceived diagnosticity of faces versus voices, as well as participants' explicit beliefs about their relative diagnostic value, but the results were mixed (Experiments 7–9). Together, these findings highlight the dynamic nature of impression updating, underscore the uniquely powerful role of voice, and offer an initial test of potential underlying mechanisms, opening promising directions for future research.

Reading Between the Lines

2:00 PM – 3:10 PM

INTERGROUP RELATIONS

Prejudices extend beyond borders of the Israel-Hamas attacks to impact Jewish and Muslim peoples worldwide. We hypothesize that outgroup narratives can alter these prejudices. Muslim and Jewish participants received a passage written from the perspective of a Palestinian/Israeli father and were instructed to either engage in empathy or count the number of times the word “the” appears. Those who received empathy instructions reported significantly greater empathy with the main character. Character empathy was significantly correlated with greater outgroup empathy. For the Jewish sample only, empathy with the main character also significantly predicted more positive outgroup attitudes. In a mediation model using data from the Jewish sample only, the indirect effect of our experimental manipulation on outgroup attitudes via character empathy was significant. Follow-up results from a Christian sample mirrored the results from the Jewish sample. Understanding the role that narratives play in improving group attitudes could inform interventions and media aimed at promoting peace between groups in conflict.

Villains and Victims in the Middle East: A Moral Typcasting Theory of Antisemitic and Islamophobic Attitudes

2:00 PM – 3:10 PM

MORALITY

We applied Dyadic Morality Theory to test pre-registered hypotheses regarding whether the moralization of actors in the Israel/Gaza war has aggravated the links between authoritarianism and intolerance. Study 1 (N=500) showed perceiving Israelis as villains mediated the positive link between left-wing authoritarianism (LWA) and antisemitism. Viewing Palestinians as moral villains mediated the link between right-wing authoritarianism (RWA) and Islamophobia (Sobel Zs=4.98 and 4.76). Study 2 (N=400) replicated these findings and showed divergent patterns for anti-Zionist vs. Judeophobia antisemitism. Path analyses revealed that anti-Zionism and perceiving Israelis as villains acted as suppressors, masking the direct effects of authoritarianism on Judeophobia. For LWA, higher anti-Zionism and perceptions of Israelis as villains masked a residual negative link between LWA and Judeophobia ($\beta=-.22$). For RWA, lower anti-Zionism and villain perceptions only provided minor suppression of the residual positive association with Judeophobia ($\beta=.49$). A final experiment (N=600) manipulates perceptions of moral harm to reduce the links between authoritarianism, anti-Zionism, and Judeophobia.

Pain and Prejudice: An Empirical Investigation of the Impacts of Hypervisibility and Invisibility among Arab, MENA, and Muslim University Students

2:00 PM – 3:10 PM

STEREOTYPING/PREJUDICE

The onset of nationwide campus protests advocating for a ceasefire in Israel/Palestine have been and continue to be met with formidable institutional backlash against Arab, Middle Eastern or North African (MENA), and Muslim university students, while at the same time invisibilizing the resulting widespread macro- and microaggressions directed at them. In line with the cumulative racial-ethnic trauma model (Awad et al., 2019), the current study empirically investigated the impacts of a set of stigma-related stressors unique to these populations. Specifically, we examined the impacts of simultaneous hypervisibility and invisibility on institutional betrayal and sense of belonging amongst these populations of university students. Findings from this study provide greater insight into the unique experiences and needs of Arab, MENA and Muslim university students, which are understudied and underrepresented populations within the psychological literature. Findings also inform recommendations for university administrators regarding the facilitation of increased sense of belonging on campus among these vulnerable populations of students.

Ameliorators and Aggravators of Affective Polarization

2:00 PM – 3:10 PM | Location: E353A, Level 3

POLITICS

Affective polarization—hostility between political parties—divides communities and threatens democracy. This symposium examines new directions in understanding the antecedents of affective polarization. Talk 1 tests dozens of interventions and finds that manipulating attitudinal polarization does not lead to a change in affective polarization, nor vice versa, casting doubt on a widely-assumed causal link. Talk 2 finds that practicing religion reduces some forms of affective polarization among American Christians, and that attending politically heterogeneous churches is linked with lower affective polarization. Talk 3 explores participants from eight religiously diverse nations and reveals that religion that is fused with nationalism is associated with greater support for undemocratic practices and political violence. Talk 4 presents a promising intervention, showing that exposing participants to political debates can increase issue-specific intellectual humility and reduce affective polarization. Together, these talks provide insights into the precursors of affective polarization and offer suggestions about the efficacy of various approaches for bridging political division.

The Relationship between Attitudinal and Affective Polarization

2:00 PM – 3:10 PM

POLITICS

What is the relationship between affective and attitudinal polarization? Although these two forms of polarization are often discussed together, it remains unclear whether reducing one has causal effects on the other. In this paper, we investigate this question by synthesizing evidence from 26 tests of treatments designed to reduce attitudinal polarization ($N = 4,892$) and 25 tests of treatments designed to reduce affective polarization ($N = 32,059$). We find that, on average, treatments aimed at reducing attitudinal polarization do not significantly impact affective polarization. Likewise, treatments designed to reduce affective polarization do not produce reliable changes in attitudinal polarization. These findings provide evidence for the causal independence of affective and attitudinal polarization. They also highlight the importance of precisely diagnosing the type of polarization at stake when designing and selecting interventions: strategies that reduce one type may have no effects on the other.

Religious Engagement and Affective Polarization in American Christians

2:00 PM – 3:10 PM

POLITICS

Can religion ameliorate political animosity, and under what conditions? We experimentally manipulated engagement with Biblical teachings (vs. meditation) among American Christians and observed reduced affective polarization in the biblical condition on some but not all measures. To explore whether engagement with religion is more naturalistically linked with reduced affective polarization, we explored whether church attendance and the political diversity of one's church predicts affective polarization. Whom one shares a pew with may be important for reducing polarization, as attending a politically diverse church allows for more cross-party contact. Indeed, we find those who attend politically diverse churches are significantly less affectively polarized than those whose churches are dominated by either in-partisans or out-partisans. Religious behaviors like reading scripture or attending services have the potential to reduce affective polarization, yet their effects may be limited in the context of politically uniform churches.

A Cross-Cultural Investigation Into Religious Nationalism and It's Correlates

2:00 PM – 3:10 PM

POLITICS

While research has extensively documented the role of religious nationalism—the desire to fuse politics and religion—in the US, a majority-Christian country, little is known about its global nature. To fill this gap, we explore religious nationalism across 8 nations ($N = 2563$), representing Christian, Hindu, and Jewish majorities. Using quota-representative surveys from the US, Australia, Brazil, Germany, India, Israel, South Korea, and England, we examine (1) the association between political conservatism and religious nationalism, (2) this association's moderation by perceived political threat, and (3) links between religious nationalism and anti-democratic attitudes. Results reveal consistent positive associations between religious nationalism and conservatism across all nations [$\beta = .23, p < .001$], strengthened by political threat in six of eight countries. Religious nationalism also predicted support for undemocratic practices [$\beta = .20, p < .001$] and partisan violence [$\beta = .19, p < .001$] across contexts. Consistent patterns across diverse religions, political systems, and nations provide a deeper understanding of political shifts, democratic drift, and intergroup conflict.

Do Debates Work? Consuming Political Debates and Intellectual Humility

2:00 PM – 3:10 PM

POLITICS

Political debates are often thought of as a vital part of a functioning democracy, but perspectives on the psychological function of political debates vary. On the one hand, by observing debates, the public may learn to appreciate the topic's complexity as well as their own intellectual limitations (i.e., intellectual humility). Conversely, debates may serve as a spectator sport that makes a mockery of intellectual engagement: people could watch debates to have their views reinforced, and to see their enemies embarrassed (i.e., intellectual hubris). To explore whether consuming debates encourages intellectual humility or hubris we ran two experimental studies (N=701; one pre-registered). Participants experimentally assigned to a debate video (vs. informational or no-video controls) displayed more intellectual humility about rent control (Study 1), defunding the police (Study 2), and even displayed less affective polarization (Study 2). Then, to explore what types of debates might lead to intellectual humility, we analyzed ~300,000 YouTube comments, finding that argument persuasiveness and debate moderation were associated with comments' greater intellectual humility.

Applications of Mixed Methods in Social and Personality Psychology

2:00 PM – 3:10 PM | Location: E450A, Level 4

METHODS/STATISTICS

Mixed methods approaches – including the combination of quantitative and qualitative analyses – have been used in social psychology since the field's foundational research programs (e.g., on the authoritarian personality and cognitive dissonance). In recent years mixed-methods research is again on the rise, due to factors such as the growth of qualitative psychology, the availability of archival datasets, and greater interest in work with real-world applications. However, available textbooks on mixed methods deal largely with theoretical issues. This symposium aims to demonstrate the power of mixed-methods research for social psychologists and to offer models for curious researchers interested in this approach. Our speakers include well-established scholars, experts in mixed methods, and rising stars in the field. Their investigations cover a great range of applied areas in social psychology, ranging from racial/ethnic identity and narratives to the workings of the U.S. carceral system. What each of the presenters shares is a commitment to the use of mixed methods to break new ground in areas that have long been studied primarily with conventional quantitative techniques.

Social Psychology as World-Making

2:00 PM – 3:10 PM

METHODS/STATISTICS

Social psychology's disconnect from the vital and urgent questions of people's lived experiences reveals limitations in the current paradigm. To re-engage social psychology with the alleviation of serious everyday world problems, I propose we consider our discipline as "world-making" in two ways. First, people are future-oriented and often are guided more by what could be than what is. Second, social psychology can contribute to this future orientation by supporting people's world-making and also critically reflecting on the role of social psychological research in world-making. In this talk I will describe the ontology, epistemology, ethics, and the importance of mixed qualitative and quantitative methods of social psychology as world-making. I will illustrate the utility of this approach to its application to comprehending serious everyday world problems. I will conclude by arguing that reconceptualizing social psychology in terms of world-making can make it more humble yet also more relevant, reconnecting it with the pressing issues of our time.

How Mixed Methods Expand the Study of Personality/Social Psychology

2:00 PM – 3:10 PM

METHODS/STATISTICS

Psychology often privileges quantitative approaches, overlooking qualitative insights into how people navigate identity within social structures. In this talk, I discuss how mixed methods designs can expand what questions we ask in personality and social psychology and offer new tools for addressing them. I outline key forms of mixed methods research and share how I have used an embedded mixed methods design to examine racial/ethnic conversations with 107 young adult friend pairs. Participants first completed written narratives about a meaningful racial/ethnic experience, followed by a recorded conversation with a friend. We coded written and spoken narratives for meaning making and quantitatively analyzed conversation dynamics around encouragement and mitigation. Findings showed higher meaning making in written than spoken narratives, with encouragement dynamics corresponding to greater meaning making in conversation. By embedding qualitative narrative analysis within a quantitative framework, this study highlights how conversational processes shape identity-relevant meaning making and offers practical guidance for integrating mixed methods in personality and social psychology.

Racial Discrimination in Everyday Life: Integrating Focus Groups and EMA

2:00 PM – 3:10 PM

METHODS/STATISTICS

Qualitative focus groups can be used to support experimental design and data interpretation both before and after quantitative data collection. Here, initial focus groups were used to design measurement tools used in a quantitative ecological momentary assessment (EMA) study looking at racial discrimination experienced by Black students at a Primarily White Institution in the U.S. Reports of discrimination over the course of 4 weeks coincided with immediate increases in negative affect, depression, and anxiety, as shown in other studies. Surprisingly, reports of discrimination were followed several hours later by bumps in positive affect, which was unexpected and has not been shown before. More focus groups were conducted in which the surprising results were presented and discussed by the participants, including what active coping may have followed instances of discrimination that may have resulted in the rebound in positive affect. Thus, qualitative focus groups supported the quantitative research at both initial design stages and during interpretation.

Credit, Cops, & Cages: A Theory of Capitalist Individualism

2:00 PM – 3:10 PM

METHODS/STATISTICS

Combining Frankfurt School critical theories of society and the criminal punishment system with cutting edge psychological methods, we offer a theory of capitalist individualism that proposes that people in the contemporary US occupy self-positions along a hierarchically structured continuum of accumulation/dispossession. Using mixed-methods, we investigate how the intersection of structural systems (policing/incarceration) and ideology (neoliberalism and capitalist individualism) affect and characterize people in the US along lines of race and class. Across three quantitative studies, we find that neoliberal ideology has a strong positive relationship with carcerality, at both social-structural (state policies) and individual (attitudes) levels. At the individual level, the relationship between neoliberal and carceral attitudes is stronger for White and higher class individuals. In a fourth study, lifeline interviews with currently incarcerated women provide both illuminative support and clarifying contradiction for our overarching theory, highlighting the importance of in-depth qualitative analysis for the refinement of quantitative methods and critical theory in psychology.

Countering Anti-Muslim & MENA Bias: The Role of Media and Paths to Intervention

2:00 PM – 3:10 PM | Location: E253AB, Level 2

INTERGROUP RELATIONS

This symposium brings together research on bias and discrimination against Muslims and MENA populations, emphasizing the powerful role of media in shaping these dynamics. We showcase four studies examining how media influence intergroup perceptions and identity threat, and how targeted interventions can reduce bias. Talk 1 investigates linguistic bias in news coverage of violence against Palestinians, showing how language that obscures agency can normalize harm inflicted on civilians. Talk 2 explores how perceived media, interpersonal, and group discrimination interact to form a reinforcing cycle of identity threat among Muslim and Latino Americans. Talk 3 examines how entertainment portrayals of Muslims affect support for anti-Muslim and anti-democratic policies, demonstrating how positive depictions reduce prejudice while negative ones heighten threat and social distance. Talk 4 presents a virtual contact intervention connecting non-Muslim U.S. students with Muslim peers from MENA and Southeast Asia, demonstrating its effectiveness in improving attitudes. Together, these talks illuminate how media and mediated contact can either sustain or challenge intergroup bias.

Media Bias in Framing Violence in Gaza: How Language Shapes Public Perceptions of Agency and Accountability

2:00 PM – 3:10 PM

INTERGROUP RELATIONS

News media play a central role in shaping popular narratives and public understanding of intergroup conflict and violence. In particular, media reportage of intergroup violence may use linguistic forms that serve to minimize the visibility and recognition of violence and erase the responsibility of perpetrators. Combining text analysis and experimental methods, this study examines the prevalence and consequences of bias in news reports in the context of the ongoing conflict in Israel/Palestine. Analyzing thousands of news headlines and reports on violence against Palestinians in Gaza by prominent US newspapers, we identify recurring linguistic patterns that obscure perpetrator agency, such as passive constructions, agent omission, nominalization, and intransitive verbs. Across three experiments (Total N ~3,500), including a preregistered study, we find that exposure to news reports using these linguistic forms, compared to reports employing active voice, reduces perceptions of perpetrator responsibility, intent to harm, and motivation to hold perpetrators accountable. These findings suggest that linguistic choices in news media may serve to condone intergroup violence, functioning as a tool of discursive oppression.

Reinforcing Spirals of Discrimination: The Mutual Influence of Media, Interpersonal and Group Discrimination on Muslim and Latino Americans

2:00 PM – 3:10 PM

INTERGROUP RELATIONS

Stigmatized groups, such as Muslim and Latino Americans, frequently encounter discrimination across multiple domains including personal mistreatment, group marginalization, and negative media portrayals. This research examines whether these domains of perceived discrimination function as distinct yet mutually reinforcing sources of identity threat. Across two studies, we investigate the cross-domain effects of media, interpersonal, and group discrimination on perceptions of stigmatization. Study 1 (N = 253 Muslim Americans) uses cross-sectional data to validate a three-factor model, showing each domain uniquely contributes to perceptions of societal hostility. Study 2 (N = 1,160 Latino Americans) employs a longitudinal design and a random-intercept cross-lagged panel model, revealing reciprocal spillover effects between perceived media, interpersonal and group discrimination over time. Results support a reinforcing spiral of discrimination, wherein identity threat in one domain heightens threat in others. These findings extend social identity theory by showing that media discrimination is a distinct, reinforcing source of identity threat beyond interpersonal or structural contexts.

The Effects of Muslim Portrayals in Entertainment Media

2:00 PM – 3:10 PM

INTERGROUP RELATIONS

Media plays a central role in shaping perceptions of minoritized groups. This study investigates how portrayals of Muslims in entertainment media shape support for anti-Muslim and anti-democratic policies and intergroup attitudes. In an experiment (N=1,005) using a U.S. sample matched to Census demographics, participants viewed positive, negative, or mixed TV depictions of Muslims. Positive portrayals led to more opposition to policies that curtail civil liberties for Muslims and Americans broadly, and fostered warmer attitudes, less social distance, lower symbolic threat, and greater identification with Muslims. Negative depictions, by contrast, actively harmed intergroup attitudes—heightening intergroup anxiety, symbolic threat, social distance, and reducing identification with Muslims. Mixed portrayals fell in between. These findings highlight that positive media representations can meaningfully reduce prejudice and strengthen democratic values, while negative depictions worsen bias and threaten social cohesion. This underscores the importance of promoting balanced portrayals to counter harmful stereotypes and support more equitable, inclusive societies

Virtual contact improves intergroup relations between non-Muslim American and Muslim students from the Middle East, North Africa and Southeast Asia in a field quasi-experiment

2:00 PM – 3:10 PM

INTERGROUP RELATIONS

Given the current polarized climate in many parts of the world, finding effective interventions to address psychological drivers of conflict is critical. While direct, face-to-face contact can reduce intergroup antipathy, many conflicts span great distances, making direct contact costly and rare. Programs for "virtual contact," which combine text-based communication with live video, extend intergroup contact's benefits to broader audiences. However, studies of such programs are typically conducted in laboratory settings, focusing only on change in outgroup attitudes. This research tests how a semester-long virtual contact intervention connecting non-Muslim US American students with Muslim students from the Middle East, North Africa and Southeast Asia shapes intergroup processes, across two field quasi-experiments (combined N = 2886). Compared to before the intervention and a control group, participants who engaged in virtual contact showed greater self-outgroup overlap, improved outgroup attitudes, and less outgroup dehumanization and meta-dehumanization. This research provides evidence that virtual contact can be an effective tool for promoting better intergroup relations.

Extending Lewin's Field Theory: Contemporary Approaches to Person X Ecology

2:00 PM – 3:10 PM | Location: E253CD, Level 2

CULTURE

This symposium revisits Kurt Lewin's foundational field theory, which emphasized the dynamic interplay between the 'person' and their psychological environment—the 'field', showing how contemporary approaches expand this concept across diverse ecological contexts.

We introduce extended ecology, arguing that non-proximal environments (intergenerational, media, virtual) shape minds and behavior. We explore lifespan dynamics of ecological affordances—how identical environments present different opportunities/threats across life stages as goals shift, and how people navigate them. We examine seasonal effects on psychology, showing how changing ecologies influence cognition, emotion, and behavior (e.g., prejudice, altruism) through neurochemical/socio-cognitive mechanisms from high-power datasets. Finally, we present ecology-driven stereotypes: cross-cultural data show that beliefs about others' home environments shape social perception, exceeding traditional categories like race.

Together, these talks offer a holistic, dynamic, empirically grounded view of person–field interaction across ecologies and time.

Extended Ecologies: A New Framework

2:00 PM – 3:10 PM

CULTURE

Ecology, features of the environment such as pathogen levels, climate, resource availability, and population density, which have fitness consequences for humans and other organisms, has been shown to influence psychology at levels. Such ecological conditions have been shown to shape state level psychology, individual differences, cultural variation, and cultural change over time. Here we present a novel framework, what we term "extended ecology," that describes how ecological conditions not proximately experienced may nevertheless exert potent influences on our minds and behavior. This expanded view, holds that alongside extended cognition and extended phenotypes, humans may essentially have extended ecologies. We highlight a variety of such paths including intergenerational transmission of past or distant ecological conditions, consumption of news about distant places, immersion in fictional or virtual worlds, and travel. We also lay out a series of novel theoretical and empirical questions that this new perspective opens for future investigation.

Ecological Affordances Across Life Stages: A Lifespan View of Lewinian Fields

2:00 PM – 3:10 PM

CULTURE

Extending Lewin's foundational field theory in social psychology, we explore here the lifespan dynamics of person-field interaction. Integrating affordance-management and life-history perspectives, we propose that ecological affordances (environmental opportunities/threats for goal achievement) shift across developmental stages, driven by changing goal priorities. For example, an environment with many relatives (e.g., high genetic relatedness) is likely to be perceived as an essential resource for children but a potential constraint for young adults seeking non-kin relationships, becoming an opportunity again for new parents needing childcare support. In response, individuals actively manage these shifting affordances by (a) calibrating attention and emotional responses to environmental cues, (b) adjusting thoughts, feelings, and behaviors, and (c) restructuring their 'living spaces' to align with life-stage goals. This framework offers new avenues for research into lifelong flexibility of person-field interactions, essential for a complete understanding of human psychology.

Seasons Matter in Many Ways and for Many Reasons

2:00 PM – 3:10 PM

CULTURE

Seasons change and so do the ecologies that people inhabit—and consequently, so do the emotions, cognitions, and behaviors of those people who inhabit those ecologies. This talk will provide an overview of seasonal effects on human psychological functioning. The overview will be illustrated by empirical research on topics of interest to social and personality psychologists (e.g., preferences, prejudices, moral values, altruistic behavior, etc.). Some of these findings are published; some aren't (e.g., results from two recent studies—one cross-sectional [with data from over 10 million respondents] and one longitudinal—on prejudices against marginalized groups). The talk will also include an overview of multiple causal mechanisms through which seasons have these many consequences. Some mechanisms reflect neurochemical responses to seasonally-varying meteorological variables, whereas others reflect cognitive and motivational responses to seasonally-varying features in natural and/or social ecologies. Methodological implications (e.g., implications for non-replication of empirical findings) will be discussed, and a few bits of useful advice will be offered.

Ecological Information Shapes Person Perception and Judgment

2:00 PM – 3:10 PM

CULTURE

A person's "field," or ecology, plays a powerful role not only in how they themselves behave, but also how they are perceived and judged by others. This talk introduces the concept of ecology stereotypes: Beliefs about people's characteristics and behavior based on their presumed home environment. Such stereotypes exist across societies and are similarly held regardless of one's own ecological circumstances. In a series of studies spanning ten years of research, we demonstrate that ecological cues can in fact exert a stronger influence on social perception than traditional categories like race or ethnicity. This work highlights that to best understand Person X Environment interactions, one must take into account how the "field" actively structures social impressions and judgments of the "person."

Friendship Formation and Change: Insights From Experimental and Network Data

2:00 PM – 3:10 PM | Location: E353C, Level 3

CLOSE RELATIONSHIPS

Friendship is critical to well-being, yet remains understudied. Here, we present four talks examining how people initiate, strengthen, lose, and perceive friendship across levels of analysis. First, experimental data show that people have biased meta-perceptions when imagining initiating a friendship. People believe they would be judged more negatively than they judge others, which shapes their willingness to reach out and predicts their real social network size. Second, six experimental studies find that requesting help signals friendship closeness even when the requested help is costly. In the third talk, we use longitudinal network data to show that closeness with friends from home declines significantly during college transition, and this decline predicts poorer mental health among students from marginalized backgrounds. Finally, egocentric network data reveal that people's perception of friends is shaped by their network structure. For instance, people feel closer to friends who are network brokers, and they perceive friends with more similar social connections as more similar to themselves. Together, these talks highlight how people connect and how friendships endure.

Biased Meta-Perceptions Inhibit New Friendships and Predict Social Networks

2:00 PM – 3:10 PM

CLOSE RELATIONSHIPS

As loneliness rises, forming new friendships is more vital than ever. Yet little research has focused on this early and uncertain stage of friendship initiation. What holds people back from reaching out? We hypothesized that people have biased meta-perceptions, believing their own attempts at initiating friendship are judged more negatively than they judge others for the same behavior. Across three pre-registered studies (N = 951), participants were randomly assigned to imagine being either the initiator or recipient of various everyday friendship invitations. Controlling for personality and attachment style, people think others perceive their friendship initiation attempts as less positive (e.g., friendly), more hesitant (e.g., socially awkward), and more overly assertive (e.g., pushy). Each judgment dimension also differentially predicts critical outcomes. For instance, people with less biased meta-perceptions for the positive traits reported being more willing to initiate friendships. Surprisingly, those who worry about seeming awkward actually have more friends. Results highlight a multifaceted cognitive barrier that discourages new ties and predicts real-world social networks.

Why didn't you ask me?: Requesting help cues interpersonal closeness

2:00 PM – 3:10 PM

CLOSE RELATIONSHIPS

Friends commonly ask each other for help, even when the help they need is costly. Across six preregistered experiments using scenario studies (N = 707) we predict and find that, despite its costs, friends prefer to be asked for help and get upset if their friends don't ask them for help, even when the task is tedious. We argue that this is because asking for help is tightly linked to friendship. Consistent with this, we find that people infer friendship strength from being asked to help and, in some cases, requesting help is seen as a more diagnostic signal of friendship than providing help. Further, we find that a friend's upset at not being asked to help is moderated by factors that lessen or increase this friendship inference: for instance, an unasked friend feels more upset if their friend asks another friend for help rather than if their friend asks someone else, like parent or co-worker, instead of them. These findings reveal that requesting help is not just a practical act but one that provides rich information about friendship strength.

Home Friendship Network Changes among College Students from Marginalized Backgrounds

2:00 PM – 3:10 PM

CLOSE RELATIONSHIPS

Students from marginalized backgrounds—such as underrepresented minority (URM) and First-Generation (First-Gen) students—often face distinctive social challenges when transitioning to college. Yet little is known about the role of “home” friendships in buffering – or exacerbating – these challenges. We used a longitudinal design to assess the home friendship networks of 280 students (31% URM; 38% First-Gen) before and throughout their first year of college. We find that all students experienced steep declines in closeness with their friends from home when they entered college. However, URM and First-Gen students experienced significantly steeper declines than their peers. Importantly, losing connection to home friends was linked to worse mental health for URM and First-Gen, but not for their peers. Potential mechanisms relating to identity, similarity, and new network characteristics are discussed. These findings suggest that, while it may be especially challenging for students from marginalized backgrounds to maintain their friendships from home, doing so may help buffer the challenges and stressors they face during the college transition.

The Shape of Connection: Networks Influence Self and Social Perception

2:00 PM – 3:10 PM

CLOSE RELATIONSHIPS

Our immediate social world—comprising the people we know and how they are interconnected—shapes how we feel about ourselves and others. Using egocentric social network data (N = 259), we examine how both the content and structure of people's social networks relate to their perceptions of individual friends, their self-perceptions, and their feelings of loneliness. First, people's impressions of friends are shaped by where those friends are situated in their network: emotionally close friends are more likely to occupy “broker” positions, bridging different social circles. Second, impressions are influenced by the broader context of who friends are connected to: friends with more similar connections to the participant are themselves seen as more similar. Third, when zooming in on participants' core support networks, lonely individuals tend to have smaller, less interconnected networks. Finally, more structurally diverse socializing networks are linked to more positive self-perceptions and higher self-esteem. These findings highlight that both social perceptions and self-views are shaped not just by individual ties, but by the structure of our broader social world.

Gender Inequalities Persist: Longitudinal and Experimental Examinations of Gender Stereotypes

2:00 PM – 3:10 PM | Location: E351, Level 3

GENDER

Despite increases in women’s representation in historically male-dominated domains (e.g., politics), gender inequality persists. This symposium examines novel ways to measure and understand gender stereotypes, with implications for judgments about people’s behaviors across contexts. Talk 1 presents evidence from across 40 years demonstrating that gender stereotypes (e.g., agency) remain exaggerated and inaccurate despite men’s and women’s occupational and behavioral differences narrowing. Talk 2 suggests that dimensions of perceived agency (e.g., competence) may explain why some gender stereotypes are more resistant to change. Talk 3 discusses surprising findings regarding people’s willingness to befriend women and men who exhibit counterstereotypic behaviors, highlighting people’s openness to stereotype violations. Talk 4 shows that White men sexualize women in high-status roles, potentially to degrade a powerful, and thus threatening, subordinate group member to maintain their own psychological dominance. Together, our symposium leverages 4,641 participants as well as longitudinal and experimental methods to explain why gender inequalities persist and how to best address them.

Same Script, Different Decade: The Gender Stereotype Freeze Frame

2:00 PM – 3:10 PM

GENDER

Over the past forty years, women’s roles have changed dramatically across politics, higher education, and beyond. Yet the stereotypes ascribed to women and men have remained exaggerated and stable. I present evidence that—despite women’s growing participation and visibility in public life and attainment of high-status roles and leadership—gender stereotypes continue to portray women and men as fundamentally different in inaccurate ways. Drawing on data from 1983, 2014, and 2024, I demonstrate the persistence of strong perceived gender differences ($d=0.9-1.8$) across the key trait dimensions of gender stereotypes—agency and communion, even as actual behavioral and occupational differences have narrowed (Haines et al., 2016). I argue that the primary impediments to gender equality are not rooted solely in stereotypes themselves, but emerge from intrapersonal, interpersonal, and structural factors across both work and home domains. To explain these dynamics, I outline the Role Prioritization Model, which extends role congruity, lack of fit, and backlash theories by specifying the boundary conditions of prescriptive and proscriptive behaviors for women and men.

Dominance (vs. Competence) Contributes to Women’s Underrepresentation in the Workplace

2:00 PM – 3:10 PM

GENDER

We draw on social role and status incongruity theories to examine the role of perceived dominance (vs. competence) in women’s underrepresentation in various organizational settings and careers. In Study 1, we show that perceived communion (e.g., warmth) and dominance (e.g., assertiveness), but not competence (e.g., skillfulness), explained perceptions that men (vs. women) were overrepresented in masculine (vs. communal) organizational cultures. Two reverse correlation studies suggest that gendered mental representation of dominance and communion (vs. competence) may explain these effects. Further, dominance and communion (vs. competence) also explain patterns of women and men’s representation across various careers. In Study 4, we show that participants viewed potential perceived gender similarities in trait dominance and communion (vs. competence) as less believable and more threatening. (Gender similarities in perceived dominance and communion were viewed similarly.) Thus, the two dimensions of gender stereotypes that contribute to perceived representation may be difficult to address. We discuss implications for assessing gender stereotypes and research on stereotype change.

Investigating the role of gender stereotypes on spontaneous impressions

2:00 PM – 3:10 PM

GENDER

Traits are spontaneously inferred from observing other’s behavior via spontaneous trait inferences (STIs). Decades of research show that STI effects are large, long lasting, and occur under various contexts. Yet, findings conflict on whether other implicit impressions, like stereotypes, impact STIs. Across 2 experiments, we investigated whether gender stereotypes impact STIs and subsequent intentions to friend and punish. Unexpectedly, in Experiment 1, participants formed stronger STIs of stereotype inconsistent (e.g. confident women, caring men) versus stereotype consistent targets (e.g. caring woman, confident men). Participants were also more likely to befriend and less likely to punish stereotype-inconsistent (vs. consistent) targets. These findings may reflect individuation (vs. stereotype) effects. To test these competing hypotheses, Experiment 2 utilized ambiguous behaviors that simultaneously implied stereotypic traits across gender (e.g., the same behavior implied the person was caring and confident). Data for Experiment 2 are collected and will be analyzed prior to SPSP 2026. We discuss implications for stereotype development, prejudice, and discrimination research.

Do White men sexualize higher-status women more in the workplace?

2:00 PM – 3:10 PM

GENDER

Within the higher ranks of leadership in the U.S., women tend to be less represented. In these leadership roles, women face backlash, which can be sexual in nature. Research on sexualized backlash has paid less attention to investigating the interlocking systems of racism and sexism and their impact on women leaders. This research investigated how White men in the U.S. sexualize women with intersecting marginalized identities in higher-status roles than themselves. Results from a pre-registered experiment (N = 641) indicated that women supervisors faced greater sexualized backlash than women colleagues (conceptual replication). But unexpectedly, White women were sexualized more than Black and East Asian women. Finally, a greater difference in role assignment (supervisor vs. colleague) in sexualization for East Asian women relative to Black women and White women emerged. Moreover, the more White men perceived their woman colleague/supervisor to be dominant and endorsed current social hierarchies, the more likely they were to sexualize her. Theoretical and practical implications will be discussed.

Is SPSP a Healthy Scientific Organization?

2:00 PM – 3:10 PM | Location: E352, Level 3

POLITICS

SPSP’s 2025 conference created a firestorm of criticism that the organization has replaced its scientific focus with a political one. In this symposium, we bring together SPSP researchers from different perspectives to debate the current scientific health of the organization. Talk 1 argues that SPSP is becoming unscientific while encouraging behavior that is in violation of egalitarian principles. Talk 2 uses large-language-model based classifiers to evaluate ideological framing and linguistic biases in SPSP symposia over time. Talk 3 evaluates whether SPSP has explicitly devalued the scientific method as racist. Talk 4 argues that, although imperfect, SPSP is nonetheless still largely healthy. With over 35,000 combined citations, our panel’s mixture of elected SPSP fellows, journal editors, and successful young researchers will open an important dialogue into the current state of SPSP. This symposium’s goal is to thus invoke vital self-examination. Even if SPSP is currently healthy, all organizations benefit from constructive criticism and debate. If SPSP is not healthy, this symposium could offer solutions to restoring that health.

Why SPSP is a Bad Society

2:00 PM – 3:10 PM

POLITICS

When SPSP sticks to being a scientific society it is on solid ground. But it has allowed itself to become a participant in the sectarian corruption of science. Contra its claims about “inclusion,” SPSP has become a club for leftists and an engine for far left/progressive activism; as such, it bears responsibility for: 1. Declining trust in academia and science, especially on the right; 2. Evoking Trump’s attacks on science. SPSP engages in and encourages illegal behavior. To understand this, it’s necessary to understand U.S. civil rights law. SPSP programs that likely violate those laws are discussed. SPSP’s website diversity statement and requirements for diversity statements for this conference, while not illegal per se, encourage illegal discrimination. SPSP leaders present a disingenuously innocuous definition of anti-racism and then make claims about White supremacy, based not on the innocuous definition, but on bizarre claims that have emerged from critical race theory. The talk ends with a list of recommendations to improve SPSP that are both tractable and likely to be supported by the membership: (<- not a typo).

Quantifying the Health of SPSP with Large Language Models

2:00 PM – 3:10 PM

POLITICS

What a scientific society deems worthy of inclusion in its scholarly programming may offer insight into its intellectual priorities, its health, or its blind spots. SPSP's symposium sessions, in particular, are competitive and reflect not only member interests, but also institutional and member judgments about what meets scientific muster and merits attention. Analyzing over 20 years of SPSP symposium abstracts using a large-language-model classifier, I provide three lines of evidence: (1) In over 20 years, there were almost no symposia with a conservative-leaning framing; (2) However, over time, the prevalence of politically neutral framing declined in step with an increasing prevalence of liberal/progressive framing; (3) Further, results indicated a rising frequency of prescriptive, activist rhetoric, primarily within liberal/progressive-framed abstracts. These patterns invite questions about pluralism and the intellectual culture within SPSP, and may reflect movement toward stronger ideological consensus. By quantifying what SPSP scholars study—and how they frame it—this study offers an evidence-based diagnostic of SPSP's evolving character and intellectual health.

Speaker

The Scientific Method is Not Racist: Choosing Between SPSP's Faces

2:00 PM – 3:10 PM

POLITICS

SPSP simultaneously uses the scientific method as the backbone of its status and yet devalues it as reflecting racist ideology. In this talk, I will present evidence that although it has been used in a racist manner, the scientific method is not racist at all. Quite the contrary, it is fundamentally good. As such, I use adherence to the scientific method as a lens to judge SPSP's organizational health. The news is both good and bad. Although the average social psychologist still practices the scientific method (reflecting a healthy organization), SPSP's policies have explicitly demoted and devalued it (reflecting an unhealthy organization). I then argue that the consequence of this demotion is that SPSP will lose both membership and influence. Finally, I conclude that the solution is to unapologetically re-elevate the scientific method to its proper place. SPSP thus must choose between its more scientific-friendly face and its "science is racism" face. For a scientific organization such as SPSP, the scientific method is not one standard among many to be discussed or discarded. The scientific method is the only reasonable standard to build our organization upon.

Speaker

In Defense of SPSP - and of its Dissenters

2:00 PM – 3:10 PM

POLITICS

Is SPSP ideologically captured, scientifically compromised, bad? In this fraught political era, SPSP's scientific health and public legitimacy depend not on avoiding critique but on its response. Dissenters are essential for provoking self-examination and deserve serious engagement. I weigh criticisms against the evidence and argue that SPSP remains a largely healthy organization capable of producing rigorous research. Controversies and rhetorical excesses have occurred, but SPSP's direction shouldn't be conflated with fringe views. The history and legacy of the scientific method isn't immune to critique, but it hasn't been discarded. SPSP's efforts to include underrepresented and disadvantaged scholars—though imperfect—can enhance the scope and quality of science when aligned with fairness and merit. SPSP has navigated a fast-changing landscape and made missteps, but it is not collapsing under politicization; historically, it stands out for its willingness to self-scrutinize. For instance, the controversial diversity statement initiative was transparently evaluated and altered following criticism. I urge SPSP to continue that tradition and resist dismissing even strident critics.

Large Language Models and the Future of Social Psychological Science

2:00 PM – 3:10 PM | Location: E270, Level 2

LANGUAGE

As large language models (LLMs) become increasingly integrated into everyday life, they present both profound opportunities and urgent challenges for social and personality psychology. This symposium showcases three talks that illustrate how LLMs can move beyond traditional methods to model, simulate, and advance core theories in social and personality psychology. Talks examine (1) belief updating in real-world discourse and the use of LLMs to foster open-mindedness; (2) psychological shifts in public engagement with a sustained geopolitical conflict through LLM-based analysis of social media data; and (3) LLM-based intimacy and how it challenges conventional models of attachment, reciprocity, and authenticity in relationship science. Speakers will address how LLMs can extend traditional methods to enhance theoretical and methodological rigor, as well as best practices and emerging ethical considerations when applying these tools to psychological data. Together, this symposium offers a path forward for integrating LLMs into the field, transforming how researchers study personality and social psychology in the era of artificial intelligence.

Harnessing Language and AI for Effective Belief Updating: New Frontiers in Social Psychology

2:00 PM – 3:10 PM

LANGUAGE

This talk explores three interconnected studies that illuminate the mechanisms of belief updating using real-world social media data. First, it details recent work analyzing social interactions and belief change among ~18,000 individuals, identifying key linguistic features that increase the likelihood of belief updating. The findings highlight the importance of well-structured, evidence-based arguments in shaping beliefs. Second, the talk covers ongoing work at the intersection of social psychology and AI: training a large language model (LLM) to engage users across diverse contexts by presenting balanced arguments, acknowledging uncertainties, and fostering open-mindedness. The goal is to facilitate productive discussion and learning. Together, these studies show how understanding language and leveraging AI can enhance belief updating. By integrating social psychology and computational tools, they offer promising applications for improving dialogue in clinical, educational, and workplace settings. Ultimately, they aim to foster more open, informed discourse and promote intellectual humility as a foundation for belief change.

Advancing Social Insight with Large Language Models: Unpacking a Geopolitical Conflict at Scale

2:00 PM – 3:10 PM

LANGUAGE

How do people engage with geopolitical crises and how can large language models (LLMs) uncover psychological dynamics in public discourse at scale? This talk presents an analysis of over 1 million English tweets about the Russia–Ukraine war during its first 10 months. Transformer-based LLM methods were used to extract evolving social insights in public reactions to key wartime events. Findings revealed temporal shifts in emotional tone, moral salience, and engagement. Early discourse showed heightened empathy, anger, and moral condemnation, while later stages reflected emotional distancing and fatigue. Embedding-based clustering and LLM-driven summarization revealed latent narratives and complemented findings. This presentation will also demonstrate how LLMs enhance sensitivity to meaning and emotional nuance in naturalistic text and address important ethical and epistemological questions about interpretability and influence. Overall, this talk demonstrates the value of LLMs for social and personality psychology, not only as tools for large-scale language analysis, but also as nuanced windows into social psychological processes unfolding outside the lab.

Rewriting Relationships: Large Language Model-Based Intimacy and the Future of Relationship Science

2:00 PM – 3:10 PM

LANGUAGE

As large language models (LLMs) increasingly serve as emotionally responsive companions, they raise questions about how language scaffolds perceived intimacy, attachment, and authenticity. This talk examines the emerging phenomenon of romantic relationships with LLM-based chatbots, drawing on foundational research on romantic human–chatbot relationship development. Although these relationships are asymmetrical and non-sentient, users often describe them as emotionally real and psychologically fulfilling, highlighting the role of LLMs in shaping relational experiences. The talk explores how LLMs function as relationship partners who are always available, linguistically adaptive, and customizable to users' emotional needs; how intimacy is constructed when one partner is artificial; and how these relationships challenge traditional models of attachment, reciprocity, and authenticity. The talk concludes by highlighting implications for revising core theories in social and personality psychology to address the unique dynamics of human–AI intimacy. As LLMs become increasingly embedded in social life, understanding how they shape and are shaped by human emotional experience is essential.

Overlooked and Omitted: Bias Against and Wellbeing of LGBTQ+ Groups

2:00 PM – 3:10 PM | Location: E253CD, Level 2

STEREOTYPING/PREJUDICE

Despite ample research on LGBTQ+ people, research has overlooked or omitted many LGBTQ+ groups, in part, because of their intersecting identities. In this symposium, we discuss findings on bias against overlooked LGBTQ+ groups and explore their unique and nuanced experiences. Speakers 1 and 2 demonstrate that LGBTQ+ people face unique stigmas due to their intersecting identities. Speaker 1 discusses how relevant ingroup and outgroup members evaluate targets with two “conflicting” identities (gay/lesbian and nonbinary Christians) differently as a function of perceived political ideology. Speaker 2 explains how people dehumanize Black transgender women more than other relevant targets, with consequences for perceptions of violence against these women. Speakers 3 and 4 extend this research by examining the unique experiences of intersectional LGBTQ+ groups. Speaker 3 examines how the experiences of LGBTQ+ individuals vary by SES. Speaker 4 explores the impact of the experiences of Indigenous LGBTQ2S+ individuals on their well-being. Together, this symposium showcases timely research centering overlooked LGBTQ+ groups and informs theories on intergroup bias and well-being.

Impact of Perceived Political Ideology on Evaluations of LGBTQ+ Christians

2:00 PM – 3:10 PM

STEREOTYPING/PREJUDICE

Researchers have examined the relationship between perceived political ideology and bias against LGBTQ+ people and Christians. We extended this work by testing the effect of perceived political ideology on evaluations of groups with two "conflicting" identities: gay/lesbian and nonbinary Christians. In Experiment 1, nonreligious gay/lesbian people (n = 164) and cisgender heterosexual Christians (n = 239) were randomly assigned to learn that gay/lesbian Christians were politically conservative, moderate, or liberal. Nonreligious gay/lesbian people and (to a lesser extent) cisgender heterosexual Christians evaluated gay/lesbian Christians more negatively when they learned that this group was misaligned versus aligned with their own political ideology. Experiment 2 conceptually replicated these findings using a similar manipulation among nonreligious nonbinary people (n = 164) and cisgender heterosexual Christians (n = 210) who evaluated nonbinary Christians. These studies provide novel causal support for ideological conflict theory by demonstrating that perceived political orientation can change intergroup evaluations, at least for two groups with "conflicting" identities.

Unpacking Transmisogynoir: What Drives Devaluation of Black Trans Women?

2:00 PM – 3:10 PM

STEREOTYPING/PREJUDICE

We examined the mechanisms driving transmisogynoir, i.e., the pervasive devaluation of the lives of Black trans women in white, heteronormative, cisnormative contexts (Bailey & Trudy, 2018). Participants (N = 277) in a nationally representative Prolific sample dehumanized and stereotyped a Black trans woman more than a Black cis woman, a white trans woman, and a white cis woman. Further, dehumanization indirectly drove tendencies to downplay the murder of a Black trans (versus cis and white) woman sex worker. These effects were driven entirely by men. A follow-up experiment is planned to replicate and extend these findings with a larger sample, and to test individual difference moderators of the effects.

Differences in Stigma Experiences by Socioeconomic Status Among LGBTQ Adults

2:00 PM – 3:10 PM

STEREOTYPING/PREJUDICE

Exposure to stigma (e.g., discrimination, victimization) has detrimental effects on well-being for sexual and gender minority (SGM) people. Socioeconomic status (SES), which includes factors like income and education, can offer some protections from these experiences, though little is known about its impact on SGM people, a population at higher risk for economic insecurity. The purpose of this study was to describe the association between SES and stigma among SGM people. Participants (N=7,326) who completed the 2018 Annual Questionnaire in The PRIDE Study, a longitudinal cohort of LGBTQ+ people, were included. A latent variable was created representing SES composed of poverty-to-income needs ratio, education, current insurance status, past year homelessness, and past year unstable housing. In logistic regressions, higher SES was associated with reduced odds of experiencing discrimination and victimization in the past year, controlling for age and ethnoracial identity. These results hold when stratified by gender identity with the most robust effects experienced by transfeminine individuals reporting discrimination in the past year. Implications will be discussed.

Resilience and Challenges: Exploring the Experiences of Native LGBTQ2S+ People

2:00 PM – 3:10 PM

STEREOTYPING/PREJUDICE

For Native LGBTQ2S+ people, their Native, LGBTQ2S+, and intersectional identities are sources of both adversity and strength. We conducted two studies to explore Native LGBTQ2S+ peoples' experiences and their consequences. In a qualitative study (Study 1, N=1097), participants identified challenges and sources of strength in their lives. Many participants mentioned experiencing numerous challenges, such as racism, homophobia, transphobia, and identity invalidation. Further, participants drew strength from diverse sources, particularly social ties and connection to Native culture. In a quantitative study (Study 2, N=196), participants experienced many challenges related to their identities, particularly in the current political climate. Importantly, some of these challenges were associated with poorer well-being (e.g., anxiety symptoms), whereas certain strengths (e.g., social ties) buffered participants from the effects of certain challenges. This research highlights unique aspects of Native LGBTQ2S+ peoples' experiences and provides a foundation to help dismantle challenges facing Native LGBTQ2S+ people.

The Architecture of Status Perception: Cues, Categories, and Consequences

2:00 PM – 3:10 PM | Location: E271, Level 2

PERSON PERCEPTION/IMPRESSION FORMATION

Social hierarchies shape life outcomes from employment to relationships, making it crucial to understand how people perceive and judge social status. This symposium brings together cutting-edge empirical work on how visual and semantic cues influence perceptions of socioeconomic status and social hierarchy. First, we examine how skin tone and class-linked names independently shape status judgements in India, with implications for employment decisions. Next, we explore how status-related societal stereotypes moderate the impact of clothing on competence perceptions in the U.S. and Singapore. We then investigate how marginalised groups strategically use attire to counter status-based stereotypes, revealing systematic differences in impression management across racial and gender lines. Finally, we present evidence that racial stereotyping emerges from the simultaneous activation of multiple fuzzy categories rather than discrete classification, revealing the cognitive mechanisms underlying hierarchical perception. These talks highlight understudied pathways through which status perception operates, advancing our understanding of how social hierarchies are perceived and reinforced.

Names and Facial Complexion Independently Predict Impressions of Socioeconomic Status: Evidence from India

2:00 PM – 3:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Socioeconomic Status (SES) is signaled by diverse cues across cultures and impacts significant life outcomes like marriage and employment. However, research on SES perception is limited by its lack of cross-cultural investigation and emphasis on unimodal stimuli. In the current study, we examine how visual (facial skin tone) and semantic (caste based names) cues contribute to SES perception among Indian participants. Study 1 demonstrates that visual and semantic cues independently influence SES perception. Study 2 shows that acculturation to a different culture (the UK) plays a limited role in influencing SES perception among migrating Indians. Finally, Study 3 highlights that SES-based cues, especially facial skin tone, impact job suitability judgments via perceived warmth and competence. These studies highlight the need for studying social perception with more multimodal stimuli and cross-culturally diverse samples to gain a more generalizable understanding of SES perception.

Dressing the Part: Economic Status Stereotype Awareness Shapes Clothing-Based Competence Perceptions

2:00 PM – 3:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Clothing plays a powerful role in shaping perceptions of competence—judgements that in turn, influence a wide range of social outcomes. However, the role of individual perceivers' societal stereotypes associating wealth with competence in these status-based evaluations remains unknown. Participants (Singapore: n = 98; US: n = 208, preregistered) rated the competence of individuals in expensive-versus inexpensive-looking clothes, and reported societal stereotypes about rich and poor people's competence. Crucially, in both studies, individuals with stronger perceptions of these societal stereotypes showed greater differentiation in competence ratings between expensive and inexpensive clothing conditions. These findings highlight how individual differences in awareness of economic status stereotypes shape social perception, potentially contributing to the maintenance of social hierarchies. We discuss possible interventions and emphasise its need to reduce the impact of status-competence stereotypes on social perception and decision-making.

Empowering Attire: The Role of Clothing in Countering Stereotypes

2:00 PM – 3:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

While clothing serves as a powerful tool for impression management, little is known about how members of stereotyped groups strategically use attire to navigate social biases. In Study 1, participants (53 Black and 52 White men, 55 Black and 55 White women, all U.S. residents) read 20 competence-salient (e.g. job interview) or irrelevant (e.g. friends meet-up) scenarios. For each scenario, they chose an outfit out of 5 options drawn from gender-specific pools of 74+ items each. These clothes and situations had been previously rated for "how professional they look" by independent raters. Competence-salient situations prompted formal attire choices. Crucially, Black participants are more likely to choose more professional attires in competence-irrelevant situations. In Study 2 (n = 214, preregistered), we replicated the findings using completely different clothing images. We examined the motivations behind the clothes choices using participants' verbal responses (Study 3). This work advances our understanding of how stereotyped groups manage their appearance, even in casual settings, and illuminates the hidden labour of countering bias through strategic self-presentation.

Stereotyping as a Function of Multiple Fuzzy Categories

2:00 PM – 3:10 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Decades of research established that mental representations of categories play a central role in stereotyping. However, the cognitive mechanisms underlying this process are much less clear. In the present research, we provide evidence that stereotyping in the context of race is shaped by simultaneous activation of multiple categories, and that the structure of these categories varies meaningfully across perceivers. In Study 1, we show that participants' stereotype-related trait impressions (e.g., "shy) of individual faces which varied in prototypicality on three race-category dimensions (Asian, Black, White) are better predicted by a model that integrates all relevant racial categories, compared to a model that assumes each face is classified only into a single category at a time. In Study 2, we find that individual differences in the strength of stereotypic attributions are correlated with categorical perception such that participants with fuzzier representations of racial boundaries show less race-consistent trait associations. Together, these findings suggest that stereotyping is determined by a high-dimensional representational space that varies meaningfully across perceivers.

Under the Surface: Exploring Cultural Differences Beyond Collectivism

2:00 PM – 3:10 PM | Location: E258, Level 2

CULTURE

This series of talks presents evidence of meaningful cultural differences beyond the collectivism-individualism paradigm. Talk 1 argues that the most-used collectivism scales fail to capture collectivism in sub-Saharan Africa (SSA). The classic scales include items about warmth and generalized positivity, which participants in Africa tend to disagree with. Instead, agreement is higher with "responsibilism", which emphasizes duties in close relationships. Talk 2 explores warm collectivism and responsibilism in romantic relationships around the world. Cultures higher in warm collectivism date more and marry earlier, while cultures high in responsibilism date less and marry later. Talk 3 investigates causal attributions beyond collectivism, focusing on self-promotive interdependence. SSA participants exhibited weaker dispositional bias, particularly when interpreting behaviors that could serve group interests. Talk 4 asks whether a socio-ecological process can better explain cultural differences in assertiveness, which have traditionally been attributed to differences in individualism/collectivism. Higher relational mobility shaped assertiveness via positive reputation management.

A Fundamental Misunderstanding of Collectivism Prevented Measurement in Sub-Saharan Africa

2:00 PM – 3:10 PM

CULTURE

An open secret in cultural psychology is that self-report collectivism scales “don’t work.” Researchers largely expect that the West is less collectivistic than East Asia, but several meta-analyses have found no differences (such as Heine et al., 2002). Comparisons with sub-Saharan Africa are similarly puzzling. For example, the US scores more collectivistic than Ghana and Nigeria (Krys et al., 2022). We argue that the scales are based on a misunderstanding of collectivism. The scales tap into intuitions about “warm fuzzy” collectivism—being nice to people in general. Our proposal is that “responsibilism” is a more accurate description of collectivism. This focuses on duties in close relationships.

To test this, we created a scale to measure responsibilism with 16,237 people from 100 cultures. Cultures in sub-Saharan Africa scored higher on responsibilism and lower on warm fuzzy collectivism. Within Africa, we found higher responsibilism in cultures with a history of rice farming, which required more coordination than crops like wheat. This hints at ecological roots of responsibilism. In sum, pulling apart two concepts of collectivism can help explain an old puzzle.

Responsibilism, Collectivism, and Relationship Status Across 92 Countries

2:00 PM – 3:10 PM

CULTURE

There are many studies on the influence of culture on human behavior, but there are surprisingly few studies on culture and romantic relationships. In this pre-registered study, we explored cultural differences in relationships. We argue that there are two different types of collectivism with opposite implications for relationships. One type is a novel measure we call “responsibilism,” which focuses on duties in close relationships. The other is “warm collectivism”, which includes “warm fuzzy” feelings to people in general. In this study, we tested responsibilism (N = 12,381) and warm collectivism (N = 5,962) in two large datasets around the world. Logistic multilevel models found that dating was more common in warm collectivistic cultures and less common in responsibilistic cultures. Further, people in more responsibilistic cultures were less likely to be in any relationship at younger ages, while those in more collectivistic cultures were more likely to be in any relationship at younger ages. The results suggest responsibilism’s focus on duty to close others may be a factor in rejecting casual relationships and delaying committed partnerships.

Self-Promotive Interdependence and Moral Attribution in Sub-Saharan Africa

2:00 PM – 3:10 PM

CULTURE

Prior research showed that Westerners tend to attribute others’ behavior to internal traits, whereas East Asians tend to consider situational factors. Building on this work, we hypothesized that many African contexts are shaped by a shared cultural understanding in which individuals pursue self-interest in ways that ultimately benefit their ingroup. Across five studies (total N = 3371), we investigated social inference patterns in Sub-Saharan Africa (SSA), moving beyond the East–West framework. Participants from multiple SSA regions (Ghana, Kenya, South Africa, and Ethiopia) exhibited weaker dispositional bias than American and Japanese participants, particularly when interpreting behaviors that could plausibly serve group interests. When the group-benefiting aspect was absent, these cultural differences in attribution diminished. Notably, SSA participants often viewed dispositional and situational factors as mutually reinforcing rather than competing. Together, these findings suggest that causal attribution in SSA may reflect a broader ethos of self-promotive interdependence, in which self-directed actions are morally justifiable when they serve the interests of one’s group.

Relational Mobility and Reputation Management Explain Cultural Differences in Assertiveness

2:00 PM – 3:10 PM

CULTURE

The theory of relational mobility—a socio-ecological factor referring to how freely people can choose and leave relationships—has explained numerous psychological differences identified in cultural psychology within a unified functional framework. This study extends the theory by testing whether cultural differences in assertiveness arise from distinct adaptive tasks related to reputation management. In high-relational mobility societies, building a positive reputation through assertiveness is adaptive, whereas in low-mobility societies, avoiding a negative reputation through modesty is crucial. A US ($n = 188$)–Japan ($n = 210$) survey found that Americans perceived greater societal prevalence of praise than Japanese, whereas no difference was found in perceived criticism. Mediation analyses showed that higher relational mobility and perceived praise serially accounted for Americans' greater assertiveness, whereas the pathway via perceived criticism was not significant. These findings suggest that cross-societal differences in assertiveness primarily reflect heightened sensitivity to positive reputation management in high-mobility societies.

Invited Symposium: What Is Good Theory and Why Should We Care

2:00 PM – 3:10 PM | Location: Lakeside Ballroom E354B, Level 3

Most of our theories are useless. Our theories need meta-theories. Our theories need to be predictive and practical. We have forgotten the importance of theory and need to recalibrate. This invited symposium brings together four speakers from diverse perspectives, with varying messages about the nature and role of theory in our field. Our field has experienced significant advances in the way we do science, from the methodological reforms to the explosion of work using generative AI. Amidst these advances, this symposium aims to take a reflective step back and revisit one of the most basic questions of our science: what is a good theory? And why should we care?

Theory as the Aim of Science

2:00 PM – 3:10 PM

These days, social psychology in particular and the science of psychology more generally are at a crossroads. Advancements in methodological rigor yielded sophisticated experiments and exacting statistical analyses, yet the pursuit of empirical precision may have overshadowed the field's commitment to theoretical depth. This paper argues that psychology has become structurally imbalanced, prioritizing puzzle-solving over genuine theory-building, leading to fragmented findings and diminished understanding of the profound whys and hows behind human behavior. Drawing parallels with natural sciences, I suggest that robust theory is essential for observation and discovery, akin to a lens through which data gain meaning. I trace the historical trajectory of this imbalance, from the social psychology's early, theoretically vibrant period to its current prevention-focused climate, shaped by crises and institutional pressures. I propose, therefore, a strategic recalibration: cultivating theorizing as a teachable skill within graduate curricula and advocating for differentiated research roles to foster collaborative teams of conceptual "builders" and empirical "testers." Our rigorous methodologies will then serve a renewed theoretical ambition, enriching our understanding of the bases of human behavior.

There Is Nothing So Useless as a Social Psychological Theory

2:00 PM – 3:10 PM

“There is nothing so practical as a good theory,” so goes the well-trod dictum from Kurt Lewin that serves as an unofficial motto for social psychology. “Theory” is strongly valued in the field, and for good reason, but what does theory mean to the social psychologist? This talk provides a commentary on the current state of theories used in social psychology, with a particular emphasis on the importance of distinguishing between theoretical models and the statistical models used to evaluate them. Most theories in the field serve more as rhetorical devices rather than proper scientific theories that can be put to empirical test. This presentation will include suggestions for how social psychological theories can improve, moving them from useless to scientific, and thereby contributing to our shared goal of scientific progress.

Psychological Theory Building Needs a Formal Adaptationist Metatheory

2:00 PM – 3:10 PM

Good theory should make clear predictions about the future and should do so without the help of a theorist. I will argue that psychological theorizing is often held back from this ideal by its purely verbal character and the lack of a metatheoretical framework. Absent metatheory, we have no means of deciding which possible theories are plausible. Absent formalisms, our theories can only make predictions as filtered through the whims and biases of human theorists. Both problems can be solved by adopting a formal, adaptationist framework for theory building. Such a framework provides guidance as to what psychological systems are likely to exist and provides language for describing unambiguously how these systems operate. This provides testable predictions that can allow psychological science to hill climb toward better descriptions of the mind. I will furthermore show how formal, adaptationist theorizing yields stronger theory with examples from relationship science.

Social Psychological Theory as a Reality Benchmarked, Collective Enterprise

2:00 PM – 3:10 PM

As defined by Allport, social psychology is the scientific study of how people’s thoughts, feelings, and behaviors are influenced by the actual, imagined, or implied presence of others. Accordingly, social psychological research has built a rigorous body of knowledge about social phenomena, explaining attitude formation and change, communication and persuasion, social judgments, interpersonal interactions, and how social contexts shape self and identity. As a relatively young science, our discipline has excelled in generating measurement methods, producing internally consistent explanations, precisely measuring mechanisms, and deriving testable predictions. But is deriving, measuring, and supporting precise empirical predictions all that we need to be doing? In this presentation, I will argue that to build sustainable theories, we need to come together as a field to enhance the predictive power and practical impact of our theories. To do so, I propose that we collectively identify key social psychological phenomena to explain and change, and survey candidate variables to build a more general theory of social behavior. I will present data from social media experiments showing that broad theory-based models of persuasion and norms outperform single theory models and purely algorithmic (LLM-based) predictions.

Defending Academic Freedom and DEI: Social Psychological Perspectives on Resistance

3:30 PM – 4:40 PM | Location: E451A, Level 4

Since Trump's inauguration, federal actions have increasingly targeted higher education, putting DEI initiatives and academic freedom under threat. Official communications and policies have framed DEI programs as discriminatory, pressured institutions to eliminate them, and influenced major funders like NSF and NIH to shift priorities. Consequently, faculty are being asked to scrub their syllabi and course materials of DEI-related content, halt DEI-related activities, rethink grant proposals, and censor academic speech. While many likely wish to resist, they might worry that doing so individually can carry serious professional consequences. As social psychologists we bear an important responsibility to address these challenges. Our research has been foundational to understanding and promoting equity and inclusion, directly informing the very DEI initiatives now under attack. Moreover, our discipline offers unique scientific insights crucial for effective resistance. This panel session will facilitate a discussion on strategies for collective action to preserve academic freedom and meaningful DEI programs, offering a vital space for shared insights and collaborative solutions.

How to successfully apply to industry internships

3:30 PM – 4:40 PM | Location: E450A, Level 4

Securing an internship in industry can be a challenging process. As a rising 3rd-year Ph.D. student this past summer, I enjoyed an exceptionally positive experience working full-time and in-person as a Summer 2025 PhD Data Science Modeler Intern at Discover Financial Services here in Chicago. In this session, I will share my perspectives on successfully navigating the corporate internship application process and gaining hands-on experience while employed at a major Fortune 500 company during a historic acquisition (by Capital One!). In the first 45 minutes, I will deliver an interactive presentation explaining how to: (1) identify internship opportunities that represent a good fit; (2) prepare competitive application materials; (3) ace the interview process; and (4) make the most of the experience. The remainder of the session will be dedicated to audience Q&A. Participants will leave this session with a practical toolkit to convert their academic CV into a professional résumé, draft a compelling cover letter, and effectively communicate their academic experiences as business-oriented proficiencies during interviews.

How Legacy Motives, Identity-based Role Allocation, Intellectual Humility, and Ethnic Diversity Shape Organizational and Societal Outcomes

3:30 PM – 4:40 PM | Location: E353A, Level 3

DIVERSITY

GROUPS/INTERGROUP PROCESSES

APPLIED SOCIAL PSYCHOLOGY

ORGANIZATIONAL BEHAVIOR

This symposium examines how motivational, interpersonal, and structural factors—such as legacy motives, role allocations, team composition, and demographic change—shape organizational behavior and broader societal systems. The first paper explores how agentic and communal legacy motives relate to entrepreneurial intentions, patenting activity, and firm ownership. The second paper investigates whether disadvantaged group members are more likely than dominant group members to be assigned to DEI roles in organizations despite their domain expertise, and examines perceived expertise and lived experience as potential explanations for these role allocations. The third paper examines how the presence of team members high in intellectual humility predicts information exchange, listening behaviors, psychological safety, affective integration, and performance in multicultural teams, especially when members differ in their values about how the team should function. The final paper analyzes six decades of global data to investigate how changes in ethnic group composition, including declines in the dominant ethnic group's population share, are associated with shifts in multiple dimensions of democratic quality. Together, these papers highlight how a range of motivational, interpersonal, and structural factors shape outcomes across organizational and societal systems.

Built to Last: Entrepreneurs Illuminate Agentic and Communal Legacy Motives

3:30 PM – 4:40 PM

ORGANIZATIONAL BEHAVIOR

In this paper, we explore the relationship between legacy motives and entrepreneurship. We posit that entrepreneurship enables people to fulfill agentic and communal generative needs. Through entrepreneurship, people can create something that will outlive themselves – thus responding to one of the most basic human drives to strive for immortality. Across four studies, we demonstrate that legacy motivation predicts both the desire to begin an entrepreneurial venture, the real behavioral action of founding a new firm, and the choices entrepreneurs make as they run their firms. We introduce an effective legacy motive activation intervention that can promote entrepreneurial efficacy and desirability. Finally, we identify behavioral outcomes that differentially emerge from a focus on agentic versus communal legacies. Specifically, we show that while a focus on leaving an agentic legacy predicts higher patenting activity, a focus on leaving a communal legacy predicts reduced firm ownership. This research is among the first to consider a key motivational predictor of entrepreneurial intention and behavior and broadens our understanding of types of legacies and how they shape choices.

Channeling Disadvantaged Group Members into Diversity Roles

3:30 PM – 4:40 PM

DIVERSITY

Disadvantaged group members are often presumed to possess unique insights into social justice issues due to their lived experiences with discrimination. Yet, such assumptions may inadvertently obscure recognition of their expertise in other domains. This research examines whether disadvantaged group members (e.g., racial minorities) are more likely than dominant group members (e.g., White individuals) to be assigned to diversity, equity, and inclusion (DEI) roles, even when they display expertise in unrelated fields (e.g., marketing). Across studies, we found that disadvantaged group members were indeed more likely to be channeled into DEI roles. This effect was mediated by perceptions of their greater social justice expertise and lived experience. Notably, the same participants also associated DEI roles with lower power and salary. These findings suggest that assumptions about disadvantaged individuals' expertise in social justice can have unintended negative consequences for their careers and contribute to inefficient use of talent.

Composing Multicultural Teams for Success: The Role of Intellectual Humility

3:30 PM – 4:40 PM

GROUPS/INTERGROUP PROCESSES

Intellectual humility (IH)—recognizing that one's views and beliefs may be wrong or fallible—bridges gaps between people from diverse backgrounds. Less is known about whether IH has a similar effect on multicultural work teams. In a multi-wave study of 120 multicultural teams working together intensely for three months (N = 510), we found that IH team composition (IHTC)—the presence of team members high on IH—later predicts more information exchange, team potency, listening behaviors, information acquisition, and affective integration. Moreover, IHTC plays a bigger role when teams have higher representational gaps (rGaps)—different perspectives on how a team should operate—such that when rGaps are large, IHTC is negatively associated with conflict and positively associated with psychological safety, subjective outcomes, and performance. These findings underscore the crucial role of intellectual humility in improving team dynamics and bridging gaps in multicultural settings.

Declining Ethnic Dominance and Democratic Quality Across Six Decades and 90 Countries

3:30 PM – 4:40 PM

APPLIED SOCIAL PSYCHOLOGY

Does diversity strengthen democracy or weaken it? And what kind of diversity matters? In the past 80 years, nations have become, on average, both more ethnically diverse and more democratic, suggesting a positive relationship between diversity and democracy. However, diversity creates the potential for intergroup conflict, which can weaken democracy. Consistent with this, resurgent ethnic nationalism featuring opposition to immigration and concerns about the status of dominant groups has accompanied democratic backsliding. Here we examine the relationship between diversity and democracy by combining complementary data from six historical data sets covering 90 countries from 1950 to 2010. We use multiple measures of democratic quality and track diversity using a conventional measure (fractionalization) as well as a measure of ethnic polarization and, critically, the historically dominant group's share of the population. Using dynamic panel models, we show that declines in ethnic dominance predict significant reductions in electoral, liberal, egalitarian, and participatory democracy. Crucially, we find that these declines are typically followed by periods of democratic resilience, suggesting that democratic backsliding is reversible and that declining ethnic dominance may lead to stronger democratic institutions over time. These findings may provide insights for fortifying democratic institutions in increasingly diverse societies.

From Adolescents to Algorithms: Social Contexts of Emotion and Trust

3:30 PM – 4:40 PM | Location: E271, Level 2

GENDER SOCIAL COGNITION CULTURE EMOTION

This session explores how emotions, identity, and social meaning are shaped across developmental, social, and technological contexts. Across four studies, presenters examine how adolescents learn emotion regulation strategies, how confrontations to prejudice influence identity safety, how people interpret and respond to humanlike AI, and how race and gender shape perceptions of leadership and competence. Together, these papers demonstrate that emotional processes, trust, and social judgments are not merely individual traits but emerge from social structures, cultural contexts, and design choices.

A large-scale study on emotion regulation skill development in adolescence

3:30 PM – 4:40 PM

EMOTION

Effective emotion regulation (ER) strategies are associated with improved adolescent wellbeing and mental health. Yet, there remains a gap in understanding what influences how adolescents develop ER skills along with the breadth of ER strategies used by adolescents. Across two large-scale studies, adolescents were asked to describe in words where they learned the ER strategies they use (N=1226) and how they typically manage their emotions when they are upset (N=3168). The responses were qualitatively coded and reported as a percentage of the total number of responses. Adolescents most frequently explained that their ER strategies were self-taught (45%) or learned from family members (23%). Adolescents reported using distraction strategies (46%), relaxation (15%), cognitive strategies (10%), social support (7%), and problem solving (5%). Nearly half of the adolescents in this study neither were taught ER strategies nor report using adaptive emotion regulation strategies. This study highlights the critical importance of providing explicit ER instruction for adolescents. It also highlights the variety of influences and strategies employed by adolescents to manage their emotions.

Confrontations to prejudice as identity safe information on social media

3:30 PM – 4:40 PM

SOCIAL COGNITION

Previous work has demonstrated that confrontation style (passive vs. assertive) meaningfully shapes perceptions of racism on social media for minoritized individuals (Meyers et al., 2020). We expand upon this work to test whether educational confrontations impact comfort with confronters when viewing confrontations of explicitly racist anti-Asian statements online (Study 1, n = 137). Findings suggest that participants reported greater comfort with confronters who used assertive and educational confrontations. In Study 2, we manipulated confronter's motivation (intrinsic vs. extrinsic, n = 218) and found that participants were more favorable towards assertive confronters regardless of their motivation, while attitudes towards passive confronters were moderated by their motivation. While past work suggests assertive confrontations are accompanied by social cost, our studies find social benefits from the perspective of targets of discrimination. This work stresses the importance of considering the viewpoint of targets of discrimination when using confrontation to cue identity safety, and the ability of confrontations on social media to designate individuals as authentic allies.

Humans Across the Globe can be Manipulated to Anthropomorphize AI-systems

3:30 PM – 4:40 PM

CULTURE

Anthropomorphism describes ascribing human characteristics (emotions or reasoning) to non-human entities. Driven by user preferences and increase usage, more human-like AIs are designed, which may lead to adverse psychological consequences. Prior work theorizes that humanlike AIs foster increased trust and emotional attachment. However, empirical support for this hypothesis is weak. This is due to a shortage of causal studies and a research focus biased towards a small, WEIRD user group. To address this, we conducted two studies (N=3500) with participants from 10 culturally diverse countries. Participants interacted in real-time with a state-of-the-art Large Language Model (LLM). We identified a high overall levels of anthropomorphization, with strong variation across cultures. We conceptualize anthropomorphization of AI characteristics in two areas: "design features" and "conversational sociality." Our second study indicates that engineers can strategically manipulate user anthropomorphization levels. This demonstrates that AI-anthropomorphism is not inevitable or uncontrollable, but partly an intentional design choice. Interestingly, contrary to assumptions in AI ethics, but consistent with past empirical findings, varying AI human-likeness did not causally affect user trust. Our study's insights carry significant ethical implications, directly informing responsible and equitable AI design. They also highlight the critical need causal research across diverse populations.

Revisiting Think Manager-Think Male: The Moderating Effects of Race

3:30 PM – 4:40 PM

GENDER

Two studies examined how race influences the think manager-think male (TMTM) effect, which suggests that men are typically more strongly associated with successful managers and leaders than women. Study 1 manipulated the race of male and female targets within the TMTM framework, focusing on competence, assertiveness and communality. Results revealed that while this effect held for men and women "in general" and for White targets, it was not observed for Black and Asian targets. For these groups, both racial and gender stereotypes shaped perceptions.

A follow-up study focused on potential implications of Study 1 found that competence was seen as more crucial than communality or assertiveness for perceptions of managerial success, potentially explaining why groups with competence stereotypes (e.g., White men) have a leadership advantage, as these stereotypes overlap more closely with the characteristics typically attributed to successful managers. These findings challenge the universality of the TMTM effect and add to the growing concern about the informativeness of gender bias research findings when attention is not paid to crucial intersecting identities such as race.

Curiouser and curiouser: Examining state-to-trait mechanisms via curiosity micro-interventions

3:30 PM – 4:40 PM

PERSONALITY PROCESSES/TRAITS

This talk examines curiosity as a model for state-to-trait personality change through two complementary studies. Study 1 (N = 91) tested a 21-day smartphone-based intervention for promoting trait curiosity. Participants were randomly assigned to receive daily curiosity-related behavioral goals (half with additional attitude-focused lessons) or to a waitlist control. App users showed significant increases in trait perceptual curiosity, meaning in life, creative behaviors, and marginal increases in trait epistemic curiosity versus controls. The subgroup receiving attitudinal lessons additionally showed increased mindful awareness and reduced boredom proneness. Study 2 (N = 194) used a 14-day mixed-design to compare the effectiveness of four naturalistic micro-interventions to an active control. Three of the four interventions promoted state-mediated effects on trait curiosity through different pathways (state curiosity or openness). Results are discussed within a comprehensive framework emphasizing repeated state experience and situational contingencies. This work helps advance our understanding of intervention-based mechanisms and causal links between personality and life outcomes.

Leading with Laughter: Leader Humor and Employee Trust

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Although scholarly interest in leader humor has increased, it remains unclear how and why humor could be used to cultivate employee trust in leaders. We examine the humor-trust connection using a combination of theory application and theory building. We apply theory by using Mayer, Davis, and Schoorman's (1995) model to distinguish humor's effects on the perceived trustworthiness of the leader, trust in the leader, and actual risk-taking behavior. We build theory by proposing six signals that could be sent by leader humor, thus explaining its impact on perceived trustworthiness. Our hypotheses are tested in multiple, preregistered studies utilizing both experimental and field survey designs across different sample populations. The results show that humor led employees to see leaders as creative, humble, and as sources of positive affect. The three signals, in turn, predicted perceived trustworthiness, trust, and risk-taking behavior. Moreover, we differentiate between affiliative humor and aggressive humor, and show the effects of leader humor were more positive when it was affiliative rather than aggressive. We discuss the implications of our results for the humor and trust literatures.

Pathways of Collective Identity: Coping with Gender Inequality and Finding Existential Meaning

3:30 PM – 4:40 PM

GENDER

Does a collective identity promote a sense of meaning for women when coping with gender discrimination? In this research, we ask whether the ways in which women connect with their collective identity might contribute to a greater sense of meaning in the face of discrimination. We recruited women from Prolific (N = 485) to reflect on their experiences of gender discrimination and then gave them an opportunity to either a) find a sense of support and community with other women (i.e., Rallying), b) work with women to fight the patriarchy (i.e., Rioting), or c) avoid thinking about the collective or the situation altogether (i.e., Ignore). Pre-registered analyses revealed that women who chose to focus on some form of unity through their collective identity (i.e., Rally or Riot) found a greater sense of meaning from their experience of discrimination. A follow-up study tests the causal nature of these effects. Ultimately, this work suggests that collective unity can come in different forms, and women who turn to the collective in response to discrimination, whether that be rallying or rioting, may benefit.

Advances in Understanding Trust to Address Societal Issues

3:30 PM – 4:40 PM | Location: E353B, Level 3

INTERGROUP RELATIONS

Trust is essential for social cooperation, yet historical harm or inequality often creates distrust, with cascading consequences for many social issues, from the ability to build diverse coalitions, interracial relationships at work, community-police interactions, and addressing societal disadvantage. The current symposium highlights new research on the causes and consequences of distrust, as well as how it can be repaired to address pressing societal challenges. Talk 1 examines how past harm can perpetuate disadvantage and distrust because leaders avoid collaborating with harmed groups due to an assumption that they will be distrustful. Talk 2 identifies asymmetries in linked fate between white women and women of color, fueling distrust. Talk 3 demonstrates that in power imbalanced relationships, high-power people can gain trust by deferring to the lower-power person's priorities. Talk 4 tests an intervention in the field, in which police officers gain community trust through transparency statements. In sum, this symposium offers new insight and solutions to some of society's most pressing problems by advancing our understanding of trust.

Perpetuating Disadvantage and Distrust: Leaders Avoid Victims Due to Concerns about Distrust

3:30 PM – 4:40 PM

INTERGROUP RELATIONS

When people are mistreated, how do leaders respond? Ideally, leaders would engage with victims to repair damage and restore trust. However, we identify circumstances in which leaders instead avoid victims, perpetuating cycles of disadvantage and distrust. This is because leaders expect victims to be distrustful, which can decrease their willingness to work with victims. These dynamics create double disadvantage: victims initially mistreated by one are then neglected by others who fear that distrust created by the original transgressor will extend to them. This neglect can increase victims' distrust of leaders and their institutions, perpetuating the cycle.

These hypotheses are supported across eight pre-registered studies (N = 2207), including field data from public health and government officials, lab studies employing tightly-controlled experimental paradigms with incentive-compatible economic games, and a scenario study with professionals considering negotiation partners. The current talk will focus on one lab study testing our full model in an economic game (N = 300, U.S. Prolific; https://aspredicted.org/S6T_BS8), and a field study (N = 91, https://aspredicted.org/2RW_R3F).

Divergent Perceptions of Linked Fate: Contrasting Beliefs About Cross-Racial Gender Relations among White Women and Women of Color

3:30 PM – 4:40 PM

INTERGROUP RELATIONS

Fostering solidarity within marginalized groups can promote social change. However, prior research suggests barriers to positive inter-minority group relations. The current work adopts an intersectional lens to explore such barriers within a marginalized group, focusing on perceptions of linked fate among women of different races and their consequences. Across 5 studies, we find that White women perceive greater linked fate with women of color than do women of color with White women. These discrepant linked fate perceptions are explained by divergent beliefs about the extent to which White women support women of color, as well as the perception that White women experience more active facilitation from others in the workplace than do women of color. Due to these linked fate discrepancies, women of color view gender-based programming as less inclusive when White women (vs. women of color) are highlighted, whereas White women expect high inclusion regardless of the race of the women featured. This work contributes greater understanding to the forces that fuel the distrustful relationship between White women and women of color and that might prevent effective coalition-building.

Increasing Trust and Reducing Threat in Interracial Power-Imbalanced Relationships

3:30 PM – 4:40 PM

INTERGROUP RELATIONS

People of color (POC) experience threat in many spaces, particularly in power-imbalanced relationships. While shared goals can build trust, they may only reflect the goals of the person in power. Thus, we propose that decisions made by high-powered individuals during goal conflict in power-imbalanced relationships are critical. Pilot data (N=129) confirms that people expect the high (vs. low)-powered person's goal to be prioritized in a goal conflict situation. In Studies 1 (N=149) and 2 (N=144), participants imagined being the low-powered person in power-imbalanced relationships and read scenarios where the high (vs. low)-powered person's goals were prioritized. Results showed that when high-powered individuals pursued a low-powered person's goal, trust towards the high-powered person was increased across all participants (Study 1) and social identity threat concerns were reduced among POC compared to White participants (Study 2). These results were replicated (pre-registered Study 3). This work highlights the importance of high-powered people ceding power in goal conflict situations. By prioritizing the low-powered person's goals, the high-powered person cues trust and safety.

Using Transparency Statements to Improve Safety and Trust in Police Traffic Stops

3:30 PM – 4:40 PM

INTERGROUP RELATIONS

America's roads are dangerous. About 40,000 people die in crashes and nearly 1,000 officer-involved deaths occur yearly in America in traffic stops, making roads one of the most important areas for public safety intervention. Police stop drivers to prevent violent crashes and crime (e.g., drug and gun trade on interstates). As the modal site for police-community interactions (Camp, 2024), drivers often form their opinions on police, leaving with less trust in the institution purportedly made to keep them safe, rarely curbing their risky behavior. To reduce this miscommunication and increase driver safety, we have implemented "transparency statements" (TS) within an American police department—statements from high-power individuals that explicitly declare the authentic, benevolent reason for their behavior to those with less power (Dobson, Dittmann, Yeager, 2025). Our intervention comprised training police and randomized TS for motorists during traffic stops with immediate follow-up measures of trust. We measured psychological (i.e., self-reported) and behavioral (e.g., complaints; language) manifestations of trust after TS in this work.

Effects of Race on Various Facets of Collective Action

3:30 PM – 4:40 PM | Location: E352, Level 3

SOCIAL JUSTICE

Given the mounting challenges that communities of color face in the United States' current political climate, it is becoming increasingly important to examine factors that influence these communities' participation in and reactions to various forms of collective action. Talk 1 examines how Asian Americans' identification with their ingroup, and outgroups such as Black Americans and LGBTQ+ Americans, affect their collective action for those outgroups. Talk 2 examines how Black and White observers differ in their perceptions of Black or White protestors when they engage in violent or non-violent protest actions. Talk 3 examines how experiences of vicarious racism affect Black peoples' likelihood to engage in collective action. Lastly, talk 4 examines how respectability politics affect public perceptions of and justification for non-violent protests, comparing Black and White protestors. Overall, these talks offer a fascinating array of collective action research that decenters the WEIRD perspective and underscore considerations for achieving social change.

Predicting Intraminority Collective Action With Ingroup and Outgroup Identification

3:30 PM – 4:40 PM

SOCIAL JUSTICE

Outgroup identification positively links to collective action between minoritized groups (Klavina & van Zomeren, 2020). Research has yet to compare how outgroup and ingroup identification might uniquely predict this intraminority collective action. We tested the extent to which ingroup identification (with Asian Americans) and outgroup identification (with Black Americans and LGBTQ+ Americans) predicted collective action intentions, behaviors, and donations for those outgroups. Synthesizing past research, we created three identification subscales. Affective identification was key, with outgroup affective identification positively predicting all collective action measures and ingroup affective identification positively predicting intentions for Black Americans. Cognitive ingroup and outgroup identification positively predicted intentions, and behaviors for Black Americans, respectively. Evaluative ingroup and outgroup identification, represented by a subscale and feeling thermometers, did not reliably predict the collective action measures. Implications for measuring and motivating ingroup identification, outgroup identification, and intraminority collective action are discussed.

Racial Effects on Support of Normative and Non-normative Collective Action

3:30 PM – 4:40 PM

SOCIAL JUSTICE

Following the public's vitriolic responses to the Black Lives Matter movement, we were interested in whether these reactions were due to the racialized topic or the race of the protestors themselves. Across various studies we showed race-balanced online participants vignettes depicting protest actions that varied in tactics, topics, the protestors' race, and the participants' prior agreement with the topics. Afterwards, participants were asked how much they supported the protestors, how legitimate they found the protest, and whether they would have liked to join. Additionally, we measured various individual differences such as Social Dominance Orientation (SDO, Pratto, et al., 1994) and Motivation to Control Prejudice (MCP, Dunton & Fazio, 1997). Across studies we found that the use of normative protest actions, prior agreement with the protest topic, and, surprisingly, the presence of Black protestors were all significantly associated with more overall support for the protestors. Higher levels of SDO were negatively associated with levels of support, while higher levels of MCP were positively associated with levels of support.

Exploring How Sources of Vicarious Racism Exposure Influence Collective Action

3:30 PM – 4:40 PM

SOCIAL JUSTICE

Within recent years, vicarious racism, or instances of witnessing or hearing about racist events, has garnered increased intellectual intrigue. However, few psychological studies have empirically tested this phenomenon. Thus, present research sought to examine the correlation between lifetime experiences with vicarious racism across various sources (e.g. friends, family members, social media) and collective action, assessing both past actions and future intentions, among Black adults. Exploratory emotion (e.g. anger) and problem-focused (e.g. collective efficacy) mediators were also considered. Across all sources, results revealed significant, positive correlations between lifetime exposure to vicarious racism and collective action, where as exposure to racism increased, so did the likelihood of both past and future collective action engagement. Furthermore, group-based anger and collective efficacy partially mediated relationships, but specific mediation pathways varied between each source. Findings provide promising results for the social ramifications of experiencing vicarious racism. However, future studies still need to experimentally test these relationships.

Race, Respectability Politics, and Perceptions of Non-Violent Protest

3:30 PM – 4:40 PM

SOCIAL JUSTICE

Public perceptions of non-violent protest play a critical role in shaping its effectiveness, particularly when the protests advocate for marginalized communities. These perceptions may be influenced by respectability politics (RP), the expectation that marginalized groups must conform to White-dominant norms to gain legitimacy. Across two studies, we examined how RP shape both justification of non-violent protests for Black rights and emotional responses toward protesters. Study 1 (N = 256) found that stronger endorsement of RP predicted lower perceptions of protest justification. Study 2 (N = 209) experimentally manipulated a protester's race and perceived respectability, revealing that respectability increased perceived justification, but this effect was stronger when the protester was Black. Respectable protesters elicited more positive emotional responses overall, however, Black protesters received more favorable emotional reactions than White protesters regardless of respectability. These findings underscore the racialized role of respectability politics in shaping responses to protest and the complexity of public support for racial justice movements.

Evaluating and predicting performance and learning: New Insights, New Directions

3:30 PM – 4:40 PM | Location: Lakeside Ballroom E354B, Level 3

JUDGMENT/DECISION-MAKING

How and how well do people evaluate and predict learning and performance, both for themselves and for others? Four talks will explore new insights about these judgments, which are critical for domains ranging from skill acquisition and education to hiring and productivity. Talk 1 shows how people accurately predict the shape of learning curves in novel visuomotor tasks, but not other parameters like initial performance, negatively impacting feelings about learning. Talk 2 examines how learning about new topics can drive overconfidence and overclaiming of knowledge, even in the face of warnings and incentives. Talk 3 investigates a self-other asymmetry in performance evaluations: individuals tend to reward high performance, but expect others to prioritize performers who have overcome challenges. Talk 4 explores why people are willing to take over tasks from partners even when they are likely to perform worse, and usually hold the mistaken belief that they performed better than their partners would have. We hope that this symposium will spur further research on how people decide how well they and others are progressing, whether developing new skills or honing old ones.

People accurately predict the shape but not the parameters of skill learning curves

3:30 PM – 4:40 PM

JUDGMENT/DECISION-MAKING

Decades of research have shown that skill learning often unfolds exponentially: people improve rapidly early on, then performance gradually levels off. Given how important expectations of learning are for actual learning, we explored whether people accurately intuit this canonical time course of skill learning. Across six preregistered experiments ($n = 500$), people correctly predict that skill learning curves (error reductions over time) on a novel visuomotor task will follow an exponential decay function, both for an imagined naive player and for themselves, before engaging with the task. Moreover, people are sensitive to conditions that merit exponential learning and only predict these curves when an imagined player puts in effort and the task is not too difficult. However, people systematically misestimate specific parameters of skill learning (e.g., initial performance, and rate of improvement), which relates to reduced affect at the beginning of learning. Critically, these negative effects can be ameliorated by practice: Providing people with minimal practice reduces their prediction errors and, in turn, buffers them from negative feelings at the beginning of learning.

When Does Learning Make You More Ignorant?

3:30 PM – 4:40 PM

JUDGMENT/DECISION-MAKING

Introductory education paradoxically increases learners' overconfidence about unknown information. Four longitudinal studies (field & experimental; $N = 1,218$) demonstrate that basic instruction in finance, psychology, or GPS led learners to systematically overclaim more knowledge of fictitious concepts, and also overestimate their understanding of real but untaught concepts. E.g., finance students' overclaiming of nonexistent finance terms increased 56% vs. only 8% in controls. Effects persisted despite explicit warnings about fictitious concepts and financial incentives for accuracy. Two key mechanisms drive this effect: (1) self-perceived expertise grows faster than objective expertise; (2) newly acquired knowledge schemas enable learners to make plausible but incorrect interpretations of novel information. These effects persisted for two years post-instruction. Critically, education did not merely increase confidence: it improved metacognitive calibration for learned content, while simultaneously worsening calibration for unknown content. Results highlight a critical need for pedagogy that actively help learners recognize both what they know and what is left to learn.

Pitting Merit Against Misfortune: Self-Other Asymmetries in the Impact of Hardship Appeals

3:30 PM – 4:40 PM

JUDGMENT/DECISION-MAKING

Hardship disclosures can be used to garner support in merit-based contexts like competitions and crowdfunding. This research investigates the perceived versus actual impact of hardship disclosures on support and preferences in merit-based decisions. Five pre-registered studies ($N = 2,262$) identify a self-other asymmetry such that although people favor individuals with higher performance indicators regardless of hardship disclosure, they believe others will favor lower-performing individuals who disclose hardship. That is, when indicating their own voting preferences, people believe they (vs. inexperienced others) are more competent and have a greater propensity to make justifiable decisions, leading to greater support for higher-performing individuals. Further, this asymmetry disappears when inferring the preferences of competent others who are able to make justifiable decisions. Finally, people are also more likely to advise individuals to disclose hardship to an inexperienced (vs. experienced) audience.

Do People Know When to Take Over Tasks?

3:30 PM – 4:40 PM

JUDGMENT/DECISION-MAKING

When working together, humans often need to decide whether to step in and help one another. Do they know when to do so? In seven experiments ($N = 4,842$), we introduce a novel method to measure how well a task is performed when one person takes over from another, and the counterfactual they cannot see: performance if the takeover had never happened. Most participants took over for their partners, and most of them reported afterwards that they had improved task performance. In fact, many had actually made things worse. This may happen because people step in too early to see how well their partners perform, and have a hard time identifying tasks where takeovers are likely to be beneficial. Takeovers are common in cooperative contexts, but people may not realize when they harm the performances they are meant to improve.

Identity-safety cues: Improving outcomes across diverse contexts for underrepresented groups

3:30 PM – 4:40 PM | Location: E258, Level 2

BELONGING/REJECTION

Identity-safety cues (ISCs; i.e., signals that one's identity is valued) can alleviate identity-related concerns for underrepresented groups. Four talks present novel experimental research on the role of ISCs across contexts in improving outcomes for members of underrepresented groups. Talk 1 investigates the efficacy of general versus disability-specific ISCs for facilitating disability disclosures in the workplace. Talk 2 expands our understanding of ISCs by examining the impact of consistent (versus inconsistent) organizational diversity statements on Black Americans' belonging in the workplace. Talk 3 utilizes a novel racial allyship framework to assess allyship perceptions of prenatal providers as an ISC for Black women in maternal health settings. Talk 4 explores how Black and Latine adults respond to relational safety and threat cues (e.g., words, behaviors) during racial conversations with White strangers, friends, and allies. This symposium highlights the power of ISCs—from institutional messages to interpersonal signals—in promoting positive outcomes for diverse underrepresented group members across workplace, healthcare, and interpersonal settings.

Disclosing Disability and the Importance of Disability-Specific Safety Cues

3:30 PM – 4:40 PM

BELONGING/REJECTION

People with stigmatized identities, such as a disability, may opt to conceal them to minimize discrimination on the basis of these identities. People with disabilities face significantly higher unemployment rates than non-disabled people. These disparities in employment rates could further dissuade people from disclosing their disability, denying them access to necessary accommodations. We aim to investigate what makes an identity safety cue (i.e., statement that one's identity is valued) effective in facilitating disability disclosure in the workplace. We find that viewing a disability-specific safety cue increases disclosure intention above both a general safety cue ($p = 0.004$) and control cue emphasizing employee success ($p = 0.01$), even when controlling for demographic factors ($N = 316$, collected prior to January 20th). Additionally, the disability-specific safety cue led participants to feel more included ($p = 0.004$), and to believe that they would have an easier time getting accommodations than the general safety and control cues ($ps < 0.003$). Thus, disability-specific identity safety cues could prove critical to facilitating equality for disabled people in the workplace.

Perceptions of Inconsistent Organizational Identity-safety Cue Implementation Over Time

3:30 PM – 4:40 PM

BELONGING/REJECTION

The U.S. is currently experiencing a DEI (i.e., diversity, equity, and inclusion) regression, with organizations increasingly abandoning their past commitments. Integrating research on attributions, we examine how consistency of identity-safety cues over time impacts perceptions of an organization's motivations. Two studies (S1=298 Black Americans; S2=217 Black Americans, 219 White cis-men) examined perceptions of an organization that had a diversity statement two years ago and had either maintained, removed, or diluted the statement. Across studies and perceivers, organizations that removed or diluted their statement were perceived as less internally motivated to be non-prejudiced in the present day and more externally motivated to be non-prejudiced in the past than a consistent organization, $p_s < .001$, $d_s > 0.40$. Further, Black Americans anticipated greater belonging at the consistent organization compared to the diluted or removed organization, $p_s < .001$, $d_s > 0.73$; No effect emerged for White cis-men. These findings afford an expanded temporal lens to the study of identity-safety cues and demonstrate how consistency impacts attributions and anticipated identity-safety.

EARS: Investigating a novel allyship framework among Black women

3:30 PM – 4:40 PM

BELONGING/REJECTION

Perceiving one's provider as an ally, or someone that acknowledges and addresses racial inequities, can transform the quality of patient-provider encounters. We examined the utility of a novel racial allyship framework, EARS (i.e., Empowerment via collaborative decision-making, Approaching racism dialogue, Recognition of systemic racial inequities, and Social support for racism-related stress), a collection of interrelated patient care objectives to convey provider allyship. Black women that had received prenatal care in the US since 2020 ($n = 285$) reported their patient-provider interaction quality for their prenatal encounters (i.e., identity-safety), pregnancy complications, and perceptions their provider was an ally – as defined by our EARS framework. Prenatal provider allyship perceptions significantly predicted greater identity-safety and fewer pregnancy complications, even when controlling for established predictors of provider evaluations (e.g., patient-provider race concordance) and pregnancy outcomes (e.g., maternal age). The present investigation, for the first time, links provider allyship to an improved pregnancy-related health outcome among Black women.

Minoritized Individuals' Identity-safety Cues: with White Strangers, Friends, and Allies

3:30 PM – 4:40 PM

BELONGING/REJECTION

In interracial interactions, marginalized group members rely on relational cues (e.g., words, behaviors) signaling identity-threat or -safety. But, such cues may hold different meaning with White friends and allies. In two pre-registered experiments, Latine ($N = 513$) and Black ($N = 478$) Americans imagined discussing a negative racial topic with a White stranger (Studies 1-2), friend (Studies 1-2), or ally (Study 2) who demonstrated relational safety (e.g., support) or threat (e.g., discomfort) cues. Participants reported identity-safety, comfort, and disclosure intent. Participants reported more positive outcomes in response to safety (vs. threat) cues. Latine participants reported more positive outcomes with White friends (Studies 1-2) and allies (Study 2) vs. strangers. In Study 1, Black individuals reported greater identity-safety and disclosure intent to a White friend (vs. stranger) showing safety (vs. threat) cues. In Study 2, they reported greater comfort and disclosure intent to a White ally (vs. stranger) who showed safety (vs. threat) cues. This work highlights the relational safety cues Black and Latine individuals desire from White strangers, friends, and allies.

Mechanisms of Self-Transformation: Insights from Narratives, Identity, Memory, and Society

3:30 PM – 4:40 PM | Location: E270, Level 2

SELF/IDENTITY

Our sense of self is both stable and dynamic, shaped by life events, transformations, and narratives we construct. This symposium connects four emerging perspectives on how our sense of self transforms and stabilizes across time, social context, and life stages. The first speaker will present longitudinal data from the 2020 U.S. presidential election, showing how societal events reshape self-perception. The second will examine gender transitions, highlighting how perceived continuity in the self is shaped by how others see us. The third will explore how older adults integrate low-point life events into a personal narrative, linking self-transformation to well-being. The final talk will combine network science and neuroimaging to show how the structural cause and effect relationships of autobiographical memory supports self-coherence—and how this process varies by mental health and well-being. Together, these talks offer converging insights into how people navigate personal transformations and major life events to maintain a coherent sense of self over time.

CANCELLED: Self-Views and Memory Across U.S. Presidential Elections

3:30 PM – 4:40 PM

SELF/IDENTITY

Self-views – or, how one perceives their own traits and values – change across social contexts. Yet, whether and how major societal events alter self-views remains to be determined. Across two studies, we investigate whether a significant event – in this case, the 2020 and 2024 U.S. presidential elections – changes self-views. We also ask if the election acts as an event boundary, and in turn impacts memory for self-views before the election (across a boundary) vs after the election (within a boundary). Data from the 2020 election revealed that traits and values changed more across the election than after it. When investigating memory for previous responses, we found that memory for ratings of values was worse across the election than after it, while memory for traits was unaffected. Analyses of data from the 2024 election are ongoing. Our findings suggest that a) a significant event can substantially alter one's self-views, and b) that the impact of an event boundary on memory for self-views may differ depending on the relevance of the remembered content. More broadly, the findings suggest that moments of major societal change can also change how we view ourselves.

Tracing Self-Continuity Across Gender Transitions

3:30 PM – 4:40 PM

SELF/IDENTITY

How do major identity-relevant life transitions shape one's sense of self across time? How are these processes informed by both internal and social understandings of identity change? Across three studies ($N = 1,039$), we investigate how transgender and cisgender individuals experience temporal self-continuity—connectedness to one's past and future selves—and how these experiences are shaped by both self-perceptions and reflected appraisals. While future self-continuity did not differ between groups (Studies 1–2), transgender participants reported lower continuity with their past selves (Studies 2–3). In Study 3, meta-perceptions (how individuals believed others viewed their identity change) predicted past self-continuity among transgender participants, whereas self-perceptions of change did not. These findings highlight how social identity and reflected appraisals shape the experience of self-continuity. More broadly, this work brings an underrepresented group into the literature on self-concept, advancing understanding of how the self is jointly constructed through personal and social lenses.

Self-Transformation Through Suffering: Stories that Shape the Self

3:30 PM – 4:40 PM

SELF/IDENTITY

Life's low points may play powerful roles in psychosocial development. Whereas some experiences fit easily into one's existing life story, adversity and suffering often challenge an individual's identity and disrupt their life narrative, calling for transformative reconstruction and meaning making. These processes may be especially consequential during the later years, when accepting one's life and experiencing ego integrity becomes a foremost concern. How an individual narrates experiences of suffering, therefore, may have important implications for their identity development and psychological well-being, as evidenced in the present longitudinal study of late midlife American adults ($N = 158$). We coded 426 narrative accounts of life's low points to evaluate their relative fit to a culturally sanctioned script for experiencing positive transformation in the face of suffering. We found that adults whose stories most closely approximated the favored script manifest a mature trait profile, higher well-being, and higher psychosocial development. Moreover, alignment with the script increased in a developmental trajectory over nine years, showing increased self-transformation over time.

Transforming Selves: Mapping Autobiographical Memories to Understand Self-Concept Coherence

3:30 PM – 4:40 PM

SELF/IDENTITY

How do people weave their life events into a coherent sense of self over time, experience, and personal change? We used network analysis to map the structure of autobiographical memory—how people perceive their life events as interrelated. Participants recalled meaningful life events and indicated which events led to others, allowing us to construct a memory network for each person. Events with more downstream influence (i.e., higher outdegree centrality) were seen as more self-defining and transformative—experiences participants felt they wouldn't be the same person without. In fMRI data, ventromedial prefrontal cortex activity tracked the centrality of memories, pointing to its role in maintaining internal maps that organize memory and support the self-concept. Critically, individuals with lower self-esteem were less likely to view highly connected memories as transformative, highlighting their struggle to draw meaning from past events, even those with significant narrative importance. These findings reveal how the structure of autobiographical memory supports self-concept coherence, and how individuals differ in the way they build a coherent identity from the stories they tell.

Psychological Interventions to Counter Misinformation: New Developments and Future Directions

3:30 PM – 4:40 PM | Location: E450B, Level 4

FIELD RESEARCH/INTERVENTIONS

Misinformation is a serious threat to democracy, public health, and public safety that has only grown more perilous in recent years. Psychologists have an important role to play in addressing this threat, and much progress has been made on developing interventions and identifying the most appropriate methods for evaluating those interventions. This symposium provides the latest insights on developing and evaluating such interventions. The symposium will feature large-scale intervention comparison studies, including some of the largest ever conducted, and will evaluate the impact of those interventions across time and culture. All studies feature large, longitudinal, and/or cross-cultural data. We will close with a discussion of how the field can and should move forward in today's difficult environment. Despite expanded interest in studying misinformation over the last decade, false information is more impactful now than ever. Further improvements in interventions will be needed, and yet changing political priorities have made funding more scarce, at least in the U.S. We will consider what has been accomplished and how to continue making progress on this critical societal issue.

The Structure of Misinformation Resilience: Measuring Susceptibility in Intervention Studies

3:30 PM – 4:40 PM

FIELD RESEARCH/INTERVENTIONS

This work is the first to systematically investigate 102 different variables related to cognitive resilience to misinformation in six different countries (US, UK, Australia, India, Kenya, Nigeria). In three longitudinal experiments with nationally representative quota samples (N1 = 7,196, N2 = 4,040, N3 = 4,606), we test these variables in nine different interventions (text-based and video-based) and three topics (GMOs, climate change, cryptocurrencies), combining bottom-up and top-down approaches with new quantitative and qualitative research methods such as exploratory graph analysis (EGA) and SHAP analyses to gain a complete understanding of the structure of misinformation resilience. Finally, we analyse and evaluate some of the most commonly used interventions to counter misinformation, including inoculation interventions (prebunking), media literacy videos and messages (cobunking), and fact-checking videos and messages (debunking), finding that the results are not uniformly positive nor negative, but have a differential impact on the various aspects of misinformation resilience.

Inoculation reduces impact of unproven accusations against mock political candidates

3:30 PM – 4:40 PM

FIELD RESEARCH/INTERVENTIONS

Inoculation interventions expose people to a weakened dose of manipulative techniques to help them develop “antibodies” to those techniques. While often tested on participants’ ability to explicitly identify false information, interventions should also reduce the impact of false narratives on attitudes about targets. Here, we test whether a short inoculation video about emotional language reduces the impact of accusations of misconduct against hypothetical political candidates in a mock social media environment. Accusations against 1/3 of the candidates are followed by a factual correction, while 1/3 of candidates face uncorrected accusations, and 1/3 face no accusation. Impressions of each candidate are rated via a feeling thermometer both immediately after seeing posts about them and ~15 minutes later. Combining data from 11 experiments (n = 6255) using an internal meta-analysis, inoculation reliably reduces impact of uncorrected accusations on ratings given both immediately and after a delay. Impacts of corrected accusations on immediate ratings are also slightly reduced. Thus, inoculation could reduce impacts of unproven or false accusations during electoral campaigns.

Adapting Media and Digital Literacy for Global Impact

3:30 PM – 4:40 PM

FIELD RESEARCH/INTERVENTIONS

Media and digital literacy interventions show promise in improving misinformation discernment, but their effectiveness depends on cultural relevance, engagement, and delivery method. A study of Gali Fakta, a prebunking game designed for Indonesians, found it increased skepticism toward false headlines without reducing trust in factual ones, suggesting its promise as a scalable intervention in the Global South. Comparing Gali Fakta and Harmony Square in Indonesia and the U.S. revealed that cultural tailoring and engagement are critical: Gali Fakta improved sharing discernment in Indonesia, while Harmony Square was effective only in the U.S. Finally, feedback itself may be a useful strategy as these techniques become more streamlined and adaptive. A subsequent study promoted digital literacy by teaching participants how to identify manipulated images online, with feedback alone being just as effective as education. Together, these findings highlight that media literacy interventions must consider cultural context, engagement, and simple yet impactful strategies like feedback to enhance their impact across diverse populations.

A megastudy testing nine different misinformation interventions

3:30 PM – 4:40 PM

FIELD RESEARCH/INTERVENTIONS

Researchers have tested a variety of interventions to combat misinformation on social media. These interventions work via different psychological mechanisms, but all share the goals of increasing recipients’ ability to distinguish between true and false information and/or increasing the veracity of news shared on social media. This toolkit of approaches is useful, but it is currently difficult to compare the interventions because they have been tested in different environments, with different sets of stimuli (e.g., headlines vs. tweets), using different participants and different methods. The current study addresses this gap by testing nine prominent misinformation interventions in an identical setting. In a large megastudy (N = 33,233 US respondents), we tested each intervention’s effect on belief in and the sharing of false, misleading, and true health-related and politics-related headlines. Our findings provide robust evidence that multiple online interventions work well at reducing belief in and spread of false and misleading health information and that real-world implementation is reasonable.

Switching Selves: Changing Identity Presentation Across Contexts and Domains

3:30 PM – 4:40 PM | Location: E253AB, Level 2

PERSON PERCEPTION/IMPRESSION FORMATION

People often change how they present their identities across contexts. People’s experiences changing their identity and people’s social evaluations of these changes are often studied across disparate literatures. Thus, this symposium integrates research on different forms of changes in identity presentations, covering how these changes are operationalized, experienced, and perceived. Speaker 1 will discuss how racial code-switching varies across demographic groups in the U.S. and the implications that racial code-switching has for job satisfaction and retention among university professors. Speaker 2 will examine how people perceive biracial people who change their racial identification across contexts. Speaker 3 will discuss people’s perceptions of autistic people who change how they behave to avoid stigma by adjusting to neuronormative social expectations. Finally, Speaker 4 will present an integrative model that suggests why people perceive different types of changes in identity presentation differently.

Racial Code-Switching in America: Unpacking Psychological and Occupational Implications

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Racial code-switching (adapting one's speech and behavior to mirror a specific racial group) is commonly used by people of color to modify their self-presentation to reduce experiences of bias and exclusion. However, code-switching is a labor-intensive task that carries major psychological and occupational implications. This study examines racial code-switching among a large nationally representative sample of Americans (Study 1; N=9,309) & a sample of university faculty (Study 2; N=2,492) to identify key demographic trends and major implications of code-switching. Findings reveal that demographic and contextual factors both play a pivotal role in predicting the rates of racial code-switching among Americans. Negative experiences such as discrimination and incivility also exacerbated these rates. Racial code-switching was perceived as stressful by nearly all demographic groups and predicted lower job satisfaction and lower faculty retention rates among all university faculty. Implications regarding the true costs and benefits of racial code-switching will be further discussed in the presentation.

Phenotype & Ancestry Information Impact Judgements of Contextual Racial Presentation

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Biracial people can change their racial identification depending on the context (contextual racial presentation; CRP). Perceivers evaluate CRP less positively than if the target has a fixed racial presentation (Albuja et al., 2018). Four studies examine how target phenotype and ancestry information influence these evaluations. First, we find perceivers expect a Biracial target's phenotype to match their stated racial identity. We also provide suggestive evidence that a Biracial target is seemingly evaluated less positively when they present as the racial identity that is most inconsistent with their phenotype. Finally, we show that judgements of CRP vary whether ancestry information is provided. If present, perceivers evaluate the target less positively when they contextually present as Black or White compared to Biracial. However, if ancestry information is absent, perceivers evaluate a target less positively if they contextually present as Black compared to Biracial. This work incorporates the wide variety in phenotypic appearance among Biracial people and the fact that perceivers rarely know a person's ancestry to increase the ecological validity of evaluations of CRP.

Measuring the Effectiveness of Autistic Camouflaging on First Impressions

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

Autistic adults exhibit differences in social behavior that often result in them being perceived negatively by the non-autistic populace (Sasson et al., 2017), leading some to change the ways that they act in order to conform to neuronormative expectations and reduce stigma (Cook et al., 2021). This is known as camouflaging. 496 participants observed and provided social feedback on videos of autistic people who were instructed either to camouflage to the best of their abilities or act authentically. Different autistic people received significantly different first impressions when controlling for camouflaging condition. Across autistic people, they were rated significantly more favorably when camouflaging than when being authentic on every item of the First Impressions Scale (Sasson et al., 2017) except for attractiveness. Camouflaging also made the observers significantly less likely to indicate they thought the person in the video was on the autism spectrum. There was also a significant interaction effect between camouflaging condition and autistic participant for every item, indicating that the benefits of camouflaging were not evenly distributed across all participants.

Switching Selves: Perceptions of Changing Identity Presentations

3:30 PM – 4:40 PM

PERSON PERCEPTION/IMPRESSION FORMATION

People frequently shift how they present themselves across situations, eliciting varied social evaluations from others. For example, people may adjust their speech at work to appear more professional (i.e., codeswitching or camouflaging), change their behavior across cultural settings (i.e., cultural frameswitching), or emphasize or minimize certain aspects of their identities (i.e., identity switching or self-monitoring). How do people evaluate these different types of identity change, and why? This review will integrate research on perceptions of identity switching to propose a model outlining factors that shape perceptions of changes in identity presentation. These factors include stigma associated with the identity, cultural context, expectations for authenticity, the identity of the target and perceiver, and whether the change in identity presentation is across domains (e.g. race and gender) or within a domain (e.g. across cultural contexts). Our integrative model provides a new lens for understanding why changes in identity presentation are perceived differently and suggests ways to test this model.

The Psychology of Victimhood

3:30 PM – 4:40 PM | Location: E265, Level 2

MORALITY

Victimhood is core to our moral psychology, influencing the judgments we make about individuals, groups, and broader institutions. Four speakers discuss the key situational and ideological factors influencing how victimhood is evaluated in society. Speaker 1 focuses on the limits of the “virtuous victim effect”—although victims are typically seen as more moral than non-victims, sexual assault victims who engaged in adjacent consent prior to assault are morally penalized. Speaker 2 reviews evidence for the distinct role of egalitarianism in victim perceptions, shaping attitudes toward inequality and support for victimized groups. Speaker 3 extends theory on the belief in a just world by introducing a typology of unjust world beliefs, each tied to divergent attitudes toward the powerful and powerless in society. Lastly, Speaker 4 discusses how liberals and conservatives share a similar concern for victimhood, but crucially differ in perceptions of who or what deserves victim status. Collectively, these talks demonstrate the psychological role of victimhood in explaining today’s most pressing issues, including political polarization, conflict, and controversies around social justice.

Sexual Assault Victims Face a Penalty for Adjacent Consent

3:30 PM – 4:40 PM

MORALITY

Across 11 studies (N = 12,257), we show that female sexual assault victims are blamed more and seen as less moral if their assault follows voluntary sexual intimacy, a factor we term “adjacent consent.” This reflects a breakdown of the “Virtuous Victim Effect,” whereby victims are typically seen as more moral than non-victims; victims who consented to sex-adjacent activity before being assaulted do not receive this moral elevation. Adjacent consent plays a unique role in undermining the moral elevation of rape victims: subjects continue to elevate victims when, in the absence of adjacent consent, we introduce other information that makes the perpetrator seem less abhorrent or that makes the victim seem promiscuous, reckless, or sexually interested in her perpetrator. These patterns also hold among political liberals and undergraduates who, when no assault occurs, have no moral objection to the victim’s voluntary sexual intimacy, suggesting that even “sex-positive” communities penalize rape victims for adjacent consent. Finally, field data from 180,000+ students across 33 U.S. universities provide evidence that victims are less likely to report assaults involving adjacent consent.

New Directions in the Study of Anti-Egalitarianism

3:30 PM – 4:40 PM

MORALITY

Much research has examined the link between (anti-)egalitarian ideology and motivated social cognition. However, this research is typically framed around anti-egalitarianism, with the other end of this ideological pole, egalitarianism, often ignored altogether or treated as merely the absence of anti-egalitarian-motivated cognition. We integrate long-standing ideas from social dominance theory with contemporary models of motivated social cognition and a recent wave of empirical findings to argue that egalitarian ideology also drives social cognition in meaningful ways. Using correlational, experimental and computational designs, we consider how egalitarianism—like anti-egalitarianism—can drive socially-consequential outcomes, including attention to inequality, empathy for others, inclusive social categorization, and the signal-boosting of the accomplishments of socially disadvantaged (vs. advantaged) groups. We discuss why pursuing this avenue of research is important and outline several unanswered questions for future research.

Beyond the Just World: Just, Non-Just, and Anti-Just World Beliefs

3:30 PM – 4:40 PM

MORALITY

Research has shown that to maintain a belief in a just world (JWB), people sometimes derogate innocent victims. However, little is known about the opposite: the belief in an unjust world. Across 5 studies (N = 14,544), we propose a novel typology of justice worldviews. In addition to JWB, we introduce two unjust world beliefs: the non-just world belief (i.e., outcomes are random, unrelated to deservingness) and the anti-just world belief (i.e., people get the opposite of what they deserve). We find evidence that self-report measures of these worldviews load on distinct factors, that JWB has declined since the 1960s, and that on average, across six countries, these beliefs are held in roughly equal proportions. Moreover, we show that these beliefs are tied to divergent attitudes toward the powerful and powerless. While JWB predicts trust in institutions, support for pro-rich policies, and less moral elevation of victims, anti-JWB predicts distrust and support for policies that harm the rich—but not necessarily ones that help the poor. Instead of falling on one continuum, justice beliefs are distinct worldviews shaping how people moralize status differences and victimization.

Differing Assumptions of Victim Vulnerability Drive Political Disagreement

3:30 PM – 4:40 PM

MORALITY

People across the political spectrum share a harm-based moral mind but differ in who they see as vulnerable. Across eight studies, we develop and validate measures of assumptions of vulnerability (AoVs), show they predict moral judgments about diverse targets, hot-button issues, and sacred objects, and replicate these patterns with implicit measures and a national sample. We find liberals see stark differences—viewing the environment and marginalized groups as highly vulnerable and the powerful and divine as invulnerable—while conservatives see all groups as more equally vulnerable. AoVs also predict charity choices and can be experimentally shifted to change moral judgments. These differences help explain clashes over abortion, policing, and climate policy. By tracing moral divides to who people see as most vulnerable, this work shows how a mind universally concerned with harm can still yield deep political differences—and offers a common currency of vulnerability that could help bridge them.

"Speaking Equity": Strategies to Counter Language Bias and Promote Belonging

3:30 PM – 4:40 PM | Location: E255, Level 2

Despite being a prominent identity feature, language is rarely addressed in inclusion efforts and society often overlooks language-based ideologies. Language diversity – world languages, minority varieties, regional dialects, accents, features associated with race, ethnicity, economic status, ability, or gender – is broad and remains invisible. Yet research shows that language bias can cause psychological harm and socioeconomic disadvantage. This session uncovers language bias and presents actionable strategies to implement inclusivity and accessibility. Topics include the impact of language bias on individuals' sense of belonging, workplace dynamics, and instruction. Since language diversity is widespread in education and organizational contexts, everyone can benefit from this workshop – as potential targets or agents of bias. We will first introduce language diversity and its impact, including evidence from two mixed-method studies with 566 US students illustrating how language insecurity predicts lower classroom belonging. Then, we will analyze case-based examples to learn how to mitigate language bias and develop tools that support language equity, accessibility, and belonging.

Advancing Relationship Science by Embracing Gender and Sexual Diversity

3:30 PM – 4:40 PM | Location: E351, Level 3

CLOSE RELATIONSHIPS

In relationship science, sexually and gender diverse (SGD) and cisgender, heterosexual samples are often studied independently. This symposium includes four talks that use diverse methods—including longitudinal, qualitative, diary, survey, and metascientific data—to highlight insights generated when research integrates and draws comparisons across SGD and cisgender, heterosexual samples. The first talk uses a large, diverse sample to reveal that gender identity, rather than sexual orientation, drives differences in mating psychology. The second talk compares same- and different-sex couples to show how couples' intimate decisions are affected by gendered contexts. The third talk examines effects of social change and uncertainty on diverse relationships. The final talk identifies barriers to studying SGD populations and describes a new resource to facilitate more inclusive scholarship. Together, these talks demonstrate that including SGD populations advances relationship science not only by illustrating phenomena specific to these communities, but also by generating broader insights into how gender, sex, and sexual orientation shape relationship processes.

Mapping Mating Psychology Across Gender Identity and Sexual Orientation

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

Prior investigations of human mating psychology have painted a consistent picture of the fundamental axes of variation in mating-related preferences, attitudes, and behaviors. However, this literature has relied almost exclusively on samples of cisgender, heterosexual participants—severely limiting our understanding of how mating psychology varies across different sexual orientations and gender identities. Here, we attempt to provide a more diverse foundation for mating psychology research by collecting a large sample of gay, lesbian, bisexual, heterosexual, cisgender, and transgender participants (n = 2,219) and applying statistical techniques that allow holistic examination of mating psychology. Overall, we find that much of the variation in mating psychology comes from differences in gender identity, not from sexual orientation. Furthermore, the mating psychologies of transgender participants are indistinguishable from cisgender participants. These insights underscore the universality of human mating phenomena and emphasize the importance of diverse sampling in relationships research.

Sociopolitical Uncertainty, Well-Being, and Gender During the 2025 Presidential Transition

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

The 2025 U.S. presidential transition created a new landscape of sociopolitical uncertainty rife with attitudinal changes and policy propositions targeting minoritized populations. The Contextual Relational Uncertainty (CRU) model predicts that sociopolitical instability can be associated with uncertainty in romantic relationships, particularly for those in minoritized relationships. To examine changes in personal and relational well-being for individuals in romantic relationships during this time period, we conducted a longitudinal study to answer the following questions: 1) How did sociopolitical uncertainty manifest prior to and after the U.S. presidential transition, and did that uncertainty manifest differently for those who identified as LGBTQIA+? 2) What was the association between sociopolitical uncertainty and well-being during and following the U.S. presidential transition, and was this association moderated by gender identity and/or sexual orientation? To address these questions, we measured sociopolitical uncertainty, individual well-being, and relational well-being quantitatively at three timepoints and qualitatively with a series of open-ended questions.

Addressing Barriers to Studying Sexually and Gender Diverse People's Relationships

3:30 PM – 4:40 PM

CLOSE RELATIONSHIPS

The diversity and inclusivity of relationship science research is limited, including with respect to sexually and gender diverse (SGD) populations. To understand the origins of this problem, we surveyed 188 relationship researchers from a range of career stages, nations, and personal backgrounds, inquiring about the nature and extent of their experiences studying underrepresented groups. Quantitative and qualitative findings suggest that individuals face barriers to studying SGD populations at various stages of the research process, from difficulties in recruitment to lack of familiarity with conducting statistical analyses when studying same-sex couples. We find that SGD researchers were more likely to have reported ever studying SGD populations, suggesting that the diversity of experiences reflected in research may be linked to identities of the researchers themselves. Acknowledging that barriers occur at both individual and structural levels, we offer recommendations for navigating structural problems and introduce a resource hub that connects researchers with existing knowledge and online tools that may help them to overcome common individual-level barriers.

Moral Minds in Polarized Times

3:30 PM – 4:40 PM | Location: E353C, Level 3

MORALITY

In polarized times, morality often fuels not just strong attitudes but deep social divides. This symposium investigates how moralized political thinking emerges and polarizes, and how its effects might be softened. Talk 1 uses formal modeling and simulation, panel studies, and ANES data to show that moral conviction spreads between connected attitudes within belief systems, especially in dense belief systems, implying a rise in sectarian, all-or-nothing political worldviews. Talk 2 uses observation and experimental studies to show that perceptions of vulnerability drive intolerance: liberals, in particular, perceive high-status groups as morally harmful, linking left-wing ideology with intolerance toward them. These patterns are troubling, but not inevitable. Talk 3 uses observational and experimental studies to show that liberals and conservatives prioritize the same core moral value, and climate messages framed around this shared value resonate across party lines. Finally, Talk 4 uses a preregistered experiment on a large representative U.S. sample to test whether popular depolarization interventions reduce three distinct dimensions of toxic partisanship.

Conviction Cascades: Moral Conviction Transmits Through Belief System Ties

2:00 PM – 3:10 PM

MORALITY

How do attitudes become moralized? While moral conviction, the metacognitive sense that one's attitude reflects a fundamental distinction between right and wrong, is central to understanding political behavior and polarization, its origins remain unclear. We propose that moral conviction spreads between connected attitudes in belief systems. In Study 1, we use a formal model to simulate this process across 6,000 belief networks varying in structure. Moral conviction spreads from a "patient zero" attitude to neighboring nodes. Spread is also more efficient in dense networks, mirroring those of ideologues (Converse, 1964). Studies 2–4 test this dynamic in three U.S. panel studies. At baseline, we measure participants' belief system structure; then moral conviction is measured across waves. Multilevel models show moral conviction spreads between closely connected, but not weakly connected attitudes. Likewise, people with denser belief systems moralize more attitudes. Finally, ANES data shows belief systems in the U.S. have grown denser over time, which our model implies results in greater potential for the moralization of entire belief systems in the population (i.e., sectarianism).

From Dyads to Divides: How Perceptions of Harm Drive Political Intolerance

2:00 PM – 3:10 PM

MORALITY

Dyadic Morality Theory shows that people perceive immorality when they see an agent harm a vulnerable patient. Study 1 (N=938) measured assumptions of vulnerability (how much people view given targets as vulnerable to harm) and showed liberals and conservatives view moral patients differently. Liberals split the world into the very vulnerable (oppressed) vs. invulnerable (oppressors). Conservatives viewed all targets as similarly vulnerable. This splitting pattern suggests perceptions of harm may drive the link between left-wing politics and animosity. Left wingers may hate groups they view as morally harmful (and like those they view as vulnerable). Study 2 (N=386, nationally representative) measured intolerance towards a wide variety of groups. Leftism was linked with more intolerance towards only two groups—men and Jewish people. Study 3 (N=408, nationally representative) replicated these results, and showed that leftists are intolerant of other high-power groups (e.g., white Americans) and that these links are explained by perceiving them as morally harmful. Experimental Study 4 (N=397) manipulated perceived harm to reduce these links.

Red, Blue, and Morally Alike: Rethinking Moral Appeals on Climate

2:00 PM – 3:10 PM

MORALITY

Climate change is one of the most politically polarizing issues in the U.S., with 78% of Democrats viewing it as a major threat compared to just 23% of Republicans. A common explanation, rooted in Moral Foundations Theory (MFT), is that liberals and conservatives prioritize different moral values—and that climate messaging typically appeals only to liberal values like harm and fairness, neglecting conservative values such as patriotism, duty, and purity. Some researchers argue that reframing climate change around putative conservative values can increase support among conservatives. In this talk, we challenge the core premise of MFT and its application to climate messaging. Across several studies, we show that when given choice, liberals and conservatives prioritize the same top moral value and that messaging on this common moral currency can be effective for motivating climate action across the political spectrum. We discuss the implications for MFT and for building bipartisan support on climate issues.

Cool It: Lowering the Moral Temperature of Toxic Partisanship

2:00 PM – 3:10 PM

MORALITY

Moralized politics can be especially toxic, transforming affective polarization into deeper forms of conflict where people are more likely to reject compromise, punish opponents at their own expense, and even support anti-democratic actions and political violence. Yet we know little about how to lower the moral temperature in intergroup settings, with most research on (de)moralization focusing on issue attitudes rather than intergroup conflict. A preregistered experiment (N = 2,950) conducted on a nationally representative sample tested whether depolarization interventions—such as correcting misperceptions about the outparty—can reduce three conceptually distinct forms of moralized partisanship: (1) moralized partisan identity, (2) perceptions of interparty disagreement as fundamentally moral in nature, and (3) viewing party membership as a reflection of moral character. The study further investigates whether such demoralization is associated with changes in anti-democratic attitudes, support for political violence, and reactions to candidates who violate democratic norms.

[1] "Stop the White Genocide!" Mediating Effects of Conspiracy Theories on Threat and Behavior

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The present research will examine the effects of realistic and symbolic threat on racialized demographic conspiracy theories and anti-immigrant behavioral intentions. Racialized demographic conspiracy theories, such as the Great Replacement theory, are theories or beliefs related to the intentional replacement of a majority group through immigration, race-mixing, and policies meant to enhance diversity. In Study 1, 148 participants read a newspaper article that included either realistically or symbolically threatening information. Results revealed that participants in realistic threat conditions reported more anti-immigrant behavioral intentions, which were mediated by conspiracy theory endorsement. Study 2 will build upon findings from Study 1 by examining the role of artificial intelligence on prejudice. Specifically, the role of artificially generated media and misinformation on anti-immigrant prejudice and perceptions of immigrants. Participants will read a newspaper article that will include AI-generated photos designed to arouse a sense of symbolic or realistic threat. Participants will then complete a survey assessing their behavior, threat perception, endorsement of conspiracy theories, and prejudice. Practical implications of anti-immigrant prejudice and conspiracy theories on behavioral intentions are discussed.

[3] “Am I Preppy enough?”

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Asian Americans are often misperceived as foreigners, as the prototype of Americans is conceptualized as being White. Past research has found that overweight and gay Asian Americans are perceived as more American than their normal-weight and straight counterparts, respectively. The present research extends this work by examining whether Asian Americans who dress “preppy”—a style historically associated with elite Northeastern prep schools, Whiteness, and wealth—are seen as more White and American than non-preppy Asian Americans. White Americans were randomly assigned to view four AI-generated images of an Asian American dressed in preppy clothing (e.g., pastel-colored shirt and shorts) or four AI-generated images of an Asian American dressed in non-preppy clothing (e.g., darker shirt and jeans). This research provides the first experimental evidence that preppy Asian Americans are perceived as more White and affluent than their non-preppy counterparts. Findings suggest that minoritized people may be afforded “entry” into the (White) American community when they signal particular cultural values and practices associated with Whiteness (i.e., preppy style).

[4] “Because I Said So!”: Masculine Honor Beliefs and Perceptions of Parenting Styles

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

We examined how individual differences in masculine honor beliefs (MHBs; i.e., values encouraging traditional norms of masculinity and the belief that aggression is sometimes justifiable, permissive, and necessary; Saucier et al., 2016) relate to perceptions of parenting styles (i.e., authoritarian, authoritative, and permissive; Buri, 1991). Participants (N = 215, 73% women, 81% White, Age: M = 19.20, SD = 3.23) completed measures of their general MHBs, their caregiver's MHBs, their perceptions of the extent to which caregivers used each parenting style, and their general evaluative perceptions of their caregivers' parenting. Greater MHBs were associated with more favorable perceptions of their caregivers' parenting, and this relationship was mediated by how much caregivers were perceived to demonstrate an authoritarian parenting style. This research suggests individuals with greater MHBs were more retrospectively appreciative of their caregivers using authoritarian parenting methods. Future research should examine the perceived utility of the authoritarian parenting style by those higher in MHBs.

[5] “You’re not Native”: Intragroup Perceptions of Native American Cultural Authenticity

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Prior work on minority intragroup biases based on within-race differences (e.g., racial phenotypicality) have demonstrated that while those with fewer prototypical traits (e.g., lighter skin tones) are generally perceived more positively, those with more prototypical traits (e.g., darker skin tones) are usually rated higher in cultural authenticity. This study aims to extend this work to an understudied group: Native Americans (NAs). Using a two-way between-subjects design, participants (all NAs) will be tasked with judging ostensibly real potential roommates based on social media profiles, with a critical trial of a NA varying in place of origin (city, reservation) and skin tone (light, dark), prior to rating perceptions of their cultural authenticity (e.g., likelihood of engaging in cultural activities or speaking a tribal language). We hypothesize that targets with lighter skin tones and those from cities will be perceived as less culturally authentic, with a potential interaction effect between place of origin and skin tone. These findings will help identify how perceptions of authenticity are derived, informing solutions to address intragroup prejudice and discrimination.

[6] 10 Years after College: Who Lives a Psychologically Rich Life?

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Since the time of ancient Greece, questions about what consists of 'the good life' have endured. Traditionally, answers revolved around happiness and meaning. However, psychological richness has been recently proposed as a third dimension (Oishi & Westgate, 2022). Existing cross-sectional data has revealed psychological richness as a related but unique concept about the desirable aspects of the good life. Our longitudinal study examined a novel question: What kind of college students were more likely to experience psychological richness a decade after in their 30s? We found that psychologically rich individuals differed from their peers in terms of personality (extraversion, openness), self-views (more agentic and independent) and valued the importance of the 'self' and 'freedom' in life. Additionally, we also found some deviations in correlational patterns between psychological richness and Cantril's Ladder. Overall, our longitudinal study sheds light on what kinds of individuals are exposed to diverse and perspective-changing experiences during emerging adulthood.

[7] A Gamified Behavioral Task for Measuring Moral Decision Making

4:40 PM – 5:40 PM

MORALITY

Rising affective polarization (Iyengar et al., 2019) and the “perception gap” (Yudkin et al., 2019) reveal hostility and distorted assumptions about what the other side values. Public speech amplifies extremes while stifling nuance, leaving people wary of divisive dialogue. Depolarization requires better tools for recognizing how our own biases shape what we perceive as others’ values—especially in the moral domain, as depolarizing dialogue depends on constructive disagreement.

We introduce a behavioral task that captures real-time moral decision making across four domains: anthropology, biology, philosophy, and religion. In each dilemma, participants are evaluated on competing values within these domains: autonomous vs. communal, harm sensitive vs. harm tolerant, utilitarian vs. deontological, and secular vs. spiritual. The task generates individualized moral profiles that show the extent to which participants lean toward each value in their decisions.

This measure advances moral psychology beyond self-report by providing a behavioral, ecologically valid method for studying decision making. Its interdisciplinary foundation and gamified format extend its relevance beyond the lab, creating opportunities for public engagement and fostering depolarizing dialogue.

[8] A Moral Lens: How Moral Convictions Influence Visual Attention and Deliberation

4:40 PM – 5:40 PM

MORALITY

Moral convictions have been shown to drive rapid judgments. While previous research has emphasized their influence on attitude strength and resistance to persuasion, less is known about how moral convictions shape cognitive processes during real-time decision-making. The current study investigates how alignment between moral convictions and decision options influences visual attention and decision caution. Participants completed a binary decision task while their eye movements were tracked. Trials varied in the degree of moral alignment—whether both, one, or neither option matched participants’ moral beliefs. Results indicate that trials where both topics align with the participant’s moral convictions elicited faster responses and fewer fixations, pointing to lower cognitive conflict when choices are morally aligned. A drift diffusion model further revealed that strong moral conviction alignment reduced boundary separation, indicating lower decision caution. These findings provide a mechanistic account of how moral values shape attention and decision-making, highlighting the role of value congruence in reducing deliberation and streamlining cognitive effort.

[9] A Pilot Wise Intervention Fosters Relationships Between Immigrant-Refugee Students and Teachers

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

When refugee youth arrive in the United States, trustworthy relationships in school are vital, especially given disruptions to their previous communal ties. The Lifting the Bar intervention (Walton et al., 2021) is a wise psychological procedure that aptly fosters relationships between students who are vulnerable to being unseen and their educators. It entails a writing activity through which students reintroduce themselves to an educator they choose using strength-based language, and a letter that lets the teacher know they were nominated. We explored how refugee students (N=17; 59% South American) used this platform and how teachers (N=5; 60% Female) responded to students. We also test the causal effects of receiving the letters on teachers’ responses to students (forthcoming). Results suggest that students welcomed the opportunity to reintroduce themselves to teachers through a strength-based lens, especially because the external challenges they faced (e.g., housing instability) had prevented them from showing their best version in class. Teachers embraced the idea of being nominated by students. Promises and challenges of future research with this population will be discussed.

[10] A Qualitative Exploration of Reactions to Non-Monogamy

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

While prior work has established that people who engage in non-monogamy (NM) encounter stigma for violating mononormative social norms, little work has explored people’s rationales for pro or anti-non-monogamous attitudes. To address this gap, we used MTurk to recruit adult participants living in the U.S. (N = 440). Participants were then asked to either generate at least three reasons why people might support NM, or three reasons why people might oppose NM. Thematic coding analyses (consistent with established methods; Braun and Clarke, 2006) revealed that participants identified numerous rationale types for either supporting or not supporting NM. Common reasons for NM included personal fulfillment, financial stability, expanded kinship networks, and increased autonomy. Emergent reasons for opposing NM included monogamous social norms, beliefs that love is zero sum, and perceived perversion/sexual deviance. Of importance, participants generated more distinct reasons for opposing NM than supporting it, reflecting prevalent mononormative ideals and models. Implications for understanding and reducing relationship structure stigma targeting NM individuals are discussed.

[11] Ability to learn as a way of increasing consumers' moral intentions

4:40 PM – 5:40 PM

MORALITY

Stemming from research on the moral asymmetry effect and on economic decision-making, in a series of three studies we investigate the factors affecting participants' moral intention to report a billing error in retailing situations. Study 1 is an online survey implementing a 3 (Agent) × 2 (Learning) between-subjects design. 478 native English speakers read a vignette describing the error being made by either a human, an automated robot or a self-checkout machine, provided with or lacking the ability to learn from reported mistakes. They then evaluate their intention to report the billing error, subjective guilt and the error's detectability and preventability. Of interest, results fail to replicate previous literature concerning the effect of Agent on participants' moral intentions, while we unveil an effect of Learning, with agents provided with the ability to learn from reported errors eliciting higher moral intention to report such errors. This has important real-world implications in everyday retailing scenarios. Studies 2 and 3 are to be conducted. All studies are pre-registered, fully follow research best practices and clearly answer RQs.

[12] Abortion stigma and mental health: The moderating role of social support

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Abortion stigma is prevalent in the U.S., and is deleterious to the mental health of people of reproductive age. However, little is known about protective factors that may attenuate such harms such as social support. This study examines associations between perceived abortion stigma (PAS) and pre-abortion mental health symptoms (depressive, anxiety, social anxiety), and whether social support from three sources (partner, mother, friend) moderate these associations. We utilized survey data from 591 people aged 18 years and older who sought clinic abortions between November 2023 and January 2025. Results indicated that higher PAS predicted greater pre-abortion mental health symptoms. Social support moderated the associations between PAS and symptoms of anxiety and social anxiety. Specifically, PAS was positively associated with social anxiety symptoms at all levels of partner support (i.e., low, moderate, high), but was strongest for those with low partner support. PAS was also positively associated with anxiety and social anxiety symptoms for people with moderate and high maternal support (but not low). This study elucidates the role of social support on the PAS-mental health link.

[13] Accent & Hireability

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Previous research on accents in the workplace has demonstrated that standard-accented English (SAE) speakers are considered more hireable and more competent than non-SAE speakers. However, less is known about the impact of accent while also considering intersections between race and gender. Existing accent research especially lacks investigations into gender, with many studies using only masculine voices or identifying the effects of gender as not of interest. Using an online experimental design, we randomly assigned American adults (N = 207) to four of eight conditions based on three factors: (a) accent (foreign versus standard), (b) race (Asian versus White), and (c) gender (woman versus man). Participants answered scales about language attitudes and hireability, as well as perceived prototypicality, realistic threat, and previous exposure to accents. We hypothesize that evaluations of each condition's hireability and competence will depend on perceptions of prototypicality and realistic threat.

[14] AI Fuels Moral Disengagement

4:40 PM – 5:40 PM

MORALITY

AI is increasingly part of moral decisions. While this can be useful, we show that it also makes people more likely to morally disengage from responsibility. AI causes moral disengagement by disrupting how people recognize the “moral dyad” in morally charged situations. Research shows that people are quick to condemn acts that fit a dyadic pattern of an intentional agent causing harm to a vulnerable victim. When AI is inserted into these situations—like helping a drone pilot launch a strike on civilians—questions of intention and causation become less clear. Who intended or caused the strike, the person or the AI? Across eight preregistered studies (N = 1,247), we find that people feel less blameworthy when AI shares responsibility, experience less moral pressure when AI is involved, and are more likely to commit harmful acts with AI than alone. These results show how AI fosters moral disengagement by disrupting key features of moral evaluation and point to ways to reduce these effects in human-AI interactions.

[15] An Experimental Investigation of False Memories for Gender and Orientation Stereotypes and their Relationship to Character Judgments

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

"An Experimental Investigation of False Memories for Gender and Orientation Stereotypes and their Relationship to Character Judgments"

False memories happen when people recall information that is not originally present in a situation. Previous research has shown that when an individual is indicated to be gay or lesbian, this increases false memories for the opposite gender's stereotypical traits (Marsh, Cook, & Hick, 2006). Straight, gay, and neutral stereotypical traits were presented as self-reported descriptions of a target person. Participants were asked to remember these personal traits. Participants also completed the LGB-KASH measure of gay, lesbian, and bisexual bias (Worthington, Dillon, & Becker-Schutte, 2005) and rated the warmth and competency of the target person after the memory study. Results revealed more false memories for gay and lesbian stereotypical information than heterosexual typical information. In the straight target conditions, participants who remembered more straight stereotypes rated the target as warmer. However, in the gay or lesbian conditions, the only predictor for perceived warmth of the target was participants LGB-KASH score.

[16] An Exploration of Basic Human Values in 38 Million Obituaries Over 30 Years

4:40 PM – 5:40 PM

MORALITY

How societies remember the dead can reveal what people value in life. We analyzed 38 million U.S. obituaries (1998–2024) to examine how personal values are encoded in individual and collective legacies. Using Schwartz's theory of basic human values, we found that tradition and benevolence dominated legacy reflections, while values like power and stimulation appeared less frequently. Major cultural events (the terrorist attacks of 9/11, the 2008 financial crisis, and the COVID-19 pandemic) were linked to shifts in value expression. Security declined after 9/11, achievement dropped following the financial crisis, and benevolence fell after the onset of COVID-19 and has yet to return to baseline. Gender and age of the deceased also shaped remembered values: men were more often described with achievement, power, and conformity; women with benevolence and hedonism. Older adults were remembered more for tradition and conformity, and men's legacies shifted more with age than women's. Obituaries serve as psychological and cultural time capsules, preserving not only individual legacies but also broader patterns of what U.S. society values in a life well lived.

[17] Analyzing Corporate Discourse on Diversity, Environment, Economy, and Governance Through Topic Modeling

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

How do companies frame their commitments on Diversity, Environment, Economy, and Governance on social media? Using Natural Language Processing (structural topic modeling), we analyzed ~270,000 Tweets (2010-2024) by Fortune 500 companies that were identified as ESG-relevant from a dataset of ~1.8 million. From a baseline model (i.e., modeling topics of all Tweets) we found that (1) environmental and social issues dominate discussion, governance is less central, and economy is rare; and (2) the most common topics focus on celebrations (e.g., "international women's day," or "earth day") and have a temporal focus (e.g., referring to "time to act" or "need"). Furthermore, we found a structural difference in the topic space over time, with ESG-specific topics increasing after 2017 and more COVID and identity/diversity topics (e.g., BLM) post 2020. Additional analyses using random forest clustering explored how topics also differed by organizational sectors, company size, and female CEOs. Overall, these findings provide deep descriptive insight into Fortune 500 companies' varied engagement across ESG domains and demonstrate evolving organizational responses to societal challenges.

[18] Antecedents of a propensity for overinvolvement

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Extant research suggests that overcommitment and overinvolvement contribute to increased stress among college students via an effort-reward imbalance. A theoretical model of undergraduate student overcommitment suggests that student effort is shaped by a cyclical process where students' effort shapes whether they receive approval and delayed rewards, which in turn impact future effort. This study investigates motivational factors that may influence overinvolvement and examines the impact of the overinvolvement on students' stress using structural equation modeling. Drawing on 4-year longitudinal data from a larger college-student cohort (N = 1,473), the present study posits that internal and external motivators, such as a desire for approval and future rewards, influence students' propensity for overinvolvement. We propose the internal factors driving overinvolvement are intrinsic motivation for challenge seeking and coping by distraction, while external factors include parental expectations and pressures, and a desire to appear competent to peers. These internal and external motivators may have implications for student stress both directly and through increased overinvolvement.

[19] Applying Social Dominance Theory to Inpatient Mental Healthcare

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

Adverse treatment event research is sparse despite concerning outcomes for acute mental healthcare service users (Morgan et al., 2018). We examine social dominance theory (SDT)'s ability to explain why some therapists are drawn to inpatient wards through a desire for social hierarchy (social dominance orientation; SDO) and how this may impact adverse events. Surveys were collected from 223 licensed therapists measuring SDO, prison, inpatient, and private practice work history; and attitudes towards mechanical restraints and patient privacy violations. We used correlational analyses to test relationships between SDO, work history, and adverse event attitudes; and t-tests to assess the relationship between SDO and current workplace. Results indicate SDO is related to years worked in prisons $r(211) = .22, p < .05$, current inpatient workplace ($M = 3.25, SD = 1.11$) compared to lack thereof ($M = 2.05, SD = .95$), $t(167) = -7.07, p < .001, d = 1.20$, support for mechanical restraints $r(168) = .36, p < .005$ and privacy violations $r(166) = .53, p < .005$, and negatively with years worked in private practice $r(215) = -.19, p < .05$. Findings support the use of SDT, suggesting SDO is related to work in hierarchical care environments and increased support for adverse event practices among therapists; implications for ward safety are discussed regarding voluntary and collaborative rather than carceral mental healthcare.

[20] Are Individuals with Autism Spectrum Condition More Utilitarian?

4:40 PM – 5:40 PM

MORALITY

Do individuals with autism spectrum condition (ASC) differ from non-autistic individuals in utilitarian moral judgment? To address this question, we compared responses from 394 individuals with ASC and 394 non-autistic participants selected using quota sampling. We employed three approaches: (1) classic trolley dilemmas (Footbridge and Switch), (2) the Oxford Utilitarianism Scale, and (3) the CNI model, which separates sensitivity to consequences (C), norms (N), and general preference for inaction vs. action (I). We also assessed traits associated with ASC (empathy, systemizing, camouflaging) and co-occurring conditions (alexithymia, depression, ADHD). Participants with ASC made more utilitarian judgments in the Footbridge dilemma and on the CNI traditional score than the control sample. They were also less sensitive to moral norms (N parameter) than the control sample. No significant differences emerged on the Oxford scale or other CNI parameters. Our findings add clarity to previous mixed results, highlighting selective differences in moral decision-making among individuals with and without ASC.

[21] Asking Matters: Race, Gender, and Self-Advocacy in Primary Care Access

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Objective: Emerging evidence suggests that inequities in healthcare access can occur during appointment scheduling. This study examined whether patient race and gender shape appointment access in primary care, and whether requesting an earlier appointment affects scheduling outcomes. Methods: In this audit study, 24 pseudonymous callers varying by racially coded names and gender placed calls to primary care clinics in major metropolitan areas of Texas, yielding 798 analyzable calls from 5,760 initial attempts. Using a standardized script, callers scheduled new patient appointments. After receiving an initial offer, callers were instructed to ask whether an earlier appointment was available. Each call was coded for the appointment time offered and whether the request for an earlier appointment was made and granted. Results: There were no significant differences in scheduling outcomes based on the race or gender signaled by the caller's name. However, callers whose requests for an earlier appointment were accommodated received significantly earlier time slots regardless of demographic characteristics. Conclusions: Although no direct evidence of differential treatment based on race or gender was found, differences in how patients advocate for themselves, potentially shaped by broader social norms, may still contribute to disparities in healthcare access.

[22] Avoiding or vaccinating against pathogen threats: Evidence from 11 countries

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

A broad range of social behaviors are shaped by pathogen threats. The behavioral immune system is a constellation of psychological strategies for handling pathogen threats. Almost all research on the behavioral immune system focuses on one strategy: pathogen avoidance—a set of tendencies that facilitate avoidance of pathogen threats. However, there are other strategies beyond avoidance, such as the tendency to prefer controlled pathogen exposure (e.g., vaccines). No post-COVID-19 research has examined cross-cultural variation in the association between pathogen avoidance and vaccine attitudes. In the current work, we examined the association between pathogen avoidance and vaccine attitudes across 11 countries. When examining results by continent, European and Latin American data (N=1173) indicate that pathogen avoidance was only associated with believing that personal caution—not vaccines—was effective for avoiding pathogen threats. Conversely, African and Asian (N=1809) data indicate that pathogen avoidance was associated with avoidance and vaccine strategies. Thus, pathogen avoidance and vaccine strategies may complement one another in ecologies with greater pathogen burden.

[23] Behavioral Forecasts in Human-AI Interaction

4:40 PM – 5:40 PM

CLOSE RELATIONSHIPS

Can people accurately predict their own and others' behavior within human-AI interactions? Across three studies (N = 895), we compared participants' accuracy in forecasting their own and others' (1) closeness to AI companions and (2) moral judgments of their erring AI companions with their actual closeness and moral judgments in a lab setting. Results revealed forecasting errors for both closeness and moral judgment. Compared to actual, in-lab measurements, participants' predictions overestimated how close others would feel towards their AI companions and how harshly others would judge their erring AI companions. When predicting their own behavior, participants also overestimated the harshness of their own moral judgments but accurately forecasted their closeness to their AI companions. These patterns—underestimating human resistance to AI bonding while overestimating negative reactions when AI fails—may reflect deeper preconceived notions about AI as fundamentally threatening.

[24] Beliefs about human nature affect political ideology and policy preferences

4:40 PM – 5:40 PM

MORALITY

We examined whether lay theories about what people are fundamentally like predict ideology and policy preferences. A sample of 128 college students reported their beliefs along four dimensions: selfishness, evil, fixedness, and genetic determinism. These dimensions echo longstanding debates in academic and popular discourse and demonstrated good internal reliability. Human nature beliefs predicted policy preferences across domains including immigration, welfare, education, criminal justice, and environmental protection, even after controlling for ideological self-placement, right-wing authoritarianism, social dominance orientation, and system justification. Moreover, different dimensions of human nature beliefs mapped onto distinct ideological tendencies: seeing people as fixed predicted RWA, seeing people as evil predicted SDO, and seeing people as genetically determined predicted system justification. Taken

together, these preliminary findings suggest that core beliefs about human nature may have profound consequences for how people think about politics.

[25] Beyond Borders: Gen Z and the Future of Global Empathy

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Empathy has historically been bounded by group identity, extending most naturally to those who share our culture, proximity, or personal ties. Yet the emerging generation—Gen Z—appears to be challenging these traditional limits. From climate justice movements to protests against systemic discrimination and, most recently, solidarity with Palestinians facing genocide in Gaza, Gen Z has repeatedly demonstrated that empathy can transcend national, cultural, and linguistic divides. Their activism is notable for extending concern to communities with whom they have no direct connection, advocating instead for a global human society rooted in justice and moral accountability.

Digital culture plays a central role in this transformation. Through social media, online communities, and immersive platforms, young people are exposed daily to diverse perspectives and experiences, fostering earlier and broader empathic engagement. This generational shift challenges traditional psychological models that locate empathy's peak in midlife, suggesting new developmental pathways shaped by technology and global interconnectedness.

Yet, this broadened empathy is not without limits. Activists often face significant personal and political costs, and group norms continue to influence who receives solidarity. This presentation reviews literature and case studies to argue that Gen Z's activism signals both the promise and fragility of global empathy. It asks: can this generational shift be sustained and institutionalized, transforming empathy from an individual moral choice into a cultural and structural norm?

[26] Beyond Direct Harm: Contextualizing Off/Online Vicarious Discrimination Experiences on Health

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

With the rise of social media consumption, exposure to racial stressors has extended into digital spaces, compounding the ways in which individuals experience race-based stressors. While studies link direct racial discrimination (DRD; i.e., firsthand experiences of racial unfairness) to health, recent findings suggest that vicarious racial discrimination (VRD)—the secondhand experience of racial discrimination—may be encountered more frequently than DRD and thus also detrimental for health. However, lack of differentiation between DRD and VRD exposures hinders standardization and cross-study comparisons. In two studies, we aimed to identify the frequency and health impact of VRD, compared to DRD. Study 1 (N=147) was a cross-sectional survey that examined frequency patterns of off/online VRD/DRD exposure across various domains and their associations with health. Study 2 (N=144) used an 8-day ecological momentary assessment (EMA) to examine how off/online VRD/DRD exposure impacts same and next-day metrics of health. Findings clarify VRD/DRD similarities and differences, expanding our understanding of how racial discrimination affects health, even among those vicariously exposed.

[27] Beyond the Left-Right Continuum, Understanding the Role of Social Versus Economic Ideology in the Endorsement of Different Group-Level Moral Values

4:40 PM – 5:40 PM

MORALITY

The current study explores group-level moral values outside of the left-right political spectrum. The Model of Moral Motives (Janoff-Bulman 2023) makes predictions about different group-level moral values endorsed by liberals versus conservatives. Specifically, Liberals endorse social justice values that focus on government regulation of economic issues (but not social issues). In contrast, Conservatives endorse social order values that focus on government regulation of social issues (but not economic issues). However, the theory does not make predictions about those who do not support government regulation in either the economic or social domains or those who want government regulation in both domains. The current study explores whether those who are economically conservative but socially liberal oppose the group-level moral values and instead apply self-discipline and industriousness (personal-level values) to the group. Similarly, it will also explore whether individuals who support social and economic regulation view the goal of economic regulation as to protect society rather than provide for it, like the model argues.

[28] Beyond Threat to Opportunity: An Affordance Management Approach to Immigrant Stereotypes and Prejudices

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Research on prejudice has primarily focused on negative stereotypes and prejudices related to threats. Grounded in the affordance management framework—which posits that the mind's role is to identify and manage both opportunities and threats—this study investigates how perceived opportunities shape "positive" stereotypes and prejudices. Specifically, it examines highly skilled immigrants and war refugees to test how "base stereotypes" (beliefs about the capacities and behavioral inclinations of group members, that represents the group as they are) are transformed into opportunity or threat stereotypes as a function of perceivers' goals, vulnerabilities, and beliefs. Furthermore, this study explores the relationship between specific opportunity stereotypes and distinct positive emotions such as enthusiasm, gratitude, admiration, and compassion. By examining how immigrants may be viewed not only as threats but also as opportunities—and how opportunity perceptions give rise to positive emotions—this work advances our understanding of stereotyping and prejudice processes.

[29] Bias in a bag. Exploring implicit biases against Arab Americans in the detection of contraband

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

This study examines whether implicit biases influences decision-making relating to aviation security screening toward people of Arab descent. Previous research has suggested that Arab men are disproportionately scrutinized in these contexts, specifically when terrorist events are made salient to participants, but limited empirical work has directly assessed how such biases manifest in screening tasks. To address this gap, participants will complete a simulated baggage screening activity in which they view computed tomographic images of bags that may or may not contain contraband, paired with passports displaying demographic information about their owners. Accuracy and reaction times (RTs) will be recorded across 150 trials in which all participants are exposed to White, Black, and Arab targets, allowing for within-subject comparisons. We predict increased mean RTs and reduced accuracy for stimuli associated with Arab targets relative to other groups. Findings will contribute to ongoing discussions about whether advanced security technologies mitigate or mask implicit bias, with broader implications for equity in airport screening practices.

[30] Bias in Generative AI Reduces Trust in AI Systems and Willingness to Use AI Across Domains: Evidence From Neurodivergent Users.

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

While generative AI is rapidly becoming part of daily life, these tools sometimes produce biased content. This study investigates how instances of such bias shape trust in AI and willingness to use it, with particular attention to neurodivergent (ND) adults who often face invisible stigma relative to members of groups with visible marginalized identities. Participants will be randomly assigned to interact with an ostensibly real AI interface that delivers one of three opinions about neurodivergence: negative, neutral, or positive. The primary outcome is trust in AI systems; willingness to use AI across domains is a secondary outcome. Perceived bias, of the AI output, serves as both a manipulation check and mediator. Using conditional process analyses, we will test whether biased output increases perceived bias, reduces trust, and lowers willingness, and whether these pathways are amplified for ND compared to neurotypical participants. This study offers evidence that biased AI disproportionately undermines trust among a marginalized group, providing guidance for building AI that is inclusive, equitable, and worthy of public confidence.

[31] Blind Loyalty to the Sunk-Cost Decision of a Loyal Leader

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

Leadership success often depends not only on leader characteristics but also on the characteristics of members responding to leader behavior. One critical member characteristic is group loyalty, defined as an emotional attachment and commitment to one's group. Loyal members are typically expected to support group decisions and prioritize collective goals over personal interests. Their role becomes especially important when leaders make flawed or irrational decisions—such as those driven by the sunk cost fallacy, where continued investment in a failing endeavor is used to justify prior investment.

Prior research on the effects of group loyalty has yielded mixed results. Some studies suggest that loyalty can impair critical judgment, blinding members to a leader's errors and encouraging uncritical conformity. Other findings show that loyalty can inspire dissent when members perceive that flawed leadership threatens the group's long-term welfare. We propose that this inconsistency may depend on how members perceive the leader's own loyalty to the group. Specifically, when leaders display loyalty through visible self-sacrifice and consistent commitment to group welfare, loyal members may view those leaders as more trustworthy, aligned with group values, and deserving of support—even when their decisions are flawed.

Grounded in trait activation theory and the similarity-attraction principle, we argue that perceived leader loyalty acts as a situational cue that activates members' trait loyalty and prompts vicarious justification. When members perceive psychological similarity in loyalty, they may internalize the leader's decision as their own, making them more likely to rationalize it.

We tested this hypothesis in two online experiments (N = 330), manipulating perceived leader loyalty and measuring trait group loyalty. Across two studies, we found converging evidence for our hypothesis. Results showed that member loyalty predicted conformity to the leader's sunk cost decision—but only when the leader was described as loyal. These findings suggest that pairing loyal leaders with loyal members may increase vulnerability to biased decision-making, especially in a sunk cost context.

[32] Bridge between Ironic and sincere within hate speech - an empirical analysis of Meta-irony effects on belief

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Paralleling Schrodinger's Cat, meta-irony is indistinguishable as sincere or ironic until the listener asks, and is used online in the context of disparaging humor and promoting extremist ideologies. There is a sense of "getting away" with the joke without negative social consequences. This study investigates whether exposure to extreme speech becomes normalized when communicated under the guise of meta-irony. We also test whether repeated exposure to meta-irony affects perceived sincerity and one's own beliefs. Participants (n=294) viewed a Reddit thread, "r/Womenssufferage." Participants saw zero to 30 meta-ironic statements against suffrage. We observed a significant increase in perceived sincerity of meta-ironic statements with repeated exposure. We also found a reactionary effect on one's own beliefs in lower exposure conditions, suggesting that some meta-irony exposure can bolster prior beliefs. However, higher exposure significantly reduced prior beliefs from the peak of the bolstering effect. No effects were found in perceptions of others' beliefs, suggesting that norms do not drive fluctuations in beliefs.

[33] Bridging Self and Society in Understanding Racism

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Despite growing discourse around structural racism, many people continue to struggle with understanding how individuals and structures perpetuate racism in tandem. Across three experimental studies, including a field study, we test a novel intervention designed to illuminate the interconnectedness of individuals and systems. Results show that participants who received the intervention reported greater perceived responsibility at both the institutional and individual levels, increased frustration, stronger motivation to take action, and greater support for anti-racist policies. They also demonstrated improved understanding of how individuals and structures mutually reinforce one another. These findings suggest that people often view individual- and structural-level racism as competing explanations rather than interconnected forces. However, when the link between them is made explicit, understanding improves. This work offers important implications for developing interventions and policies that address racism at both individual and structural levels.

[34] Buffers and Mechanisms of Structural Stigma and Sexual Minority Health

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Structural stigma and regional bias have increasingly come to the fore as fundamental causes of health disparities. Indeed, a rapidly-expanding literature demonstrates that sexual minorities living in regions characterized by increases in or higher overall levels of discriminatory legislation and heterosexist bias exhibit poorer physical and mental health outcomes. However, potential buffers of and mechanisms linking structural stigma and health remain obscure. We utilized data from both large publicly-available datasets (Project Implicit, the US Census, MIT Election Lab, and Movement Advancement Project) and from Generations: A Study of the Life and Health of LGB People in a Changing Society, United States, 2016-2019, a longitudinal survey of a national probability sample of sexual minority Americans. More specifically, we hypothesized that social support from family, social support from friends, and subjective sexual and gender minority (SGM) community connectedness would each either moderate or mediate the relationship between state-level policy environments or county-level explicit and implicit sexuality bias and measures of health and well-being among sexual minorities.

[35] Can you travel through your body? Brain-heart dualism and its ability-related advantages

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Self-regulation may benefit from an ability to simulate oneself traveling through the body in a strategic manner. This would be particularly true concerning the brain and heart regions of the body, which, folk theory contends, are good at rational (brain) versus experiential (heart) tasks. Pursuant of these ideas, two studies (total N = 455) asked participants how much of their self typically exists in brain and heart regions of their bodies while engaging in a diverse set of daily activities. These responses permitted a calculation of brain-heart dualism, defined in terms of a representational self that moves toward the brain for some activities and toward the heart for others. Participants differed in brain-heart dualism, with some displaying it (negative brain-heart correlation) and others not (no negative correlation). Participants who exhibited dualism excelled in both intellectual and experiential domains, as captured by outcomes such as ACT scores and ability-based emotional intelligence. The ability to simulate oneself as a bodily entity that can travel up versus down appears to be functional in reconfiguring the self to support both rational and experiential endeavors.

[36] CBT-Informed Approach to Understanding Interracial Interaction Challenges

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Over a half century of research on the benefits of intergroup/interracial contact demonstrates that positive contact can decrease intergroup anxiety (e.g., Pettigrew & Tropp; 2008). There have been various efforts to reduce intergroup anxiety among White people in interracial interactions (Oyler et al., 2022), yet none, to our knowledge, have employed a cognitive behavioral therapy (CBT) approach. Adapting a CBT framework, we investigated the emotions, automatic thoughts, and behaviors of White Americans in interracial interactions. Eighty-eight participants provided three interracial interaction scenarios and rated them on various dimensions (e.g., discomfort/distress, automatic thoughts, emotions/reactions). We hypothesized that: 1) discomfort, emotions, and reactions would be significantly higher in scenarios with greater perceived intensity, and 2) scenarios involving power differences, direct involvement, or close relationships would elicit higher discomfort. Participants reported increased discomfort and emotional responses in higher intensity scenarios (H1). Mixed-method analyses focusing on the characteristics of interracial situations and associated automatic thoughts, is ongoing (H2). Preliminary findings suggest that the perceived intensity of an interaction directly influences both emotional and cognitive responses. The current study will inform future interracial interaction interventions on ways to reduce White Americans' interracial anxiety and thereby improve racially minoritized group members experiences in novel cross-race encounters.

[37] Characterizing First Impressions of East and South Asian Faces

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Asian individuals represent a highly diverse and growing subgroup of the American population with whom people interact every day. Yet much social psychological research ignores this diversity and focuses on East Asian individuals. For example, in the domain of face perception, South Asian faces are understudied, and there is a lack of information on how people perceive and interact with South Asians. This experiment will fill this gap by exploring perceptions of warmth, competence, and threat from faces of White, East Asian, and South Asian men and women. Participants will view 60 unique faces of East Asian, South Asian, and White men and women one at a time in a random order in three randomly presented blocks. In each block, participants will rate the faces on how warm, competent, or threatening they appear to them. Based on prior work, we expect that South Asians might be rated higher in warmth and lower in competence compared to East Asians. Another possibility is that, potentially due to colorism, South Asian women may be perceived as more threatening than East Asian or White women. Data collection is ongoing, and results will be discussed.

[38] Children and adults' evaluations about others' capacity for redemption

4:40 PM – 5:40 PM

MORALITY

Children and adults hold different beliefs about redemption (i.e., moral improvement). For instance, 6- to 8-year-olds view people as more capable of redemption than do adults (Cohen et al., 2023; Dunlea & Heiphetz, 2021). The current project examines mechanisms underlying children's and adults' views. We will recruit 6- to 8-year-olds and adults to learn about characters who transgressed. Within-subjects, we will vary whether characters exerted high or low effort to fix wrongdoing (e.g., to help a friend feel better after hurting their feelings) and whether the effort was successful (e.g., whether the friend felt better). Participants will indicate the extent to which characters changed for the better. We expect to replicate results showing that children perceive people as more redeemable than adults. Because children and adults perceive effort to be virtuous (Mosley et al., 2024; White et al., 2024), we also predict that participants in both age groups will perceive people as particularly redeemable when they exert a lot of effort to fix their wrongdoing and their effort is successful. We are currently awaiting IRB approval and will begin data collection immediately thereafter.

[39] Cognitive Homophobia Across Cultures: A Systematic Review

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

What are people homophobic about? This preregistered systematic review examined the framework of cognitive homophobia and its cultural variations. We searched five databases and analyzed 574 items from 89 validated homophobia scales in 81 studies across 18 countries (1970–2024). Thematic analysis identified 21 categories clustered into five themes: (T1) threats to heteronormativity, (T2) essentialism and pathologizing, (T3) violations of gender/sexual norms, (T4) rejection of cultural diversity, and (T5) negative contact experiences. Most themes and categories showed no significant differences across contexts, suggesting universal elements of cognitive homophobia. Meanwhile, variations emerged: At the theme level, Confucian-influenced contexts placed greater emphasis on essentialism and pathologizing than many others. At the category level, East European contexts emphasized civilizational decline (in T1) and foreign threats (in T4) than many others; Confucian-influenced contexts stressed abnormality/inferiority (in T2) more than English-speaking contexts. These findings provide a conceptual framework for cognitive homophobia and highlight cultural variations across societies.

[40] Collective Narcissism, Disgust Sensitivity, and Prejudice against Zainichi Koreans: Evidence from an Online Survey in Japan

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

This study investigates associations of prejudice against Zainichi Koreans (Korean residents in Japan), collective narcissism, and disgust sensitivity. An online questionnaire survey was conducted in December 2024 with Japanese respondents aged from 20s to 60s and above. After excluding satisficing responses, the analyzable sample size was 600 (290 men and 310 women; Age [Range = 20 – 80, M = 48.4, SD = 14.9]). As indicators of prejudice, we employed the feeling thermometer and the Modern Racism against Zainichi Korean Scale. Correlational analyses showed that collective narcissism was moderately positively correlated with modern racism and weakly negatively correlated with the feeling thermometer. Comparison of the absolute values of the correlation coefficients indicated that the association with modern racism was significantly stronger. Disgust sensitivity was correlated with the prejudice indicators in the predicted direction, but the effect sizes were small or negligible. We discuss the implications of the findings that collective narcissism is particularly associated with modern racism and that disgust sensitivity is just a weak predictor of both types of prejudice.

[41] College Students' Responses to Setbacks in Difficult Courses: Associations with Peer and Faculty Support

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Objective: We examined how college students self-regulation their academic motivation after experiencing setbacks in difficult courses, and how different forms of social support from peers and faculty influence that process.

Design: We surveyed 323 college students over the course of an academic quarter. The surveys tracked changes in academic motivation, use of goal adjustment strategies, and perceptions of informational and emotional support following lower-than-expected midterm performance.

Results: Students who received disappointing midterm scores showed declines in academic motivation. However, those who engaged in goal adjustment strategies were better able to maintain their motivation. Informational support from both peers and faculty predicted greater use of these strategies. Notably, emotional support from faculty was linked to higher overall academic motivation.

Conclusion: Goal adjustment strategies are effective in preserving motivation after academic setbacks. Importantly, the type and source of social support matter—informational support facilitates adaptive goal regulation, while emotional support from faculty helps sustain motivation.

[42] Comparing Susceptibility to Social vs. Artificial Intelligence Influence

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Evidence suggests that people increasingly rely on artificial intelligence (e.g., ChatGPT) to make decisions. However, it is unclear whether and when people rely more on AI than other people as the primary source of information. This research compares the magnitude of social and AI influence on everyday decisions and explores the conditions under which one is stronger than the other using two experiments (total N = 2,881). In both studies, participants completed true/false health questions. We provided some participants with information about how other participants evaluated the statements. Others were given information on how AI chatbots evaluated them. We also manipulated credibility, such that for some participants, this additional information was either correct or incorrect. The first study found that regardless of information source, people performed better when given credible (vs. noncredible) information. Study 2 manipulated the difficulty of health statements, to explore whether difficulty moderates study 1's findings; data collection is in progress. Findings suggest that people rely on AI chatbots and humans similarly on everyday decisions.

[43] CANCELLED

4:40 PM – 5:40 PM

People may be bothered by errors such as falsely accusing an innocent person (false alarm) and failing to apprehend a guilty person (miss). Similar processes occur in stereotyping – one may mistakenly apply a stereotype or fail to apply a stereotype to a person who has that trait. We tested whether individual differences in concern about false alarm and miss errors in everyday contexts (e.g., accusing a student of cheating) related to beliefs about stereotyping and tendencies to apply traits to social groups. Miss concern related to lower beliefs that stereotypes are immoral, whereas false alarm concern related to greater stereotype immorality beliefs. However, miss concern related to higher endorsement of negative traits across social groups (e.g., criminality in Black, White, and Asian Americans), whereas false alarm concern related to higher endorsement of positive traits across social groups. These findings indicate that those concerned with misses vs false alarms may hold different perceptions of the base rates of traits in people generally, suggesting that concern about errors in social decision making is associated with the ways people think about and apply traits to others.

[44] Conforming to Gender Roles Influences Spontaneous Trait Inferences

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Traits are spontaneously inferred from observing people's behavior via spontaneous trait inferences (STIs). However, little research tests if other implicit impressions, like stereotypes, influence the strength of STIs and whether STIs impact subsequent perceiver behavior. Across two experiments, we assessed the impact of gender stereotypes on STIs and intentions to approach and punish targets. Counter to predictions, Experiment 1 (N = 202) showed that participants made stronger STIs for stereotype inconsistent targets (e.g. ambitious women, emotional men) compared to consistent targets (e.g. emotional women, ambitious men). Participants were also more likely to befriend and less likely to punish inconsistent targets if they formed a STI about that person. These results may reflect individuation, not stereotyping. Experiment 2 (N = 215) tests these competing hypotheses by using ambiguous behaviors that simultaneously implied stereotypic traits across gender (e.g. same behavior implied the person could be emotional or ambitious). Data for Experiment 2 are collected and will be analyzed prior to SPSP 2026. We discuss implications for stereotype development and discrimination.

[45] Consent to consume: Passivity and authority in meat marketing

4:40 PM – 5:40 PM

MORALITY

Why, despite evidence that sentience reduces willingness to eat meat, are anthropomorphic animals a staple of meat marketing? Across two experiments, we test a theory of perceived consent using barbecue restaurant logos featuring animal mascots. In Study 1 (N = 447), compared with an image of a real animal, anthropomorphic mascots were rated more appropriate for consumption, mediated by perceptions that the mascot was consenting. In Study 2 (N = 900), we tested whether perceived consent stemmed from cues of authority or passivity by manipulating mascot gender (feminized, masculinized, neutral). Across mediation models, perceived consent drove consumption judgments, but the pathway to consent was sensitive to gender cues: Authority mediated consent for masculinized mascots, while passivity mediated consent for feminized and neutral mascots. These effects were exacerbated in participants who linked meat with masculinity. Anthropomorphism paradoxically increases consumption through perceptions of animal consent, an effect apparently sensitive to gender stereotypes with masculinized mascots legitimizing consumption and feminized/neutral mascots yielding to it.

[46] Contextualized and intersectional positive and negative automatic evaluations of social categories are related to discrimination in dichotomous choice decisions

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The relation between automatic evaluations and behavior is notoriously small. One reason for this may be the assumption that automatic evaluations should be conceptualized as a single number representing relative valence. However, research in close relationships has demonstrated the utility of conceptualizing automatic evaluations as separate positive and negative associations, in part, because doing so disentangles truly neutral attitudes from ambivalent attitudes. The present research ($N > 600$) found strong relations (some r 's $> .7$) between automatic evaluations conceptualized as separate positive and negative associations and one specific class of behavior: dichotomous choice decisions. Specifically, which automatic evaluation (positive, negative, or ambivalent) was related to the decision to award a scholarship to a Black woman depended on whether she was pitted against a Black man, white man, or white woman at two time points: when the automatic evaluations were measured and when the dichotomous choice was made. For example, in the present study, how often Black women recommended a Black woman over a white woman for a scholarship was related to associating Black women with positivity but not negativity when they were contrasted with white women ($r = .73$) but the relation was much weaker when they were contrasted with Black men ($r = .19$) or white men ($r = .33$).

[47] Contextualizing Positive Vocational Identities: A Qualitative Study Among Resettled Refugees

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

This qualitative study elaborates on the four pathways (growth, integration, virtues, esteem) for positive vocational identity construction among three different groups of refugees by introducing the concept of a "core positive vocational identity," which means that the construction of a positive vocational identity is shaped by the individual's most salient contextual factor. Among Hmong participants in this study, this core positive vocational identity was value-driven as they prioritized community respect and contribution. For MENA participants, the future and hope for upward mobility despite present barriers constituted their future-driven core positive vocational identity. Somali participants emphasized the importance of balancing personal ambitions and family expectations, leading to a life-stage-driven positive vocational identity. We propose that positive vocational identity is deeply shaped by context-driven core factors – cultural values, future aspirations, or life stage – that influence how individuals experience growth, integration, virtue, and esteem. We call for further research into additional contextual influences on positive vocational identity formation.

[49] Coping Styles: Understanding Risk-Aversion in Decision-Making

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Individuals exhibit different rates of risk avoidance behaviors based on their anxiety (Eisenberg, et al., 1998). Individuals who report high dispositional anxiety display higher rates of risk avoidance behaviors (Maner, et al., 2007). Current research utilized self-report measures of anxiety, which does not accurately measure repressive copers. Repressive copers are not consciously aware of their anxiety, thus self-report low anxiety while physiologically experiencing high anxiety (Weinberger, et al., 1979). This study aims to explore the impact of repressive copers' on the current risk avoidance literature. Participants are classified into three groups (high-anxious, low-anxious, and repressive copers) using two surveys: Marlowe-Crowne Social Desirability Scale and Taylor Manifest Anxiety Scale (Weinberger et al., 1979). This study employs the Balloon Analog Risk Task to assess rates of risk aversion (Lejuez et al., 2002). We expect to replicate previous literature showing high-anxious individuals display higher risk avoidance compared to low-anxious individuals. Additionally, we expect that repressive copers will have similar risk avoidance patterns to high-anxious individuals.

[50] Cultural Differences in Metamorality: Resolving Moral Conflict Across Societies

4:40 PM – 5:40 PM

MORALITY

When moral values come into conflict, individuals rely on metamoral principles to adjudicate between them. Prior work has argued for at least four such principles: utilitarianism, divinity, honor, and rational self-interest. To measure the importance given to these principles across cultures, we used a newly developed metamorality measure in a series of four preliminary studies (N = 624) and tested its validity in the U.S. Results demonstrated that our measure had construct validity and reliability. We recently finished collecting data for a cross-cultural study spanning 14 countries (N = 4,600) to test the validity of our measure and examine how metamoral principles relate to cognition (holistic vs. analytic thinking, reflection vs. intuition) and moral behavior, such as utilitarian decision-making and generosity, using incentivized behavioral tasks. To our knowledge, this project is the first to examine how metamoral principles vary across populations and sheds light on how culture and cognition contribute to the resolution of moral conflicts around the globe.

Keywords: Morality, metamorality, culture, prosociality, cognitive styles, thinking styles.

[51] Cultural differences in outrage and sympathy toward viral outrage on the Internet

4:40 PM – 5:40 PM

MORALITY

In previous research, viral outrage-the cumulative online condemnation of an offensive remark- not only encourages one to join mass condemnation but also foster sympathy toward a target. Namely, when exposed to viral outrage, one may conform to majorities but at the same time, they may deviate from condemning others. Given cultural differences in social sensitivities, we predicted the former pathway would be stronger in interdependent cultures, but the latter pathway in independent cultures. A cross-cultural study (202 Koreans & 203 Americans) confirmed the prediction. Perceived norm and outrage sequentially mediated the effect of viral outrage on condemnation, and such pathway (viral outrage → perceived norm → outrage → more condemnation) was stronger for Koreans. In contrast, all the participants thought condemnation was extreme and felt sympathy more in the viral outrage condition than in the control condition, leading to the reduction in one's condemnation, the pathway (viral outrage → perceived excessiveness → sympathy → less condemnation) was stronger for Americans. We are collecting additional data to examine psychological mechanisms underlying the cultural difference.

[52] Development of the Contamination Threat Bias Scale: A Measure of Perceptual Contamination Sensitivity

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

How readily we infer contamination from ambiguous cues colors who we trust, avoid, and stigmatize—biasing social judgments and policy attitudes under ambiguity. Yet no trait measure exists that directly indexes perceived contamination threat, so researchers often substitute self-reported feelings of disgust (e.g., the Disgust Scale-Revised). To fill this gap, we developed the Contamination Threat Bias Scale (CTBS). Participants (N=663) rated 53 candidate contaminants across 6 domains (human/nonhuman biological, food/drink, public space, environmental, conspiratorial) on 3 dimensions (likelihood an item is a source, likelihood resulting contamination causes harm, and likelihood of person-to-person spread). Confirmatory factor analyses reduced the pool to 41 items and indicated "source likelihood" was redundant. A second sample (N=379) replicated the subscale structure with good fit, and CTBS showed expected convergent and discriminant validity with other disgust measures. CTBS offers a direct, theory-consistent index of trait contamination threat bias that disentangles threat from disgust and has applications exploring, for example, stigma, avoidance, and political policy views.

[53] Did the Hamas Attack Change Implicit and Explicit Anti-Arab Muslim Biases?

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The Hamas attack in Israel on October 7th, 2023, may have had a global impact on attitudes toward Arab Muslims. Drawing on Social Dominance Theory, we hypothesized that individuals in hierarchy-enhancing roles - such as law enforcement and the military - would be motivated to express stronger implicit and explicit biases against Arab Muslims compared to individuals in hierarchy-attenuating roles. We further predicted that these differences would intensify after the attack. In a preregistered study, we analyzed responses ($N = 1,138$) to implicit (Arab-Muslim Implicit Association Test) and explicit (self-reported preferences) measures from Project Implicit. Results indicated that officers and military personnel exhibited more explicit bias against Arab Muslims relative to educators and students, and that this bias increased in the year following the attack. Additionally, we explored the moderating role of political identification in implicit biases post-attack. These findings highlight the importance of understanding the mechanisms underlying the effect of global events on implicit and explicit biases, which may contribute to disparate and unjust policing outcomes for Arab Muslims.

[55] Discomfort as a Mediator between Pre- and Post-Intervention Attitudes: Impediments to the Effectiveness of Imagined Contact Among Prejudiced People

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

This study aims to examine the potential impediments of the imagined contact (IC). We hypothesized that the difficulty of imagination and the discomfort of the imagined situation induced by prejudice inhibit the effect of reducing that prejudice. Data was collected via a Japanese crowdsourcing service; the final sample was 383 heterosexual men aged 22-77 ($M = 45.1$, $SD = 10.9$). Participants reported pre- and post-intervention attitudes towards gay men. After the IC, they answered the difficulty of imagination and their level of discomfort with the imagined situation. Mediation analysis showed that, in addition to the direct effect of pre- to post-intervention attitudes, only the discomfort significantly mediated the two attitudes. In other words, the more negative individuals' prior attitudes, the more uncomfortable the imagined situations are, which in turn reduces the effectiveness of the intervention. This indicates that there are impediments to effectiveness among the very targets of the IC (i.e., prejudiced people). Future research should investigate how to enable these individuals to imagine a comfortable contact and maximize the effects of the intervention.

[56] Disrupting Assumptions: Identity Threat and Science Achievement in U.S. Eighth Graders

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Despite persistent gender disparities in STEM, little is known about how social identity threats affect middle school science achievement. Using nationally representative data ($N=23,861$, $Mage=14.23$, $SDage=0.46$, 51.1% female, 749 schools) from the 2011, 2015, and 2019 Trends in International Mathematics and Science Study (TIMSS), we examine how students' gender, perceptions of identity threat, teacher gender, and school science resources predicted science achievement among eighth graders in the United States, using hierarchical linear modeling. Although female students consistently performed worse relative to male students ($b=-1.21$, $p<.001$), male students demonstrated greater sensitivity to identity threat ($b=.29$, $p=.011$), potentially driven by higher science liking and confidence. We found no evidence that teacher gender moderated students' achievement ($p=.095$), suggesting that perceived teacher warmth in middle school may buffer students from threat effects. These findings challenge assumptions about who experiences identity threat and when it emerges, and they underscore the need for early, motivation-focused interventions to promote equity in STEM education.

[59] Distinguishing perceived and actual psychological safety: low-status members underestimate the safety

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

Psychological safety is a group-level concept defined as the shared belief that a team is safe for interpersonal risk-taking. As this is a shared belief, members of the same team are assumed to perceive similar levels of safety. However, it has been demonstrated that low-status members perceive a lower level of safety than high-status members. Thus, we examined the gap between "actual" and perceived psychological safety among high- and low-status members. We conducted a web survey (N = 641) to measure participants' subjective status and perceived psychological safety (e.g., If I make a mistake on this team, my colleagues will hold it against me). We also estimated actual safety by averaging each participant's attitudes toward others (e.g., If my colleague makes a mistake on this team, I will hold it against them). The results demonstrated that (1) participants' perceived safety was lower than actual safety, (2) this gap was larger among low-status members, and (3) low-status members perceived lower psychological safety. These findings suggest that low-status members underestimate safety, which may inhibit error reporting or voice behavior.

[60] Distributional Hypothesis of Immigrant Stereotypes

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Stereotypes of immigrants are shaped by historical affordances; as history changes, so do mental representations. We distinguish two forms of stereotypes. Symbolic representations capture a group through labels and traits (e.g., nationality, competence). Distributional representations capture the network of concepts that co-occur with a group, such as major cities, political events, and public figures, thereby linking the group directly to historical contexts beyond abstract labels. We analyzed two forms of stereotypes of Chinese immigrants using the Corpus of Historical American English from the 1900s to the 1990s. Adjectives associated with symbolic Chinese became more positive over time on warmth and competence. Meanwhile, the distributional concepts shifted (e.g., from railroad construction to world wars, and global trade), but their evaluations remained stably negative. Preliminarily, we found symbolic stereotypes align with friendlier elite rhetoric toward Chinese, while distributional stereotypes reflect limited changes in their economic status. By anchoring group images in history, distributional stereotypes illuminate the socio-structural roots of stability and change.

[61] Do Ecology Stereotypes Override Race Stereotypes? A Focus on Asian and Latino Americans

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The affordance management approach posits that in the US, social perceivers use race stereotypes as a proxy for ecology stereotypes. Previous research suggests that without ecological information, African American stereotypes reflect harsh ecologies, while White American stereotypes represent hopeful ecologies. When ecological information is provided, the race effect vanishes. The current study extends the prior work and examines this ecology-override perspective in the context of Asian and Latino Americans. Based upon a life history perspective, it was hypothesized that (1) without ecology information, Asian stereotypes reflected hopeful ecologies, highlighting slower life history strategies than those of White/Latino/African American. (2) Latino stereotypes reflected harsh ecologies, highlighting faster life history strategies than those of White individuals and similar to those of African Americans. (3) When ecological information is provided, the racial difference in ecology-related stereotype perception will decline or disappear. A 4×3 ANOVA tested these predictions. Results generally supported our hypotheses; however, more nuanced patterns emerged based on participants' political ideology. Findings will enhance the applicability of affordance management theory and shed light on racial bias reduction in the US.

[62] Do Gay People Face Discrimination in Jobs Perceived as Influencing Others' Values?

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Anti-gay rhetoric has dramatically increased, particularly targeting gay people in certain jobs (e.g., teachers). This research examines whether a job's perceived influence on others' values predicts greater anti-gay discrimination by increasing perceptions that gay people in such roles threaten societal norms and values. We first looked at teachers, pretested as a job that shapes values. In Study 1 (N = 274), straight participants who read about teachers' abilities to instill values in students saw gay teachers as more threatening and supported discrimination against gay teachers more than participants who read about teachers in a non-value-related context (e.g., standardized testing). Study 2 (N = 180) examined whether this effect generalizes to journalists, another job pretested as influential to others' values. While we found that participants supported discrimination against gay journalists more than straight journalists, increasing the perceived value influence of journalists had no effect. Together, these findings provide mixed evidence for the role that a job's perceived value influence plays in driving discrimination against gay people.

[63] Does Outrage Close or Open Minds? Moral Outrage and Information-seeking

4:40 PM – 5:40 PM

MORALITY

Moral outrage is often portrayed as a driver of polarization and hostility. But it may also motivate constructive behaviors like seeking opposing viewpoints. Across two experiments, we examined whether outrage promotes seeking opposing viewpoints (or seeking disconfirming information) and attitude change. In Study 1 (N = 669) we measured information seeking as choosing complex (vs. simple) arguments; and inducing outrage did not increase this preference compared to sadness or control. In Study 2 (N = 905) we measured information seeking as the number of arguments one disagreed with but read anyway. Here, inducing outrage increased seeking disconfirming information compared to sadness, but not control. Moreover, by increasing exposure to disconfirming information, outrage indirectly reduced expected outrage from future disagreements but reinforced participants' support for and confidence in their existing beliefs. These findings partially support the idea that outrage may motivate seeking disconfirming information, and suggest a complex relationship between these constructs, as the effects depend on the comparison emotion and how information seeking is operationalized.

[64] Double Standards and Moral Misperceptions Among Political Partisans

4:40 PM – 5:40 PM

MORALITY

Double standards seem to arise whereby political partisans permit certain behaviors for their ingroup yet condemn the same behaviors for the outgroup. The current study (N=455) utilized a between-groups design to (i) identify such double standards and (ii) examine whether the size of double standards depends on misperceptions of political ingroups and outgroups in terms of their norm adherence tendencies in presumed responses to moral dilemmas. The results indicate that outgroup partisans were perceived to exhibit more opponent spite and be more likely to support undemocratic candidates than ingroup partisans. Additionally, outgroup members were perceived to be more supportive of partisan violence than ingroup members. Finally, perceived differences in the support for partisan violence were larger among participants who perceived larger differences between typical ingroup and outgroup members in terms of their norm adherence tendencies in presumed responses to moral dilemmas. Counter to our hypotheses, there was little evidence for genuine double-standard effects in which same behaviors were condemned for the outgroup but not the ingroup.

[66] Dynamic Norms Signal Future Group Prototypes: Reframing National Identity to Mobilise national movement

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Commitment to one's nation is paramount to sustaining successful national movements. Yet there is limited research on whether national identity can shift and, if so, through what mechanisms this may affect national movements. We propose that dynamic norms—norms that signal how group norms are changing over time—not only provide self-efficacy to overcome challenges and change, but also introduce a novel mechanism whereby dynamic norms can reshape group prototypes and, in turn, strengthen national commitment. Specifically, we argue that dynamic norms highlight shifts in group prototypicality, offering cues about the future ideal member of the nation. To test this, we examined a newly established national movement in Singapore: intergenerational bonding. Participants (N = 300) first read an article about intergenerational bonding, followed by dynamic norm information describing either increasing national commitment as a future national prototype (vs. pet-lover commitment toward a pet-shelter prototype). Results showed that participants who identified as committed to their nation, when exposed to the national prototype condition, reported stronger relatedness across age groups, greater support for government policies on intergenerational bonding, and higher willingness to adopt behaviours aligned with the future prototype of increasing national commitment. These effects were mediated by increased national optimism about the success of the movement. Overall, the findings suggest that dynamic norms can reorient group prototypes and encourage stronger national commitment, offering a novel pathway for mobilising collective action.

[67] Effects of Skin Tone on Mind Perception and Occupational Suitability Judgments

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

People form different impressions about and exhibit biases towards others based on skin tone. We investigated whether there is a bias in mind perception (agency, experience; Gray et al., 2007) towards targets with different skin tones and tested a possible mechanism of the relationship between them, as well as one of its downstream consequences. In Study 1, Korean participants perceived lighter-skinned Korean targets as having higher agency (but not experience) than darker-skinned Korean targets. This relationship was mediated by perceived socioeconomic status (SES): Lighter-skinned (vs. darker-skinned) Korean targets were perceived as having higher SES, which was in turn associated with being perceived as having higher agency. Study 2 examined a practical implication of these findings in terms of perceived occupational suitability. Higher perceived agency of lighter-skinned (vs. darker-skinned) Korean targets was associated with higher suitability for occupations requiring high agency.

[68] Environmental Moral Concern in Australian and American Children

4:40 PM – 5:40 PM

MORALITY

No group will bear the brunt of climate change more than today's children, so clarifying their environmental reasoning is timely and pragmatically important. Examining children's moral concern in countries with similar per-capita greenhouse gas emissions provides insights into the generalizability of such concern, which is important for global mitigation strategies. 228 children in Australia (N = 74) and the United States (N = 154) ages 5-10 were tested to examine trajectories of moral concern during a sensitive period of development. Children's concern for 24 items falling under the categories of environment, objects, humans, and animals was measured using a child-friendly moral circles paradigm. Children prescribed at least some concern for environmental entities, but less than certain animals and people (e.g., mothers). Children's concern for some, but not all, environmental entities increased with age and did not vary between the two countries. Altogether, these findings present avenues for future research and interventions to promote sustainable behavior, especially before environmentally unfriendly behaviors become ingrained.

[69] Everyday Moral Disagreement: Context, Content, and Consequences

4:40 PM – 5:40 PM

MORALITY

Everyday life is full of moral disagreements, yet research rarely examines this in context. In a preliminary study, participants (N=82) provided detailed accounts of their most recent disagreement along dimensions of content, context, and consequence. Most disagreements were at least moderate in personal significance (67%) and about the permissibility of actions (63%), although disagreement about the moral traits of individuals (30%) were still notable. The most relevant moral foundations were harm, proportionality, and equality (>45%). Disagreements mostly occurred in groups (66%), with family or friends (35-51%) and in residential settings (50%), but rarely with strangers (4%) or remotely/online (17%). This calls into question the generalizability of research that investigates disagreements with strangers or on online platforms. Most disagreements were resolved by agreeing to disagree without further conflict (57%); however, a fair number of disagreements (28%) resulted in successful moral persuasion. These findings suggest that close relationships and personal settings are the most relevant contexts for studying disagreement and that people may be surprisingly tolerant and open to updating their views.

[70] Examining Honesty as a Moral Pillar: A Pilot Study

4:40 PM – 5:40 PM

MORALITY

Moral foundations theory (MFT) posits that there are six universal pillars of morality: care/harm, fairness/cheating, loyalty/betrayal, authority/subversion, sanctity/degradation, and liberty/oppression. Scholars have argued for the inclusion of honesty as an additional pillar, suggesting it may uniquely inform moral attitudes and behaviors. The present study sought to explore this claim empirically, assessing whether the perceived honesty of an action differentially predicts its perceived morality when controlling for the six established pillars. Participants (N = 105) read a series of 15 scenarios, each of which described behavior relevant to honesty along with at least one other pillar. Participants then rated their overall assessment of the behavior's (im)morality, and indicated to what extent they felt the behavior upheld/violated each of the six established pillars, as well as honesty. Linear regressions revealed that, for 10 of the 15 scenarios, honesty did uniquely predict assessments of morality when controlling for established pillars. We will discuss implications and future directions for research on the inclusion of honesty within the MFT framework.

[71] Examining political polarization of young people in the United States

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

During the 2024 U.S. presidential election, the political ideology of people under 30 became a popular topic of conversation as the divide between young men and women has begun to diverge. A common narrative explains the difference as emerging from conservative media figures promoting traditional gender roles and political violence towards out-groups.

The present study will examine media trust and political attitudes in a sample of undergraduate students in the U.S. The survey includes measures of political collective narcissism (Golec de Zavala et al., 2009), Ambivalent Sexism (Rollero et al., 1999), zero-sum thinking (Chinoy et al., 2023), and social dominance orientation (Ho et al., 2015) and questions about media trust, status threat, gun interest, and civic engagement interest. We expect to find that white men will have a stronger desire for social dominance, be more likely to trust conservative media, be more interested in guns, and less interested in civic engagement. These results will provide insight on how media consumption, gender attitudes, status threat, and societal perceptions may contribute to political attitudes and behavior among young adults in the United States.

[72] Examining the Christian-Science Stereotype for Religious "Dones"

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Research supports the existence of a stereotype that Christians are less competent in and trusting of science than Atheists. Christians are aware of these stereotypes, while Atheists also believe in the stereotypes (Rios et al, 2015). Recently, researchers have focused attention on religious "Dones"; those individuals who are formerly Christian believers, but no longer hold those beliefs (Van Tongeren et al., 2021) and a religious residue effect, showing the continued impact of one's Christian affiliation. We examined the residue of being Christian for the descriptive and prescriptive interpersonal stereotypes of one's competence and trust in science. In Study 1, participants rated Always Christians, Former Christians (i.e., "Dones"), and Always Atheists on several traits, including competence and trust in science and analytical thinking. Dones were expected to be significantly more competent and trusting than Always Christians, but still less than Always Atheists. Study 2 examined the impact of one's reason for disassociating with Christianity and demonstrates the impact of intellectual versus moral reasons.

[73] Examining the Role of Early Parent-Child Interactions on Moral Judgment: Extending the Scope of the Affective Harm Account (AHA)

4:40 PM – 5:40 PM

MORALITY

The Affective Harm Account (AHA) of moral judgment posits that harm and affect jointly contribute to evaluations of immorality. Within this framework, harm perception is theorized to stem from cultural assumptions, but other formative influences remain understudied. Building on research on the effects of secure child-caregiver attachment on social and emotional development, we examined how early parent-child interactions shape the mechanisms proposed in the AHA. Participants (N = 572) completed measures of perceived parental warmth, communication, and control. They then evaluated moral scenarios on harmfulness, disgust, victimhood, and immorality following AHA procedures. Results replicated the AHA's central finding that perceived harm strongly predicts immorality. Early parent-child interactions moderated this relationship: participants who reported more open maternal communication and control, as well as greater paternal warmth and control, judged scenarios as more immoral, but only when they did not perceive them as more harmful. These results expand upon the AHA account by providing novel insights into the roles of parent-child interactions on moral development.

[74] Explicit but Not Implicit Bias: White Supremacist Beliefs Predict Discrimination Toward Muslim Men Across Anglo-Saxon Countries

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

White supremacist extremism continues to pose a significant threat to multicultural societies, with a rise in violence and discriminatory rhetoric targeting Muslim individuals across Western nations. White supremacists (WS) believe in the superiority of white people, particularly straight, cisgender Christian men. Yet, there is limited research on biases against Muslim individuals and how WS beliefs may amplify them. Across three pre-registered studies conducted in the United States, Canada, and Great Britain, we examined whether WS beliefs moderated implicit evaluations and explicit hiring referrals toward perceived Arab/Middle Eastern and White men based on their religious affiliation. Results were consistent across the three countries: WS beliefs did not moderate implicit evaluations, but they did moderate explicit discrimination. Individuals high in WS endorsement were significantly more likely to discriminate against all Muslim men and to favor White Christians in hiring referrals. Overall, these results highlight the role of WS beliefs in amplifying explicit, but not implicit, biases against Muslim men and reinforcing positive ingroup biases toward White Christian men.

[75] Exploring caste-based microaggression in India through an intersectional lens

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The caste system, the social stratification in hierarchical order based on birth, has been entrenched in the Indian cultural milieu. It has been explicitly earlier, and is still, although subtly, a dominant state of mind directing perception, leading to biases, stereotypes, and discrimination in Indian society for the marginalized groups. The expression of this subtle, covered, involuntary form of discrimination is called microaggression. Based on the social identity theory, this study explores the caste-based microaggression and its association with other factors affecting social identity as gender, region, class, sexual orientation, and disability. A mixed-method study was designed, and 550 individuals (469 Females & 81 Males) aged 14 to 43 (Mage = 27.68) participated. Surveys and open-ended interviews were conducted. The findings revealed that caste-based microaggression, which is expressed in the form of verbal abuse and many times in non-verbal behaviour as untouchability, is still prevalent in the Indian society, which worsens for those when coupled by gender, class, region, and sexual orientation. Disability in itself showed a lot of prejudice and discrimination, but not particularly with caste-based microaggression.

[76] Exploring Lived Experiences and Social Perceptions of Fatherlessness on Reddit

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Father absence is a growing dynamic in the United States, yet little is known about how fatherless individuals describe their lived experiences and how they are perceived by others in informal contexts. This study used a qualitative thematic coding analysis to analyze 72 Reddit posts across four threads centered on individual experiences being fatherless as well as the social perceptions of the fatherless. Seven themes emerged: emotional and psychological struggles, identity and masculinity concerns, relational difficulties, maternal influences, stigma, and resilience. Respondents reported issues with self-esteem, intimacy, and trust; men often tied these struggles to issues with their masculinity while women described their challenges as a general consequence of being fatherless. One thread revealed stigmatizing portrayals of fatherless women as unstable or promiscuous in romantic relational contexts, reflecting a gendered double standard in how fatherlessness is viewed and interpreted. Results highlight how stereotypes around fatherless individuals not only shape cultural perceptions, but also how they may be internalized, deepening challenges associated with father absence.

[77] Exploring Translational Effectiveness of a Strategic Resource Use Intervention by Examining Heterogeneous Engagement

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Psychological interventions have improved student performance in randomized trials, but to establish translational effectiveness, scientists need to distribute these interventions at scale and monitor students' actual use. By examining engagement heterogeneity, researchers can examine the psychological ingredients that support student achievement. Undergraduates (across 76 classrooms and 9 semesters) completed a strategic resource use intervention targeting self-regulation by prompting them to select study resources, explain each resource's purpose resource, and plan their use. Completing the purpose explanation was uniquely associated with increased exam scores. To understand the psychological process of students that benefited from the intervention, we examined their responses to the purpose explanation component using thematic analysis and subsequent word count dictionaries. Students' consideration of exam format, strategies targeting learning, and evaluating strengths/weaknesses were associated with increased exam scores, but social processes were not. Understanding heterogeneous engagement may help pinpoint the effective psychological ingredients in an intervention.

[78] Extending the Stereotype Content Model to Romantic Dyads across Sexual Orientation

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Although the Stereotype Content Model (SCM) has been widely applied to social groups, the perception of dyads within this framework has yet to be explored. To address this gap, the current study (N = 119) compared perceptions of warmth and competence across sexual orientation for individuals (heterosexual men, heterosexual women, gay men, and lesbian women) and romantic dyads (heterosexual, gay, and lesbian couples). For individuals, results replicated prior work, with heterosexual men being rated as most competent and heterosexual women as most warm. For couples, heterosexual couples were perceived as the warmest and most competent, followed by gay couples, then lesbian couples. Comparisons of individuals and dyads revealed identity-specific effects: heterosexual couples were rated as warmer than heterosexual men and more competent than heterosexual women, gay couples as warmer than gay individuals, and lesbian couples as more competent than lesbian individuals. These findings suggest that relational cues such as coupledness can positively shift stereotype content, though in ways that differ by sexual orientation.

[79] Extreme Gender Stereotypes in LLMs: Evidence from Semantic and Stylistic Signatures

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

In over 1000 model queries, we prompted ChatGPT-4o to imitate teenage girls (GPT-Girl) and boys (GPT-Boy) expressing excitement. We extracted semantic and stylistic signatures to reveal stereotypical content and style best described as gender caricatures. GPT-Girl talked about Taylor Swift and puppies; GPT-Boy talked about Spiderman and pizza. GPT-Girl used over twenty times the number of emojis, twelve times the number of exclamation marks, and 1.5 times the interjections compared to GPT-Boy. GPT-Girl uniquely used expressions such as gosh/duh/hehe/soooo/ughhh/omg/bestie compared to GPT-Boy's more limited range of bruh/aw/yo/huh/nah. Additionally, GPT-Girl employed high-frequency nouns like "thing/outfit/concert" and adjectives like "cute/excited/fave" whereas GPT-Boy used "game/video/sport" and "new/crazy/big/instant." Replications with several prompt variations revealed similar stereotypes without abatement. These extreme results, generated by ChatGPT with such ease, raise concerns about gender stereotypes embedded in the LLM, coupled with a lack of accountability as it reinforces and reifies gender stereotypes in the minds of young users.

[81] Feeling the Truth: Measuring Non-Natives' Affect Toward and Preference for Decolonized History in Textbooks

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Research shows that K-12 social studies texts are biased in their presentations of history, often favoring Whites and either omitting Native Americans or dehumanizing them. For non-Natives, these texts may be their main source of Native representation and play a powerful role in shaping their understandings of history. Decolonization involves rewriting historical narratives to accurately represent Native Peoples. This study examined how non-Native college students responded to colonized (erasing/dehumanizing) vs. decolonized U.S. history excerpts. Participants (N=227) read both types of excerpts (order randomized), rated their affect (arousal, pleasure), indicated which excerpt they preferred, and stated which should serve as a model for history texts. The decolonized (vs. colonized) excerpts elicited higher arousal and lower pleasure, indicating discomfort. Yet, participants overall preferred the decolonized excerpt and were more likely to endorse it as a model. These findings show that despite initial unease, the inclusion of decolonized narratives in history may encourage critical reflection, helping to reshape harmful narratives about Natives in history curricula.

[82] Fetishized and Blamed: Attitudes Toward Asian American Women as Victims/Survivors of Sexual Assault

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The present study sought to investigate whether there are differences in the perceptions of Asian American women as victims/survivors of sexual assault compared to White American women, as well as which factors may influence any differential attitudes. This study utilized an online survey format to present participants with a sexual assault vignette that featured either an Asian American woman or a White American woman as the victim. Participants (N = 256) were asked to assign blame to the victim and the perpetrator. In addition, participants responded to measures of their endorsement of rape myths and stereotypes about Asian Americans. It was found that participants who were neither White nor Asian blamed the Asian American victim significantly more than the White American victim, although no differences in perpetrator blaming were found. Among Asian and White participants, this research did not find significant differential blaming based on victim race. This study demonstrated a tendency to blame Asian American women more than White American women for their sexual assaults, though this effect was not established for all participant groups. This finding has large implications for the healthcare, wellbeing, and legal treatment of Asian American women as survivors of sexual assault.

[83] Filtering Negative Affective Content from Social Media Increases Well-being

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

The influence of social media on well-being remains unclear. While High Arousal Negative (HAN) content (e.g., anger) is linked to lower well-being, causal evidence remains limited. In two pre-registered studies, we examined this using a plug-in that identified and removed HAN content from users' social media feeds in real time. Study 1 (N=217) recruited users over 4 months; in Study 2 (N=92), recruitment occurred during the 2024 U.S. Presidential Election. In both studies, users were randomly assigned to one of three conditions and provided daily well-being reports for four weeks. In the two treatment conditions, we reduced HAN exposure in week 2 or 3 using the filter; feeds remained unchanged in the control condition. Reducing HAN exposure significantly improved life satisfaction in both studies. In Study 2, during the election, it also reduced anxiety and depression. Reductions in HAN exposure mediated these effects and not explained by changes in platform use (e.g., time spent). Importantly, filtering did not reduce political engagement or news knowledge. These findings suggest that user-side interventions targeting affective content can meaningfully support well-being.

[84] Finding Focus in an Era of Constant Distraction

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Chronic distraction is a pervasive challenge across all domains of life. It interferes with learning, social relationships, performance, and time management. Therefore, it is useful to find ways to help people learn the self-regulatory skill of focusing on one thing at a time. Drawing on 11 evidence-based design principles, we developed a no-cost, publicly available tool to help people train their attention during routine activities that require concentration. Two naturalistic studies, including a pre-registered direct replication, evaluated this tool with adolescents across multiple public schools. While using the tool, students' focus improved within individual sessions and cumulatively across multiple sessions. Sensitivity analyses confirmed that these improvements emerged early in students' use of the tool and continued to develop over time. Among students with attention-deficit/hyperactivity disorder, the across-session improvement remained statistically significant while the within-session effect did not. Students also reported improved overall focus during class and independent assignments, with those who completed more sessions having the greatest gains in focus during independent work. These findings support a scalable approach to training attention and underscores the broader value of theory-driven design principles when building self-regulatory interventions.

[85] Fostering Student Growth: How Teachers' Mindset Beliefs Shape Classroom Opportunities

4:40 PM – 5:40 PM

MOTIVATION/GOALS

A growth mindset is the belief that qualities like intelligence can be developed through effort, exploring new strategies, and help-seeking. At the student-level, this mindset is linked to greater engagement and overcoming academic setbacks. Increasingly, however, research shows that growth mindset beliefs are most impactful when shared at the classroom-level too: when students take part in “cultures of growth” that emphasize mastery, provide learning support, and offer many opportunities to practice. Students see teachers as central to shaping these cultures, yet little is known about how teachers’ own mindset beliefs do—and do not—translate into growth-supportive behaviors. We surveyed 87 teachers across grade levels about their mindset beliefs and classroom practices. Teacher growth mindset was moderately related to some growth-supportive behaviors (e.g., allowing resubmissions, reframing mistakes as productive), but not to others (e.g., offering low-stakes formative assessments). We discuss these mixed findings—for example, some growth practices may not be seen by teachers as expressions of mindset, while others may be constrained by limited agency over teaching decisions.

[86] Fostering Virtues through Discussions of Moral Dilemmas

4:40 PM – 5:40 PM

MORALITY

Engaging with others who hold different beliefs is a particular need in our complex world. We studied the effectiveness of a co-curricular event where participants discuss challenging moral dilemmas to increase virtues such as intellectual humility, civility, and integrity. The study (N=128) compared event participants and a group of students who engaged with the dilemmas individually online, in a quasi-experimental design. Results revealed that event participants reported significantly greater perceptions of learning and higher quality social feedback from fellow students than online participants (who imagined peer discussions). Though we did not see direct effects on our key virtue outcomes, we suspected these cognitive and social perceptions might serve as pathways to virtue development. Through the cognitive pathway, event participants reported greater perceptions of learning than online participants, which was associated with greater perspective-taking, authenticity, and specific interest in further topic discussion. Through the social pathway, higher quality social feedback was associated with greater authenticity and general interest in future civil dialogue. d

[87] From Career Choice Motivation to Work-Related Outcomes via value congruence and Identity Fusion: A One-Year Longitudinal Study of Korean Police Officers

4:40 PM – 5:40 PM

MOTIVATION/GOALS

This study examined the longitudinal relationship between motivation for choosing a police career and subsequent work engagement and emotional exhaustion, focusing on the sequential mediating roles of value congruence and identity fusion. Participants were 194 new police officers in South Korea who completed online surveys at two time points. At Time 1 (one month after academy enrollment), participants reported their career choice motivations, perceived person–organization value congruence, work engagement, and emotional exhaustion. At Time 2 (one year later, six months after departmental assignment), they reported their levels of identity fusion with the police, work engagement, and emotional exhaustion. Results showed that higher intrinsic career choice motivation predicted greater perceived value congruence during early training, which in turn fostered stronger identity fusion one year later. This pathway ultimately led to higher work engagement and lower emotional exhaustion. These findings offer practical insights for recruitment and initial career development in policing.

[88] From High School to Creative Careers: The Role of Gender

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

The explanation of the gender gap in creative occupations is largely centered on the notion that men and women differ in the personality dispositions that lead to creative success. This notion hinges on the assumption that the predictors operate similarly across genders, despite the limited empirical evidence for this assumption. We addressed this omission by testing whether gender moderates the relationships between conceptually relevant predictors of creative achievement (i.e., personality traits, occupational interests, and abilities) and occupational creativity, directly testing the equal-prediction assumption. Using a nationally representative cohort of U.S. high-school students followed for 50 years (1960 to 2010), we tested preregistered Personality $\times$ Gender interactions via hierarchical regressions with robust covariate adjustments. Across 47 interactions, most moderator effects were small and unstable. Overall, we found robust evidence that the personality predictors of occupational creativity are similar for men and women.

[89] From Principles to Signals: Why Public Virtue Gets Undermined

4:40 PM – 5:40 PM

MORALITY

Virtue discounting—the tendency to derogate public acts of virtue—has mostly been studied in generosity and fairness, leaving open its generalizability across virtues. We conducted a preregistered, highly powered study ($N = 800$) testing 40 behaviors across 20 virtues. Participants read vignettes of private or public behaviors and rated them on moral goodness, virtue, principled motivation, reputation signaling, and norm signaling. Public behaviors were perceived as more reputation-driven ($d = 0.29$) and more norm-motivated ($d = 0.40$). Private behaviors were seen as slightly more principled ($d = -0.03$). This pattern held for fairness, generosity, honesty, integrity, love, and perseverance, but no condition differences emerged for perceived morality or virtue of the act. Correlations showed that principled and norm-setting—but not reputation—motives predicted greater perceived virtue and morality. Thus, while public virtue invites reputational attributions, it also elicits norm-focused attributions, with these and principled attributions being stronger predictors of virtue/moral goodness, suggesting concerns about virtue discounting may be less severe than previously thought.

[90] From the Cradle to the Crown: A Developmental Perspective on Leadership

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

Leadership is an essential element of all human groups. Although much work has examined the consequences of different leadership styles, we know relatively little about the factors that influence people's leadership styles. The current work uses an attachment perspective to develop predictions about developmental underpinnings of leadership. Three studies reveal that attachment insecurity (i.e., anxiety and avoidance) is associated with dominance, a social influence strategy founded on force and intimidation, whereas attachment security is associated with prestige, a social influence strategy founded on wisdom and voluntary deference. Study 1 demonstrated correlations between individual differences in attachment style, dominance, and prestige. Study 2, an experiment, revealed that participants who engaged emotionally with an attachment security (versus control) prime displayed a penchant for prestige. Study 3 replicated findings from Study 1 while also showing that certain aspects of prestigious leadership may be associated with high levels of attachment anxiety. Discussion centers on the contributions of the present work to the literatures on both attachment and group behavior.

[91] Gender bias in the perception of women with alcohol use disorder

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

People with substance use disorders (SUDs) are described as dangerous, immoral, and of weak character (Fetterhoff 2023). People also see SUDs as a disorder as a mans disorder (Sileo et al., 2020). Research shows that women are seen as more nurturing (Nesdoly et al. 2020). This may result in women with SUDs, especially mothers, to be evaluated more negatively than their men counterparts. Fathers' parenting behaviors are more often goal-oriented, where mothers are expected to provide more emotional support. Our study aims to see if gender differences affect society's prejudice against mothers who use large amounts of alcohol. Participants read a scenario involving men or women parents who used excessive alcohol or not. We then measure attitudes toward the target in the scenario, and repeat the process several times seeing varying conditions. We find strong main effects that people who use excessive alcohol are rated much more negatively compared to control. We also find that, among women who drink excessively, single moms were rated significantly worse than married moms or women without kids. Among men who drink excessively, evaluations were most negative among married fathers relative to single dads and men without kids.

[92] Gender Differences in Perceived and Actual Moral Behavior

4:40 PM – 5:40 PM

MORALITY

Who is more ethical, men or women? Prior research suggests both men and women tend to think women are morally superior. But are these beliefs accurate? Across five studies (N = 1910), we test whether people's beliefs about the ethicality of others aligns with true rates. In Study 1, we find that people generally overestimate the unethicality of others' self-reported behavior, but this effect is attenuated when judgments are about women. In Study 2, we replicate this pattern using judgments about hypothetical situations. In Study 3 and 4, we turn to estimating rates of prosociality: We find that people overestimate how often someone would return a wallet—an effect which is greater when estimating the rate for women (Study 3). In Study 4, participants estimated the generosity of others in a dictator game. We found that participants overestimated the generosity of women, but underestimated the generosity of men. In Study 5, we plan to use a dictator game to test if similar patterns emerge when estimating rates of cheating. Overall, people consistently overestimate the ethicality of women, revealing that people are largely inaccurate in predicting gender differences in moral behavior.

[93] Generating Redemption Narratives Buffers the Acute Affective Consequences of Reliving Past but not Ongoing Racism

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Racism threatens the psychological well-being of communities of color. Past work suggests that redemption narratives (RN), a form of positive reappraisal wherein people seek ways they have grown from past adversity, can reduce the negative emotional consequences of re-living experiences of discrimination. The present work examined whether RNs shape responses to ongoing discrimination. Black participants (N = 569) relived an experience of racism and were then assigned to generate a RN or to a control condition. Global positive affect was assessed prior to (T1) and just after (T2) the reliving task and after engaging in the RN or control task (T3). Participants then read an article about federal attacks on DEI/Black history and their global positive affect and coping intentions were assessed (T4). Replicating past work, T1 & T2 affect did not differ by condition, but the T3 positive affect of RN participants was significantly greater than that of control participants. There were not, however, condition differences in either participants' T4 positive affect or coping intentions, suggesting that RNs do not blunt the pain associated with new experiences of racism.

[94] Generative Artificial Intelligence Dependency: Scale Development, Validation, and its Motivational, Behavioral, and Psychological Correlates

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

As generative Artificial Intelligence (AI) becomes increasingly integrated into daily life, concerns have emerged about AI dependency and its potential consequences. This research develops and validates the Generative AI Dependency Scale, a multidimensional tool to assess individual differences. Across six studies with 1,333 participants from the United States and Singapore, the scale demonstrated strong psychometric properties, including a stable three-factor structure (cognitive preoccupation, negative consequences, withdrawal) and good test-retest reliability (ICC = .87). Confirmatory factor analysis supported a higher-order construct, and scalar invariance was established across sex and cultures. Convergent and discriminant validity were shown with an AI addiction scale and the Big Five personality traits respectively. Dependency was significantly associated with motivational (lower basic psychological need satisfaction, greater fear of missing out), behavioral (increased procrastination and cognitive failures, lower task performance, critical thinking), and psychological (reduced self-concept clarity, greater loneliness) outcomes. The findings suggest that dependency reflects a misalignment between psychological needs and the strategies employed to meet them. The scale offers a robust basis for future research, and responsible AI design and use.

[95] Goal Disruption Theory: Qualitative Analysis of Daily Life Expectation Violations

4:40 PM – 5:40 PM

MOTIVATION/GOALS

According to goal disruption theory (GDT), when people's expectations about goal pursuit are violated, they experience psychological disequilibrium, a motivational state that drives systemic changes in cognition and behavior to help people regain psychological equilibrium. Despite several laboratory studies providing evidence for these effects, there has been little work examining goal disruption in daily life. We recruited a large Prolific sample (N = 438) for a weeklong daily diary study that longitudinally and qualitatively assessed people's goals, hindrances to goal pursuit, and their experiences of goal expectation violations. We addressed 3 research questions: 1. Do people's goals map onto categories found in prior GDT research? 2. What are the prominent categories of people's goal expectation violations? and 3. How do people respond when they are prevented from working toward their goals? Three independent raters coded the qualitative data. Most goals mapped onto GDT-derived categories (RQ1), goal expectation violations were the most common impediments (RQ2), and people took action in response (RQ3). These qualitative findings help establish the ecological validity of GDT.

[96] Happiness is what happiness does: Inferring happiness levels from situational judgment

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Social cognitive theories contend that lives are built on particular responses to particular situations in much the same way that a wall can be built using individual bricks. Theories of this type can be fleshed out through the use of the situational judgment test method, which asks test-takers how they would respond to concretely described life situations. A general-purpose test of this type was created, following which each participant's vector of situation/response units was correlated with a prototype of the happy person. In two studies (total N = 356), participants received behavioral tendencies of happiness (BT-H) scores on the basis of their responses. As hypothesized, higher-scoring participants experienced higher levels of well-being, partially because they were more successful in satisfying basic psychological needs. A second study linked BT-H scores to key processes involved in self-regulation and to daily behaviors and experiences that have been emphasized in recent theories of well-being. The research demonstrates the value of understanding broad constructs, such as happiness, on the basis of more particular person-situation-behavior units.

[97] Health-Related Stigma Consciousness as a Predictor of Health Information Avoidance

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Despite the potential benefits of personalized health risk information, some people choose to avoid information about their health. Health-related stigma consciousness, or the extent to which someone perceives discrimination against those who are unhealthy, may motivate people to avoid learning negative information about their health, especially if they perceive their health status as out of their control. Thus, we aimed to understand how stigma consciousness and locus of control relate to avoidance of health information. Participants were undergraduate students ($n = 378$) who completed measures of health-related stigma consciousness, health-related locus of control, and health-information avoidance. Regression analyses indicated that those who were higher in health-related stigma consciousness were more likely to avoid information about their health, even when their internal locus of control is higher than average. These results represent a first step in identifying health-related stigma consciousness as a possible reason for health information avoidance and suggest the need for future research examining whether and how stigma consciousness might cause health information avoidance.

[99] Heterosexual and bisexual adults' moral and punishment evaluations of identity denial targeting bisexual individuals

4:40 PM – 5:40 PM

MORALITY

People with intermediary identities (e.g., outside of binary categories), such as bisexual individuals, often face miscategorization. Prior work suggests that people tend to perceive that common behaviors are morally good (Goldring & Heiphetz, 2020); thus, they may not view common forms of biphobia (e.g., identity denial) as immoral. Yet people are also motivated to perceive the world accurately (Higgins, 2019); therefore, participants may view miscategorization as wrong because it entails inaccurate perceptions of others. Two studies investigating evaluations of miscategorizations showed that straight and bisexual participants responded most favorably to not miscategorizing bisexual targets and least favorably to miscategorizing bisexual targets as straight, with gay/lesbian miscategorizations falling between these two extremes. Bisexual participants also reported harsher responses overall than did straight participants. In line with truth motivation, participants viewed identity miscategorization unfavorably; however, direct experience with this type of miscategorization may have amplified this response. These findings advance research in both social identity and moral cognition.

[100] Historical Indigenous Knowledge links to Perceptions of Racism and Advocacy for Indigenous People

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Historical erasure is connected to systemic oppression, as research shows that limited historical knowledge of past racism contributes to lower perceptions of racism in current events. This finding has been less studied in Indigenous populations. In study 1 ($N=158$), we demonstrated significantly higher Indigenous historical knowledge in participants that identified as Native American (vs. White) and that more historical knowledge related to lower perceptions of invisibility, higher perceptions of isolated/systemic racism, and more advocacy intentions. Results also indicated those with higher Indigenous historical knowledge attributed more systemic and less individual causes to the Missing and Murdered Indigenous Women Girls and Two-Spirit crisis (i.e., MMIWG2S, high rates of violence toward Native women and two-spirit individuals, with some rates more than 10 times the national average). Study 2 examines whether providing White participants ($N=300$) with information on Indigenous history can increase detection of present-day racism, leading to endorsement of more systemic and less individual MMIWG2S causes, more advocacy support, and greater recognition of systemic racism.

[101] How & why?: Third-person perceptions of people with terminal illnesses' suicides as a function of suicide method & motive

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

We assessed third-person perceptions of people with terminal illnesses' suicides as a function of situational factors related to the suicide. Vignettes were used in between-groups designs to manipulate a target's suicide method (Study 1) and primary motive (Study 2). Both studies also measured perceivers' individual differences. Medical methods (e.g., physician-assisted death) tended to be perceived more favorably than traditional methods (e.g., hanging; Study 1), but minimal differences emerged across motives (e.g., mental health concerns, wanting control over death; Study 2). Masculine Honor Beliefs positively related to stigmatizing attitudes. Free Will Beliefs' effects were often moderated by conditional manipulations. Fear of Death yielded contradictory effects. Suicide Acceptability was consistently positively associated with favorable attitudes. Overall, this research has important implications for understanding the extent to which individual differences and nuanced situational factors contribute to stigma directed toward end-of-life decisions.

[102] How AI-Based Personalized Messaging and Learning Processes Promote Virtuous Behavior

4:40 PM – 5:40 PM

MORALITY

Virtue ethics and consumer behavior literature suggest that consumers can escape competitive consumption patterns by cultivating virtues, particularly temperance, which in turn promotes temperance-related behaviors. By leveraging AI technologies—such as personalized recommendations, aggregated data, and future impact predictions—this paper proposes potential applications of AI to provide: 1) enhanced future self-continuity, and 2) aggregated climate impact feedback. These applications aim to increase (1) consideration of the future (counteracting present-focused inertia) and (2) collective perspective (counteracting individualistic inertia), thereby encouraging temperance behavior.

[103] How and why moral judgment influences aesthetic experience

4:40 PM – 5:40 PM

MORALITY

Open questions remain regarding the role of moral considerations in aesthetic judgments of artists and their products. Here, we systematically investigated the robustness, boundaries, specificity, and moderators of the moralization of aesthetics. Data from five preregistered studies (N = 4,845) show that moral information about creative professionals impact the aesthetic experience of their work. In Study 1, moral evaluations of artists accused of wrongdoing predicted ratings of the enjoyment of their music, evincing a moralization of aesthetics. Study 2 showed the generalization of this effect across different categories of creatives and moral violations. Study 3 demonstrated the specificity of this effect to cases of moral, compared to social, violations. Study 4 showed that the effect was asymmetrical: more pronounced for negative than positive moral behavior. Finally, in Study 5, we show moderation by individual differences in people's valuation of aesthetics. We contextualize this research within the debate between moral primacy and values pluralism as well as the broader literature on moralization.

[104] How Cultural Contexts Shape Views on Aging in Emerging Adults in Hawai'i

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Aging is a universal process, yet self-perceptions of aging are shaped by cultural contexts. The present study (n = 150) aimed to examine how collectivist and individualist mindsets influence self-perceptions of aging among emerging adults (ages 18–25) in Hawai'i. The quantitative survey assessed cultural mindset and aging perceptions and compared local Hawaii students to those from the continental U.S. and international students. Local students, influenced by collectivist values prevalent in Native Hawaiian and Asian cultures, reported more positive aging perceptions. Mainland students, who held more individualistic mindsets, showed more negative aging perceptions. As opposed to previous mixed findings between collectivism and self-perceptions of aging, the present study's findings illuminate how cultural mindsets are developed within specific geographic contexts, which then shape aging perceptions during emerging adulthood. Results can inform culturally tailored interventions to promote healthy aging attitudes. The findings contribute to the growing literature by integrating cross-cultural and place-based perspectives in a unique multicultural environment.

[105] How Cultural Tightness Alters Gender Norms' Impact on Societal Development?

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Societies differ in cultural norms and gender roles, shaping stability and development. Yet research rarely tests their joint impact on happiness and prosperity, leaving macro-level effects understudied. This study investigates how gender norms (GN) and cultural tightness-looseness (CTL) interact to predict societal well-being (SWB) and economic outcomes worldwide. Using World Values Survey Wave 7 data, we constructed country-level GN, CTL, and SWB indices. Preliminary OLS models controlling for sex and income indicate that tightness predicts higher SWB while gender norms predict lower SWB; however, CTL can either amplify or buffer GN effects depending on context. We next incorporate female labor participation as a mediator and link the model to five-year average GDP, with planned multilevel and mediation analyses evaluating labor participation as a pathway to SWB and GDP. The cross-sectional design supports replication but limits causal inference and may mask within-country heterogeneity. Nevertheless, these findings advance cross-cultural theory by highlighting conditions where gender equality promotes well-being and growth, guiding policies on equity and sustainable development.

[106] How do Companies Discuss the Grand Challenges of Diversity, Environment, Economy, and Governance?

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

Corporations hold power: controlling resources, employing millions, and shaping public discourse. As calls grow to look beyond profit, it is critical to examine how they discuss Grand Challenges (GCs) of diversity, environment, economy, and governance. Here, we present a methodological framework and empirical findings into 162 international companies' GC communications on social media (Twitter/X) over 14 years (2011-2024). First, we developed and validated a fine-tuned predictive classifier to detect GC content at scale, analyzing ~1.8 million posts and finding that 14.6% reference GCs, with most (70.3%) focused on social/environmental issues. Utilizing transformer-based (BERT) sentiment analysis, we found companies employed more positive sentiment in GC communications than in other posts, with such positive sentiment rising over time, while neutral/negative tones declined. Notably, topic models revealed this positivity often marked celebratory events (e.g., Earth Day), rather than confronting GCs directly. Overall, results underscore how corporate social media both informs and manages impressions, signaling values that shape collective views and actions on societal issues.

[107] How Do Religious Group Identity and Belief Alignment Shape Social and Moral Judgments?

4:40 PM – 5:40 PM

MORALITY

Moral psychology often investigates transgressions at the interpersonal level, but in everyday life, wrongdoing often occurs in group contexts. Because people often link religion and morality, religion provides an especially useful lens through which to examine how alignment with religious groups shapes moral judgment. We will probe participants' moral judgment about religious and secular transgressors whose beliefs align or misalign with their group. We predict participants will judge belief-misaligned transgressors more harshly than those who are aligned, in line with prior work showing that group misalignment increases negative social judgment (Pinto et al., 2010). We also predict participants will judge targets in the religious group harsher than those in the secular group, because religion elicits expectations of increased moral behavior (Bloom, 2012). This research will illustrate how group alignment informs how people judge transgressors and how religious identity influences this dynamic. We are awaiting IRB approval and will collect data as soon as approved; in past work we have tested hundreds of participants in a week or less using platforms such as Prolific.

[108] How does academic performance ranking affect students' psychological well-being? A scenario study in Chinese 6th grade classrooms.

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Class and grade level-wide ranking of students' academic performance is common practice throughout China. However, little is known about the effects of such ranking systems on students' psychological well-being.

We use a scenario study to investigate the causal effects of academic performance ranking on students' sense of belonging, self-efficacy, growth mindset, and academic motivation at a Chinese public school.

Sixth grade students (N = 324) at a Chinese public school are randomly assigned to read and respond to control condition with no ranking, low/high ranking, and low/high ranking + explanation. Our primary hypothesis is that both low and high academic ranking, compared to no ranking (control), induces stress and encourages a fixed mindset about self and intelligence, especially for low-ranking students. Moreover, we test whether a statement describing the purpose and reasoning for the ranking (low/high ranking + explanation) mitigates the negative impacts of ranking on students' sense of belonging, self-efficacy, and academic motivation.

Potential implications on Chinese education policy, educator training, student mental health and flourishing are further discussed.

[109] How Emerging Adults' Perceptions of Parental Social Dominance Orientation Relate to their Academic Self-Efficacy

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Theoretically, parents' ideological beliefs, including views on social hierarchies, may shape college students' academic confidence. To examine this relationship, this study collected data from college students (N = 211; 61% female; 50% White) and asked: (1) To what extent do students' perceptions of their parents' Social Dominance Orientation (SDO) relate to their academic self-efficacy, and does perceived parental expectation mediate this link? (2) To what extent do students' own SDO or perceived parental SDO relate to their interest in hierarchy-attenuating and hierarchy-enhancing occupations? A mediation analysis (5,000 bootstraps) showed that perceiving their parents as endorsing hierarchical beliefs predicted lower academic self-efficacy ($B = -0.179$, $p = .002$), though perceived parental expectations did not mediate this effect ($B = 0.014$, $p = .556$). A correlation analysis indicated no link between self- or parental SDO and occupational aspirations. These findings suggest implicit hierarchical beliefs shape academic motivation in emerging adulthood and highlight the need for research on sociopolitical influences in students' academic experiences.

[110] Human-AI Relationships and the Perception of AI Moral Patency

4:40 PM – 5:40 PM

MORALITY

Advancements in AI technology have resulted in a growing number of people turning to AI for emotional support and companionship. Although people generally do not perceive AI as moral patients (i.e., deserving moral concern), little work has examined how these emerging relational contexts might impact such ethical judgments. The present work examines how a human's relationship with an AI may influence perceptions of moral patency. Participants will read a vignette in which an individual insults an AI either described as a generic chatbot, or another person's AI companion. Participants will then judge the wrongness of this action either 1) because the AI has moral worth in itself, or 2) solely because of the negative effects on the human who may care for the AI. This distinction elucidates whether relationships increase perceptions of patency because of AI's intrinsic moral value, or simply its extrinsic value based on possible harm to the human companion. Results would help us better understand how we perceive AI as moral entities, providing useful insight as society grapples with how to most ethically integrate this new frontier of human-AI relationship into the social landscape.

[111] Ideological Profiles of Privilege Management

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

A recent theoretical model (Shuman et al., 2024) proposes that White Americans manage their privileged racial identity through four strategies: Deny, Defend, Distance and Dismantle. Across three studies, we investigated how preferences for these strategies are informed by dispositional and situational factors. In Study 1 (N = 248), SDO, system justification, meritocracy beliefs, ingroup identification, and racial threat were associated with privilege-preserving strategies, whereas favorable outgroup attitudes and self-efficacy were associated with dismantling. In Study 2a (N = 706), latent profile analysis of these variables identified five unique ideological subgroups of White Americans with distinct strategy preferences. Study 2b (N = 523) followed participants three months later, experimentally manipulating exposure to ingroup privilege. Strategy preferences remained stable across time and condition, supporting their dispositional basis and complicating their theorized function as flexible coping responses to situational threat.

[112] If The Roles Were Reversed, Would I Still Be The A**Hole?

4:40 PM – 5:40 PM

MORALITY

People frequently withhold empathy from those perceived as undeserving such as criminals, cheaters, or other moral transgressors. Prior research indicates that perspective-taking can increase empathic responses, though its efficacy with such moral transgressors remain unexamined (Batson et al., 1997). In this study participants will be asked to engage in perspective taking (or remain objective) while reading one of three AITA-style Reddit posts describing a man who abandons his family, later seeks reconciliation, and is rejected. The man's degree of remorse, intentions, and motivations vary across conditions, influencing perceptions of deservingness. Following the assigned AITA-style post, participants will complete Batson's Adjectives Task to assess situational empathy towards the man. A 2 (perspective-taking vs. objective) x 3 (undeserving, neutral, deserving) ANOVA will test main effects and interactions, with post hoc comparisons as appropriate. We hope findings will clarify whether perspective-taking extends empathy to morally transgressive targets and explain the role of perceived deservingness in shaping empathic responses.

[113] Impact Evaluation of the “Geleceğe Adımlar” Social-Emotional Learning (GASEL) Intervention: A Pilot Study

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Early adolescence is a critical period for developing social and emotional skills especially during the transition to middle school. Social and Emotional

Learning (SEL) programs are designed to support positive development during this critical period. This study assesses the effectiveness of a five-day SEL intervention implemented in Istanbul, Turkey. A randomized controlled trial with 540 students from

economically disadvantaged areas tested the program's impact on competencies such as empathy, emotion regulation, and stress coping. Students in the intervention group showed significant short-term gains in social-emotional skills, empathy, emotion regulation, problem-solving, and social support seeking. At the 10-week follow-up, only gains in overall social-emotional skills were sustained, suggesting that ongoing SEL education is needed. These findings highlight the potential of culturally grounded, school-based SEL programs to strengthen essential competencies among middle school students in a non-Western setting.

[114] Implicit and explicit attribution of gender stereotypes

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Gender shapes social relations, which aligns with the human tendency to categorize others' faces into sex/gender groups spontaneously. However, the socio-evaluative effects of such categorization remain unclear. For example, face perception is thought to activate gender stereotypes implicitly, but the consistency of such activation with explicit evaluations has been questioned. This study introduces a new trait-association task to investigate the links between implicit and explicit processes in gender perception. On each trial, this online computerized task shows participants a face stimulus (male or female) and a stereotypically gendered personality trait (e.g., empathic). Participants attribute the trait to the face from 1 to 7 with a speeded response. Average differences in stereotype attributions (ANOVA) and stimulus discrimination (GLMM) show differences in explicit (1-7 trait attribution) and implicit (response speed) processes aligning with dual models of face perception. By investigating implicit and explicit processes simultaneously, this study promises to clarify contradictions between explicit gender stereotyping, shifting towards neutrality, and societal discrimination.

[115] Improving Rural Workers' Mindsets about Conflict Management and Interpersonal Skills

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

In rural workplaces in the U.S., where resources for formal training are often more limited and social ties are especially interdependent, growth mindset or beliefs about the malleability of interpersonal and conflict management-related skills may be critical for worker and organizational wellness. Across two studies, we experimentally tested the effect of a one-time training on rural workers' growth mindset in partnership with the National Alliance on Mental Illness (Study 1; N = 991), and are now conducting a survey to examine the extent to which this mindset relates to key work outcomes (Study 2; goal N = 300). As Study 1 results showed, those in the training condition (but not the control condition) reported a stronger growth mindset in the follow-up compared to their baseline. Study 2 (current n = 207) will examine correlates of growth mindset among rural employees (e.g., conflict self-efficacy, stress, job satisfaction, turnover intentions). While Study 1 found that the training improved the growth mindset for rural workers, Study 2 will identify associated worker experiences to illustrate potential training outcomes and practical implications.

[116] Income Moderates Political Orientation's Effect on Fairness of Distributive Justice

4:40 PM – 5:40 PM

MORALITY

Political orientation is closely tied to attitudes toward social policy. Liberals often support wealth redistribution, whereas conservatives tend to oppose it. Despite political differences, supporters across the political spectrum vary in socioeconomic status, and income may influence perceptions of distributive justice. The current study examined how income interacts with political beliefs to shape fairness judgments. College students (N= 217; 67% female; 54% liberal-leaning, 23% centrist, 23% conservative-leaning) completed a novel distribution task in which they rated the fairness of equal, proportionate, and need-based financial allocations to families of low, middle, and high income levels. We observed that students with more conservative beliefs from higher-income families perceived giving money to the most disadvantaged families as less fair than did their lower-income conservative peers. These findings suggest that income moderates the association between political ideology and fairness judgments, highlighting the role of socioeconomic background in shaping political beliefs.

[117] Increasing Bias Confrontation Receptivity with the Habit of Mind Model

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

We examined whether embedding a racial bias confrontation within the prejudice habit of mind framework would lead to more confrontation receptivity and less dismissal. The prejudice habit of mind approach conceptualizes bias as an unintentional habit due to socialization that makes bias extremely common and pervasive (Devine et al., 2012). We utilized a between-subjects design (N = 354) where all participants went through a social memory task that assessed anti-Black bias. Once participants finished the memory task, they were randomly assigned to one of three conditions: receiving no result information, receiving a standard confrontation with results indicating that they showed anti-Black bias on the task, or receiving results indicating they showed anti-Black bias embedded in the logic of the habit of mind framework. Aligned with our predictions, we found that participants who received the habit of mind confrontation were more receptive to the feedback, thought the results of the memory task were more consequential, and were more likely to express acceptance in their open-ended responses than participants in the standard confrontation condition. Implications for how to engage in the most effective confrontations are considered.

[118] Increasing intergroup contact effects: the effectiveness and underlying mechanisms of self-affirmation

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Since the development of intergroup contact theory, research has shown that contact between social groups can reduce prejudice, a key contributor to social exclusion and unequal treatment. However, counter-stereotypical contact—such as positive contact with stigmatized groups or negative contact with admired groups—often has weaker effects than stereotype-consistent contact. The present research tested whether self-affirmation enhances the impact of counter-stereotypical contact and examined the mediating roles of state epistemic defense and state self-esteem, as well as the moderating roles of trait epistemic defense. Two experiments in China involved overweight individuals (stigmatized, N = 289) and elite athletes (admired, N = 315) using a 2 × 3 design (self-affirmation × contact valence). Self-affirmation increased positive attitudes following positive contact and buffered declines following negative contact, primarily via reduced state epistemic defense and increased self-esteem. Moderation analyses revealed a marginally significant three-way interaction: under negative contact, self-affirmation enhanced attitudes across all trait epistemic defense levels, strongest among low levels; under positive or neutral contact, benefits appeared only for medium or high levels. These findings clarify cognitive and motivational mechanisms underlying counter-stereotypical contact and suggest interventions to foster constructive intergroup interactions.

[119] Individual Action in Complex Societal Problems: Developing an Integrated Solution Mindset Using the Domain of Fossil Fuel Usage

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Complex societal problems like climate change are often characterized by inaction by individuals. In the transition away from fossil fuel usage, several factors make it difficult to motivate individuals to change their behavior. First, many people perceive the problem as too vast for personal actions to make a meaningful impact and do not see how their actions contribute to broader structural changes they understand are needed. Second, people do not perceive their unsustainable actions as directly harming others. Third, many unsustainable actions are perceived as the norm. These factors undermine personal responsibility in collective action, and lead individuals to wait for systemic change to occur independently—rather than seeing their action as integral to broader changes. To address this, we explore an integral solution mindset—where personal actions are understood as integral to broader societal efforts—that combines key beliefs about efficacy, harm attribution, norms and systems responsibility. We test this in a theoretically grounded and applied context: climate warning labels on gas pumps. Participants (N=3,600) were randomly assigned to warning label conditions in a 2 (direct harm vs. indirect harm) × 2 (norm message vs. no norm) × 2 (broader effort vs. no broader effort) + 1 (control message with no climate label) experiment. Our findings indicate that participants exposed to the direct harm message with public support were more likely to perceive shared responsibility and express intentions to reduce their fossil fuel usage.

[120] Individual Differences in Mortality Saliency: An Agent-Based Modeling Approach

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Decades of work investigating terror management theory (TMT) have produced strikingly mixed experimental and meta-analytic results supporting the existence of mortality saliency (MS) effects—the finding that reminders of death produce compensatory behaviors. Little is known, however, about whether potential theoretical mechanisms might explain this heterogeneity. We explored some of these mechanisms by developing an agent-based cognitive model designed to operationalize three potential ways of responding to MS: bolstering one's beliefs, derogating the beliefs of others, and avoiding engagement with MS entirely. We ran 10,000 independent simulations investigating the consequences of these MS response styles. Results showed that these response styles could lead to distinct outcomes in defensiveness: individual differences in responding produced variability in the extent to which worldview and self-esteem defenses were activated. Such individual differences may help explain some contradictory empirical findings in the TMT literature, highlighting a need for greater precision in how the core components of TMT, and other theories of psychological defense, are specified.

[121] Infants Recognize the Emotional Consequences of Unfairness

4:40 PM – 5:40 PM

MORALITY

Do humans rely on multiple innate moral foundations (e.g. harm, fairness, loyalty; Graham et al., 2013) or one harm-based foundation (Schein & Gray, 2018)? Recent studies suggest even infants are sensitive to harm and fairness (Woo et al., 2022). While this could reflect separate foundations (Ting & Baillargeon, 2019), we provide evidence here that infants may recognize unfairness as a form of harm. In S1, 13-17m infants (N=48) were familiarized with an unequal (3:1) cookie distribution in which one actor gave cookies to two other actors. On test trials, infants looked longer ($p < .01$) when the recipients displayed emotions incongruent with the cookie distribution (3 cookies = sad, 1 cookie = happy) than when the emotions were congruent with the distribution (3 = happy, 1 = sad). Consistent with a VOE interpretation (Margoni et al., 2024), this suggests that infants expected beneficiaries of unfairness to be happy and victims to be sad. Thus, infants recognize that unfairness can also cause harm. Additional studies (N=48 each) demonstrated that 11-12m infants did not hold these expectations (S2) and controlled for numerical alternate explanations that do not rely on fairness (S3).

[122] Integrating Student and Faculty Perspectives on Purpose Reflection to Support First-Generation Students in STEM

4:40 PM – 5:40 PM

MOTIVATION/GOALS

First-generation students continue to face additional barriers to success in Science, Technology, Engineering, and Mathematics (STEM) fields. Purpose reflection, or considering “why” one has chosen to pursue STEM, can help students cope with stressful and threatening academic environments. The present research explores both student and faculty perspectives on purpose reflection to understand how this intrapersonal psychological process can be embedded into the culture of STEM to promote first-generation student success. Study 1 (374 STEM undergraduates) found that students who reported engagement in purpose reflection also reported lower stress and greater authentic belonging in STEM. Higher stress appraisals for first-generation than continuing-generation students diminished when students reported high degrees of purpose reflection. Study 2 (101 STEM faculty) documented faculty beliefs about the implementation of purpose reflection in their classrooms. First-generation faculty especially saw purpose reflection as beneficial for their students. Supporting both students and faculty is needed to adopt purpose reflection into STEM classrooms and support first-generation students.

[123] Intersectional Political Identities Reduce Moral Bias Against the Outparty

4:40 PM – 5:40 PM

MORALITY

People tend to judge moral transgressions more harshly when committed by outgroup members, particularly those from the political outparty. We examined whether political identity complexity, the perceived overlap between one's political ingroup and other social identities (e.g., race, religion, gender, occupation), moderates this bias. Across six studies (N = 3,912), partisans evaluated outparty transgressors across seven scenarios (e.g., dishonesty, corruption). Individuals with higher political identity complexity (who saw their political identity as loosely connected to their other identities) judged outparty members less harshly than those with more tightly integrated identities. This effect was consistently mediated by seeing outparty transgressors as less prototypical outparty members, weaker ingroup attachment, and greater tolerance for group deviance, suggesting that identity complexity attenuates both cognitive and motivational roots of intergroup bias. Finally, we demonstrate a novel intervention to increase political identity complexity by increasing the salience of inparty and outparty heterogeneity, which significantly reduces bias in moral judgments of outparty members.

[124] Investigating the Role of Disability Models in Spontaneous Stereotypes About Disability

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

In the US, we use two main models of disability: the medical model, which conceptualizes disability as an individual problem, and the social model, which frames it as due to societal inaccessibility. For example, the medical model would consider hearing impairments inherently limiting, while the social model may suggest limitations arise from not widely offering ASL. The medical model is predominant among laypeople and predicts disability bias. In the present study, we aim to investigate how disability model beliefs shape spontaneously generated disability stereotypes. Participants will be asked to list characteristics that come to mind when they think of a person with a given disability (45 total), then surveyed about their model beliefs. We hypothesize that people who hold higher (vs. lower) medical model beliefs will assign characteristics indicating lower competence and higher deviance to people with disabilities. We further hypothesize that people with mental (vs. physical) disabilities will be assigned characteristics indicating lower competence. Thus, targeting model beliefs could be critical for interventions aiming to reduce negative stereotypes and lessen disability bias.

[125] Is cognition like emotion: Peak versus typical expressions in daily life

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Recent evidence shows cognitive performance varies within people, challenging the assumption that individual differences in intelligence are stable (e.g., Aschenbrenner & Jackson, 2024; Lovden et al., 2007; Schmiedek et al. 2013). Subsequently, the view that cognitive measures assess individuals' maximum cognitive ability, instead of their typical cognitive level, has been put into question (e.g., Vaughan & Birney, 2023). In the present work, we aim to examine within-person distributions in cognitive performance with respect to these two views. The maximal-level view implies cognitive performance is negatively skewed around individuals' true capacity, with contextual factors (e.g., stress) serving to reduce functioning rather than enhance it. The typical-level view implies a normal distribution, with contextual factors driving cognitive performance above and below typical levels. Our preliminary findings support the maximal view of cognitive expression, unlike the manifestation of personality and affect which typically fall under normal distributions. This conclusion, however, does not hold for all measures, highlighting the functional differences across cognitive measurements.

[126] Is That What They See?: How Hair Texture Shapes College Students' Depictions of Black Womanhood

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Stereotypes of Black women, while deeply rooted in a history that casts concepts of whiteness and blackness as oppositional, continue to shape portrayals of Black womanhood in TV, media, and film (e.g., Adams-Bass, et al., 2014). But how do these portrayals shape perceptions held by everyday perceivers? This study adapts the Draw a Scientist test (e.g., Chambers, 1983; Newton & Newton, 1988) to examine how college students (ages 18-24) visually represent Black women by focusing on their hair texture portrayals. A planned sample of N= 80 participants will complete a drawing task, followed by a survey probing their elemental choices. Drawings will be coded for hair type (straight vs. natural) and frequency of co-occurring stereotypical elements (e.g., bigger lips, wider nose) using a coding scheme with interrater reliability ($\kappa > .80$). Hypotheses predict that participants will draw more Black women with straight vs. natural hair/hairstyles, and that natural hair/hairstyles will co-occur with more stereotypical elements when compared with straight hair/hairstyles. Findings will shed light on contemporary and emerging stereotypes about Black womanhood through the lens of hair texture.

[127] Is the Truth Need Distinct from the Three Needs in Self-Determination Theory? An Examination of Factor Structure and Predictive Validity

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Guided by Regulatory Effectiveness Theory and Self-Determination Theory, this study examined the associations between fulfillment of the truth need and the three basic psychological needs proposed by Self-Determination Theory (competence, autonomy, and relatedness). A sample of 341 Japanese adults (aged 20–59; 178 male and 163 female) were asked to complete measures assessing satisfaction of the four psychological needs, trait self-control, and indicators of well-being (life satisfaction, vitality, positive emotions, and negative emotions). Confirmatory factor analyses indicated that a four-factor model, distinguishing between satisfactions of truth, competence, autonomy, and relatedness, provided the best fit; however, a three-factor model combining need satisfactions of truth and competence also showed an acceptable fit. Multiple regression analyses further revealed that satisfaction of the truth and competence needs predicted trait self-control. In contrast, satisfaction with competence, autonomy, and relatedness needs predicted well-being indices (e.g., life satisfaction). These findings suggest that fulfillment of the truth need may primarily contribute to performance-related outcomes rather than to subjective well-being. Implications for education and social support are discussed.

[128] Just World Thinking and Moral Goodness Attributions in Accidental Happiness

4:40 PM – 5:40 PM

MORALITY

Happy (versus unhappy) people are judged more morally good. Might just world thinking explain this happiness moral boost? Happy people have experienced a valued positive outcome. In a just world, they must be good people. To test this hypothesis, 5 studies (combined N = 5714), tested whether happiness that was a matter of luck enhances moral goodness. Study 1 participants rated happy (versus unhappy) infants more morally good and more likely to engage in good behaviors as adults. In Study 2, targets described in obituaries with a smiling (versus neutral) photo were rated more morally good and more likely to have engaged in good behavior. In Study 3, a target who was rendered happier (versus unhappier) by a TBI, was rated more morally good and more likely to engage in good behavior. Study 4 showed similar effects when targets were prisoners who initiated a fight that caused the TBI. Study 5 replicated Study 1 and assessed indicators of just world thinking. Results showed that rating targets likely to experience random positive events partially explained the effect of happiness on moral attributions. Consistent with a just world account, even when happiness is purely accidental, it enhances moral evaluations.

[129] Justice, Just for Me: Identity and Conditional Attributions for Inequality

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

This study examines how intersecting identities—particularly among white women occupying privileged (racial) and marginalized (gender) positions—shape discrimination perceptions. Building on evidence that marginalized identities foster Attributional Complexity (motivation to consider contextual forces), this research investigates whether white women's gender identification cultivates broader awareness of structural injustice or whether discrimination detection is more limited to ingroup-relevant cases. The study assesses how white women respond to subtle discrimination claims in corporate contexts with "false diversity cues" obscuring bias. Participants (N=277) will evaluate racial or gender discrimination lawsuits involving a Black male, white female or control (white male) claimant. Dependent variables include attributions for claimant outcomes (personal failings vs. company bias), claimant and company fairness perceptions, and, ultimately, a settlement recommendation. While data collection is forthcoming, the study has been fully developed with pre-registration planned, and seeks insights on whether identity-based marginalization cultivates solidarity with oppressed outgroups.

[130] Light in the Dark: Cross-Sectional and Longitudinal Investigation of the Network of Dark Triad and Big Five Personality Traits, Resilience and Anxiety

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Multivariate approaches are needed to gain a better understanding of positive and negative impact of Dark Triad traits within personality networks under different socio-cultural and personal conditions. In three studies in two countries (total N = 4,700), we applied network analyses and structural equation modelling to investigate the network of personality (Dark Triad and Big Five), resilience and anxiety. The results confirmed, for the first time with longitudinal evidence, the pattern of indirect associations between the Dark Triad and anxiety through resilience/mental toughness. The findings also emphasized the importance of differentiating the three 'dark traits', as they showed different relations with other traits. For example, narcissism predicted better mental health, whereas Machiavellianism and psychopathy were linked to poorer resilience and mental health. Narcissism was also the most influential node in the network of personality, resilience and anxiety. Considering the consistency of the effects across the samples, the results provide a promising avenue for research into malleability of personality networks and for developing educational and workplace interventions.

[131] Linking Perceived Reasons for Discrimination to Varieties of Anger: A Bayesian Approach

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Discrimination is linked to anger—whether suppressed (anger-in), expressed (anger-out), or regulated (anger-control). Less is known about whether the reasons people attribute to unfair treatment shape anger responses. Attributions include personal identity (age, gender, race, ethnicity/nationality, religion, sexual orientation), physical characteristics (appearance, height/weight, physical disability), and socioeconomic status (i.e., SES; occupation, education, finances). Using the Midlife in the United States (MIDUS) data (N = 1,165), we examined how attributions relate to anger types. Effects were estimated via Bayesian regression, with Bayesian model averaging (BMA) used to assess the relative importance of each attribution. Initial results showed that personal and physical attributions were linked to greater anger-in and anger-out, whereas SES attributions were tied to lower anger-control. BMA revealed more distinct patterns: personal identity attributions had a high posterior inclusion probability only for anger-out, physical attributions only for anger-in, and SES attributions only for anger-control. Findings offer new insight into how discrimination attributions shape anger.

[132] Loneliness and Its Association with Divergent Thinking and Creativity

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Prior work suggests that lonely individuals process the world in idiosyncratic ways, in ways that are different not only from non-lonely individuals but also from other lonely individuals. This raises the possibility that lonely individuals have ways of thinking that are significantly more divergent than the rest of the population. In this study (N = 63), participants completed a free association "Forward Flow" task, in which they generated a continuous chain of words starting with a given seed word. For each participant, we calculated the semantic distance between successive responses and summed these values to assess each participant's propensity to divergent thinking. We then related this measure to loneliness using the UCLA Loneliness scale. Results revealed no significant association between a person's propensity to divergent thinking and loneliness (Pearson's $r = -0.037$, p value = 0.77). These findings suggest that creativity and loneliness may be distinct processes and that the idiosyncratic nature of lonely individuals' thought patterns may not be explained by a general tendency toward divergent thinking.

[133] Lost in Pronunciation: The Influence of Sociolinguistic Cues on Truth Judgements

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Accent shapes social perception, but mechanisms driving accent-based bias remain unclear and debated. Focusing on truthfulness judgements, this study examined three theoretical explanations: (1) standard language ideology: standard-accented speakers are granted higher credibility due to institutional prestige; (2) accent-based stereotyping: accent evaluations reflect the perceived status of associated ethnic or social groups; and (3) processing fluency: harder-to-understand accents trigger negative evaluations due to increased cognitive effort. One hundred and thirty-seven adults listened to personal anecdotes from: (1) standard-accented speakers, (2) standard-accented speakers with low audio quality, (3) non-standard speakers with high social status, and (4) non-standard speakers with low social status, and rated their perceived warmth, competence, and truthfulness. Standard language ideology best predicted truth judgements. Unexpectedly, however, non-standard-accented speakers were rated as more truthful than standard-accented ones, even though they were seen as less competent. This surprising effect was mediated by higher warmth attributions to non-standard-accented speakers.

[135] Managers' Motives to Engage in Employee Development: Origins and Consequences

4:40 PM – 5:40 PM

MOTIVATION/GOALS

In three studies, we examine the motives that drive managers to engage in employee development (ED), drawing on Schwartz's theory of personal values.

In Study 1 (N = 43 managers and 94 employees), we show that employees' perceptions of their managers' motives are shaped partly by the motives reported by the managers themselves and partly by the employees' own personal values. Perceived motives interact with managers' actual engagement in ED to predict employees' sense of bonding with their managers.

In Study 2 (N = 75 managers and 199 employees), we find that managers' motives interact with the organization's investment in ED to predict employees' organizational satisfaction, organizational identification, and turnover intentions.

In Study 3 (N = 145 managers), we demonstrate that different types of motives are associated with managers' self-perceived openness about their motives and their general belief about whether employees should be aware of these motives.

Together, our findings highlight the importance of considering the reasons managers engage in ED, and not just how much they engage or how much the organization invests.

[136] Mapping Adolescent Well-being: Latent Profile Analysis of Social, Emotional, and Behavioral Skills

4:40 PM – 5:40 PM

PERSONALITY DEVELOPMENT

Adolescents' social, emotional, and behavioral (SEB) skills are widely recognized as critical for well-being, yet little is known about how these skills cluster within individuals and relate to mental health. Person-centered approaches, such as Latent Profile Analysis (LPA), allow for the identification of distinct subgroups of individuals based on patterns of strengths and weaknesses across multiple skill domains. Although commonly used in developmental psychology, these methods remain relatively rare in personality psychology, where they can provide important insights into heterogeneity in individual differences. This study applies LPA to a large and diverse sample of American secondary school students to identify profiles of SEB skills and examine how these profiles are associated with concurrent symptoms of anxiety and depression. By capturing meaningful variation at the subgroup level, the findings will demonstrate how person-centered analyses move beyond average associations to reveal unique configurations of skills that carry implications for both theory and practice. More broadly, this work may shed further light on the role that SEB skills can play in shaping adolescents' mental health and adjustment, highlighting their potential as key targets for educational and clinical support.

[137] Mapping the Link between Emotional Intelligence and Humour Styles: A Systematic Review

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Growing evidence has examined how emotional intelligence (EI) and humour styles interact in shaping adaptive outcomes, yet systematic evidence on this relationship remains limited. This review searched five databases—MEDLINE, PsycINFO, Web of Science, PubMed, and Psychology and Behavioural Sciences Collection—for studies published on or before July 1, 2024. Eligible studies were empirical and quantitative, involved adult participants in non-clinical settings, and used measures explicitly referred to as humour styles or EI tests. Of the 489 records screened, nine studies were included in the qualitative synthesis. Across these, EI was consistently and positively associated with adaptive humour styles (self-enhancing and affiliative) and, in some studies, negatively associated with maladaptive styles (self-defeating and aggressive), with small-to-moderate effect sizes. Trait EI generally showed stronger associations than ability EI. Self-enhancing humour displayed the most consistent links across all adopted EI measures, while aggressive humour yielded few and weak correlations. This review highlights links between emotional competencies and humour, suggesting future research should test whether fostering context-appropriate humour can enhance emotional and social functioning and reduce risks of low mood or anxiety.

[138] Me, Myself and You: The Role of Self Construal in Perceived Social Support

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Perceiving one's partner as supportive is a crucial component of relationship satisfaction. However, the impact of perceived social support on relationships varies considerably between individuals. One factor that may explain this is relational interdependent self-construal (RISC) (Cross et al., 2000). Individuals with higher RISC define themselves through their relationships, hence they may be more sensitive to changes in them, including fluctuations in social support. Previous research demonstrates that RISC moderates the effects of perceived social support on life satisfaction (Heintzelman & Bacon, 2015). However, no study has examined this moderating effect on relationship satisfaction in romantic dyads and across time. We collected data on perceived social support and relationship satisfaction from 218 romantic dyads ($n = 436$) over 14 days. We anticipate that individuals will experience greater relationship satisfaction on days when they perceive greater social support from their partners, but this within-person association will be stronger for individuals who are higher in RISC. These findings will shed light on the role of the self in relationship outcomes

[139] Metamotivational Beliefs about how Promotion and Prevention Focus Help with Intrinsically and Externally Motivated Activities

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Metamotivational beliefs are about how to get in the right frame of mind to do well at various tasks. This is the first research to examine metamotivational beliefs about how promotion and prevention focus could be useful for doing well at intrinsically and externally motivated activities. Eager, approach strategies and promotion-focused valuation of goals (e.g., as hopes) could help people explore opportunities for growth in intrinsically motivated activities. Vigilant, avoidance strategies and prevention-focused valuation of goals (e.g., as duties) could help people avoid thoughtless mistakes and maintain engagement with externally motivated activities. Four within-subjects experiments (N = 500) showed strong correlations between judged usefulness of intrinsic interest and of eager strategies for creative and careful tasks, and strong correlations between judged usefulness of external reward and of vigilant strategies for these tasks. They also showed that participants viewed promotion focus as more useful and appropriate for their own intrinsically motivated activities, and prevention focus as more useful and appropriate for their own externally motivated activities.

[140] Mission Statements and Employee Perceptions

4:40 PM – 5:40 PM

MORALITY

Mission statements play an important role in shaping organizational culture and guiding employee perceptions and behavior, yet little is known in psychological research about how employees perceive and engage with them. In a pilot study, we examined lay beliefs about the purpose and function of mission statements, finding that employees generally value organizations having a mission statement and endorse the importance of established company values. Building on this, we designed a study in which participants (employees) are prompted to revise hypothetical company mission statements. Participants are randomly assigned to evaluate statements from different industries (food and beverage, healthcare, retail) and presented with neutral mission statements to edit. Language analysis captures pragmatic vs. moral edits made by participants. We examined the moral identity of participants as well as other individual differences to predict the likelihood of making moral edits to these statements, where we predict that high moral identity results in more edits with ethical content. This work lays the foundation for a broader research program investigating the influence of moral framing of mission statements on behavioral outcomes in experimental contexts.

[141] Moderators in the Relationship Between Dark/Light Traits and Malicious Compliance

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Malicious compliance (MC) is a passive-aggressive subtype of counterproductive work behavior (CWB) in which individuals follow rules, policies, or orders exactly as stated knowing the outcome will be harmful or undesirable. Emer (2020) found workplace characteristics, specifically unionization and degree of centralization, moderated the relationship between dark personality traits, light personality traits, and toxic work behaviors (e.g., mobbing, incivility, and abusive supervision). Using a community sample via Prolific, the current follow-up study examined whether workplace size, workgroup size, and supervisor/coworker gender further moderated relationships between dark traits, light traits, and malicious compliance. Moderator analyses revealed significant effects of gender, workplace size, and unionization. Light and dark triad traits correlated with malicious compliance in larger, but not smaller, work environments. The predictive value of light traits for counterproductive work behaviors, including malicious compliance, was moderated by unionization (holding in non-unionized settings only). Coworker gender also mattered: light traits predicted counterproductive work behavior when coworkers were female or mixed gender, but not when they were predominantly male. Findings suggest the predictive value of dark and light traits depends on organizational context.

[143] Moral Duo: Human Disclosure and AI Guidance

4:40 PM – 5:40 PM

MORALITY

This project investigates how AI agents advise on complex, low-consensus moral dilemmas and how humans interact with them. Our design enables free-form, multi-round conversations to capture more naturalistic human–AI interaction. This approach allows us to analyze both AI advising patterns and human advice-seeking behaviors in a more realistic setting. We hypothesize that, given their roots in reinforcement learning from human feedback, AI agents are trained to optimize user appeal by aligning with users’ revealed and implicit positions instead of offering principled, consistent counsel. Additionally, we examine how people seek advice—whether they openly disclose their stance to invite agreement or instead conceal to elicit less biased guidance. We also explore whether the degree of moral alignment between AI and human users has a more nuanced, non-linear impact on users’ openness to alternative perspectives suggested by AI agents. By systematically studying human–AI exchanges in this context, our project offers critical insights for the ethical design and deployment of AI agents in human interaction.

[144] Moral Judgments Follow Schema Violations

4:40 PM – 5:40 PM

MORALITY

The Habitus Framework proposes cultural schema strength directly modulates moral judgment severity, distinguishing it from theories treating moral judgments as stable and content-specific responses to evolutionary problems. This study tests whether experimentally manipulating schema strength influences moral evaluation intensity through gender role deviations. Participants (n=885) receive traditional masculinity priming or control, then evaluate targets conforming to or deviating from gendered presentation. We predict masculinity priming amplifies negative judgments for gender-deviant targets, strongest for male targets violating the primed schema. This demonstrates moral judgments are dynamic responses influenced by momentary schema accessibility rather than responses to violations of a fixed set of moral concerns. Such findings provide critical evidence that moral psychology operates through flexible, culturally-mediated processes rather than invariant moral intuitions, fundamentally advancing understanding of how cultural learning shapes moral cognition.

[145] Moral language in news headlines

4:40 PM – 5:40 PM

MORALITY

Moral Foundation Theory (MFT) posits that conservatives and liberals differ in their moral values: liberals’ morality centers on the individualizing foundations (care and fairness), while conservatives rely more on the binding foundations (loyalty, authority, purity) than liberals do. However, research does not consistently show that moral language use differs by ideology as predicted by MFT. This may be because liberals and conservatives rely on the binding and individualizing foundations similarly but use them to emphasize different issues. We present a study in which we analyze more than two million news headlines from English-language publications published in 2019 and 2021. More specifically, we use Structured Topic Models (STM) combined with a word embedding model to examine the moral language used by news outlets and to identify the issues left-leaning versus right-leaning outlets moralize the most in their headlines. This allows us to examine whether left-leaning and right-leaning news outlets moralize different issues within each of the moral foundations.

[146] Moral Relativism Recast: MARS validation and Flexible Harm Inference

4:40 PM – 5:40 PM

MORALITY

People’s moral philosophies, i.e., whether they lean toward relativism or absolutism, shape not only policy stances on politicized issues, but also how they interpret everyday conflicts. Yet, no validated scale has systematically captured this distinction. We advance a new conceptualization of moral relativism that unifies measurement and underlying mechanism. Across 4 studies, we formalize relativism as variability across individual, societal, and situational beliefs, developing the Moral Absolutism and Relativism Scale (MARS). In Study 1 (N=649), factor analyses supported a three-factor structure. Study 2 (N=201) established predictive, discriminant, and concurrent validity and strong test–retest reliability. In Study 3 (N=202), the three subscales showed distinct predictive power for domain-specific vignettes. Study 4 (N=100), drawing on dyadic morality, found that relativism correlated with lower perceived victim vulnerability and reduced assignment of agent and patient roles. Together, these studies recast relativism as a flexible, multi-domain mode of harm inference, offering a validated scale and a new lens on moralization and ideological conflict.

[147] More Nature, Less Anti-Gay Bias: Individual, County, and State-Level Evidence

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Over the past decade, crimes targeting sexual orientation have consistently ranked among the Top 3 most reported crime categories in the U.S., suggesting pervasive anti-gay bias and posing serious threats to the well-being of sexual minorities. We proposed that nature may help mitigate such bias and tested this proposition across three studies by analyzing existing datasets. In Study 1, by using data from the General Social Survey 2018 (N = 612), we found that people with greater nature contact reported more positive attitudes toward homosexuals. In Study 2, by using large-scale data from Project Implicit (N = 756,285), we found that people living in counties with greater natural land cover showed lower implicit and explicit anti-gay bias, even after controlling for individual demographics and county-level factors. In Study 3, we found that states with greater natural land cover reported lower rates of hate crimes based on sexual orientation. Together, three studies provided correlational evidence linking nature to reduced anti-gay bias across individual, county, and state levels. Future research may examine the mitigating effect of nature on anti-gay bias experimentally.

[148] Motherhood Ideologies Shaping Women's Entrepreneurial Career Choices

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Mothers frequently experience conflict between professional and family roles, especially under societal pressures portraying employment as incompatible with childcare. Intensive mothering ideologies contrast with integrated mothering, a framework where women combine maternal and professional identities and delegate childcare without guilt. Such beliefs may shape entrepreneurial motivation, particularly in necessity-driven career transitions. This research investigates links between motherhood approaches and entrepreneurial cognitions among unemployed or career-changing women. In Study 1 (n = 631), motherhood predicted entrepreneurial intentions via more favorable attitudes and stronger entrepreneurial identity fit. In Study 2 (n = 309), salience of intensive versus integrated mothering was experimentally manipulated. Mothers in the intensive condition reported less favorable evaluations of the time and effort required for entrepreneurial activity, which mediated effects on attitudes, self-efficacy, and intentions. These studies represent the first quantitative investigation of integrated motherhood, highlighting how parenting ideologies influence women's work-family arrangements.

[149] Motivating and Inhibitory factors of Collective Action Tendencies for Racially Discriminated Groups in India

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

This study investigates collective action tendencies among two racially discriminated groups in India—northeasterners in the Mainland India and mainlanders in Northeast India. This research extends the Social Identity Model of Collective Action (SIMCA) by integrating fear and helplessness as inhibitory factors in taking collective action. We propose two moderated mediation models. In model 1, anger mediates the relationship between social identification and collective action and in model 2, perceived collective efficacy plays the role of the mediator. In model 1, we hypothesised that fear moderates the relationship between anger and collective action, while in model 2, we hypothesised that helplessness moderates the relationship between perceived collective efficacy and collective action. While SIMCA emphasises motivating factors, this study uniquely integrates inhibitory emotional states and expanding the model's applicability to non-WEIRD contexts. Data from 280 participants (140 per group) has been collected. Participants completed validated measures of social identity, perceived discrimination, anger, fear, efficacy, helplessness, and collective action. Moderated mediation analyses using PROCESS (Model 21) will test both models. By empirically examining both motivating and suppressing factors, this study contributes a grounded understanding of race-based collective action and offers insights for equitable policy-making in India.

[150] Motivating Pro-Environmental Behavior: Exploring the Interactive Effects of Outrage and Mindful Observation

4:40 PM – 5:40 PM

MORALITY

Moral outrage and mindfulness are both independent predictors of pro-environmental behavior. Research has shown that mindfulness may counterintuitively increase the experience of moral outrage and subsequent retributive behaviors, but this has not been studied in the context of pro-environmental behaviors. In Study 1, we induced participant (N = 150) outrage through piloted vignettes depicting environmental harm. Participants completed trait measures of mindfulness, reported pro-environmental intentions, and completed a computer-based pro-environmental behavior task. Results were inconsistent, but exploratory analyses revealed a positive correlation between outrage, the observation facet of mindfulness, and pro-environmental intentions. Study 2 aims to follow up on these results with a few key modifications. For one, we employ a within-participants mindfulness induction that specifically targets mindful observation. We piloted videos for a more potent environmental outrage induction, and we increased the difficulty of the computer task to better target costly and retributive pro-environmental behavior. We hypothesize that inducing mindful observation will increase the strength of the relationship between moral outrage and pro-environmental behavior. The expected results would provide a novel approach to motivating pro-environmental behaviors.

[151] Motivation differentiation: exploring a new concept

4:40 PM – 5:40 PM

MOTIVATION/GOALS

While extensive research has examined emotion differentiation and its relationship with well-being and emotion regulation, the concept of motivation differentiation remains largely unexplored. This study aims to investigate individuals' ability to distinguish between different motivational states and to adaptively select motivation strategies. Understanding how people differentiate their motivation may offer valuable insights into how individuals recognize and regulate both the level and type of motivation across varying contexts. This, in turn, could inform interventions and best practices for fostering flexible, adaptive, and effective motivational regulation. A total of 250 university students (N = 250) participated in an online study involving written reflections, individual difference questionnaires, and self-reports assessing motivational awareness, cognition, emotion regulation, personality, and well-being. In addition to quantitative analyses, we also explore the potential of natural language use as an indicator of individuals' motivation differentiation ability.

[152] Motivational Conflict and Attentional Scope

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Past work has revealed that motivational drives to move towards or away from an object influence attentional scope. Experiencing high-intensity approach motivated states, for example, has been linked with attentional narrowing, while affective states low in motivational intensity have been linked with attentional broadening. Little work, however, has investigated how experiencing motivational conflict (e.g., a drive to simultaneously approach and avoid an object) might influence attentional scope. To investigate this, motivational conflict was manipulated by giving participants a difficult choice between viewing either a positive or negative image. Viewing positive images was associated with 0 reward points, while viewing a negative image allowed participants to earn 0 points (avoidance only), or 2, 4, or 6 points (approach-avoidance conflict conditions with varying intensity). After making this decision, participants engaged in a Navon letter task, a measure used to assess attentional scope. It is hypothesized that experiencing motivational conflict will broaden attentional scope when compared to avoidance only conditions.

[153] Motives, Ambiguity, and Moral Judgment: Shifting Perceptions of Crime Suspects

4:40 PM – 5:40 PM

MORALITY

How do motives for a crime impact moral judgments about perpetrators? In two preregistered studies (Study 1, $N = 233$; Study 2, $N = 362$), we investigate how motives shift moral judgments depending on the ambiguity of evidence. In Study 1, participants evaluated a suspect with or without a loyalty motive (harming someone who harmed his sister). We predicted and found that when the evidence made it unclear if the suspect was guilty, a loyalty motive increased perceived guilt and decreased moral character evaluations (because participants assumed the motivated suspect did it). However, once the evidence clearly showed the suspect was guilty, this pattern reversed—they gave more lenient evaluations to the motivated perpetrator. Study 2 tested whether this reversal was specific to loyalty motives by comparing it to no motive or to a self-interest motive (harming someone who harmed the self). Both loyalty and self-interest motives increased guilt attributions and decreased moral judgments under ambiguity, but led to more positive moral judgments once the evidence was unambiguous. Together, these findings show the nuanced ways motives can shape others' judgments of a potential suspect.

[154] Narcissistic Traits and Academic Outcomes in the First College Semester

4:40 PM – 5:40 PM

PERSONALITY DEVELOPMENT

Narcissism is a multifaceted construct with a core of entitled self-absorption (Krizan & Herlache, 2018). When combined with approach-related motivations, this entitlement manifests as grandiosity, which involves an exaggerated estimation of abilities and self-confidence. Although much work has investigated narcissism in the context of social relationships, academic settings are also an important venue in which traits of entitlement and grandiosity may be impactful (e.g., McManus et al., 2022). Using a sample of 1130 first-year college students, the current study investigated associations between grandiosity, entitlement, and academic outcomes. Higher levels of grandiosity were associated with lower class attendance ($r = -.14$, $p < .01$) and lower first-semester Grade Point Average (GPA; $r = -.09$, $p < .01$), though not class preparation ($r = .00$, $p = .96$). The effects with attendance and GPA, though small, remained significant when adjusting for entitlement in multiple regression analyses. In contrast, entitlement showed no significant links (p 's $> .13$). These results suggest that grandiosity may have a modest negative association with academic performance.

[155] Navigating Moral Dilemmas in High-Stakes Leadership: A Social Identity Perspective

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

High-stakes leadership—such as during organisational crises, public health emergencies, or disaster response—requires complex moral decision-making under pressure. While ethical leadership is critical, the role of social identity processes in shaping moral choices, particularly across formal and informal leadership roles, remains underexplored.

This poster presents a conceptual framework grounded in existing theory, linking social identity processes to moral decision-making in high-stakes contexts. The model highlights:

1. Formal leaders (positional authority) and informal leaders (influence without formal authority) as distinct sources of influence on ethical outcomes.
2. Psychological mechanisms, including ingroup/outgroup perceptions, identification with followers, and perceived moral norms, that may guide decision-making.
3. Moderating factors, such as contextual urgency, organisational culture, and individual moral orientation, which can shape leader behaviour.

The framework is intended to generate testable hypotheses for future empirical research and to stimulate discussion on practical implications for ethical leadership development.

This poster invites researchers and practitioners to engage with the framework, provide feedback, and explore research directions, fostering an interactive discussion on how social identity processes operate across different leadership roles in high-stakes situations.

[156] Not all immigration policies are equal: Children disapprove of inequitable policies but not entry regulations

4:40 PM – 5:40 PM

MORALITY

How do children reason about structural norms that perpetuate social inequality? We examined this question by asking children (5-12yrs; N=138; White=72%) to evaluate various immigration policies. Participants heard vignettes about families that immigrated to evade danger, to reunify their family, or wanting to move, and evaluated how morally acceptable (on a 6-pt scale) they perceived restrictions and financial discrimination due to immigration status. Lower scores represented moral disapproval of the policies. We conducted a linear mixed model, predicting evaluations by age, reason for immigration, policy type, and their interactions as fixed effects, and participants as a random effect. We found a significant main effect of policy type ($p < .001$), indicating disapproval of birthright citizenship and financial discrimination, but approval of barring people from unauthorized entry. An interaction of age and policy type ($p < .001$) indicated that disapproval of financial discrimination increased with age. Overall, these findings indicate that children disapprove of policies that enforce inequality, yet feel that people should follow the rules that these policies establish.

[157] Open to interpretation: How the survey question shapes moral judgment and language

4:40 PM – 5:40 PM

MORALITY

Survey methods often assume objective and uniform respondent interpretation of the questions. Across three analyses, we demonstrate the role of respondent-specific interpretive processes consistent with the multiple levels of speech act theory. In a study with 242 participants, we collected "morality" and "appropriateness" ratings for eight moral scenarios and open-ended responses asking participants to "describe" and "justify" scenario behaviors, with participants' political ideology, assigned perspective, and protagonist identity as independent variables. When asked to "describe" and "justify" the behaviors in a moral scenario, the moral foundation language used in the justification but not description predicted "morality" ratings but not "appropriateness" ratings. Moreover, conservatives used more Purity and Loyalty language in response to "describe" but not "justify" items. Finally, comparing "morality" and "appropriateness" as measures across conditions demonstrated differences in distributions, with appropriateness ratings varying and morality ratings remaining stable. Together, these findings reinforce the importance of respondent interpretive processes in survey responses.

[158] Overweight or exclude: The role of gender diversity in group norm judgements

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Humans are highly attuned to group norms; however, judgements of what is normative can be biased by the behaviors of those that deviate from the norm (i.e., outliers). While prior research shows that behavioral outliers can shift judgments of norms, it is unknown whether this effect depends on social identity. In the current study, I examine how the behavior of individuals with stigmatized identity can influence norm assessments. That is, I investigate if the social behavior of a transgender individual is excluded from group norm judgements. Participants (N = 250) viewed individuals arriving to a teleconference co-working session, with their arrival time highlighted. The group included one time-based outlier which varied by gender identity (cisgender, transgender). We predict that descriptive and injunctive norms of arrival time will be biased by the time-based outlier insofar as the outlier is cisgender. Such effects may depend on exploratory moderators like entitativity. Results aim to clarify the relationship between behavioral outliers, norm judgements and gender, with a focus on how biased group perception can contribute to the exclusion of marginalized groups.

[159] Parental Motivations for Adoption and Their Impact on Adoption Stability

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Children and adolescents remain a tragically underserved and under researched population despite the population size and developmental importance. This is especially concerning given the compounding barriers faced by those in child welfare programs. Perhaps the strongest predictor of distress, adjustment challenges, and developmental delays for this population is residential instability. One potentially critical area of research that addresses the barriers and limitations associated with child welfare research relates to theories of motivation. The current study examines motivations for adoption using an adapted Motivation to Have a Child Scale (MCS), distinguishing autonomous and controlled motivations. Results indicated that participants who had considered or acted toward dissolving an adoption reported significantly higher controlled motivations than those who had not. This finding aligns with self-determination theory, which suggests that controlled motivations are less stable and enduring than autonomous ones. Overall, the study underscores the potential role of parental motivational quality as a predictor of adoption stability.

[160] Perceived Latinx: Naming Conventions and Fluency on Identification

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Racial prototypicality research has examined the role of skin color and hair texture on racial identification. This research has found prototypes of racial/ethnic groups, yet these prototypes have largely centered on phenotypic traits. We aim to fill the research gap by using cultural characteristics to examine the role of Hispanic and Portuguese fluency and naming conventions on perceived Latinx identity and the moderating role of Latinx contact and Latinx identity. With a 2 x 5 experimental design, participants will answer items about a vignette, which has the target's name and language fluency varied between participants, and complete measures of intergroup contact, national identity, acculturation, modern racism, prejudice, and social dominance orientation. We hypothesize that (1) Spanish fluency and Hispanic naming conventions will be stronger predictors of perceived Latinx identity than Portuguese fluency and Portuguese naming conventions, and (2a, 2b) Latinx contact and Latinx identity will moderate that relationship, such that those high in Latinx contact or Latinx identity will more strongly associate Spanish fluency and Hispanic naming conventions with Latinx identity.

[161] Perceptions of Asexual and Demisexual People: Gendered Contexts

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The current research investigates how people perceive asexual and demisexual men and women compared to heterosexual targets. There is limited research on perceptions of demisexual individuals versus asexual individuals, who face biases (Iraklis, 2024). We predicted that heterosexual targets would be rated more positively than asexual and demisexual targets, and that female targets would be characterized with more emotions than male targets. Participants (N=170) reviewed vignettes about a person and their sexual identity, then completed feeling thermometers, answered questions about identity, and rated emotions and traits. Results showed no significant differences in feelings toward the targets and strong signs of identity dismissal for asexual and demisexual targets. There was nuance in emotion and trait ratings depending on the target's sexual orientation or gender, including the finding that demisexual targets received higher ratings of human-nature emotions (e.g., love) than asexual targets. The findings will be discussed in terms of theoretical implications related to anti-demisexual bias and how it differs from other forms of sexuality-based prejudice.

[162] Perceptions of Intersectionality: Beyond Two Identities

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Can people perceive more than 2 social identities simultaneously? Numerous studies have investigated the influence of 2 social identities (ex: race & gender) on social perception. However limited work has investigated past this barrier. Across 3 studies (2 preregistered, 1 ongoing), participants were asked to evaluate the likelihood of targets to experience different aspects of discrimination (e.g. the likelihood of holding a leadership position/being verbally harassed). We manipulated race (black/white), gender (women/men), and sexuality (gay/straight). We find that the number of stigmatized identities are positively correlated with perceptions of experiencing discrimination, however this relationship follows a quadratic pattern with diminishing returns. In Study 3 we will attempt to explain these findings using Intersectional Invisibility (Purdie-Vaughns & Eibach, 2008) as a framework. We predict that those with more marginalized identities are viewed as less prototypical of their respective social groups. These results suggest that the most marginalized members of our society may be overlooked in conversations about discrimination because of their perceived non-prototypicality.

[163] Perceptions of Therapy: How Racism Shapes Mental Health Stigma and Trust

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Racism is reinforced through ignorant or purposeful actions that have a devastating effect on black individuals' experience with systems they need to survive. The resulting mistrust in the healthcare system and mental health services exacerbates the lack of access and poorer treatment outcomes for Black individuals. This study explores how structural racism shapes Black individuals' perceptions of and experience with mental healthcare. 350 participants self-identifying as Black/African-American, Afro-Caribbean, Afro-Latino and African, across two age groups (i.e., 18-24 and 45+) were studied. They completed a survey assessing trust in doctors and therapists, mental health literacy, awareness of structural racism, perceived mental illness stigma, and history of mental health and treatment. Results show that racism undermines perceptions of therapy through mistrust and mental health stigma. Rather than having a direct impact on therapy perceptions, racism linked to both mistrust in therapy and heightened awareness of mental health stigma. These factors, in turn, predicted negative perceptions of therapy. Contrary to lay assumptions about generational gaps in openness to mental health care, the younger group had significantly more negative perceptions than the older group. Limitations and implications for further research are discussed. This is the first in a series of studies to understand the interconnected and compounding effects of racism on mental health help-seeking.

[164] Peril of the mind: The racial triangulation of Asian American vs. Asian immigrant success, threat, and exclusionary policy support

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Despite extensive research on perceptions of Asian Americans as successful and unrestricted by racism (the model minority myth, MMM), perceptions of Asian Americans as foreign (the perpetual foreigner stereotype, PFS) remain understudied. Moreover, few studies test the joint implications of both stereotypes. In this project, we argue that being simultaneously cast as model minorities and perpetual foreigners heightens competition and threat towards Asian Americans. We first constructed and validated a scale measuring PFS endorsement using an online sample of White Americans (S1; N=648). A preregistered online study of White Americans (S2; N=263) found that PFS endorsement positively correlated with anti-Asian threat and exclusionary policy support. In an online experiment (S3; N=626) and preregistered replication (S4; N=840), participants watched a video describing Asian American or Asian immigrant success (vs. a control). Participants in both the Asian American and Asian immigrant conditions reported greater MMM endorsement vs. the control, but only the latter reported greater PFS endorsement, threat, and exclusionary policy support. We discuss implications on theory and policy.

[165] Philosophical arguments can boost charitable giving

4:40 PM – 5:40 PM

MORALITY

Do reasoned arguments increase charitable giving? Evidence is mixed. One possible explanation is that arguments vary in effectiveness. We crowdsourced 90 philosophical arguments for charitable giving, coding them for a variety of features. In Study 1 (N=2161, MTurk), participants read either a control text or one of five arguments preselected as especially promising. Participants who read the philosophical arguments expressed more positive attitudes towards donating and donated about \$1 more on average of a potential \$10 bonus. Study 2 (N=8982, MTurk) employed all 90 arguments, with each participant reading one argument. We found arguments to be more effective when they mentioned children, mentioned the specific impacts of donating, and/or emphasized that large benefits can be achieved at low cost. Among the features less predictive of donation: addressing counterarguments, mentioning the equivalence of persons or the participant's own assumed good fortune, appealing to religion or expert authorities, or appealing to the participant's self-interest. Together, these studies provide evidence that reasoned arguments can shift moral behavior, but some are more effective than others.

[166] Pluralistic Ignorance in Academic Self-Efficacy as a Predictor of Study-Related Behaviors

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Pluralistic ignorance refers to the systematic misestimation of the magnitude/direction of a group norm. The current study focuses on students' (mis)estimation of other students' academic self-efficacy (ASE), which represents one's belief about their ability to overcome academic challenges, and its relationship with study behaviors (i.e., office hour visits, tutor visits, class participation, and study time). Students who overestimated others' ASE were expected to engage in more study behaviors to match the group norm. During the first month of the fall term, participants from the Introductory Psychology course completed survey measures of ASE beliefs of themselves and other students. At the end of the semester, they reported study behaviors. After controlling demographics and high school GPA, contrary to our hypothesis, overestimation of others' ASE was associated with lower frequency of office hour visits and higher frequency of tutor visits, but only for those with higher-than-average ASE. Overestimation was also associated with lower class participation rate regardless of one's own ASE. Misestimation of others' ASE was not related to one's study time.

[167] Post-War Afghanistan Reports the Lowest Subjective Well-Being in Global History

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

War is devastating, but for Afghans, the end of the War in Afghanistan marked a further decline in subjective well-being. We analyzed data from Afghans surveyed during the latter stages of the war and its aftermath from 2018 to 2022 (N = 4,127) and found that life satisfaction dropped to a low mean of 1.28 (0–10-point scale) in 2022, after the U.S. military withdrawal and subsequent Taliban takeover. Two-thirds of Afghans reported a life satisfaction score of 0 or 1. To contextualize this, we then compared Afghanistan's mean subjective well-being score (i.e., life satisfaction) in 2022 to all 2,213 mean subjective well-being scores in the Gallup World Poll (N = 2,591,054) and all 18,855 mean subjective well-being scores in the World Database of Happiness, together covering more than 170 countries from 1946 to 2022. We found that the life satisfaction of Afghans in 2022 (M = 1.28) is the lowest mean subjective well-being score ever recorded. Furthermore, hope in Afghanistan also dropped in 2022 to a critically low mean of 1.02. Wars are destructive, but the conclusion of war can appear worse from the perspectives of civilians despite the de-escalation of physical violence.

[168] Predicting Anti-Immigrant Attitudes in the U.S. and France

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Hostility towards undocumented immigrants is rising as certain media stoke the anxieties of natural-born citizens. In Study 1, participants (N = 285 U.S.-born citizens; 128 women; 131 racial minority; preregistered) read four randomly-ordered news stories about an undocumented immigrant living in the U.S. and evaluated whether this target should be allowed to stay (along with related attitudes). Overall, we found that older Christian nationalists held the most anti-undocumented-immigrant attitudes compared to other demographic subgroups. Moreover, we found that certain "privilege maintenance strategies" explained these attitudes, specifically defending and denying their privilege over immigrants. In Study 2 (proposed N = 400; 200 U.S., 200 French; preregistered), we extend Study 1 by testing which kinds of anxieties over undocumented immigrants most drive negative attitudes (economic threat, cultural threat, violent threat). Given rhetoric in the U.S. and France, we hypothesize that economic threats will drive negative attitudes in both countries. U.S. participants, however, will be more concerned over violent threats, whereas French people will fear cultural threats more.

[169] Presidential Election Vote Outcome as a Predictor in County Level Sexual Orientation and Gender Motivated Hate Crimes across the United States

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Animus towards LGBTQ individuals remains high, exemplified through the growing incidence of hate crimes motivated by a victim's perceived LGBTQ identity. The increase in hate crime incidents may seem incongruous given recent polling data suggesting that attitudes towards the LGBTQ community are growing more positive year over year rather than negative. Recent work has proposed the importance of political factors influencing hate crime incidence in the United States, with jumps in occurrences loosely associated with major political events. Thus, our research seeks to clarify how one such event, the 2016 presidential election, may have influenced hate crime incidence for the following four years post-election. To accomplish this, we will utilize a mixed effects regression model analyzing whether Republican voting counties experienced an increased amount of hate crimes motivated by bias towards LGBTQ individuals during the four years following the election compared to Democratic voting counties. Our results will add to the current body of literature by clarifying how macronational events may exert extended influence on intergroup interactions with marginalized communities.

[170] Pride or Prejudice? Consumer Responses to Corporate Activism

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Over the past decade, the frequency of companies taking public stances on social issues, such as BLM, climate change, and LGBTQIA+ rights, has steadily increased. But today's shifting political and cultural climate has complicated this wave of corporate advocacy. How will companies' decision to commit to, or step away from, social advocacy impact perceptions of the causes they supported, their motives, and the company itself? And how do cultural perceptions of companies' political leaning shape these judgments? My study investigates this question using responses to real-world corporate social media posts supporting, or not acknowledging, Pride Month in June 2025. I will examine how their decision shapes support for LGBTQIA+ rights, whether people think their advocacy is self-serving or altruistic, and people's affinity towards the companies. Additionally, I will compare perceptions of these companies in 2023 to now, to examine how companies' decision to continue or stop advocating for Pride Month impacts how people perceive them. This work will help illuminate how the current political and cultural climate has changed the interpretations and impacts of corporate advocacy.

[171] Principle vs. Loyalty: How Moral Anchoring Shapes Partisan Engagement

4:40 PM – 5:40 PM

MORALITY

Moral commitments structure political judgment in ways that often override pragmatic considerations. While prior research shows that people derogate political out-groups as immoral regardless of their fair or prosocial behaviour (e.g., Skitka, Bauman, & Sargis, 2005), less is known about how voters evaluate in-party violations of core moral values. This study examines whether voters' responses to morally dissonant representatives depend on how they anchor their morality: internally in personal conscience (autonomy) or externally in group norms (authority). Across three experimental conditions, U.S. participants (N = 250) evaluated a co-partisan representative who (1) privately violated a core moral stance (pro-life/choice/family), (2) benefited from a flawed electoral process, or (3) shared misinformation later flagged by fact-checkers. This design tests whether moral dissonance triggers loyalty or defection, and whether moral anchoring predicts tolerance versus repudiation of the representative. The findings will clarify how voters reconcile moral values with partisan loyalty, with implications for understanding political accountability and the resilience of democratic norms.

[172] Profitable third-party punishment destabilizes cooperation

4:40 PM – 5:40 PM

MORALITY

Third-party punishment is theorized by scholars to be essential to the evolution of cooperation, but empirically, it often fails to bring about its desired effects. Here, we suggest that third-party punishment destabilizes cooperation when third parties have profit motives to punish. Across nine economic games and judgment experiments (including four preregistered studies), we find that when third-party punishment is profitable, rates of cooperation decrease immediately and remain lower even when punishment outcomes are optimized to support cooperative behavior. Profitable third-party punishment causes targets of punishment to anticipate antisocial punishment and perceive social norms in terms of self-interest, suggesting that the introduction of payment degrades the communicative signals that punishment is meant to convey about punishers' intentions and social norms. Critically, participants who would benefit from increased cooperation inadvertently reduce their own monetary compensation by opting in to experimental conditions that pay punishers, suggesting that they intuitively fail to consider the signaling consequences of profit motives to punish.

[173] Promoting Problem-Solving Intra-Team Task Conflict with Innovative Organizational Identity: Mediating Role of Creative Self-Efficacy

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

A problem-solving approach to conflict is essential for high-performing teams, particularly in the context of task-related disagreements that require integrative and creative resolution. This study builds on the idea that problem-solving conflict management is inherently a creative act and examines how organizational identity shapes individuals' psychological readiness to engage in such processes. Study 1 tested whether perceived innovative organizational identity activates a situated self-concept centered on creativity, thereby enhancing individuals' creative self-efficacy. In study 2, it was examined whether individuals high in creative self-efficacy are more likely to exhibit problem-solving approaches to task-conflict situations. Finally, Study 3 investigated the process in which creative self-efficacy mediates the relationship between perception of innovative organizational identity and problem-solving conflict management. With the findings that support the hypotheses tested, this framework contributes to research at the intersection of identity, creativity, and conflict by demonstrating how identity-based signals shape adaptive, collaborative conflict behavior within teams.

[174] Psychological Costs of Convenience: A Cross-cultural Examination of the Impacts of Automation on Everyday Tasks

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Many of our daily task experiences will be altered by the ever-increasing progression and adoption of technology. To date, few studies have examined the tradeoff between ease and agency in automated tasks, with even fewer studies exploring this tradeoff cross-culturally. Previous research conducted with Japanese undergraduates suggests that automation may dampen feelings of agency, self-efficacy, and flow when completing a task, yet overriding automation may restore and even boost them (Oikawa & Oikawa, 2022). The current research compares these effects in a sample of American undergraduates (N = 800) across two studies, examining the effects of automation on experiential feelings of agency, efficacy, meaning, and other variables in AI-assisted learning environments (e.g., studying) and across common daily experiences (e.g., driving). In addition, several individual difference measures, such as cognitive reflection, are assessed to observe their role in the experience of automation. While some psychological costs of task automation may be universal, the present research intends to detect those that may be influenced by cultural nuances.

[175] Psychological Predictors of Lying Behaviour

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

The purpose of this study is to examine the relationship between different types of lying behaviour (i.e., altruistic, self-serving, vindictive, and face-saving) and various psychological factors (i.e., authenticity, empathy, trust, moral disengagement, and loneliness). 236 participants completed an online survey on Qualtrics consisting of the Three-Factor Lying Scale, the Face-Saving Lies Scale, the Authenticity Scale, the Kernis-Goldman Authenticity Inventory Short Form, the Basic Empathy Scale, the General Trust Scale, the moral disengagement scale specific to lie-telling, the UCLA Loneliness Scale Revised, and the Marlowe-Crowne Social Desirability Short Form. I hypothesized that altruistic and face-saving lies would be positively associated with higher levels of authenticity, empathy, moral disengagement, and loneliness, as well as lower levels of trust. Additionally, I hypothesized that self-serving and vindictive lies would be positively associated with lower levels of authenticity, empathy, and trust, along with higher levels of moral disengagement and loneliness. Results indicated that authenticity was generally negatively associated with lie-telling, while empathy was positively associated with altruistic and negatively associated with vindictive lies. Moral disengagement was positively associated with all types of lie-telling, and loneliness was positively associated with all but vindictive lies. Trust was not significantly related to any type of lying behaviour. These findings suggest that the tendency to tell various types of lies is differentially associated with several psychological factors.

[176] Psychometric Development and Validation of the LGBTQIA+ Prejudice Scale

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The current study aimed to develop and validate a psychological measure of prejudice towards LGBTQIA+ individuals. While several existing scales measure prejudice towards some sexual or gender minority groups, no comprehensive test was found that includes trans, intersex, and asexual individuals alongside other LGBTQIA+ populations. The LGBTQIA+ Prejudice Scale consists of seven subscales measuring prejudice towards lesbian, gay, bisexual, trans, queer/LGBTQIA+, intersex, and asexual individuals. Each subscale was individually validated and contains only 10–15 items, allowing flexible use for individual research needs. Strong reliability was found for all subscales, with Cronbach's alpha and McDonald's omega values ranging from .94 to .97. All subscales demonstrated convergent validity with pre-existing prejudice scales as well as scales measuring Religious Fundamentalism and Right-Wing Authoritarianism. Analyses, including Confirmatory Factor Analysis and model-of-fit testing, found adequate validity and suggested differences in complexity and formation of prejudice towards different LGBTQIA+ groups. The LGBTQIA+ Prejudice Scale is a versatile and empirically supported instrument for measuring sexual and gender prejudice. It offers researchers a comprehensive tool to assess attitudes towards diverse LGBTQIA+ identities, with potential applications in both academic research and intervention development.

[178] Racial Differences in Perceived Passion and Motivation: Exploring Antecedents for Asian American and Asian Dehumanization

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Research indicates that Asian Americans and Asians (AAAs) in the U.S. are often viewed as robot- and machine-like, or mechanistically dehumanized, which has implications for social and workplace dynamics (Bai & Zhao, 2024; Li, 2023). However, little is known about why AAAs are prone to this dehumanization. This study explores perceived passion and motivation at work as antecedents of mechanistic dehumanization. We proposed that perceived lack of passion and intrinsic (versus extrinsic) motivation, an indicator of emotionality, may explain increased dehumanization. We conducted an online survey using a within-subjects design (n= 354) to explore US participants' perceptions of different racial groups in each construct. Results showed that AAAs generally were perceived to have higher extrinsic motivation and lower intrinsic motivation and passion. Among the three factors, higher perceived extrinsic motivation significantly correlated with higher mechanistic dehumanization for AAAs. Future research should continue to explore the role of extrinsic motivation in mechanistic dehumanization of AAAs, along with potential workplace outcomes.

[179] Racial Trauma, Drinking Motivations to Cope, and Alcohol Use: Testing a Series of Moderated Mediation Models

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The increasing rates of alcohol abuse among college students (SAMHSA, 2021) highlight a public health concern, particularly among historically marginalized racial/ethnic (HMRE) students who experience higher levels of racial discrimination (Lee et al., 2021; Pittman et al., 2019). Race-based traumatic stress symptoms (RBTSS), such as avoidance, depression, and hypervigilance, have been linked to alcohol use (Johnson et al., 2023a; Carter, 2007). Minority stress and racial trauma theories suggest that alcohol may serve as a coping mechanism for race-related stress (Keum & Ángel Cano, 2023; Keum & Li, 2022), yet the specific pathways linking RBTSS to alcohol use remain underexplored, particularly regarding drinking motives to cope and racial/ethnic differences in these associations. A sample of 389 students from a Northeast minority-serving institution completed validated measures assessing RBTSS (Race-Based Traumatic Stress Symptom Scale; Carter et al., 2013), drinking motives (Drinking Motives Questionnaire-Revised; Cooper, 1994), and alcohol use (Trauma and Alcohol Perceptions Scale; NIDA, 2018). Bivariate correlations, MANOVAs, and a series of moderated mediation analyses (Hayes' PROCESS Model 7 and Model 8; Hayes, 2022) were conducted. The study examined whether drinking to cope mediated the relationship between race-based traumatic stress symptoms (RBTSS) and alcohol use, with racial/ethnic differences explored. Mediation analyses showed that depression immediately after (DEP-I: indirect effect = 0.03, $p < .05$) and recently (DEP-R: indirect effect = 0.05, $p < .01$), as well as avoidance immediately after (AVOID-I: indirect effect = 0.06, $p < .001$) and recently (AVOID-R: indirect effect = 0.06, $p < .001$), partially mediated alcohol use. Self-esteem recently (SE-R: indirect effect = 0.04, $p < .001$) fully mediated alcohol use through drinking to cope. Moderated mediation revealed significant racial/ethnic differences, with Black Non-Hispanic and Asian Non-Hispanic participants showing stronger mediation effects, while Bi-/Multiracial Non-Hispanic participants exhibited inverse relationships.

[180] Racialized Peer Dynamics: Responding to the Acting White Accusation

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Previous research on the Acting White Accusation (AWA) has focused primarily on its content and psychological effects among Black and Latine students, but its interpersonal and behavioral consequences remain understudied. This study examined interpersonal outcomes and coping strategies following the AWA across four dimensions: motivation to disprove stereotypes, antagonism, freezing, and avoidance (Taylor et al., 2021). Utilizing a 2 (Participant Race: Black, Latine) x 2 (Condition: AWA, no AWA) design, participants (N = 380) were randomly assigned to read a scenario where a same-race classmate either accused them of "acting white" or made a neutral statement. Participants then completed measures assessing identity safety, intergroup anxiety, attitudes (i.e., negative, positive) towards the classmate, and coping strategies. Racial centrality was included as an exploratory moderator. Preliminary findings suggest that those exposed to the AWA scenario showed higher intergroup anxiety, more negative attitudes toward their same-race peer, and greater engagement in coping behaviors. These results highlight the importance of understanding racialized peer dynamics in academic contexts.

[181] Read the Room: Situational Awareness as a Foundation for Virtuous Behavior

4:40 PM – 5:40 PM

MORALITY

Russell (2009, 20-25), while building on Aristotle's view of practical wisdom, claimed that the traits of comprehension, sense, intelligence, deliberative excellence, and cleverness are needed for one to possess practical wisdom. These traits all have a common foundation of accurate environmental perceptions and assessment of sociocultural contexts. Therefore, it is implied that to possess the virtue of practical wisdom, one must be socially and culturally aware enough to identify appropriate contexts in which to take action. Whole Trait Theory (WTT) also proposes that social-cognitive processes can explain density distributions of states, which are influenced by situational factors (Fleeson & Jayawickreme, 2015). The current poster examines how individuals' personal and environmental situational awareness may be a critical skill needed to enact virtuous behavior. It is hypothesized that individuals with higher levels of trait truthfulness will also have higher levels of situational awareness compared to individuals with lower levels of trait truthfulness. It is also hypothesized that individuals with higher levels of both trait truthfulness and situational awareness will more accurately assess if situations are truth-relevant compared to individuals with lower levels of trait truthfulness and to individuals with higher levels of trait truthfulness and low levels of situational awareness.

[182] Reappropriating Fat: The impact of self-labeling on weight-related social identity

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The word fat generally has a negative connotation and is used to stigmatize individuals with heavier weights. Previous research with other marginalized groups suggests that reclaiming negative slurs may help individuals feel more powerful by signaling solidarity with the group. Using an exploratory approach, 52 individuals who have used the word fat to describe themselves in a positive way were surveyed on their reasons for doing so. Additionally, 93 individuals who have observed others positively self-label as fat were surveyed on the reasons they think others do so. Results showed that reasons categorized as signaling solidarity with the group ("To enhance the power of overweight and obese people in society") were the least endorsed by self-labelers and observers, while reasons signaling individual self-worth ("To show other people that they (self-labelers) are comfortable with their bodies") were most frequently endorsed. Findings suggest that individuals may not see weight as being a part of their social identity. Our results can help future research better understand the relationship between weight stigma, social identity, and the role of reappropriating fat as a label.

[183] Recovering from inaction: The effect of self-affirmation following failure to confront sexism

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Confrontations are an effective tool to combat prejudice (Czopp & Monteith, 2006). Although many people intend to confront, few do when given the opportunity (Woodzicka & LaFrance, 2001). Failing to act in line with one's intentions can spark dissonance, increasing tolerance of bias and undermining commitment to opposing bias (Mallett et al., 2019; Szekeres et al. 2022). However, this is not inevitable. Resolving dissonance through self-affirmation reduces the likelihood that people will compensate for failing to confront by increasing their tolerance of bias (Rasinski et al., 2013).

The present research examines whether self-affirmation moderates the effects of failing to confront on participants' intention to confront bias in the future. Approximately 300 participants will be randomly assigned to confrontation condition (confront vs. fail to confront a sexist statement) and to self-affirmation condition (self-affirm vs. control). They will report IMS, affect, evaluations of the interaction partner, endorsement of ambivalent sexism, and future intentions to confront. Data collection will be complete by November 17, 2025.

[184] Reducing Bias Toward Poverty Through Attributional Interventions

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

As wealth inequality rises in the US, the need for prejudice reduction interventions aimed at minimizing class-based bias has become an increasingly important social issue. In the present research, we investigate strategies for reducing stereotyping and prejudice toward unhoused peoples. Prior literature has demonstrated that employing situational attributions reduces derogation and blame toward stigmatized identities that are commonly perceived as "controllable", including low-socioeconomic status targets. Informed by attribution theory, this intervention encourages participants to practice identifying environmental constraints on upward mobility. Participants subsequently report perceptions of blame, class stereotyping, and attitudes toward wealth inequality. Through recognizing situational factors that lead to poverty, participants may more readily identify them in everyday, interpersonal encounters. We further discuss the role of attributional framing for reducing bias toward other forms of identities that are perceived as controllable.

[185] Reframe Your Ex-Partner: A Strategy to Minimize Post-Breakup Digital Engagement in Anxiously Attached Individuals Diagnosed with Generalized Anxiety Disorder

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Romantic relationship dissolution is especially distressing for individuals with anxious attachment, often triggering rumination and maladaptive digital behaviors such as monitoring an ex-partner's social media or sustaining text contact—behaviors linked to slower recovery and adjustment. This pilot study investigated a novel CBT strategy integrating cognitive reappraisal with phone-based behavioral cues to reduce these behaviors. Four adults (two male, two female) with recent breakups (≤4 weeks), diagnosed with generalized anxiety disorder and anxious attachment, participated in four weekly individual therapy sessions. In session one, clients identified negative traits of their ex and renamed the ex's contact information (e.g., "Alex, Drunk, Immature, Rude") on their phone/apps (i.e., WhatsApp, Instagram). Subsequent sessions reinforced and expanded these descriptors. Clients self-reported digital engagement weekly. All participants reported reductions; three ceased text contact by week two and social media monitoring by week three. By week four, all had ceased both behaviors and attributed the contact-name cue as critical. Control group did not cease behaviors. Findings suggest combining cognitive reappraisal with digital-environment modifications offers practical in vivo support to reduce post-breakup engagement and promote emotional recovery.

[186] Religious Ethnocentrism Scale Predicts Prejudice Beyond RWA, SDO, and Religious Fundamentalism

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Religious ethnocentrism (Altemeyer, 2003), which is the belief that one's own religious group is superior to other religious groups, has been implicated as a significant predictor of prejudice toward both religious and non-religious targets (Budesheim et al., 2024). Altemeyer's 16-item Religious Ethnocentrism (RE) Scale measures religious-based prejudice and hostility against others who differ from them in faith. Across two studies using a college sample (N = 390) and a non-college (Prolific) sample (N = 328), we validated a brief (6-item) measure of Altemeyer's religious RE scale using exploratory and confirmatory factor analysis. A third study (N = 347) established that the brief RE scale was a significant predictor of prejudice toward a variety of targets, but especially toward religiously relevant targets (e.g., Jews, Muslims, homosexuals). Moreover, we established significant incremental validity for the brief RE scale in that it was a significant predictor of prejudice above and beyond key religious variables (i.e., religious fundamentalism, religious quest, religious commitment) and ideological variables (i.e., SDO and RWA) typically connected with prejudice.

[187] Repainting anatomical models to be identity-safety cues in classrooms

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Underrepresentation of Black students in STEM may be influenced by non-identity-safe classrooms reducing belonging and motivation for POC students. We used Black and White skin-tone anatomical models in a mock biology classroom setting to measure effects on belonging. Online participants viewed a learning video presented with a Black or White anatomical model, took a quiz, and completed surveys to record belonging and other variables. The sample included 373 Black participants 18-30yrs, of which 203 were students. There was a significant 3-way interaction between condition, stigma consciousness, and student status predicting belonging, $F(1, 364) = 5.21, p = .02$. For students there was a simple 2-way interaction between stigma consciousness and condition, $p = 0.13$, such that at high stigma consciousness there was marginally more belonging in the Black model condition than the White model condition, $p = .07$, but not at low stigma consciousness, $p = .63$. Other variables showed similar results. Repainted models alongside other changes, may help increase identity-safety for Black students in STEM settings and in turn help diversify STEM fields by signaling to students that they belong.

[188] Representations of possibility in the Moral Domain

4:40 PM – 5:40 PM

MORALITY

The ability to represent what is possible is an important aspect of social cognition, and it is shaped by both physical and social and moral laws. Here, we examine how morality influences people's sense of what is and is not possible, testing whether these judgments are linked to imaginative capacity. Across 3 studies ($N = 942$), participants under time pressure judged whether various actions—ordinary, physically impossible, and very morally good ("saintly")—were possible in response to a moral issue. In Study 1, people were more accurate when evaluating the possibility of ordinary or impossible actions compared to saintly ones. Study 2 replicated this and found that the proportion of saintly actions viewed as possible was correlated 1) positively with scores in an alternate use task and 2) negatively with imaginative resistance (p 's $< .029$). Study 3 will examine whether viewing saintly actions as possible is also linked to judgments about immoral actions, moral values, beliefs about societal progress, and additional measures of imagination. Our results will provide a novel examination of the potential role of possibility judgments in moral cognition and imaginative thought.

[189] Resolving the Attitudinal Versus Behavioral Information Controversy: Experimental and Computational Insights about Social Influence

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Although information about someone's attitudes and behaviors is known to influence others, their relative impact remains unclear. Prior studies intended to compare attitudinal and behavioral information have inadvertently confounded the information or ignored participants' inferences about the behavior of those expressing attitudes. To clarify these effects and better understand social influence, Study 1 ($N = 938$) presented both attitudinal and behavioral information, or attitudinal information alone, as part of a group chat. Study 2 ($N = 300$) introduced social media posts that jointly discussed attitudinal and behavioral information, compared to either attitudinal or behavioral information alone. In both studies, coupling attitudinal and behavioral information had a greater influence than presenting either type alone. Studies 3 and 4 (N s = 50 and 98) presented attitudinal and behavioral surveys while manipulating inferences about people's behavior based on their attitudes. The surveys were most influential when they presented explicitly paired attitudinal and behavioral information or attitudinal information that implied behavior, followed by attitudinal information that did not imply behavior and mere behavioral information. Lastly, Study 5 employed an observational analysis of customer reviews confirmed these findings, highlighting the value of distinguishing between attitudinal and behavioral influences in real-world decisions.

[190] Rethinking Sacredness: Domains, Psychological Properties, and Moral Boundaries

4:40 PM – 5:40 PM

MORALITY

Sacred values research has broadened our view of sacredness, emphasizing resistance to trade-offs. Yet it often overlooks how people actually experience sacredness in daily life. Drawing on developmental psychology and the psychology of religion, we present two preregistered studies suggesting that sacredness is more psychologically diverse and personally grounded than previously assumed.

In Study 1 (N = 117), participants described something they held sacred. Content coding revealed five recurring domains, capturing a wide range of sacred objects and concepts. This highlights the need to explore sacredness beyond abstract value trade-offs.

In Study 2 (N = 163), participants completed the same prompt and then responded to probes adapted from developmental research on moral obligation and spiritual belief. While a few sacred objects (e.g., ecology) were described in universal moral terms, most were rooted in personal meaning rather than moral mandates.

Taken together, our findings suggest that sacredness is not a monolithic moral stance but a richly multidimensional psychological construct. Moving beyond trade-off paradigms, a participant-centered approach better captures the everyday experience of the sacred and reveals its diverse role in shaping how people find meaning and protect what they hold most dear.

[191] Revealing Invisibility: Tracking Current Perceptions of Black Women in Society

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Black women are one of the most cited instantiations of intersectionality since Kimberle Crenshaw put forth the concept (1989). Holding non-prototypical and subordinate identities in both their race and gender, Black women encounter a unique set of challenges. The misrepresentation, inattention, and understanding of Black women contributes to the idea of intersectional invisibility (Purdie-Vaughn & Eibach, 2008). The current study seeks to expand empirical work on invisibility through the method of spontaneous generation of subgroups for 6 categories (Black/White people, Black/White women, and Black/White men), to see where Black women stand socially in comparison to other identity groups. Supporting the main hypothesis, participants generated the fewest subgroups for the category of Black women. These results imply a type of social invisibility for Black women and indicate that the experiences of Black women are not strictly dictated by the summation of the Black experience and the female experience: Black women's double non-prototypicality exposes them to a complex world of subordination that needs to continue being explored.

[192] Revisiting Samurai virtues: A psychological analysis of Bushido through Large Language Models

4:40 PM – 5:40 PM

MORALITY

The longstanding dominance of WEIRD-based values has come under increasing scrutiny in the social sciences. Addressing this imbalance requires attention to non-WEIRD traditions, particularly those that historically influenced WEIRD audiences. Recent advances in natural language processing enable rigorous analysis of classical non-WEIRD texts. This study examines Bushido: The Soul of Japan, a widely read classic that introduced Japanese moral ideals to the West. Using Contextualized Construct Representations (CCR), we assessed how Bushido conveys psychological constructs by referencing established scales of morality and personality. Bushido consistently showed higher semantic alignment with these constructs than texts related to Christianity or Japanese culture, suggesting that it articulates moral and personality structures rooted in Japanese traditions that resonate across cultures and eras. Multidimensional scaling identified Meiyō (名誉) as the central virtue, distinct from Western pride-based honor. These findings demonstrate how classical non-WEIRD texts can reveal enduring, cross-cultural moral frameworks, offering a compelling alternative to the WEIRD-centric paradigm.

[193] Robot Bias: Individual Differences Moderate the Uncanny Valley Effect

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Why do some people find robots more unsettling than others? This study tested whether trait differences moderated uncanny valley responses. Participants (N = 169) completed measures assessing pathogen avoidance, disgust sensitivity, creepiness sensitivity, and general threat sensitivity as well as rated the uncanniness and eeriness of realistic and mechanistic humanoid robots. Results indicated that disgust sensitivity, creepiness sensitivity, and threat sensitivity interacted significantly with robot type to predict uncanniness: those higher in these traits rated realistic robots as more uncanny. Disgust sensitivity and threat sensitivity interacted significantly with robot type to predict eeriness, yet subsequent simple slopes were only significant for general threat sensitivity. Pathogen avoidance was not a significant trait moderator for either uncanniness nor eeriness. Overall, results suggest certain threat-based emotional traits may bias perceptions of humanlike robots, explaining why some find robots more unsettling than others.

[194] Science of Thriving: Supporting Basic Psychological Need Fulfillment in Transfer Students

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Science of Thriving is a multi-cohort longitudinal field study tackling student persistence. This intervention is developed with Self-Determination Theory (SDT) at its root. We investigate the effects of a non-traditional introduction to college course during a transfer student's first semester in college in a cohort model with other transfer students. Real world incoming transfer students are randomly assigned into one of two courses: Science of Thriving (Experimental) and University Transfer Success (Control). Students in Science of Thriving learn mindfulness techniques, relationship-building techniques, and finding and pursuing strengths. Students in the control condition receive a typical introduction to college course centering on campus resources. We investigate student outcomes at 4 timepoints: course start, course end, 1 semester after course end, 2 semesters after course end. We hope to present considerations for socioemotional interventions aimed at supporting student persistence and preliminary data.

[195] Seeing the Present as Future Memories

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

People engage in various future-preparing behaviors, one of which is documenting daily life for future reflection. Despite growing evidence that such documentation offers psychological benefits, little is known about who is more likely to engage in documenting daily experiences. To address this gap, we introduce a novel psychological construct, Seeing the Present as Future Memories (SPFM), which refers to the tendency to view the present as future memories worth preserving. Across three studies, we verify the positive relationship between SPFM and documenting daily life. First, we develop the SPFM scale and demonstrate that SPFM significantly predicts documenting daily life beyond related constructs—savoring belief and optimism (Study 1). Study 2, using a two-wave longitudinal design, shows SPFM at Wave 1 predicts documenting behavior at Wave 2, which in turn leads to greater well-being at Wave 2. Finally, Study 3 extends these findings by showing that individuals higher in SPFM also perceive greater value in daily records created by others. These results provide initial evidence that viewing the present as a future resource motivates individuals to preserve the present.

[196] Segmenting Chinese Students' Adaptation in Russian HEIs

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

This study investigated adaptation patterns among 500 Chinese students in 4 top Russian HEIs using Kim's cross-cultural adaptation theory. Two-step cluster analysis identified three distinct profiles based on educational satisfaction and cross-cultural adjustment: "Thriving and Integrated" (33.2%) with high satisfaction and adjustment; "Struggling and Discontent" (36.4%) with poor adjustment and satisfaction; "Academically Content but Culturally Challenged" (30.4%) with high educational satisfaction despite poor cultural adjustment. Pre-departure cross-cultural preparation, personality, chronic stress, socioeconomic status, and functioning significantly differed between clusters.

Open-ended responses reveal that cross-cultural adjustment and education satisfaction develop independently, with distinct stress experience/perception and resource utilization patterns across clusters. Findings suggest universities should develop targeted support sources addressing different adaptation needs and ensure adequate information distribution about these resources, allowing the students to choose appropriate support if they want to use it rather than assuming uniform experiences.

[197] Self-affirmation, Risk-taking, and Socioeconomic Status in a Job Interview Context

4:40 PM – 5:40 PM

MOTIVATION/GOALS

This preregistered study examines the effects of self-affirmation and socioeconomic status (SES) on risk-taking and confidence in a job interview scenario. We hypothesized that self-affirmation would increase risk-taking willingness and job interview confidence. Participants (N = 711) on Prolific were randomly assigned to either a self-affirmation task (writing about personal values) or a control. Risk-taking willingness and confidence were assessed both before and after the task in two ways: (1) self-reported willingness to take a specific risk in a job interview, and (2) general risk-taking tendencies in social and financial domains. Contrary to predictions, self-affirmation did not significantly affect risk-taking or confidence. However, SES positively predicted both financial risk-taking and confidence, both pretest and posttest, with higher SES associated with greater risk-taking and confidence. SES also negatively predicted social risk-taking posttest, though this effect was not significant when controlling for pretest scores. These results suggest that higher SES correlates with increased risk-taking and confidence but self-affirmation does not appear to enhance risk-taking.

[198] Self-Concordance and Positive Affect: Do They Predict Short-Term Goal Achievement?

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Self-concordance is the level of alignment of our goals with our interests and personal values. Higher self-concordance is associated with higher achievement. Similarly, higher positive affect is associated with higher achievement. We aimed to examine if self-concordance combined with positive affect predict achievement in short-term goals. On Friday, participants from a large public university (N=96) reported their positive affect using the PANAS, set three weekend goals, and completed the Self-Concordance Scale for each goal. On Sunday evening, they reported their achievement for each goal as a percentage. We hypothesized that self-concordance and positive affect collectively would be positively associated with goal achievement. Using the average self-concordance and achievement level for the three goals, we ran a multiple regression with self-concordance and positive affect as predictors whereas goal achievement was the outcome variable. Results showed that the model was not significant ($R^2=.016$, $F(2,91)=.750$, $p=.475$). We discuss possible interpretation of the results using both the high-performance cycle and expectancy theory.

[199] Self-Control Strategy Selection in Moral and Non-Moral Temptations

4:40 PM – 5:40 PM

MORALITY

Self-control is often studied as a matter of effortful resistance, but less is known about how people choose which strategies to regulate themselves. This project examines whether the moral framing of temptations influences self-control strategy selection. Expanding on recent work by Murray and Bermudez (2023), participants read realistic vignettes describing temptations framed either as moralized or non-moralized. For each scenario, participants rate situational characteristics using the DIAMONDS taxonomy (Rauthmann et al., 2014), and indicate which self-control strategy the protagonist should adopt out of attentional focus, cognitive change, response modulation, situation selection, or situation modification. (Duckworth et al., 2016). We hypothesize that moralized temptations increase the selection of proactive situational strategies (situation selection, situation modification) compared to non-moralized temptations. We also predict that situational characteristics will moderate these effects. Results will shed light on whether morality changes not just the strength of self-control but its architecture, clarifying the interplay of morality, self-control, and situational contexts.

[200] Self-Motives Predict Anti-Racist Intentions Following Racism Feedback

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Research finds that people who view themselves as better-than-average (BTAE) are more defensive following feedback about racial biases (Howell & Ratliff, 2017). Self-enhancement underlies BTAE, but other self-evaluation motives may reveal meaningful differences in reactions to feedback about one's racism. The proposed study (n = 400) will measure participants' anti-Black attitudes, self-evaluation feedback goals, and reactions to feedback about these attitudes. We anticipate that people's goals to self-enhance predict more defensive reactions toward feedback about racism (replicating past work), whereas goals to self-assess and improve are anticipated to predict lowered defensive reactions. We also expect different self-evaluation goals (e.g., assess and improve) will predict the extent of people's engagement with anti-racist behaviors. Individuals' awareness of their racial biases is crucial for promoting anti-racist behavior (Howell et al., 2024; Perry et al., 2015), so we seek to understand how people interpret the utility of racism-related feedback in a way that satisfies self-evaluation goals.

[202] Self-Serving CEO Activism? The Interaction of Business-Relatedness and CEO Morality

4:40 PM – 5:40 PM

MORALITY

When chief executive officers (CEOs) take public stances on contentious social or political issues—i.e., CEO activism—they elicit mixed reactions from stakeholders, resulting in both support and opposition toward the corporation. Drawing on attribution theory, this research examines how the perceived business-relatedness of CEO activism and CEO morality shape stakeholders' inferred motives and corporate reputation. Across survey and experimental studies, we find that as CEO activism is perceived to be more related to the core business, it reduces attributions of a self-serving motive of CEO activism. However, if the CEO's moral integrity is questioned, it does not affect the attribution process. The perceived self-serving motive of CEO activism spills over into attributions regarding corporate social responsibility (CSR), making CSR efforts appear opportunistic and ultimately harming corporate reputation. This study advances understanding of how stakeholders attribute motives to CEO activism, particularly in the context of CEO morality and CSR initiatives.

[203] Sensation Seeking Moderates Occipitoparietal Response to Food-Cued Vape Packaging

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Objective: E-cigarette vaping is the most common form of tobacco use among U.S. young adults (YAs). Vape marketing often features colorful food images to increase visual salience. Over 80% of YAs cite flavors as a reason for vaping. This fMRI study tested whether food cues on vape packaging heighten visuospatial attention, whether occipitoparietal responses predict subsequent vaping, and whether impulsive sensation seeking (ISS) moderates this link.

Methods: 67 YA vapers (M_age=20.1, 64.2% female) viewed vape packages with/without food cues during fMRI. Four occipitoparietal ROIs were identified via contrasts of packages with vs. without food cues. One-month vaping frequency was assessed via weekly follow-ups. Regressions tested whether ROI responses predicted vaping and whether ISS moderated effects.

Results: Food cues elicited greater activation in bilateral secondary visual cortex and parietal regions linked to visuospatial attention. Left inferior parietal lobule (IPL)/BA19 response predicted higher vaping frequency ($\beta=.34$, $p=.02$, $\Delta R^2=9.5\%$), but only in low sensation seekers ($\leq 2.72/4$; $\beta=-1.28$, $p=.01$).

Conclusion: Food-cue packaging enhances occipitoparietal salience responses that predicted increased vaping, with effects moderated by ISS. Findings highlight individual differences as critical in understanding neural risk mechanisms for vaping

[204] Sex Worker Stigma Through the Lens of Morality, Sexism, and Disgust

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

This study is a follow-up to prior research on the predictors of sex worker stigma, with a focus on ambivalent sexism, moral concerns, and disgust. The project replicates and extends earlier findings using a more diverse sample and improved measurement tools. Sex worker stigma has important social and policy implications, making it critical to understand its psychological underpinnings. Specifically, this study examines how purity-based moral concerns and ambivalent sexism contribute to negative attitudes toward sex workers, and whether disgust mediates this relationship.

Two aims guide the project: (1) validating the Sex Worker Implicit Association Test (Sex Worker IAT) by testing it in a more diverse sample and comparing it with established explicit measures, including the Normative/Deviant Subscale of the Attitudes Toward Prostitutes and Prostitution Scale; and (2) assessing relationships among stigma, moral concerns, ambivalent sexism, and disgust sensitivity. Explicit measures also include feeling thermometers, policy endorsement items, and scales of attitudes toward prostitution. Based on prior findings, we expect purity concerns to uniquely predict negative attitudes, beyond hostile and benevolent sexism. The inclusion of disgust allows for testing whether it mediates the link between purity concerns and stigma.

[205] Silence in the Scroll: Psychological Dynamics of Political Self-Censorship

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Political self-censorship – the deliberate decision to withhold one’s political views – threatens democratic discourse. Building on spiral-of-silence and pluralistic-ignorance theory, this research examines how perceived social norms, exposure to misinformation, and trust interact to shape willingness to express political attitudes. Previous work has identified how social media amplifies pluralistic ignorance, suggesting that digital environments may intensify these psychological processes. In this study, U.S. participants report baseline perceptions of norms, trust, and anticipated social/institutional sanctions. We then experimentally manipulate normative climate (perceived approval vs. disapproval), information environment (accurate vs. misleading content), topic (politically polarized vs. low-salience), and context (social media vs. offline) to understand the psychological conditions under which people silence their political views. In doing so, this work advances theory on self-censorship and identifies leverage points – such as norm signaling, interventions, and platform design – for sustaining open political dialogue.

ORGANIZATIONAL BEHAVIOR

This study explores employees’ implicit theories of wise management. Semi-structured interviews were conducted with 26 employees from an industrial organization, analyzed using Interpretative Phenomenological Analysis. Results revealed three core dimensions of wise management: intrapersonal attributes (e.g., moral reasoning, emotional balance), interpersonal behaviors (e.g., empathy, team development), and job-related skills (e.g., foresight, problem-solving). These domains formed the basis of the Tripartite Model of Wise Management (TMWM), consisting of nine managerial styles, ranging from “wise manager” to “self-centered ineffective,” illustrating variations in wisdom-related competencies. TMWM expands existing leadership frameworks by integrating ethical self-regulation with strategic and relational capacities. It offers a more dynamic and value-oriented approach to management, emphasizing not only how managers act but also why they act in a particular way. This framework informs management development, assessment centers, and selection processes by capturing the complexity of wise behavior in contextually demanding environments.

[207] Skewed Dispositional Regulatory Focus in Citizen Science: Implications for Engagement in Environmental and Public Health Monitoring

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Citizen science faces persistent challenges in sustaining engagement, and understanding drivers of volunteer participation, particularly in digital initiatives addressing environmental and public health concerns. The study offers a novel application of Regulatory Focus Theory to examine the impact of dispositional goal orientations among participants of Mosquito Alert, a transnational initiative tracking invasive disease-carrying mosquitoes. Using mixed-method analysis of survey data and in-platform behavioral metrics, a significant skew towards prevention-focused participants was found. A further discrepancy emerged between self-reported motivations and actual behavior. Notably, heightened dispositional regulatory focus correlated with shorter participation spans. The findings revealed critical gaps between perceived motivations and behavioral outcomes, underscored importance of further integrating psychological constructs into platform design to enable and maintain long-term volunteer participation. The study advances theoretical understanding of volunteer psychology in sustainability contexts offering actionable strategies for improving the efficacy of initiatives.

[209] Social media and perceptions of adulthood

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Social media users post highlights from their daily lives, like personal accomplishments and milestones. However, in doing so, they generate opportunities for social comparison, known to shape users' self-evaluations. This raises an important question: can social media also affect how we view our own rate of development? In this study, we set out to answer this question by randomizing college students (N = ~400) into one of two conditions: one where they view social media posts of similar-aged peers achieving adult milestones (e.g., getting married, having children) and one where they view posts of similar-aged peers doing everyday activities (e.g., visiting the beach). We hypothesize that those exposed to adulthood-salient social media will perceive themselves as younger, less adult-like, more depressed, and more "behind" their peers in adult development. With this research, the field may gain a better understanding of how to support the health and well-being of young people through a largely subjective and socially-influenced life stage, like emerging adulthood.

[210] Social Mobility Beliefs Predict Competence Stereotype Gap Between Classes

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The poor are often seen as less competent than the rich. This research tested whether social mobility beliefs—the perceived chance of people moving up or down in society—shape these stereotypes. We predicted that high (vs. low) social mobility beliefs would strengthen views of the poor as less competent, due to stronger internal attributions for their low status. Using a mixed experimental design, two studies (Singapore undergraduates, n = 260; UK online sample, n = 201) tested our hypotheses. Participants' social mobility beliefs were manipulated using bogus articles reporting high or low social mobility in their country. Participants then made attributions of social class, and rated the competence of rich and poor targets. Across studies, high mobility beliefs increased internal attributions for both targets. Crucially, high mobility beliefs reduced competence ratings of poor targets compared to low mobility beliefs, mediated by higher internal attributions of social class. Social mobility beliefs did not affect competence ratings of the rich. Findings suggest that believing in high social mobility may inadvertently widen the competence stereotype gap between the rich and poor.

[212] Social Pain Minimization Mediates Discrimination's Effect on Sleep Health

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Discrimination disrupts sleep and contributes to race-based health inequities for Black Americans, but less is known about the psychological processes of this relation. This research tests whether emotion invalidation, termed Social Pain Minimization (SPM), mediates discrimination's disruptive effects on sleep. The current work centers the experiences of Black Americans because of extant evidence of racism and SPM's effects among this group. Four studies using cross-sectional (Studies 1a-1b) and multi-wave designs (Studies 2-3; Ntotal = 1,176) were employed. Discrimination and SPM were measured with validated scales and self-reported sleep quality was assessed with multiple operationalizations including the short form Patient-Reported Outcomes Measurement Information System (PROMIS) Sleep-Related Impairment (SRI) subscale and composites of the Insomnia Severity Index (ISI). Cross-sectional (Studies 1a-1b) and longitudinal mediation analyses (Studies 2-3) indicated SPM partially mediated discrimination's effects on sleep. Beyond its direct negative effect on sleep, discrimination also operates through SPM to reduce sleep quality. Secondary experiences with emotion invalidation disrupt the sleep of Black Americans and contribute racial deficits in sleep health.

[213] Social Roles and Interpersonal Morality: Moral Ingroup Favoritism Among Chinese and Americans

4:40 PM – 5:40 PM

MORALITY

Relational and socio-cultural contexts are central to studying interpersonal morality. The current study compared China and United States on how social roles and relationships influence moral decision-making, and perception of interpersonal moral responsibilities. Study 1 used an experimental survey about hypothetical costly decision-making regarding family, friends, colleagues and outgroup members. Study 2 explored people's perception and justification of real-life role-related duties. Chinese and Americans generally differentiated between ingroup and outgroup, suggesting collectivism and in-group preference are cross-culturally universal. Comparatively, Chinese display a greater prioritization of family roles and relations, especially greater concern for parents; Americans value relationships with 'friends' and 'romantic partner'. Cultural differences in interpersonal morality may be related with specific person-construal, moral worldview, and socioecological environments. This study contributes to developing a relational-context-sensitive measure in moral psychology and characterizing cross-cultural patterns beyond the traditional typology.

[215] Stereotype Content and Cybervetting: The Effects of Anti-Sexism Social Media Posts on Hiring Evaluations

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

Cyber-vetting (i.e., evaluating applicants through their online presence) is increasingly common, yet prior research on gender and racial bias in cybervetting has rarely examined how identity-based online advocacy shapes hiring. This study tests how anti-sexism posts, applicant gender, and race affect hireability. Participants with hiring experience recruited from Prolific will review a fictitious resume and cover letter paired with X posts in one of six conditions: White men (anti-sexism vs. neutral), White or Asian women (anti-sexism vs. neutral). Post valence and engagement cues are held constant across conditions. We predict that (1) men posting anti-sexism content will be rated as more hireable than men posting neutral content, mediated by higher perceived warmth and competence; (2) women posting anti-sexism content will be rated as less hireable than women posting neutral content, mediated by lower perceived warmth; and (3) the hireability penalty for anti-sexism content will be greater for Asian than for White women, mediated by a larger reduction in perceived warmth. Findings will show how online advocacy shapes unequal hiring outcomes and inform efforts to reduce bias.

[216] Stereotypes as Shared Cultural Information

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Stereotypes convey explanatory information about groups (Reyna, 2000) and this stereotype information may be widely shared and socially understood within a culture. The current studies tested whether members of a stereotyped group (gay men) and out-members or observers of that group (heterosexual people) differ in their knowledge of that group's cultural stereotypes. Data was collected at 2 time points – in 2009 and in 2023. Data was collected for Study 1 at gay pride events in Chicago, while Study 2 subjects were recruited through the university's subject pool and completed an online survey for course credit. A one-way MANOVA was conducted for both timepoints, and remarkable similarity was found in recognition of gay stereotypes between gay men, bisexual men, and heterosexual individuals ($F(196, 1837) = 1.01, p = .462$), with a few exceptions. Implications for how individuals may leverage this shared cultural knowledge to communicate about their identities are discussed.

[217] Stereotypes of Dogs Are Context Dependent

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Research on animal stereotypes often lacks nuance, focusing on animals broadly rather than specific subgroups or contexts. Dogs are often seen as positively stereotyped, which may explain their role as beloved companions. However, this does not explain harm or utilitarian roles (e.g., dog fighting, laboratory research), suggesting a more complex stereotype landscape.

We examined stereotypes about dogs across two studies. In Study 1, participants (N=172) listed stereotypes about Dogs, Aggressive Dogs, and Friendly Dogs in open-ended responses. We identified 17 themes for Dogs (e.g., "good companions"), 15 for Aggressive Dogs (e.g., "dangerous to children"), and 20 for Friendly Dogs (e.g., "affiliative").

In Study 2, we created items from Study 1 responses and asked a new group of participants (N=305) to rate their personal endorsement of stereotypes of one condition (Dogs, Friendly Dogs, or Aggressive Dog). The most endorsed stereotypes were: "good companions," "loyal," "loving," "protective," and "love people" (Dogs); "dangerous to children," "dangerous," "hard to handle," "not properly socialized," and "will bite" (Aggressive Dogs); and "good companions," "loving," "good-natured," "sweet," and "love attention" (Friendly Dogs). We found that dog stereotypes are complex and depend on context. We discuss how stereotypes may influence attitudes toward animal welfare policies.

[220] Stigma, Minority Stress, and Mental Health: A Weekly Diary Study

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Stigma exposures (e.g., harassment) among sexual and gender minority (SGM) youth are hypothesized to elicit minority stress reactions—rejection concerns [RC], concealment motivation [CM], and internalized homonegativity [IH]—that contribute to mental health symptoms. Yet their temporal sequencing and covariation remain unclear, hampering causal inference. Using data from the control condition of a trial of 59 SGM youth ages 16-25 (M=21.95, SD=3.48) who completed 10 weekly mood tracking assessments, we examined within- and between-person associations among stigma, minority stress reactions, and depression and anxiety via lagged and unlagged multilevel models. Stigma predicted RC (lagged within: $b=0.2, p=.03$; lagged between: $b=0.65, p=.001$) and CM (lagged within: $b=0.06, p=.02$; lagged between: $b=0.11, p=.01$). RC predicted depression (unlagged within: $b=0.12, p=.046$) and anxiety (lagged between: $b=.43, p=.03$). CM predicted anxiety (unlagged between $b=1.24, p=.01$). IH predicted depression (unlagged within: $b=0.53, p=.049$) and anxiety (unlagged within: $b=0.82, p=.002$). Stigma exposure may generate state-like RC and CM, while IH might operate as a trait, not varying with stigma exposure.

[221] Stories of the Self: The Connections Between Narcissistic Personality Traits and Narrative Identity

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Background: Individuals differ in how they recognize and reflect on their life stories. Narcissism may shape this awareness by influencing self-perception and interpretation of past experiences.

Objective: We examined the connections that narcissistic traits had with narrative identity facets (awareness, temporal, causal, and thematic coherence) and whether cultural context (Turkey vs. United States) moderates these associations.

Method: Participants were 907 adults (454 Turkey, 453 United States) who completed measures of narcissism and narrative identity.

Results: Extraverted narcissism positively predicted all narrative identity facets, whereas antagonistic narcissism negatively predicted them. Neurotic narcissism showed small negative associations with causal and thematic coherence. Cultural context moderated these patterns: links for extraversion and antagonism were stronger in the U.S., whereas neuroticism's negative associations were stronger in Turkey.

Conclusion: Narcissistic traits relate to narrative identity in distinct and culturally contingent ways. Extraversion facilitates coherent life narratives, whereas antagonism undermines them and neuroticism has mixed associations with them. These results highlight the importance of personality and culture in life story construction.

[222] Structural views of prejudice predict engagement in collective action

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Beliefs about the nature of prejudice shape our decisions about how and when to effectively confront it. While interpersonal confrontation may seem sufficient for dealing with prejudiced individuals, widespread forms of bias like systemic prejudice may require larger-scale interventions to create meaningful social change. In an online survey of American adults ($n = 197$), this study examined whether self-reported beliefs about the relative source of prejudice (interpersonal vs. structural) predicted individual intent to engage in collective action behaviors such as boycotts, petitions, and protests. We found that participants with more structural views of prejudice were more likely to report collective action intentions, even when accounting for demographic factors such as gender, race, and socioeconomic status. This research identifies beliefs about the structural or systemic nature of prejudice as a potential target for experimental manipulation and eventually intervention.

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Following the 2020 resurgence of the Black Lives Matter (BLM) movement, a groundswell of people has shown a keen interest in the cause. The present study investigates virtue signaling, specifically, whether it inhibits people from engaging in meaningful direct actions that might promote social change. We tested whether the order in which participants are asked to publicly show support by posting on social media affects their willingness to donate. Participants were less inclined to donate time or money if, first, they were given the opportunity to indicate their support by posting on social media. Posting on social media as a form of virtue signaling is a low-cost action in comparison to donating one's time or money. The results suggest that these low-cost actions satisfy people's self-presentation goals, affirming to others that they, too, are on the right side of history, yet they may undermine more direct and perhaps more meaningful supportive actions.

[224] Subjectivity Feels Objective: Moral Evidence Under Emotional Burden

4:40 PM – 5:40 PM

MORALITY

Trust decides who gets believed in court, at work, and in relationship, but when led by emotion over evidence, it risks favoring sympathy over justice and volume over harm. While emotion shapes trust in legal settings (Ask & Landström, 2010), its role in moral contexts remains unclear, partly due to vague dilemma types. This study examines how emotional burden affects perceived credibility of subjective and objective evidence in a care-related moral dilemma.

We first analyzed 1,794 Reddit posts and over 300,000 comments from the AITA subreddit involving care-related moral dilemmas. As emotional intensity increased, commenters expressed more trust in the posts ($p < .001$), indicating that emotion may amplify the credibility of subjective moral claims.

In line with this pattern, participants ($n=100$) were assigned to high- or low-emotional burden conditions and rated the credibility of subjective and objective statements in a care dilemma. Emotional burden selectively reduced the perceived gap between subjective and objective evidence ($d=-0.46$, $p=.023$), suggesting that emotion can make moral claims feel more objective. This effect was specific to the burden-inducing party.

[225] Testing the universal model of prejudice: A replication of Hehman and Neel (2024) in Japan

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Hehman and Neel (2024) introduced "Prejudice Model 1.0," which employs elastic net regression to identify key predictors among multiple theories of prejudice. Building on their framework, this study examined the model's cross-cultural validity and context-specific predictors in a Japanese sample ($N = 877$). The models demonstrated strong predictive accuracy for toward Chinese people ($R^2 = .62$) and gay people ($R^2 = .46$). Consistent with prior findings, perceived threat consistently increased prejudice, while high-quality positive contact reduced it, supporting the model's robustness in a non-Western context. Two culturally distinctive findings also emerged. First, the relatively lower accuracy for predicting prejudice toward the wealthy ($R^2 = .26$) suggests that this group may not represent a salient target of prejudice in Japan. Second, Japanese national identity was an exceptionally strong predictor of prejudice against Chinese people, indicating a unique link between nationalism and outgroup attitudes. Overall, the results highlight both universal mechanisms and culture-specific pathways underlying prejudice.

[226] The Ambivalence of Proactive Behavior: From Campus to Workplace

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

Although proactive behavior is generally regarded as adaptive, it involves challenging the status quo and thus entails the risk of negative reactions or evaluations from others (e.g., Twemlow, Tims & Khapova, 2023), making early-career employees hesitant to engage in. We examined whether positive or negative experiences of interpersonal proactive behaviors in college correlate with subsequent workplace voice behaviors. A semi-structured interview with 10 college seniors confirmed that interpersonal proactive behaviors resulted in both positive and negative outcomes for oneself and others (Study 1). In Study 2, 324 early-career employees completed scales that measured their experience of proactive behaviors in college (newly developed based on Study 1), interdependent self-construals (harmony vs. avoidance orientations), perceived interpersonal risk in the workplace, and their voice behavior. Positive self-change in college experience had the strongest association with workplace voice behaviors. Furthermore, those with a harmony-oriented interdependent self-construal voiced more, while those with an avoidance-oriented self-construal voiced less. The ambivalent nature of proactive behavior itself, as well as its ambivalent associations with the two dimensions of interdependent self-construal, provide critical insights into how such behavior may be facilitated.

[227] The Amplifying Effect of Self-Quantification on Self-Perception: The Role of Goal Achievement

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Self-quantification, the use of digital technologies to track health and behavior, has been linked to both empowerment and psychological costs. Yet, the conditions under which these outcomes emerge remain unclear. Across two preregistered studies, we investigated how self-quantification moderates the psychological consequences of goal achievement for self-perception. In a cross-sectional survey (N = 1136), we found that goal failure was associated with higher self-objectification and self-optimization pressure among self-quantifiers compared to non-quantifiers, supporting the idea that tracking amplifies the costs of failure. However, contrary to expectations, self-quantification did not enhance empowerment when goals were achieved. A 14-day daily diary study (N = 230) replicated these effects within individuals, demonstrating that on days when goals were not achieved, self-quantification predicted heightened objectification and self-optimization pressure both on the same day and the following day. Together, these findings suggest that the psychological effects of self-quantification are not uniform but contingent on goal outcomes, with tracking functioning primarily as an amplifier of the negative consequences of goal failure.

[228] The Black Model Minority Myth: Conversations Across the Diaspora

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The Black model minority myth (BMMM) refers to Black immigrants being viewed in more characteristically "positive" traits than Black Americans, which contributes to disparities in treatment and stereotype internalization. This study explores how Afro-Caribbean immigrants, Black Americans, and African immigrants discuss their experiences with Black identity labels on social media forums such as Reddit. To investigate these dynamics, we webscraped and analyzed over 2,500 responses from Reddit threads where people voiced their experiences ranging from not being labeled "Black" until arriving in the U.S to Black Americans being stereotyped as "violent" and "lazy". Our content analysis revealed that themes such as racial history in the US, uniformity, stereotypes, displacement, discrimination, upbringing, and fluidity with race and space are frequently discussed. These findings highlight the complexities of how individuals navigate their Blackness in relation to the BMMM. By centering participant dialogues from online forums, we reveal the intricate dynamics of identity and white supremacy to deepen our understanding of racialized identity construction relevant to intragroup solidarity.

[229] The Cross-Cultural Difference in the Effect of Competence and Benevolence on Preference for Teamwork: The Mediation Effect of Trust in Co-Workers

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

This study will investigate how perceptions of competence and benevolence in organizational relationships influence employees' preference for teamwork, with trust in co-workers serving as a mediator. Focusing on cross-cultural differences, it will test the hypotheses that competence exerts a stronger effect on trust in individualistic cultures, while benevolence is more influential in collectivistic cultures. Two quantitative studies will be conducted: a cross-sectional survey and a scenario-based experiment, both involving employees from Korea and the United States. Measures will assess perceived competence, benevolence, trust in co-workers, and teamwork preference. Data will be analyzed using a serial mediation-moderation model using SPSS Process Macro and multi-group SEM to examine cultural variations in these relationships. By clarifying how culturally shaped trust dynamics affect collaborative preferences, the research will contribute to theory on trust formation and offer practical insights for managing teamwork in culturally diverse organizations.

[230] The Effect of Meaning Making on the Emotional Experience of Past Event Recollection

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Meaning-making research has focused on the context of negative events, proving meaning-making to be vital in resilience following these experiences. Less is known about the role of individual differences in meaning-making and their emotional implications in both positive and negative past event recollection. The present study evaluated the effect of individual differences in meaning making on negative and positive emotional responses to recalling past positive and negative life events. Across 2 studies (n = 201; n = 199), people higher in meaning-making reported overall higher positive and lower negative emotions. Multilevel analysis revealed that people higher in meaning-making reported higher positive emotions in response to positive, control, and to a lesser extent, negative conditions. Additionally, people higher in meaning-making had lower negative emotions in positive and neutral conditions, but not in the negative conditions. These findings add new insights to the meaning-making literature by suggesting that while meaning-making increases positive reinterpretation and growth-oriented narratives, it may not fully buffer the emotional impact of recalling negative events.

[231] The Effects of (Dis)Advantage on Subjective Judgments of Harm

4:40 PM – 5:40 PM

MORALITY

Across three preregistered experiments, we find that people expect identical acts to cause less harm to advantaged versus disadvantaged targets. In Study 1, participants learned about a target who either won or lost money in an initial lottery (manipulation of advantage) and was then subjected to social exclusion in a game of cyberball. Participants believed that social exclusion caused less harm to advantaged targets. In Study 2, we manipulated the order of the lottery and the cyberball game and found that participants believed that social advantage (being included in cyberball) would inoculate targets against monetary losses. Study 3 used face-valid targets to examine whether these results generalize to a range of social advantages (power, wealth, status, and health). Across contexts, participants expected advantaged targets to be less harmed by social media attacks, and were less likely to support them in the aftermath. These results shed light on how social status shapes moral judgment, adding nuance to our understanding of dyadic harm (Schein & Gray, 2018) and challenging the common narrative that disadvantaged targets are seen as more resilient to harm (Cheek, 2021).

[232] The Effects of Observing Constituents' Norm Violations on Trust in Authority

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

The credibility of authorities is fundamental to institutional trust and democratic functioning, as well as life in society. While authority figures are typically judged based on their behavior, we propose that constituents' behaviors also shape their judgments and trust of authority. Five experiments (total N = 2,129) found that observing constituents' norm violations (e.g., cheating on an exam or misreporting taxes) undermined perceived authority's character (i.e., moral integrity) and competence (i.e., expertise), as well as trust in the authority. This effect generalized across experimental paradigms and contexts (i.e., education, business, and government; Experiments 1-5), persisting even when the authority had no power over the constituents' behavior (Experiments 3 and 4). However, messages emphasizing the ethical values underlying the norm effectively curbed the negative impact of constituents' misconduct (Experiment 5). These findings highlight how social contexts shape trust in authority bottom-up and suggest strategies for safeguarding institutional trust when norm violations occur.

[233] The Human=Own Group Effect as a Feature of Regionally Dominant Groups: Evidence from Japan

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Despite the equal humanity of all human groups, White Americans associate "Human" more with White and "Animal" more with non-White groups on a measure of social cognition, the Implicit Association Test (IAT; REDACTED, 2023). Strikingly, White respondents from multiple countries (e.g., USA, Canada, UK, Germany) similarly displayed this implicit Human=White effect (IAT $D_s \geq 0.24$). This produced a theoretically interesting question: Are Human=Own Group associations restricted to individuals of European descent, or are they a feature of any regionally dominant group? Across four studies ($N = 412$), we tested this question directly. Specifically, we explored whether Japanese participants, living in Japan and tested in Japanese, display Human=Own Group associations across various White-Japanese/Human-Animal IATs. Providing strong evidence for the generality of the Human=Own Group effect, Japanese participants displayed robust Human=Japanese associations in all four samples (IAT $D_s \leq -0.34$). In fact, stereotype strength was stable across variations in category label ("White" versus "American") and writing system (i.e., Kanji or Katakana), and emerged robustly across demographic groups (e.g., age, gender, education). Together, this work demonstrates that the differential attribution of humanity to one's own group may be a penchant of dominant groups across the globe.

[234] The Impact of Elaboration and Automatic Thinking on Counterfactual Perception

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Counterfactuals (CF) indicate how past outcomes could have differed (Byrne, 2016). CFs differ in potency (i.e., plausibility), which influences subsequent negative emotions and the strength of future behavioral intentions (Petrocelli et al., 2011). CFs also differ in focusing on actions that should have been taken (additive CF) or not (subtractive CF). We hypothesize that individuals perceive additive CFs ("If only I did X") as more potent than subtractive CFs ("If only I did not do X"), eliciting more negative emotions and strengthening behavioral intentions.

Participants read a series of hypothetical negative events, followed by an additive CF, a subtractive CF, or a control thought. In the CF conditions, they will rate the CFs for potency and how much regret they would feel about the situation. In all conditions, they will rate how likely they would be to enact the implied behavior in the future.

We hypothesize that (1) additive counterfactual statements will be perceived as more potent compared to subtractive counterfactuals and to our control condition statements, and as a result, (2) additive counterfactuals are likely to create higher feelings of regret and stronger behavioral intentions.

[235] The Impact of Existential Isolation on Organizational Decision-Making, Behaviors, and Hierarchies

4:40 PM – 5:40 PM

ORGANIZATIONAL BEHAVIOR

This research examines the relationship between existential isolation (EI; Helm et al., 2019; Pinel et al., 2004), the feeling that one is alone in their subjective experience, and organizational decision-making, behaviors, and hierarchies. For study 1, we predicted that people with higher EI would make more selfish decisions, while people with lower EI will make more collaborative decisions. We also predicted that the transparency of decision will result in more prosocial behavior, though only for those high in EI. Study 1 ($n = 400$) found a significant interaction between EI and transparency of the behavior in predicting selfish organizational decision making. Study 2 hopes to further examine the relationship between EI and decision making, while also examining the role of leadership hierarchies and social loafing behaviors. We expect to replicate the relationship observed in study 1, but are agnostic about the potential moderating roles of organization size, leadership position, and other organizational factors. The role of EI in organizational settings has not yet been explored in depth and could yield important implications for community building, team dynamics, and well-being.

[236] The Impact of Implicit Theories of Peer Relationships and Social Achievement Goals on the Quality and Quantity of Interpersonal Relationships Among First-Year University Students in Japan

4:40 PM – 5:40 PM

MOTIVATION/GOALS

This study developed a Japanese version of the Implicit Theories of Peer Relationships Scale for university students and examined how implicit theories of peer relationships and social achievement goals relate to friendship satisfaction and number of friends. An online survey was conducted with 843 first-year Japanese university students; after data screening, 275 valid responses were analyzed. Measures included scales for implicit theories of peer relationships, social achievement goals, friendship satisfaction, and number of close friends. Confirmatory factor analyses supported the expected structures. Correlation analyses showed that entity beliefs were positively associated not only with performance-oriented goals but also unexpectedly with mastery-oriented goals. Regression analyses revealed that mastery-approach motivation positively predicted friendship satisfaction, while mastery-avoidance motivation negatively predicted number of friends. Performance-avoidance motivation was positively associated with friend count. Beliefs about the universality of friendships did not significantly influence either the quality or quantity of interpersonal relationships. These findings suggest that achievement motivation plays a more central role in shaping interpersonal outcomes than implicit beliefs about relationship malleability.

[237] The impact of religious identification and narrative perspective taking on empathy and transprejudice

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

The current poster explores the impact of narrative perspective taking on empathy towards transgender individuals and self-reported transprejudice. Participants read a transition story of a youth from the perspective of either the youth, their parent, or a 3rd person perspective. Religious identification of the family was also manipulated. The family was either labeled as religious, nonreligious, or there was no mention of religion. This study plans to expand on previous research showing narrative perspective and religious identification can impact reported empathy. In particular, the presence of control conditions in the current study allows for a better understanding of the direction of change. Previous research has not been able to show if particular conditions increase or decrease reported empathy. Discussion will focus on how to leverage the current findings to bolster empathy for transgender individuals and promote positive mental health outcomes.

[238] The Impact of Video Interventions on Attitudes about Undocumented Migrants

4:40 PM – 5:40 PM

FIELD RESEARCH/INTERVENTIONS

Research suggests that several intervention factors are individually effective at increasing support for an outgroup, including: 1) combining cognitive and affective techniques, 2) being delivered by ingroup members, 3) fostering perspective-taking, and 4) appealing to moral foundations such as ingroup loyalty. Here, we will extend this research by testing novel video interventions to examine the complex interplay between these factors and their effects on reducing support for anti-migrant policies and increasing willingness to help undocumented migrants in a US sample (N=1800). Each video intervention will combine both cognitive and affective approaches and present information from the perspective of 1) ingroup members (U.S. American farmers/employers), 2) outgroup members (undocumented migrant employees), or 3) a combination of both ingroup and outgroup members. We will then assess which intervention, when compared to a no-video control condition, results in the greatest increase in support for undocumented migrants—while also exploring perspective-taking as a potential mediating variable and ingroup loyalty as a potential moderating variable.

[240] The influence of history on moral and legal judgments: How past adversity shapes evaluations of antisocial and prosocial behavior

4:40 PM – 5:40 PM

MORALITY

Building on our past research, two planned studies examine the role of historical factors in moral judgment. Study 1 ($n = 480$) investigates whether targets from disadvantaged backgrounds (DB), advantaged backgrounds (AB), or a no-background information control (C) are praised more and viewed as having better moral character when they engage in prosocial behaviors related to their disadvantage/advantage. We expect that relative to C and AB conditions, targets from DB will receive greater praise for their actions and will be viewed as possessing more moral character. In Study 2 ($n = 480$), participants will learn about a target described as having come from a DB or AB (vs. C) who commits the same moral infraction (unrelated to their backgrounds). We predict that DB targets will be evaluated less negatively than in other conditions. Sample sizes will be sufficient to find pairwise effects as small as $d = 0.31$. This research has implications for moral and legal decision-making, as emphasizing historical factors might influence moral judgments, resulting in decreased or increased perceived culpability for wrongdoing or greater/less assigned praiseworthiness for prosocial acts.

[241] The Influence of Ongoing Adversity on Empathy, Morality, and Prosociality

4:40 PM – 5:40 PM

MORALITY

A body of research suggests that adverse life events can foster increased prosociality via heightened trait-level empathy. However, little is known about how ongoing adversity might impact people's propensity to exercise empathy in the service of prosocial behaviors.

In two preregistered studies ($n = 403$), we examined whether the severity of ongoing adversity (COVID-19) was positively associated with prosociality via trait empathy (i.e., empathic concern, perspective-taking) as mediators. In Study 1 ($n = 200$), we found that the severity of ongoing adversity was inversely associated with trait empathy. Despite this, the severity of ongoing adversity was still a robust predictor of prosocial behaviors. In Study 2 ($n = 203$), we attempted to replicate the results of Study 1 while uncovering alternative mediators that account for the association between the severity of ongoing adversity and prosociality. We found that moral foundations (i.e., Loyalty) may mediate the positive association between the severity of ongoing adversity and prosocial behaviors in place of trait empathy.

Results from this study may help us understand the motivation underlying adaptive behaviors in the face of adversity.

[242] The influence of social context on the consistency of alignment between algorithmic fairness definitions and human moral beliefs

4:40 PM – 5:40 PM

MORALITY

The widespread embedding of machine learning (ML) into decision-making processes once managed by humans has elicited concerns about whether common mathematical definitions of fairness align with the notions of fairness held by the people affected by the models. In this research, we investigate two complications in designing fairness metrics informed by non-specialist fairness preferences; that individuals routinely violate their preferred decision-making axioms in practice, and that people's fairness preferences have been shown to be context-dependent.

Through two pre-registered behavioral experiments, we examine the extent to which an individual's preferences for particular fairness definitions align with their behavior in specific choice problems; how they reconcile deviations from their stated preferences; and whether these choices vary systematically over features of social contexts. In the first experiment we embed fairness in a particular context by training classification models constrained by group-based fairness metrics on data from emergency room visits. In the second, we use vignettes to manipulate contextual features of interest (i.e., familiarity).

[243] The Interpersonal Invisibility Measure: Development and Validation

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Interpersonal invisibility (feeling unnoticed or ignored) is a potentially detrimental experience that may be particularly likely to affect stigmatized groups. In order to better assess and understand this experience, we generated and validated a 10-item measure of interpersonal invisibility. Study 1 (n = 511) uses exploratory factor analysis on a set of generated items to guide item selection. Study 2 (n = 190) confirms the measure's factor structure. Study 3 (n = 943) examines the convergent and discriminant validity of the measure and tests for measurement invariance by gender, race, and sexual orientation. Study 4 (n = 1000; analysis ongoing) examines the predictive and incremental validity of the measure. Our unidimensional measure displays strict measurement invariance by race, gender, and sexual orientation and can provide an essential tool for understanding a broader array of stigmatization experiences beyond traditional measures of discrimination. Future work will validate context-specific versions of the measure to better capture the nuance surrounding interpersonal invisibility. To this end, we selected 10 items that could be easily modified in future work.

[244] The Mo Salah Effect: A Muslim Star Footballer's Impact on Islamophobia

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Islamophobia is one of the most common forms of prejudice in the UK (Khattab & Johnston, 2015). Considering that, would a star footballer in the English Premier League – who is also a publicly practicing Muslim – have any impact on Islamophobia in the UK? The current study aims to test the effects of parasocial contact on attitudes and beliefs about Muslims in a real-world, quasi-experimental setting.

Consider the example of Mohamed "Mo" Salah. Mo Salah is a professional footballer who currently plays for Liverpool Football Club (Liverpool FC) – one of Britain's most successful clubs (Dawkes, 2020; McNulty, 2019), and the current league champions. Importantly, supporters of Liverpool FC and their local rivals, Everton FC (also based in the city of Liverpool), are highly similar and nearly homogenous aside from their football loyalties, thus creating a unique field experiment setting. Given the active Muslim faith of Liverpool FC's star player, Salah, it was predicted that identity with a particular football club, and parasocial contact with Mo Salah would have differential effects on pro-Muslim outcomes. Specifically, it is hypothesised that Liverpool fans would express greater pro-Muslim attitudes than non-football watching residents of Liverpool, and even greater pro-Muslim attitudes than fans of rival club, Everton FC.

[246] The Moderating Role of Perceived Social Support on the Relationship Between Cultural Values and Alcohol Related Problems Among Hispanic Drinkers

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Research has shown that perceived social support may have stronger effects on health due to traditional family values among Latinx. However, there's limited research on how perceived social support moderates the relationship between cultural values and alcohol use severity among Hispanic. We hypothesize that Perceived Social Support will moderate the relationship between Cultural Values and Alcohol use Severity among Hispanics. Participants (n=256) were recruited through Prolific and completed the survey on Qualtrics and completed the Multidimensional Scale of Perceived Social Support, Mexican American Cultural Values Scale, Daily Drinking Questionnaire. Simple moderation analysis in MPLUS was conducted to assess any interactions with our variables of interest. Regression Analysis showed that stronger adherence to Hispanic Cultural Values was significantly associated with higher alcohol use ($\beta=0.748$, $p=0.026$). Perceived Social Support from friends was a significant predictor for higher alcohol use ($\beta=0.557$, $p=.007$) suggesting that peer support might increase alcohol use. However, an interaction between Cultural values and friend support ($\beta=-1.295$, $p=.003$) indicated a protective effect. Our study found that stronger adherence to Hispanic values and greater support from friends predicted higher alcohol use. However, high cultural value adherence and support from friends was a protective factor. Future studies should focus on evaluating different types of friends support and its role in alcohol use.

[247] The Moral Foundation of Honesty and Relationship Satisfaction

4:40 PM – 5:40 PM

MORALITY

Honesty seems important for close relationships because it likely influences communication. Individuals' appraisals of situations where honesty is violated may relate to attachment style. Moreover, individuals with attachment avoidance and/or anxiety may misperceive violations of honesty in their relationship. This study examined how valuing honesty relates to relationship satisfaction and attachment style. Participants ($N = 105$) answered questions about scenarios where honesty was violated. They also completed the Relationship Assessment Scale and Experience in Close Relationship Scale-Short Form. Viewing the scenarios as less in violation of honesty was associated with lower relationship satisfaction and greater attachment avoidance. Also, appraisals of (dis)honesty predicted attachment avoidance (but not relationship satisfaction) even after controlling for appraisals of other moral values. These findings suggest that individuals with higher attachment avoidance may struggle to detect violations of honesty. Thus, they may unknowingly act dishonestly, and/or fail to recognize when their partner acts dishonestly. This may contribute to poor communication and explain lower relationship satisfaction.

Honesty seems important for close relationships because it likely influences communication. Individuals' appraisals of situations where honesty is violated may relate to attachment style. [248] The Moral Signaling Effect of Being Busy: The Perspective of Morality-as-Cooperation Theory

4:40 PM – 5:40 PM

MORALITY

Busy people may be less warm (Jiang et al., 2024), but could they be seen as more moral, and if so, why? This research tested the moral signaling effect of being busy across 4 preregistered studies ($N = 1,500$ Chinese participants, $M_{age} = 31.12$, $SD = 8.25$). Study 1 ($n = 300$) showed that a busy (vs. non-busy) target was rated as less warm (e.g. sociable, funny), but more moral (e.g. principled, just). To identify the key mechanism underlying this moral signaling effect, we used cross-sectional (Study 2, $n = 200$) and block mediation (Study 3, $n = 600$) designs. We found that perceived cooperative intention (morality-as-cooperation theory, Curry, 2016), rather than perceived agency (moral typecasting theory, Gray & Wegner, 2009), played a crucial role in explaining this effect. Study 4 ($n = 400$) found that busy people were more likely to be seen as moral in a non-zero-sum status context that made busyness appear more cooperative. These findings extend the morality-as-cooperation framework to person-perception, showing that busyness can be moralized because it signals a willingness to cooperate by using one's time, a limited resource, to contribute to social production.

[249] The Motivational Drivers of Adolescent Alcohol Use and the Moderating role of religious attendance

4:40 PM – 5:40 PM

MORALITY

Background: The study investigates the relationship between attendance at religious services and the prevalence of antisocial behaviors and alcohol use among individuals. Research indicates that antisocial behaviors are significant risk factors that contribute to alcohol use among adolescents. In environments where alcohol use is perceived as typical antisocial behavior, it may also act as a potential pull factor that draws adolescents towards environments that use alcohol. Examining the relationship between religious service attendance and its impact on the connection between antisocial behavior and alcohol use among adolescents and young adults is critical.

Method: The 35,545 participants were drawn from the NESARC III public dataset. Pearson correlations assessed bivariate relationships, and the primary and interaction effects of antisocial behavior and religiosity on alcohol use were determined using multiple linear regression.

Results: Our findings indicate that attending religious services means less alcohol use and the antisocial behaviors predicted higher alcohol consumption ($r = -.15$, $p < .001$); regression results revealed antisocial behavior negatively predicted alcohol use ($\beta = -.02$, $p < .001$), whereas religiosity positively predicted alcohol consumption ($\beta = .18-.22$, $p < .001$). The interaction between antisocial behavior and religiosity was significant ($\beta = -.01$, $p < .001$).

Conclusion: Religiosity may amplify the protective association between lower antisocial behavior and reduced alcohol use.

Keywords: antisocial behavior, religiosity, alcohol use, adolescents, young adults.

[250] The Power of Partner Involvement: Goal Pursuit, Self-Control, and Relationship Satisfaction in Romantic Couples

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Romantic relationship partners play a crucial role in shaping goal pursuit, either facilitating or hindering an individual's progress toward their goals. This study investigates how self-control moderates the relationship between active partner involvement in goal pursuit and relationship satisfaction in 148 couples in committed relationships who completed a web-based questionnaire. Results from Actor-Partner Interdependence Models (APIMs) showed a significant actor effect indicating that individuals who frequently discussed their goals with their partners reported higher levels of relationship satisfaction. Additionally, a significant partner effect emerged, suggesting that people reported higher satisfaction when their partners actively involved them in their goal pursuits. Moderation analyses revealed that the actor effect was stronger when paired with higher actor self-control. Results suggest that active partner discussion and integration can bolster perceptions of relationship stability, especially among those high in self-control. These findings highlight the value of open goal-related dialogue and support for relationship satisfaction, with self-control amplifying these benefits. Future research should further examine the mechanisms that connect goal coordination and relationship satisfaction.

[251] The Prevalence and Relevance of Black Women's Future Goals

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Goals are important for identity, self-continuity, and well-being. Fewer studies address the experiences and goals Black women, and there is value in improving representation in this research space. We were interested in the expressions of specific identity-based, agency-based, communion-based, and health-based goals among young Black women. In a secondary analysis, we analyzed expressions of lifespan goals from 18-to-24-year-old Black women ($n = 80$; $M \text{ age} = 19.71$, $SD = 1.76$), were recruited from multiple college and community sites. Most women expressed goals grounded in identity, agentic motives, communal motives, and health. Multiple factors, including age, were related to the prevalence of life goals. We considered whether women's goals—as reflections of personality differences—were related to psychological well-being and hopefulness. Multiple life goals were positively related to well-being and hope among women, reinforcing the values of life goals for identity and self-continuity. Findings showcase the importance of different types of goals for young Black women and highlight the need to continue addressing the ways life goals emerge and continue to change over time.

[252] The Relationship Between Malicious Compliance and Individual Difference Traits in the Workplace

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Malicious compliance (MC), or the tendency to explicitly follow orders or policies despite knowing that one's behavior will not yield a desired outcome, is a relatively uninvestigated form of counterproductive work behavior (CWB). The inherent contradiction of this construct suggests that factors such as prosocial and sadistic tendencies are able to both predict these actions. This current research utilized a community sample of participants via Prolific. The survey assessed the perceived acceptability and likelihood of performing various forms of workplace behaviors, as well as a variety of individual difference traits, including prosocial tendencies and other dark (e.g., Machiavellianism) and light (e.g., Kantianism) traits. After controlling for general prosocial tendencies, multiple regressions found that light traits negatively predicted MC toward one's supervisor and CWB toward one's organization, while dark traits positively predicted MC toward one's company. Furthermore, organizational citizenship behaviors (OCB) toward one's coworkers were positively predicted by light traits, while OCB toward one's organization was both positively predicted by light traits and negatively predicted by dark traits. Together, this research shows that while employees' light traits do a better job at predicting a range of workplace behaviors, competition between one's light and dark traits may always be a challenge when trying to manage employee behavior.

[253] The Relationship Between Stereotypes About Nationality and Stereotypes About Race/Ethnicity

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

In the U.S., nationality is a well-established basis for stereotyping and discrimination. However, the American racial/ethnic hierarchy often subsumes nationality groups under broader racial and ethnic labels. When are nationality groups stereotyped primarily based on their national origin, and when is stereotyping more heavily influenced by their assigned racial/ethnic category? We propose two explanations: nationality groups' prototypicality and racial/ethnic groups perceived likelihood to identify with race/ethnicity over nationality. Across four studies ($N > 7,600$), more prototypical nationality groups (e.g., Mexican Americans) were stereotyped more similarly to their associated racial/ethnic group, and racial/ethnic groups that were perceived as likelier to identify with race/ethnicity over nationality (e.g., Black Americans) were stereotyped less similarly to their associated nationality groups. The amount of similarity in stereotyping between nationality and racial/ethnic groups was predictive of real-world immigration patterns. In a nation shaped by nationality groups, our findings illuminate how nationality and race/ethnicity jointly structure stereotypes.

[254] The Role of Anti-Asian Threat in the Endorsement of the Model Minority Myth and Perpetual Foreigner Stereotype

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Anti-Asian sentiment in the United States has intensified in recent years, reflecting a persistent view of Asian Americans as competitive outsiders. Two central stereotypes define this perception: the model minority myth (MMM), portraying Asians as successful yet socially distinct, and the perpetual foreigner stereotype (PFS), casting them as inherently un-American. Despite their prevalence, limited research has examined how these stereotypes shift under status threat. We tested whether threat-based narratives about Asian success heighten endorsement of MMM and PFS. In an online Prolific experiment ($N = 626$), White American participants viewed one of three videos depicting Asian American success, Asian immigrant success, or a neutral control. Both threat conditions increased MMM endorsement relative to the control, but only the immigrant condition elevated PFS endorsement, heightened perceived realistic threat, and strengthened support for exclusionary social policies (e.g., immigration restrictions). These findings indicate that framing Asian success as immigrant-driven more strongly activates perceptions of foreignness and competition, reinforcing hierarchy-preserving attitudes.

[255] The Shifting Landscape of Harm: Investigating the Phenomenon of Concept Creep in Harm Perception

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Concept creep, the gradual semantic expansion of harm-related concepts (Haslam et al., 2020), is a phenomenon garnering increasing attention in the field of psychology and is examined in the context of shifting perceptions of what is considered harmful. While what is considered harmful has shifted throughout generations, why these shifts happen and what motivates society to accept these broadening definitions has yet to be explained. Up to this point individual differences such as activism, left-wing authoritarianism, risk, empathy, stressful life events, and dark triad personality have yet to be investigated as potential contributors to the expansion of harm-related concepts. Thus, this study investigated the influences of generational changes and individual differences on the broadening of harm-related concepts. Results suggest that higher levels of empathy and left-wing authoritarianism were the primary drivers of the expansion of fringe forms of harm.

[256] The Two Forms of Purity: Differentiating Sexual- and Pathogen-Related Morality

4:40 PM – 5:40 PM

MORALITY

In moral psychology, purity refers to a range of attitudes concerning sexual conduct, hygiene, food taboos, unnatural acts, and sacrilege. We argue that sexual purity and pathogenic purity are distinct moral domains with separate evolutionary and psychological foundations. In particular, we proposed that sexual purity concerns arose from the adaptive challenges of successful mating and are shaped by mate-guarding psychology and mating strategy, while pathogenic purity arose from the adaptive challenges of avoiding infectious disease and is shaped by disgust psychology.

[257] The White Gaze in Racial Stereotype Research: Sample Bias and its Consequences

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Existing research on racial stereotypes predominantly relies upon White subjects, exploring their perceptions of Blacks and Asians. Do its findings generalize beyond Whites? To find out, we combined insights from the Stereotype Content Model and Gendered-race Theory, exploring the racial stereotypes of Whites, Blacks, and Asians simultaneously as both perceivers and targets. In two studies involving White, Black, and Asian Americans (Study 1, N = 702), and surveys in Australia, Japan, South Korea, and China (Study 2, N = 6508), we found both similarities and differences in how racial groups perceive each other. Asians were consistently seen as more competent but less athletic, while Blacks were seen as more athletic but less competent. Whites fell between these poles. But each group differed in viewing their own race as warmer than other races, suggesting ingroup favoritism. This research demonstrates that diverse racial samples are needed for a less Eurocentric and more accurate understanding of racial stereotypes.

[258] The wisdom of the heart: Self-locations and emotional intelligence

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Folk theory links the head to rational abilities and the heart to experiential abilities. Perceiving oneself as an entity that can travel from head to heart or vice versa could allow people to reconfigure oneself such that one's processing strategy (rational or experiential) is matched to the task at hand. Participants in 3 studies (total N = 472) were asked to simulate themselves performing a variety of activities, following which they indicated whether the self would be located in the brain area of the body, the heart area, or somewhere in between. For each participant separately, self-locations per activity were correlated with whether the activities involve feelings, as rated by experts, resulting in heart/feeling scores that varied across participants. Participants whose self was perceived to migrate toward the heart when activities involve feelings scored higher in ability-based tests of emotional understanding (Study 1a), emotion management (Study 1b), and reported feelings that differentiated stimuli more accurately (Study 2). Emotional intelligence appears to benefit from simulations of the self that are flexible in linking feelings to the heart rather than the head.

[259] Trauma, Care, and Morality: Emotions as the Link Between Childhood Adversity and Moral Foundations

4:40 PM – 5:40 PM

MORALITY

Adverse childhood experiences (ACEs) are prevalent predictors of poor health outcomes in adulthood, but their impact on moral foundations remains underexplored. This quantitative cross-sectional study examined the effects of ACEs on adult morality and proposed affective personality traits and caregiving factors as possible mediating mechanisms. The researcher administered a comprehensive online survey to a global sample of $N = 376$ English-speaking adults, comprised of four validated survey measures that assessed both retrospective and present experiences, traits, and character styles. The survey assessed ACE exposure (10-item ACE-Q), species-typical caregiving practices (EDNH), the Affective Neuroscience Personality Scales (ANPS), and the 20-item Moral Foundations Questionnaire (MFQ-20), an assessment of moral intuitions derived from Moral Foundations Theory (MFT). The researcher designed the study to test the trauma/Thriving-Emotions-Morality (tTEM) framework, which posits that emotions are primary in moral beliefs and are cultivated through childhood relationships. Results from group comparisons between high-ACE (≥ 4) and low-ACE (≤ 3) participants indicated small but significant differences, with high-ACE participants tending toward higher Individualizing and lower Binding moral foundations scores compared to low-ACE participants. Structural equation modeling (SEM) indicated a mediated link between ACEs and MFT, where positive personality traits and heightened EDNH scores positively predicted both Binding and Individualizing moral foundations. These results suggest that early nurturance promotes positive emotional development, shaping moral proclivities. Such research is instructive for clinicians, educators, and policymakers alike, informing existing practices and promoting the future development of enrichment programs that support positive childhood experiences and later moral development.

[262] Trust in artificial moral advisors across cultures

4:40 PM – 5:40 PM

MORALITY

Developers of artificial intelligence are already building prototypes for artificial moral advisors: autonomous systems designed to provide humans with recommendations on ethical issues. Yet it remains unclear whether people will actually trust and adopt these technologies. Here, we investigate perceptions of human and artificial moral advisors in a large-scale cross-cultural experiment (12 countries; $N = 6,896$). We show that people trust artificial advisors less than human ones, especially when their advice aligns with utilitarian rather than deontological principles. Nonetheless, people update their own moral judgments in the direction of the advice – regardless of whether it came from a human or AI advisor – and do so more when the advice is deontological. These findings reveal a psychological paradox: people trust artificial moral advisors less, yet still defer to them in practice. This dissociation raises serious questions about the potential influence of machines on human morality, with implications for AI governance.

[263] Understanding hiring decisions: When the racial composition of the applicant pool biases decision-making

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Understanding how the racial composition of a job applicant pool influences hiring decisions is crucial for addressing racial inequalities in the workplace. In the present research, participants viewed the resumes of equally qualified applicant pairs for a project manager position. In Experiment 1 ($N = 222$), participants showed a pro-Black bias when choosing between a Black and a White applicant; however, this bias did not emerge when the Black applicant was compared with an Asian applicant. Experiment 2 ($N = 330$) was designed to determine whether the pro-Black bias from Study 1 is replicable and whether participants demonstrate a pro-Asian bias when deciding between a White and an Asian applicant. In addition, Experiment 2 will test how participants' motivations (e.g., to diversity in the workplace) influence decision making. The results of these experiments will provide insights into how the racial composition of an applicant pool may bias personnel selection decisions. Furthermore, it will help organizations to identify strategies to mitigate bias and increase equitable outcomes.

[264] UNDERSTANDING INDIVIDUAL DIFFERENCES UNDERLYING AFFECTIVE FORECASTING: THE ROLE OF TRAUMA EXPOSURE AND RUMINATION

4:40 PM – 5:40 PM

INDIVIDUAL DIFFERENCES

Trauma history may influence affective forecasting—the prediction of future emotional responses—by heightening cognitive biases and emotion dysregulation (Fitzgerald et al., 2022). We examined associations among trauma exposure, posttraumatic stress symptom (PTS) severity, and affective forecasting in 130 participants (53% men, 63% white) who rated expected emotional reactions to descriptions of International Affective Picture System images. Trauma exposure was significantly correlated with rumination ($p = .002$), and mediation analyses showed that trauma exposure increased predicted negative feelings both directly and indirectly via rumination. In contrast, affective forecasting accuracy was not significantly related to trauma or rumination, suggesting that these factors shape the intensity of predicted and actual emotions without impairing accuracy. These findings highlight the importance of interventions that focus on regulating emotional intensity rather than assuming forecasting deficits in trauma-exposed individuals.

[265] Understanding the emergence of extraordinary altruism: The case of the independently vegetarian child

4:40 PM – 5:40 PM

MORALITY

What drives someone to donate a kidney to a stranger? Prior research links certain personality and cognitive traits that distinguish “extraordinary altruists” from the typical population, but little is known about their developmental origins. Here we examine an unusually altruistic decision that can be expressed in childhood: the decision not to eat animals. Across two studies, we compared independent vegetarians (i.e., vegetarians raised in non-vegetarian households), family vegetarians, and non-vegetarian adults ($N = 284$) and children ages 8–11 ($N = 236$), assessing empathy, disgust sensitivity, cognitive reflection, fearful facial recognition, social dominance orientation (SDO), and speciesism. Independent and family vegetarian adults were less speciesist, lower in SDO, and higher in disgust sensitivity and empathy. Although we expected independent vegetarian children to show especially distinct traits, they differed little from others. Both independent and family vegetarian children were less speciesist than non-vegetarians, with no difference on other measures. These findings suggest dietary choices may reflect specific moral values rather than broad psychological traits.

[266] Understanding When Dynamic Norms Flourish or Fail to Promote Sustainability and Social Equity

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

What determines whether a trend grows into a prominent norm or fades away? While prior research has identified factors that moderate conformity to static norms, relatively little is known about moderators for dynamic norms. We test three dynamic norm attributes (specific perceptions about a trend) that may shape conformity: Longevity (will the trend last?), Universality (will it spread widely?), and Sufficiency (is further change needed?). In two studies on adopting novel proenvironmental technologies (heat pumps, $N = 320$; induction cooktop stoves, $N = 940$), perceived high longevity and universality corresponded to increased interest compared. In a third study on reducing peak hour energy use ($N = 380$), perceived sufficiency (when progress was seen as sufficient) predicted less willingness to take action. We then test if these findings replicate in an ongoing national sample in the U.S. ($N = 1,600$) across multiple issue domains (e.g., EV ownership and bail reform). This research will advance understanding of when and why social trends spread or fail to grow, offering psychological insights into the dynamics norms and social change.

[267] Unexpected Advocacy from Right-Leaning Companies Shifts Perceptions of Societal Support for Social Issues

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

Increasingly, companies take public positions on social issues. At times, these stances unexpectedly deviate from a company's reputation (e.g., the NFL publicly supporting transgender fans, Fox supporting Black Lives Matter). Using real corporate social media posts, we examined how progressive messages, and their perceived alignment with a company's reputation and subsequent actions, shape perceptions of companies, their motives, and their impact on the broader public. We examine perceptions across four key issues: racial justice, LGBTQ+ representation, transgender rights, and climate action. Study 1 shows that while unexpected advocacy is perceived as inauthentic, importantly, it does not reduce positive perceptions of the company. In fact, unexpected advocacy more strongly increases perceived societal support for issues than expected advocacy. Study 2 finds that when companies' actions deviate from their message, positive perceptions of companies and perceived support for issues decrease. Study 3 explores these effects in the context of recent political shifts that have reshaped the norms and reputational risks of corporate social advocacy.

[268] Victims of Circumstance, Villains of Choice

4:40 PM – 5:40 PM

MORALITY

Three studies tested the hypothesis that experiences of interpersonal victimhood affect people's perceptions of their own and others' free will. Study 1 (N = 261) found that participants' tendency for interpersonal victimhood was uncorrelated with their beliefs in their own free will but was positively correlated with their beliefs in others' free will. Study 2 (N = 360) found that, compared to writing about an unspecified interaction with another person, writing about being treated unfairly by another person decreased participants' perceptions of their own free will but increased their perceptions of the other person's free will. Study 3 (N = 367) replicated these results and additionally found that, compared to writing about an unspecified interaction with another person, writing about treating another person unfairly increased participants' perceptions of their own free will but decreased their perceptions of the other person's free will. These results provide evidence that people's beliefs in their own and others' free will can diverge, and that this divergence can result from being the recipient—or the perpetrator—of interpersonal victimhood.

[269] Victims or Villains? Social support blurs the lines for deviant goals

4:40 PM – 5:40 PM

MORALITY

As digital use and social media exposure increase at younger ages, it is crucial to understand how these platforms shape not only how we perceive events but also how we morally justify them. Goal contagion research shows that people unconsciously adopt others' aims based on subtle cues, particularly in abstract domains like information-seeking. Digital platforms amplify this: peer influence is immediate, constant, and often invisible, making social media uniquely powerful in shaping norms around deviance and prosociality. This project investigates how online discourse influences moral and social judgments around deviant goal pursuit, using crime as a lens to examine how everyday interactions—likes, comments, and shares—shift cognition about deviance. To test this, we designed a fully interactive social media simulation. Participants can scroll, like, comment, and share posts while we manipulate (a) the type of social support expressed (sympathetic, condemning, neutral) and (b) engagement visibility (high vs. low). By mirroring real platforms, this experiment maximizes ecological validity and reveals how online interactions subtly shape moral judgment and goal pursuit.

[270] Visual Imagery Perspective in Goal Pursuit: The Moderating Role of Self-Concordance

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Positive mental imagery can boost motivation, but the role of imagery perspective remains unclear. This study tested whether imagining a personal goal from a first- or third-person perspective affects goal pursuit motivation and whether the effect depends on goal self-concordance, defined as the extent to which the goal is aligned with one's core values and interests. Drawing on process models of imagery perspective, we hypothesized that third-person imagery would be particularly motivating for self-concordant goals. Undergraduate participants identified a current goal, rated why they were pursuing it, and were instructed to visualize their goal pursuit from a first- or third-person perspective. Participants then rated their goal pursuit motivation (i.e., feelings of motivation, commitment, and confidence). Contrary to our preregistered moderation hypothesis, imagery perspective did not interact with goal self-concordance. Exploratory analyses found that third-person imagery sometimes led to greater motivation than first-person imagery, but this effect varied across domains. Overall, there was not consistent evidence that imagery perspective influenced goal pursuit motivation.

[271] Vividly Imagining Other People's Experiences Reduces Negative Moral Judgments of their Actions

4:40 PM – 5:40 PM

MORALITY

Moral character assessment is central to person perception. Research indicates that judgments of moral character are even more diagnostic than warmth or competence. Yet little is known about how different methods of eliciting these evaluations shape moral judgment. We provide evidence that vividly imagining another's experience—like an actor playing a role—reduces negative moral judgments in ambiguous cases of wrongdoing. In Study 1 (N = 160), participant pairs were randomly assigned to act out a scene together over Zoom in real time in which one character steals the other's notebook. After receiving instructions to embody their assigned role like an actor, as if they were experiencing it themselves, participants performed the scene live. Those who played the ambiguous thief judged his actions as more moral and rated him as more trustworthy and likeable than those playing the victim. Study 2 (N = 451) replicated this effect with an online sample: participants read their own lines aloud and the other's silently. Those who played the ambiguous thief again evaluated him more favorably than those who played the other role or read the scene silently in a control condition.

[272] Weighing Out the Options: The Role of Weight Management Strategy on Weight-based Beliefs and Attitudes

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

Weight loss is a billion-dollar industry; methods of weight loss influence weight stigma and person perception. Loss through bariatric surgery and medications are viewed as "taking the easy way out" while behavior modification is viewed as morally superior. Regardless of method of weight loss, weight regain is the norm for most individuals; however, research has never examined how person perception may change in the context of weight loss and regain. A sample of 297 participants were randomly assigned to view one of three vignettes describing a woman who lost and regained weight through behavior modification, bariatric surgery, or medication. Participants reported on their perceptions of the target, lay beliefs about weight, and effectiveness of weight management strategies. The target was viewed more positively in the behavior modification condition relative to medication, but not surgery. Further, it was clear participants overestimate the controllability of body weight and do not understand the efficacy of weight management strategies. This work highlights the need for empirically informed information on body weight in public health and mitigation strategies for weight stigma.

[274] What do free will, moral curiosity, and emotional reaction tell us about a person's moral character when their behavior harms others?

4:40 PM – 5:40 PM

MORALITY

The current studies examine three types of information a person might use to assess the moral character of a person whose actions cause harm: That person's belief that they had no choice but to act, how the person responded after hearing that they have caused harm, and a novel individual difference we are calling "moral curiosity."

A correlational study and three initial experiments examined relationships between these three domains by measuring and manipulating each domain separately and examining their impact on moral character judgments and beliefs about the other domains. Building on this, the three experiments we will present each concurrently manipulated two of the three domains (e.g., free will and moral curiosity) and examined their effects on downstream variables.

We found that when targets feel they can act freely, are lower in moral curiosity, or fail to respond with an "appropriate" emotional reaction, they are rated as more immoral, although some nuance also emerged as a function of which domains were manipulated in tandem. We discuss how each domain provides a unique route to moral judgment, but also highlight how each domain is informative about the others.

[275] What drives downward comparison in morality? The effect Narcissistic Personality has

4:40 PM – 5:40 PM

MORALITY

People often engage in downward comparison. They are motivated to view oneself as better than others, particularly in the moral domain.

This study explored the relationship between pathological narcissism and social comparison in the moral domain. Previous research demonstrated that pathological narcissism is linked to downward social comparison (Bogart et al, 2004) and moral grandstanding (Şen et al, 2022). Moreover, moral comparisons differ from comparisons in other domains in terms of frequency, perceived threat, and diagnosticity (Fleischmann et al, 2021).

Thus, we examined how pathological narcissism affects downward comparison depending on domain of comparison (moral vs. athletic) and perceived self-threat.

[276] What Happiness Means to Gifted Adolescents: Value Profiles and Implications for Motivation

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Do gifted adolescents construe happiness in ways that support intrinsic motivation for learning? We compared gifted high-school students (n=66) and age-matched peers (n=45; 15–17 years) from two urban Russian schools. Participants completed Subjective Happiness and Dispositional Optimism scales and answered "What is happiness?". Two trained judges, blind to group, coded responses into categories (e.g., meaning/self-development, achievement, family/close ties). Groups did not differ in happiness or optimism. However, gifted adolescents referenced meaning/self-development and achievement more often, whereas peers emphasized family/close ties; $\chi^2(7)=27.05$, $p<.001$, Cramér's $V=.39$ (N codes=178). This mixed-methods profile helps explain why gifted youth show stronger autonomous/achievement motivation without higher global well-being and suggests needs-supportive, mastery-oriented classroom practices.

[277] What Turns “Us” Into Accomplices? Identifying the Emergence of Corrupt Collaboration

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

How does corrupt collaboration arise? This research explores the micro-mechanisms of this transformation, which stem from a conflict between the norms of honesty and coordination. We hypothesize that social feedback about peers' behavior is the critical catalyst that resolves this conflict, acting as a potent normative catalyst, not merely strategic information. By providing social proof, it reduces the psychological cost of dishonesty and grants implicit permission to prioritize an emergent, local norm of corrupt collaboration over the global norm of honesty.

We conducted a real-time interactive experiment, with 180 adults assigned to 30 six-person groups in a 2 (Social Feedback: With vs. Without) $\times$ 30 (Trials) mixed-design. Using a die-rolling paradigm, participants faced conflicting incentives for individual honesty and collective coordination (a bonus if all six members reported the same number). The key manipulation was social feedback: the “With Feedback” condition saw peers' reports from the preceding trial, while the “Without Feedback” condition did not. We measured individual (honesty, decision time, normative beliefs) and group-level outcomes (corrupt collaboration, group consensus).

At the individual level, social feedback systematically eroded honest behavior ($b = -1.03$, $p < .001$) and reduced decision times ($p < .001$), suggesting it offloaded the burden of moral deliberation. Crucially, feedback also selectively bolstered the belief that corrupt coordination was appropriate ($p = 0.014$). These individual changes aggregated into dramatic group-level phenomena. Feedback triggered an explosive learning curve in corrupt collaboration and fostered rapid behavioral consensus ($p < .001$). The core psychological mechanism was the formation of normative consensus: only in the feedback condition did groups rapidly form a strong consensus that abandoning the honesty norm was acceptable, creating a shared reality that licensed collective corruption.

Our study demonstrates that social feedback is a powerful catalyst transforming individual dishonesty into coordinated group corruption. The mechanism is social influence via social learning. Observing peers' behavior provides the social license for a group to collectively abandon a pre-existing honesty norm for a new, profitable norm of corrupt collaboration, resolving the cognitive and social conflict.

[278] Who Counts as ‘Us’? Latent Profiles of Moral Inclusiveness, Trauma History, and Psychological Wellbeing

4:40 PM – 5:40 PM

MORALITY

Moral inclusiveness, the scope of people and beings considered worthy of ethical concern, shapes how individuals relate to family, community, humanity, and the natural world. This study applied latent profile analysis to cross-sectional data from 763 U.S. adults to identify distinct patterns of inclusiveness across these domains. Participants completed measures of moral inclusiveness, trauma history, recent adverse events, mental health, and spirituality. Five profiles emerged: from concern confined to close relationships, to concern encompassing all humans and animals. Narrower profiles were associated with higher depression, anxiety, PTSD symptoms, more recent stressors, and greater spiritual decline. Expansive profiles reported low psychological distress and high spirituality, while lifetime trauma exposure was comparably substantial. Thus, trauma alone does not determine the breadth of moral scope. Spiritual injury and ongoing adversity restrict inclusiveness; positive spiritual engagement fosters resilience and universal empathy. These findings extend prior work by showing that moral concern is multidimensional and deeply intertwined with trauma and spirituality.

[279] Who's at the Door? A Psychogeography of Surveillance

4:40 PM – 5:40 PM

NORMS AND SOCIAL INFLUENCE

With advancements in technology, home surveillance and other forms of home ‘fortification’ have become pervasive throughout American culture. Neoliberal orientation is proposed to be a motivator of positive attitudes towards and use of home surveillance. The present research uses a mixed-methods approach to examine the predictors of pro-surveillance attitudes in line with a theory of tessellated neoliberalism (Atkinson & Blandy, 2016), wherein neoliberal ideology is instantiated in the fortification of the home, which is reflected in broader social structures. Study 1 ($N=151$) used reflexive thematic analysis to generate three themes from US residents about motivations for home surveillance: a dangerous world, social isolation, and fortified home/fortified self. Study 2 ($N=490$) experimentally manipulated rising (vs. stabilizing) crime rates. The manipulation interacted with certain facets of neoliberal ideology such that those high in neoliberal ideology responded to rising crime with elevated pro-surveillance attitudes. Implications for an empirically validated theory of tessellated neoliberalism are discussed.

[280] Why Do People Actively Seek New Opportunities After Setbacks? An Examination Based on Implicit Theories of Opportunity and Intelligence

4:40 PM – 5:40 PM

MOTIVATION/GOALS

This study examined the relationship between goal strategies for setbacks that cannot be overcome by ability alone and two types of implicit theories. A total of 341 adults ($M = 40.63$, $SD = 10.72$) completed scales measuring implicit theories (the theory of intelligence and the theory of opportunity), and then indicated their goal strategies (active, passive, and abandonment) in response to three hypothetical scenarios involving setbacks. Factor analysis revealed that two implicit theories were distinct factors. Furthermore, both fixed theories of intelligence and opportunity were positively correlated with passive goal strategies and goal abandonment. Regression analysis revealed an interaction between the two implicit theories: the incremental theory of intelligence was negatively associated with goal abandonment among those who held an incremental theory of opportunity, whereas this relationship was not found in those with a fixed theory of opportunity; goal abandonment was lowest when both theories were incremental. The discussion considers the potential impact of cultural factors and social systems on the relationship between goal strategies and implicit theories.

[281] Why Go Green? Unpacking the Motivational Reasons Behind Private and Public Environmental Actions

4:40 PM – 5:40 PM

MOTIVATION/GOALS

Drawing on Self-Determination Theory (Deci & Ryan, 2000), this research explores motivations behind pro-environmental behaviors in Turkey, where an authoritarian political climate may inhibit participation in collective public actions. Study 1 ($N = 375$; $Mage = 22.35$; $SD = 2.38$) revealed that autonomous, but not controlling, reasons uniquely predicted private- and public-sphere behaviors, controlling for connectedness to nature and perceived environmental threat. Participants also responded to vignettes assessing their willingness to act sustainably at personal cost. Together, the results suggest that autonomous reasons predict both actual behavior and intention, even when time and effort are required. Building on Study 1, Study 2 (total $N = 160$; $Mage = 23.55$; $SD = 7.17$) used a six-week diary design and found that weekly variation in autonomous, but not controlling, reasons positively predicted weekly fluctuations in both behavior types. Further, perceived environmental threat also predicted between-person differences in such behaviors across both realms. These findings underscore the role of autonomous motivation in sustaining green behavior, even under restrictive conditions.

[282] Women's Weight and Sexual Orientation Judgments in Six Countries

4:40 PM – 5:40 PM

STEREOTYPING/PREJUDICE

In Western culture, higher-weight women are often accused of being unfeminine or even of being lesbians by strangers who know only their photograph. Research conducted in the US has demonstrated this connection, with women of higher subjective weight judged as more likely to be lesbian. This relationship was mediated by perceived gender roles (i.e., femininity and masculinity). However, cultures across the world have different standards for what constitutes a feminine body. We recruited participants from six countries on four continents to react to images of women. In all samples, higher-weight women were judged as more feminine and less masculine than lower-weight women. The relationship between gender roles and sexual orientation judgments was more varied, with both femininity and masculinity predicting sexual judgments only in Brazil. Model fit indices suggested that only Germany, India, and Ukraine fit the predictive model. Overall, our findings suggest that other factors – such as nationwide body norms and LGBT stigma – may be required to understand the relationship between weight, gender roles, and perceived sexual orientation.
