

# Vaping among Delaware Students

## Findings from the 2019 Delaware School Survey of Eleventh Grade Students

Vaping is far more prevalent than cigarette use.

### Perceptions of Harm from Vaping

Most students agree that vaping presents a moderate to great health risk.

Among students who have ever vaped, 39% had used their first vape by the age of 15.

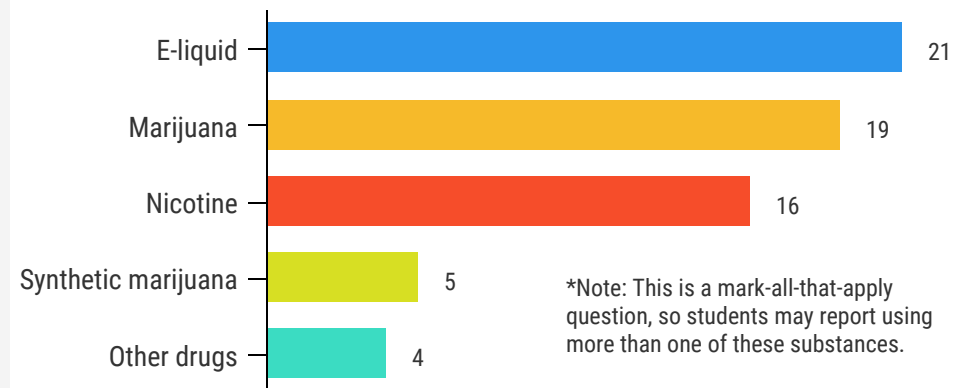

Among students who report cigarette use in the past year, 100% have also used a vaping device.

Approximately 16% of students report living with an adult who vapes at home.

### What are students consuming in vaping devices? (%)\*

\*Note: This is a mark-all-that-apply question, so students may report using more than one of these substances.

Vaping is the act of using an electronic cigarette or device such as Juul to inhale vaporized e-liquid, nicotine, marijuana, or other drugs.

E-liquid, also known as e-juice or vape juice, is fluid used in vaporizers or electronic cigarettes that contains artificial flavoring and sometimes nicotine.
