# Algebraically Defined Graphs and Generalized Quadrangles

Vladislav Taranchuk (joint work with Felix Lazebnik)

29th British Combinatorial Conference

July 11, 2022

#### Definition

A simple graph  $\Gamma = \Gamma(V, E)$  is a pair, where V is the set of vertices, and  $E \subset \binom{V}{2}$  is the set of edges. We denote the fact that a vertex x is **adjacent** to a vertex y by  $x \sim y$ . Since  $\Gamma$  is simple, the above definition removes the possibility of multiple edges, directed edges, and loops. In this talk, every graph mentioned will be a simple graph.

#### Definition

Let  $\Gamma$  be a graph containing at least one cycle. The **girth** of  $\Gamma$  is the length of the shortest cycle in  $\Gamma$ .

### Definition (Algebraically Defined Graphs)

Let  $P=L=\mathbb{F}_q^m$  be two copies of the m-dimensional vector space over  $\mathbb{F}_q$  with  $q=p^e$ . Call the set P points and L lines, with the distinction in notation by  $(a)\in P$  and  $[a]\in L$ . Define  $\Gamma_q=\Gamma_q(f_2,f_3,\ldots,f_m)$  to be the bipartite graph with parts P and L and with edge relation defined between them as follows: If  $(p)=(p_1,\ldots,p_m)\in P$  and  $[\ell]=[\ell_1,\ldots,\ell_m]$ , then  $(p)\sim [I]$  if and only if

$$\ell_2 + p_2 = f_2(\ell_1, p_1)$$

$$\ell_3 + p_3 = f_3(\ell_1, p_1, \ell_2, p_2)$$

$$\vdots$$

$$\ell_m + p_m = f_m(\ell_1, p_1, \dots, \ell_{m-1}, p_{m-1})$$

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

• Each point (or line) in  $\Gamma_q$  has exactly one neighbor whose first coordinate is x, for every  $x \in \mathbb{F}_q$ .

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

$$\ell_{2} + p_{2} = f_{2}(\ell_{1}, \mathbf{x})$$

$$\ell_{3} + p_{3} = f_{3}(\ell_{1}, p_{1}, \ell_{2}, p_{2})$$

$$\vdots$$

$$\ell_{m} + p_{m} = f_{m}(\ell_{1}, p_{1}, \dots, \ell_{m-1}, p_{m-1})$$

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

$$\ell_{2} + p_{2} = f_{2}(\ell_{1}, x)$$

$$\ell_{3} + p_{3} = f_{3}(\ell_{1}, x, \ell_{2}, p_{2})$$

$$\vdots$$

$$\ell_{m} + p_{m} = f_{m}(\ell_{1}, p_{1}, \dots, \ell_{m-1}, p_{m-1})$$

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

$$\ell_{2} + p_{2} = f_{2}(\ell_{1}, x)$$

$$\ell_{3} + p_{3} = f_{3}(\ell_{1}, x, \ell_{2}, p_{2})$$

$$\vdots$$

$$\ell_{m} + p_{m} = f_{m}(\ell_{1}, p_{1}, \dots, \ell_{m-1}, p_{m-1})$$

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

$$\ell_{2} + p_{2} = f_{2}(\ell_{1}, x)$$

$$\ell_{3} + p_{3} = f_{3}(\ell_{1}, x, \ell_{2}, p_{2})$$

$$\vdots$$

$$\ell_{m} + p_{m} = f_{m}(\ell_{1}, x, \dots, \ell_{m-1}, p_{m-1})$$

Some general facts about algebraically defined graphs are as follows. Let  $\Gamma_q = \Gamma_q(f_2, f_3, \dots, f_m)$ :

$$\ell_{2} + p_{2} = f_{2}(\ell_{1}, x)$$

$$\ell_{3} + p_{3} = f_{3}(\ell_{1}, x, \ell_{2}, p_{2})$$

$$\vdots$$

$$\ell_{m} + p_{m} = f_{m}(\ell_{1}, x, \dots, \ell_{m-1}, p_{m-1})$$

So 
$$[\ell_1, \ell_2, ..., \ell_m] \sim (x, p_2, ..., p_m)$$

ullet  $\Gamma_q$  is q-regular with  $|V|=n=2q^m$  and

$$|E|=q^{m+1}=\left(\frac{n}{2}\right)^{\frac{m+1}{m}}$$

•  $\Gamma_q$  is q-regular with  $|V| = n = 2q^m$  and

$$|E|=q^{m+1}=\left(\frac{n}{2}\right)^{\frac{m+1}{m}}$$

• For each  $b \in \mathbb{F}_q$ , there exists an automorphism  $t_b \in \operatorname{Aut}(\Gamma_q)$  given by

$$t_b[\ell_1, \ell_2, \dots, \ell_m] = [\ell_1, \ell_2, \dots, \ell_m + b]$$
  
 $t_b(p_1, p_2, \dots, p_m) = (p_1, p_2, \dots, p_m - b).$ 

Let ex(n, F) denote the largest number of edges in n-vertex graph that does not contain copy of F as a subgraph.

Let ex(n, F) denote the largest number of edges in n-vertex graph that does not contain copy of F as a subgraph.

• It has been shown that  $\operatorname{ex}(n,C_{2k}) \leq c_k n^{1+1/k}$  for a constant dependent on k. Bondy and Simonovits showed  $c_k = 100k$  works, and over time this constant has been improved several times, first by Verstraëte, then Pikhurko, and most recently by Bukh and Jiang who showed  $c_k = 80\sqrt{k \log k}$ .

Let ex(n, F) denote the largest number of edges in n-vertex graph that does not contain copy of F as a subgraph.

Bondy and Simonovits showed  $c_k = 100k$  works, and over time this constant has been improved several times, first by Verstraëte, then Pikhurko, and most recently by Bukh and Jiang who showed  $c_k = 80\sqrt{k \log k}$ .
- Lazebnik, Ustimenko, and Woldar used algebraically defined graphs to show that for infinitely many n,  $c_k' n^{1+2/(3k+3+\epsilon)} \leq \exp(n, C_{2k})$  where  $\epsilon = 1$  when k is odd and  $\epsilon = 0$  otherwise.

Algebraically defined graphs have a strong connection to finite geometry.

Algebraically defined graphs have a strong connection to finite geometry.

#### Definition

A **generalized** n-**gon** of order  $q \ge 1$  is a (q+1)-regular bipartite graph with diameter  $n \ge 2$  and girth 2n.

• 
$$q = 1$$
,  $n \ge 2$ :  $C_{2n}$ 

• 
$$n = 2, q \ge 1$$
:  $K_{(q+1),(q+1)}$ 

Algebraically defined graphs have a strong connection to finite geometry.

,  $q \ge 1$ :  $K_{(q+1),(q+1)}$ 

### Theorem (Tits 1959)

For n = 3, 4, 6, there exists a generalized n-gon of order q for every prime power q.

#### Theorem (Feit and Higman 1964)

There do no exist any generalized n-gons of any order q when  $n \notin \{2,3,4,6,8\}$ .

A generalized 3-gon is called a **projective plane**. Let  $f_2=f_2(p_1,\ell_1)$  and consider  $\Gamma_q=\Gamma_q(f_2)$ . Recall  $(p_1,p_2)\sim [\ell_1,\ell_2]$  iff  $p_2+\ell_2=f_2(p_1,\ell_1)$ . If  $\Gamma_q$  has girth 6, there is a unique way to obtain a projective plane from  $\Gamma_q$ .

A generalized 3-gon is called a **projective plane**. Let  $f_2=f_2(p_1,\ell_1)$  and consider  $\Gamma_q=\Gamma_q(f_2)$ . Recall  $(p_1,p_2)\sim [\ell_1,\ell_2]$  iff  $p_2+\ell_2=f_2(p_1,\ell_1)$ . If  $\Gamma_q$  has girth 6, there is a unique way to obtain a projective plane from  $\Gamma_q$ .

• The classical projective plane can be obtained using  $f_2(p_1, \ell_1) = p_1 \ell_1$ .

A generalized 3-gon is called a **projective plane**. Let  $f_2 = f_2(p_1, \ell_1)$  and consider  $\Gamma_q = \Gamma_q(f_2)$ . Recall  $(p_1, p_2) \sim [\ell_1, \ell_2]$  iff  $p_2 + \ell_2 = f_2(p_1, \ell_1)$ . If  $\Gamma_q$  has girth 6, there is a unique way to obtain a projective plane from  $\Gamma_q$ .

- The classical projective plane can be obtained using  $f_2(p_1, \ell_1) = p_1 \ell_1$ .
- All translation planes can be represented this way by using  $f_2(p_1,\ell_1)=p_1\star\ell_1$  where  $\star$  is the multiplication used in any particular quasifield. Translation planes account for many non-isomorphic classes of projective planes.

A generalized 3-gon is called a **projective plane**. Let  $f_2=f_2(p_1,\ell_1)$  and consider  $\Gamma_q=\Gamma_q(f_2)$ . Recall  $(p_1,p_2)\sim [\ell_1,\ell_2]$  iff  $p_2+\ell_2=f_2(p_1,\ell_1)$ . If  $\Gamma_q$  has girth 6, there is a unique way to obtain a projective plane from  $\Gamma_q$ .

#### Question

Can we construct generalized quadrangles this way too?

Yes we can! Algebraically defined graphs of the form  $\Gamma_q(f_2, f_3)$  give a method for constructing a generalized quadrangle (4-gon).

Yes we can! Algebraically defined graphs of the form  $\Gamma_q(f_2, f_3)$  give a method for constructing a generalized quadrangle (4-gon).

• For all prime powers q, one can attach a tree to  $\Gamma_q(p_1\ell_1,p_1\ell_2)$  to obtain the classical generalized quadrangle.

Yes we can! Algebraically defined graphs of the form  $\Gamma_q(f_2, f_3)$  give a method for constructing a generalized quadrangle (4-gon).

• For all prime powers q, one can attach a tree to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  to obtain the classical generalized quadrangle.

#### Question

Do there exist generalized quadrangles of odd order q that are not isomorphic to the classical generalized quadrangle?

Yes we can! Algebraically defined graphs of the form  $\Gamma_a(f_2, f_3)$  give a method for constructing a generalized quadrangle (4-gon).

• For all prime powers q, one can attach a tree to  $\Gamma_a(p_1\ell_1,p_1\ell_2)$  to obtain the classical generalized quadrangle.

#### Question

Do there exist generalized quadrangles of odd order q that are not isomorphic to the classical generalized quadrangle?

 No other (non-isomorphic) generalized quadrangles of odd order q are known.

13 / 18

Yes we can! Algebraically defined graphs of the form  $\Gamma_q(f_2, f_3)$  give a method for constructing a generalized quadrangle (4-gon).

• For all prime powers q, one can attach a tree to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  to obtain the classical generalized quadrangle.

#### Question

Do there exist generalized quadrangles of odd order q that are not isomorphic to the classical generalized quadrangle?

- No other (non-isomorphic) generalized quadrangles of odd order q are known.
- Algebraically defined graphs provide one potential method for answering this question. In large part, this question motivated our research.

So far, we know:

So far, we know:

ullet For all prime powers q,  $\Gamma_q(p_1\ell_1,p_1\ell_2)\cong \Gamma_q(p_1\ell_1,p_1\ell_1^2)$ .

So far, we know:

- For all prime powers q,  $\Gamma_q(p_1\ell_1,p_1\ell_2)\cong \Gamma_q(p_1\ell_1,p_1\ell_1^2)$ .
- Many graphs of the form  $\Gamma_q(p_1\ell_1, f_3(p_1, \ell_1))$  have been shown to either be isomorphic to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  or have girth less than 8, [1, 3].

#### So far, we know:

- For all prime powers q,  $\Gamma_q(p_1\ell_1,p_1\ell_2)\cong\Gamma_q(p_1\ell_1,p_1\ell_1^2)$ .
- Many graphs of the form  $\Gamma_q(p_1\ell_1, f_3(p_1, \ell_1))$  have been shown to either be isomorphic to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  or have girth less than 8, [1, 3].
- There are no known graphs,  $\Gamma_q(f_2, f_3)$  with girth 8 that are not isomorphic to  $\Gamma_q(p_1\ell_1, p_1\ell_1^2)$ .

So far, we know:

- For all prime powers q,  $\Gamma_q(p_1\ell_1,p_1\ell_2)\cong \Gamma_q(p_1\ell_1,p_1\ell_1^2)$ .
- Many graphs of the form  $\Gamma_q(p_1\ell_1, f_3(p_1, \ell_1))$  have been shown to either be isomorphic to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  or have girth less than 8, [1, 3].
- There are no known graphs,  $\Gamma_q(f_2, f_3)$  with girth 8 that are not isomorphic to  $\Gamma_q(p_1\ell_1, p_1\ell_1^2)$ .

One way to understand if there is still much viability in this approach is to answer the following question.

So far, we know:

- For all prime powers q,  $\Gamma_q(p_1\ell_1,p_1\ell_2)\cong \Gamma_q(p_1\ell_1,p_1\ell_1^2)$ .
- Many graphs of the form  $\Gamma_q(p_1\ell_1, f_3(p_1, \ell_1))$  have been shown to either be isomorphic to  $\Gamma_q(p_1\ell_1, p_1\ell_2)$  or have girth less than 8, [1, 3].
- There are no known graphs,  $\Gamma_q(f_2, f_3)$  with girth 8 that are not isomorphic to  $\Gamma_q(p_1\ell_1, p_1\ell_1^2)$ .

One way to understand if there is still much viability in this approach is to answer the following question.

#### Question

Given  $\Gamma_q(f_2, f_3)$  where  $f_2 = f_2(p_1, \ell_1)$  and  $f_3(p_1, \ell_1, p_2, \ell_2)$ , does there exist a function  $f_3' = f_3'(p_1, \ell_1)$  so that  $\Gamma_q(f_2, f_3) \cong \Gamma_q(f_2, f_3')$ ?

Observe that for any graph of the form  $\Gamma_q(f_2(p_1, \ell_1), f_3(p_1, \ell_1))$ . Observe that since

$$p_2 + \ell_2 = f_2(p_1, \ell_1)$$
  
 $p_3 + \ell_3 = f_3(p_1, \ell_1)$ 

Observe that for any graph of the form  $\Gamma_q(f_2(p_1, \ell_1), f_3(p_1, \ell_1))$ . Observe that since

$$p_2 + \ell_2 = f_2(p_1, \ell_1)$$
  
 $p_3 + \ell_3 = f_3(p_1, \ell_1)$ 

then for all  $a, b \in \mathbb{F}_q$ , the function  $t_{a,b}$  where

$$t_{a,b}[\ell_1, \ell_2, \ell_3] = [\ell_1, \ell_2 + a, \ell_3 + b]$$
  
 $t_{a,b}(p_1, p_2, p_3) = (p_1, p_2 - a, p_3 - b)$ 

is an automorphism of  $\Gamma_q$ . Meaning,  $q^2 \leq |\operatorname{Aut}(\Gamma_q)|$ .

Let  $\Gamma = \Gamma_q(p_1\ell_1, p_1\ell_1p_2(p_1+p_2+p_1p_2))$ . This family of graphs appeared in the thesis of Nassau 2021.

Let  $\Gamma = \Gamma_q(p_1\ell_1, p_1\ell_1p_2(p_1+p_2+p_1p_2))$ . This family of graphs appeared in the thesis of Nassau 2021. It was checked via computer that for all odd prime powers  $q=p^e<43$ ,  $|Aut(\Gamma)|=qe$ , and hence, there do not exist functions  $f_2, f_3$  of just  $p_1$  and  $\ell_1$  such that  $\Gamma \cong \Gamma_q(f_2, f_3)$  for these values of q.

Let  $\Gamma = \Gamma_q(p_1\ell_1,p_1\ell_1p_2(p_1+p_2+p_1p_2))$ . This family of graphs appeared in the thesis of Nassau 2021. It was checked via computer that for all odd prime powers  $q=p^e<43$ ,  $|Aut(\Gamma)|=qe$ , and hence, there do not exist functions  $f_2,f_3$  of just  $p_1$  and  $\ell_1$  such that  $\Gamma\cong\Gamma_q(f_2,f_3)$  for these values of q.

#### Theorem (Lazebnik and T. 2022)

Let p be an odd prime with  $p \equiv 1 \pmod{3}$ . If  $\Gamma$  is defined over  $\mathbb{F}_p$ , then  $|Aut(\Gamma)| = p$ .

Let  $\Gamma = \Gamma_q(p_1\ell_1,p_1\ell_1p_2(p_1+p_2+p_1p_2))$ . This family of graphs appeared in the thesis of Nassau 2021. It was checked via computer that for all odd prime powers  $q=p^e<43$ ,  $|Aut(\Gamma)|=qe$ , and hence, there do not exist functions  $f_2,f_3$  of just  $p_1$  and  $\ell_1$  such that  $\Gamma\cong\Gamma_q(f_2,f_3)$  for these values of q.

#### Theorem (Lazebnik and T. 2022)

Let p be an odd prime with  $p \equiv 1 \pmod{3}$ . If  $\Gamma$  is defined over  $\mathbb{F}_p$ , then  $|Aut(\Gamma)| = p$ .

### Corollary (Lazebnik and T. 2022)

Let p be an odd prime with  $p \equiv 1 \pmod{3}$ . Let  $f_2 = f_2(p_1, \ell_1)$  and  $f_3 = f_3(p_1, \ell_1)$  be functions of  $p_1$  and  $\ell_1$ . Then  $\Gamma_q(f_2, f_3) \not\cong \Gamma$ .
