RESEARCH INTERESTS

Small-scale hydrodynamics and sediment transport processes for coastal applications

Sea level rise and increased storm intensity will have disproportionate effect on natural and built coastal environments. My research is generally interested in the processes that occur in the direct vicinity of the instantaneous shoreline in a region referred to as the inner surf and swash zone. Here, coastal processes are intense with water level variations from dry to over a meter on short time scales, rapid velocities and fluid turbulence, high sediment loads, rapid morphodynamics, fluid/air/sediment interactions, and fluid infiltrating and exfiltrating the sand surface. The complexity causes difficulty in process understanding, but at the same time make the area rich with intriguing signals. Unfortunately, those signals are often hard to sample due to the very environment of interest. Some of my work focuses on developing remote sensing and in situ sensing capabilities to help in understanding the underlying

physics. Ultimately, we seek proper physical relationships between the hydrodynamic forcing and sediment response. Other areas of research interest consist of nature-based and nature-inspired solutions for coastal disaster mitigation and Department of Defense based applications of coastal engineering and coastal processes.
